Please see Appendix Table 1 for discussion on how this study meets the conditions for GATHER guidelines.

1.0 Data

1.1 Model geographies

This analysis selected 88 countries for water and 89 countries for sanitation based on their Socio-demographic Index (SDI) (see Appendix Table 2).¹ The SDI is a measure of education, fertility, and income. Countries included were in the middle, lower-middle, or low SDI quintiles with certain exceptions. China and Libya were included despite higher-middle SDI status to create better geographic continuity. Countries were excluded due to lack of available data in the Global Health Data Exchange (GHDx)² or to support the modeling paradigm from either the water or sanitation analysis or both. We also excluded island nations with fewer than 1 million inhabitants, which were the nations of Fiji, São Tomé and Príncipe, Solomon Islands, Maldives, Vanuatu, Samoa, Saint Lucia, Kiribati, St. Vincent and the Grenadines, Grenada, Micronesia, Tonga, Seychelles, Dominica, Marshall Islands, and American Samoa. These countries were typically data-scarce and did not have sufficient geographic continuity for a geospatial analytic approach to be advantageous over a national one.

We subdivided the spatial modelling domain by country (see Appendix Figure 3). By modelling each country individually, we were able to account for potential non-stationarity in the relationships between covariates and the outcome across the modelling domain as each country would be modelled independently. Furthermore, subdividing the modeling domain allowed for computational feasibility.

1.2 Data inclusion criteria

For a survey or census to be considered for this analysis, we required that it fit our country inclusion criteria outlined above, included geography information more granular than the national level, had data collected during the time frame of 2000 to 2017, had survey weights if the survey was not self-weighted, and had data on household drinking water source or toilet type. Furthermore, sources were only included for modelling if they were representative of the entire population during the time period and across the geographic area of measurement. Additionally, certain sources were excluded if the associated estimates seemed implausible based on expert review of estimates and comparison with other sources (including WHO-UNICEF Joint Monitoring Programme [JMP] estimates) in the same country and time period (see Appendix Section 1.8.2). After screening 2,175 household survey and census sources that were tagged for water, sanitation, and hygiene relevance in the GHDx,³ 833 sources met all of the inclusion criteria and were extracted and collated for analysis (see Appendix Figure 2). They were then further vetted and outliers were removed from modelling.

1.3 Summary of included data sources

The household and census surveys used in modelling access to water and sanitation can be found at <http://ghdx.healthdata.org/record/ihme-data/lmic-drinking-water-and-sanitation-facilities-access-geospatial-estimates-2000-2017> and are visualised in Appendix Figures 4a–e and 5a–e respectively. 501 data sources from 88 countries were included in the water model, and 457 data sources from 89 countries were included in the sanitation model.

1.4 Facility type classification

The types of water and sanitation facilities reported were categorised into the standard indicators developed by the WHO-UNICEF JMP.⁴ Each type of drinking water facility was classified as piped, improved well, unimproved well, improved spring, unimproved spring, other improved, other unimproved, or surface water.

Similarly, each sanitation facility was classified as sewer or septic, other improved flush toilet, unimproved flush toilet, improved latrine, unimproved latrine, other improved, other unimproved, or open defecation.

Wells, springs, flush toilets, and latrines can be categorised as improved or unimproved depending on their respective construction. When responses were ambiguous regarding the details of their construction, summary mean access was calculated at each space-time location for ambiguous versions of the corresponding facility (ambiguous wells, ambiguous latrines, etc.). Then these estimates were divided into improved and unimproved based on the ratio of improved to unimproved of the corresponding facility prevalent in the same country. If a country had less than five unique data sources, the ratio was derived from across the modelling region the data source was in. For example, the mean prevalence of ambiguous latrines in Nigeria was divided into prevalence of improved and unimproved latrines based on the ratio of improved to unimproved latrines in Nigeria from other data sources. These estimates were then combined with the overall access levels to improved and unimproved facilities correspondingly.

After classification, the facility type data were appropriately combined in accordance with JMP definitions to yield the respective water and sanitation indicators. This resulted in piped, other improved, unimproved, and surface water for water indicators, and sewer or septic, other improved, unimproved, and open defecation for sanitation indicators.

1.5 Processing data for modelling

Data corresponding to each georeferenced point were summarised as survey weighted means. For data without corresponding GPS coordinates, data were summarised across the smallest spatial area the data were representative over to produce areal estimates. Household sizes and survey weights were used to produce weighted means of access representative at the individual level. The household sizes and survey weights were further used in a Kish approximation⁵ of an effective sample size for each mean in order to account for the complex survey design of most of the data used.

