## Supplementary methods

### ***NPM1*-mut risk stratification**

A multi-step analysis of clinically significant gene co-mutations associated to *NPM1*-mut was performed. At each step, combinations of up to two additional genes (either mutated or wildtype) that were present in at least 10 patients were explored. While late relapses in *NPM1*-mut AML have been reported, patient prognosis is mostly determined within the first 2 years from disease diagnosis in this AML subtype<sup>1-3</sup>. In fact, in HARMONY training cohort there was <10% difference between 2-year OS (62.6%) and 5-year OS (53.5%) and an increasing number of follow-up losses between those timepoints (**Figure S27**), so 2-year OS was selected for outcome comparison. The 2-year-OS for each combination was estimated using 100-fold bootstrap sampling and compared to the 2-year OS of *NPM1* wildtype (-wt) patients in the same dataset. Cloglog transformation of survival curves was used for testing differences at this fixed 2-year timepoint, as previously recommended<sup>4</sup>. Only combinations with statistically significant differences (cloglog p-value <0.05) compared to their respective opposites, in at least 60% of bootstrap sampling comparisons, were initially selected and represented in **Figures S4, S8, S11, S13, S16 and S19**. Finally, gene mutation combinations that allowed patient reclassification into different European LeukemiaNet (ELN) 2022 risk categories were selected<sup>5</sup>. When multiple co-mutational patterns could potentially lead into patient reclassification, the most representative (i.e. with higher number of patients) was selected.

Exploratory analyses demonstrated similar findings with *IDH1*-mut and *IDH2*-mut in *NPM1*-mut (**Figures S1 and S2**), so they were combined as *IDH*-mut (any mutated) or *IDH*-wt (both wildtype) in the final risk classification.

In the first step, combinations that met the aforementioned criteria are depicted in **Figure S1**. Baseline cohort (i.e. all *NPM1*-mut) presented a 2-year OS between ELN2022 favorable-risk and ELN2022 intermediate-risk for *NPM1*-wt in the same dataset. However, patients with *FLT3*-ITD

and *DNMT3A* had a 2-year OS that was different to ELN2022 intermediate-risk (cloglog p-value <0.001) and closer to ELN2022 adverse-risk patients (cloglog p-value 0.834), so this combination was selected. The deleterious effect of *DNMT3A*-mut was confirmed when the subset with *NPM1*-mut and *FLT3*-ITD was analyzed (**Figure S5**) and therefore triple-mutated patients (i.e. *NPM1*-mut, *FLT3*-ITD and *DNMT3A*-mut) were classified as “*NPM1* adverse”. Subsequently, the subset with *NPM1*-mut, *FLT3*-ITD and *DNMT3A*-wt was evaluated (**Supplementary Figure S8**). This subset had a 2-year OS between ELN2022 favorable-risk and ELN2022 intermediate-risk, but *IDH*-mut patients had a 2-year OS that was distinct to ELN2022 intermediate-risk (cloglog p-value 0.013) and was closer to ELN2022 favorable-risk (cloglog p-value 0.409) and were therefore classified as “*NPM1* favorable”. Conversely, *IDH*-wt patients had a 2-year OS that was different from ELN2022 favorable-risk (cloglog p-value <0.001) and closer to ELN2022 intermediate-risk (cloglog p-value 0.913) and were therefore classified as “*NPM1* intermediate”. Similar methodology was applied to classify the remainder of *NPM1*-mut patients (**Supplementary Figures S11, S13 and S16**).

## Supplementary figures

**Figure S1.** *IDH1/2* sub-analysis of overall survival in patients with *NPM1*-mut, absence *FLT3*-ITD and *DNMT3A*-mut.