When household size information was missing, the corresponding cluster of data was adjusted as follows. Overall, data were tagged as urban, rural, or unspecified. For each category, logistic regressions were fit on means calculated with and without household sizes (assuming household size equals 1). A single indicator variable was used as a covariate. The ratios obtained as the fixed effect corresponding to the indicator variable acted as an adjustment scalar for adjusting urban, rural, or unspecified data with missing household size information. Additionally, if more than 20% of a cluster was missing information on water source or sanitation facility, we dropped the cluster from the analysis. Furthermore, if a cluster or a data source was missing weights and the source used a weighted sampling strategy, we excluded the source

1.6 Processing areal data for geostatistical modelling

For areal data, 10,000 locations were randomly sampled from the area using population values from WorldPop⁶ raster to weight the sampled points. K-means clustering was performed over these points to generate integration points (1 point per 1,000 WorldPop grid cells encompassing the area) to be used in the modelling. Weights were assigned to integration points as the proportion of the original 10,000 points that entered the k-means cluster. Each of these integration points was assigned the areal mean. The integration points were included in the input dataset for further modelling. In this manner, the spatial variation of covariates could be leveraged and areal data could be incorporated into the geostatistical model. The above resampling method used is consistent with the resampling conducted in the previously published geospatial modelling of diphtheria-pertussis-tetanus vaccine coverage.⁷

1.7 Creating ordinal indicators

In order to appropriately account for the mutually exclusive and collectively exhaustive nature of the indicators, we used a continuation ratio ordinal regression framework. Data were processed to generate a set

of independent and conditional variables that were subsequently modelled. The following outlines how this framework was implemented for the water indicators:

$$\begin{aligned}
 & \text{Water facilities: } \{Piped, Other\ Improved, Unimproved, Surface\} \\
 & \text{Modeled Variables: } \{Piped, Other\ Improved_{conditional}, Unimproved_{conditional}\} \\
 & 1 = Piped + Other\ Improved + Unimproved + Surface \\
 & Other\ Improved_{conditional} = \frac{Other\ Improved}{1 - Piped} \\
 & Unimproved_{conditional} = \frac{Unimproved}{1 - Piped - Other\ Improved}
 \end{aligned}$$

Sanitation indicators were also modelled via variables generated in an ordinal continuation ratio framework as above. In the case of sanitation, sewer or septic sanitation was the independent category just as piped water was in the case of water.

1.8 Data vetting

1.8.1 Facility type classification

Prior to modelling, all categorisations of types of water and sanitation facilities by the JMP standard indicators were thoroughly reviewed. Using the JMP classifications as a guide, every unique type of water and sanitation facility was independently scrutinised to ensure proper categorisation. In the case of facility types in a foreign language, translations were checked and verified through survey documentation or Google Translate. These final vetted lists of categorised drinking water and sanitation facilities were used in subsequent data vetting and model runs.

1.8.2 Data validity

Following the vetting of indicator string matching, all surveys were systematically reviewed for data quality. Country-specific diagnostic plots were produced for water and sanitation plotting each data source's national estimate of each water and sanitation indicator (see Appendix Figure 62). The estimate for each indicator from each data source was compared to the other available data sources for that country for similar years, as well as estimates for the corresponding indicator and country from the JMP (see Appendix Figure 63). If the data source's estimate was considered implausibly different from other sources as well as the JMP estimate, then the source was excluded. Each country-specific diagnostic plot was independently reviewed, considering country and time trends, as well as whether a survey was nationally or subnationally representative. After data source exclusions, of the 826 data sources extracted and collated for inclusion in the water analysis, 501 sources were included in the final model dataset. Similarly, of the 747 data sources extracted and collated for inclusion in the sanitation analysis, 457 sources were included in the final model dataset (see Appendix Figure 2).

2.0 Covariates

2.1 Covariate selection

The first stage of modelling used 7 covariates, composed of various environmental and social indicators (see Appendix Tables 3–5). Each covariate was formatted at a 5×5 -km resolution from 2000 to 2017 (see Appendix Figure 6). They included travel time to nearest settlement, aridity, elevation, urbanicity, length of growing season, irrigation, and time.

In the first stage, for each country, three types of models were fit to the data: generalised additive models (GAM), boosted regression trees (BRT), and lasso regression. In doing so, we attempted to account for the varying and potentially non-linear relationship between each of the covariates and the outcome indicator. Each of the seven covariates was used in the BRT and lasso regression model.

2.2 Modelling covariates via stacked generalisation

As noted above, for each country, three models were fit to the data: GAM, BRT, and lasso regression. Each model was fit using five-fold cross-validation (out-of-sample) as well as on the entire dataset at once (in-sample). Out-of-sample predictions were generated from each model and logit transformed for subsequent use as covariates in the geostatistical model. The logit transformation was conducted to ensure the covariate and the outcome water and sanitation indicator data would be in the same functional space. The in-sample predictions from these “sub-models” were used as covariates when generating predictions using the fitted relationships from the geostatistical model.