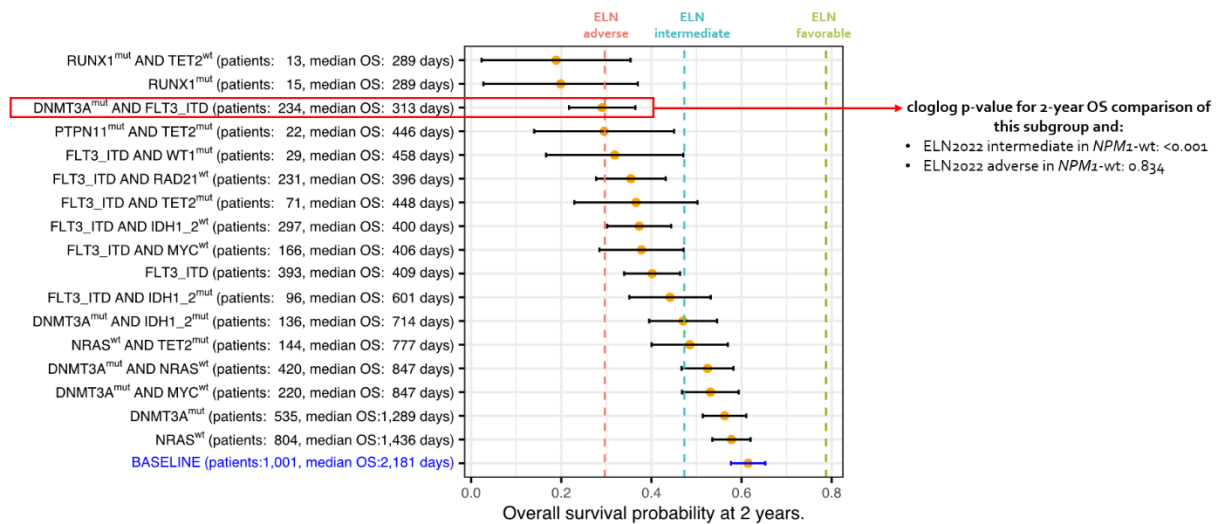

**Figure S2.** *IDH1/2* sub-analysis of overall survival in patients with *NPM1*-mut, *FLT3*-ITD and *DNMT3A*-wt.

*NPM1* mutation was used as the reference for the Bradley-Terry model

**Figure S3.** Variant allele frequency of most-frequently mutated genes in *NPM1*-mut AML (training cohort) and Bradley-Terry model of relative order of mutation acquisition.

**Figure S4.** Two-year overall survival comparison of gene co-mutations in *NPM1*-mut AML compared to ELN2022 risk classification in *NPM1*-wt patients, in the training cohort. Baseline cohort of the figure: *NPM1*-mut.

**Figure S5.** Two-year overall survival comparison of gene co-mutations in *NPM1*-mut AML compared to ELN2022 risk classification in *NPM1*-wt patients, in the training cohort. Baseline cohort of the figure: *NPM1*-mut and *FLT3*-ITD.

**Figure S6.** Co-mutational landscape of patients with *NPM1*-mut and *FLT3*-ITD.

**Figure S7.** Co-mutational landscape of patients with *NPM1*-mut, *FLT3*-ITD and *DNMT3A*-mut.

**Figure S8.** Two-year overall survival comparison of gene co-mutations in *NPM1*-mut AML compared to ELN2022 risk classification in *NPM1*-wt patients, in the training cohort. Baseline cohort of the figure: *NPM1*-mut, *FLT3*-ITD and *DNMT3A*-wt.

**Figure S9.** Co-mutational landscape of patients with *NPM1*-mut, *FLT3*-ITD and *DNMT3A*-wt.

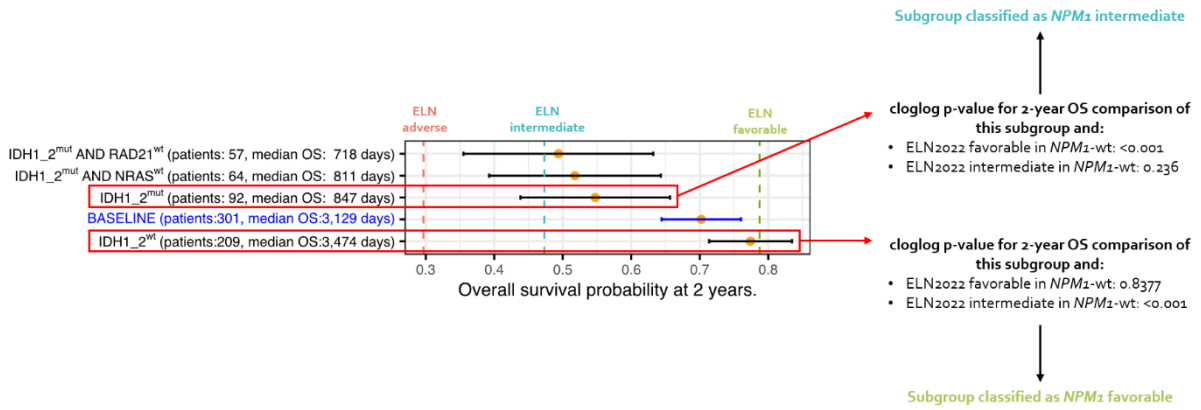

**Figure S10.** Overall survival of patients with *NPM1*-mut AML and *FLT3*-ITD according to HARMONY *NPM1*-mut classification.

**Figure S11.** Two-year overall survival comparison of gene co-mutations in *NPM1*-mut AML compared to ELN2022 risk classification in *NPM1*-wt patients, in the training cohort. Baseline cohort of the figure: *NPM1*-mut and absence of *FLT3*-ITD.

**Figure S12.** Co-mutational landscape of patients with *NPM1*-mut and absence of *FLT3*-ITD.

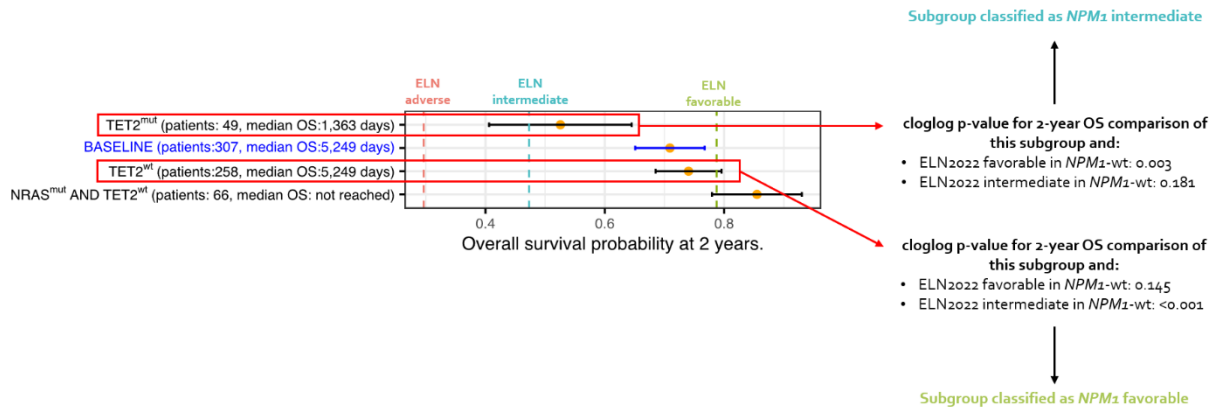

**Figure S13.** Two-year overall survival comparison of gene co-mutations in *NPM1*-mut AML compared to ELN2022 risk classification in *NPM1*-wt patients, in the training cohort. Baseline cohort of the figure: *NPM1*-mut, absence of *FLT3*-ITD and *DNMT3A*-mut.

**Figure S14.** Co-mutational landscape of patients with *NPM1*-mut, absence of *FLT3*-ITD and *DNMT3A*-mut.

**Figure S15.** Overall survival of patients with *NPM1*-mut AML and *DNMT3A*-mut according to HARMONY *NPM1*-mut classification.

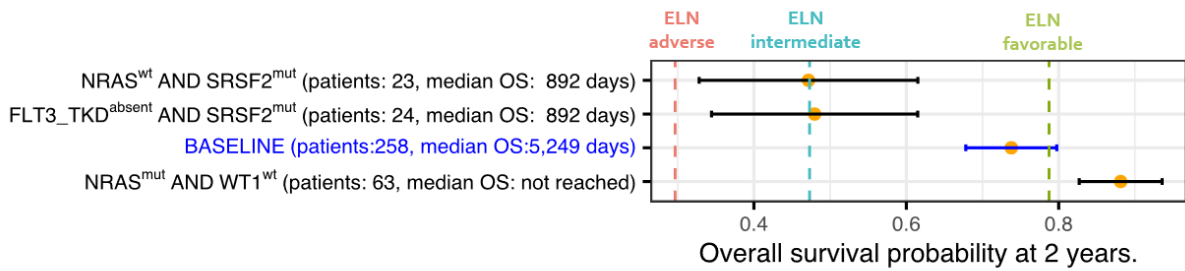

**Figure S16.** Two-year overall survival comparison of gene co-mutations in *NPM1*-mut AML compared to ELN2022 risk classification in *NPM1*-wt patients, in the training cohort. Baseline cohort of the figure: *NPM1*-mut, absence of *FLT3*-ITD and *DNMT3A*-wt.

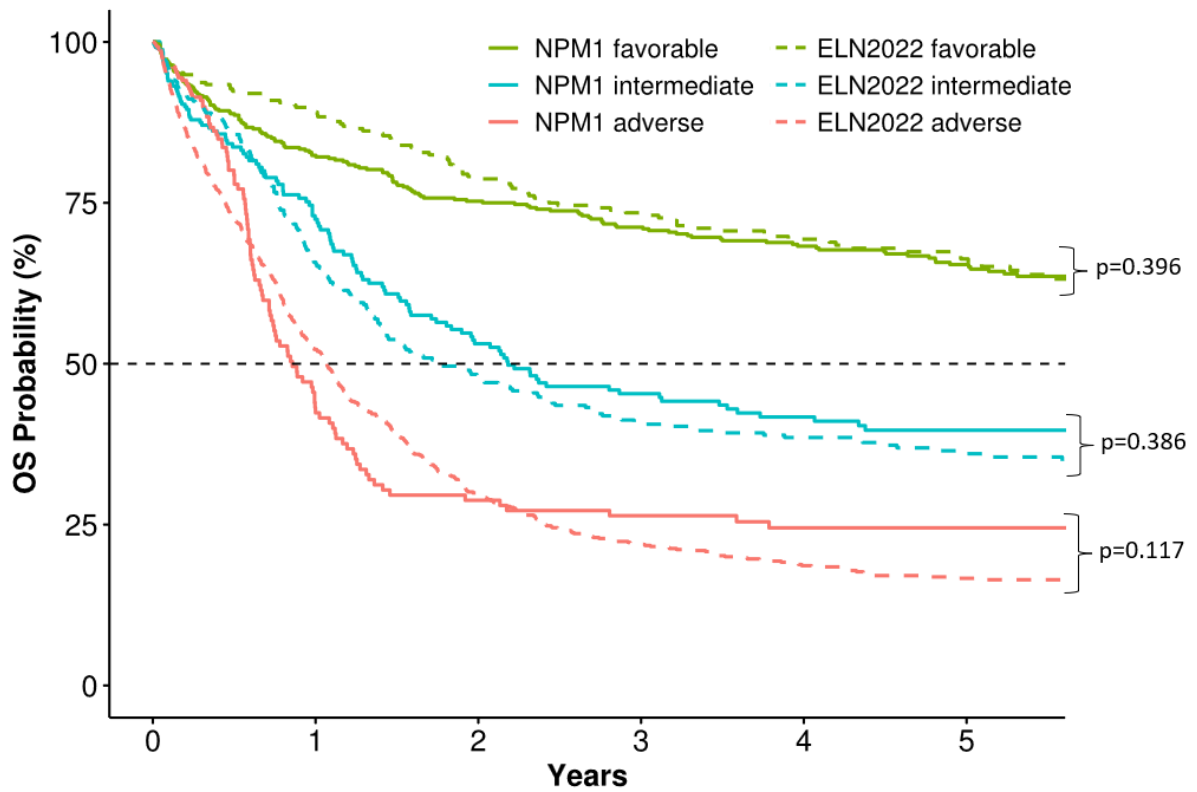

**Figure S17.** Co-mutational landscape of patients with *NPM1*-mut, absence of *FLT3*-ITD and *DNMT3A*-wt.

**Figure S18.** Overall survival of patients with *NPM1*-mut AML, absence of *FLT3*-ITD and *DNMT3A*-wt, stratified by *TET2* mutational status.

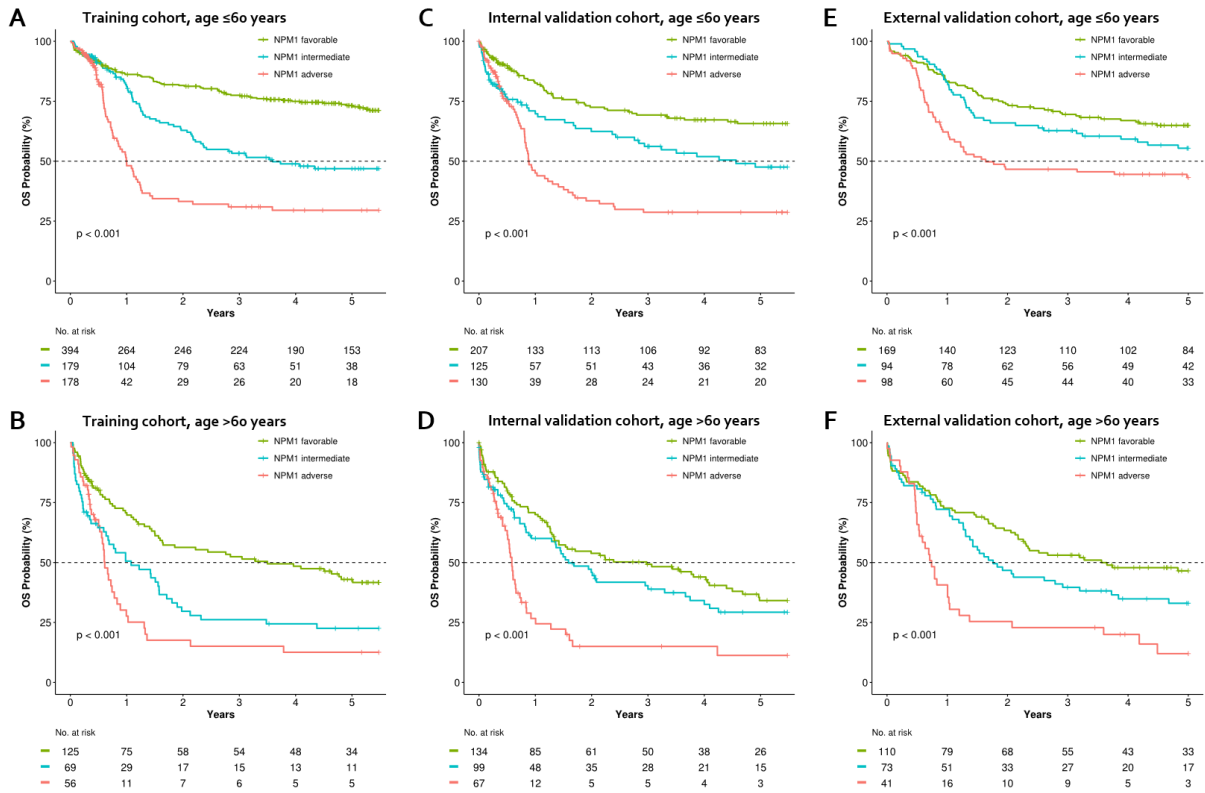

**Figure S19.** Two-year overall survival comparison of gene co-mutations in *NPM1*-mut AML compared to ELN2022 risk classification in *NPM1*-wt patients, in the training cohort. Baseline cohort of the figure: *NPM1*-mut, absence of *FLT3*-ITD, *DNMT3A*-wt and *TET2*-wt.

No. at risk

—	519	339	304	278	238	187