3.0 Modelling

3.1 Ensemble modelling

A Bayesian spatiotemporal generalised linear regression model was used to fit the binomial data of access to water and sanitation using a logit link function in each country. The model was defined as follows:

$$\begin{aligned}
 C_i | p_i, N_i &\sim \text{Binomial}(p_i, N_i) \\
 \text{logit}(p_i) &= \beta_0 + \boldsymbol{\beta} \mathbf{X}_i + \epsilon_{GP_i} \\
 \epsilon_i &\sim N(0, \sigma_{nu}^2) \\
 \epsilon_i &\sim N(0, \sigma_{ctry}^2) \\
 \epsilon_{GP} | \boldsymbol{\Sigma}_{\text{space}} &\sim GP(0, \boldsymbol{\Sigma}_{\text{space}}) \\
 \boldsymbol{\Sigma}_{\text{space}} &= \frac{2^{1-\nu}}{\tau \times \Gamma(\nu)} \times (\kappa \mathbf{D})^\nu \times \text{K}_\nu(\kappa \mathbf{D})
 \end{aligned}$$

Within each country, the number of individuals at cluster, C_i , from a sample of individuals, N_i , were modelled as binomial counts. The counts, C_i , probabilities, p_i , predictions, and residuals, ϵ , were all indexed in space and time. The logit access, $\text{logit}(p_i)$, was modelled as a linear combination of the out-of-sample predictions from three sub-models, \mathbf{X} and a spatial Gaussian process, ϵ_{GP_i} . The spatial Gaussian process had a Matérn spatial process. This allowed for the correlation structure in the residuals to be leveraged for improved predictions. The posterior distributions were fit using R-INLA^{8,9} with the stochastic partial differential equation (SPDE) approximation to Gaussian process regression. Data points from sources that were not nationally representative were not included in estimation of the linear fixed effects, \mathbf{X} , but only in the spatial Gaussian process, ϵ_{GP_i} .

3.2 Priors

The following priors were used for all models:

- $\beta_0 \sim N(\mu = 0, \sigma^2 = 1000)$,
- $\boldsymbol{\beta} \sim^{iid} N\left(\mu = \frac{1}{\# \text{ ensemble models}}, \sigma^2 = 1000\right)$
- $\theta_1 = \log(\tau) \sim N(\mu_{\theta_1}, \sigma_{\theta_1}^2)$
- $\theta_2 = \log(\kappa) \sim N(\mu_{\theta_2}, \sigma_{\theta_2}^2)$

Uncorrelated multivariate normal priors were used as determined by INLA based on the finite elements mesh construction for the log-transformed spatial hyperparameters κ and τ . The mean (μ) and variance (σ^2) parameters for the hyperpriors selected by INLA for each country can be found in Appendix Tables 7–12. α and γ in the *loggamma* distribution represent scale and shape, respectively.

3.4 Estimate generation

Models were fit in INLA consistent with methods used in the previously published geospatial modelling of diphtheria-pertussis-tetanus vaccine coverage.¹⁰

Georeferenced data points were modelled with weights set to 1. Integration points as a result of k-means clustering were modelled with weights corresponding to the weight generated from the k-means algorithm as described above. The weights for each data point represented the relative contribution to the log-likelihood. In this manner, points as a result of resampling contributed less than true georeferenced points to the model fit. Additionally, the contribution of points from the resampling process to the log-likelihood estimation was diffused across the polygon.

The covariates for the model were the out-of-sample predictions from each sub-model as described above. After the fitting process, estimates were generated by taking 250 draws from the posterior distribution and using the in-sample predictions from the sub-models as covariates to generate prediction surfaces across the modelled country. The 2.5th and 97.5th percentiles were calculated across draws for each grid cell to generate 95% uncertainty intervals in addition to means. Grid-cell-level estimates were aggregated to the second administrative level (eg, districts, counties) and first administrative level (eg, states, provinces) by calculating population-weighted averages across each respective administrative boundary.

3.5 Modelling national time trends and harmonization

To capture national time trends in access to water and sanitation, separate generalized additive models were fitted to national aggregates of data sources that were nationally representative for each country. The relationship with covariates were modelled as thin-plate splines in countries where there was more than three years of data. In countries where they had three or fewer years of data available in the modeling period, the relationships were estimated as linear fixed effects.

3.6 Model validation

For model validation, the INLA model was tested in and out of sample as described below before the estimates were harmonized to national time trends. This was done to test the performance of the geostatistical model itself. Certain countries were excluded by indicator as their data could not support five-fold cross validation and the exclusions represent a small minority of the full sample of the data. The exclusions are as follows: 1) Bolivia, Brazil, Gabon, Indonesia, Cambodia, Madagascar, Peru, Papua New Guinea, Tanzania, South Africa, and Vietnam for piped water, 2) Bolivia, Brazil, Botswana, Central African Republic, Gambia, Indonesia, Kyrgyzstan, Morocco, and Mongolia for conditional improved water, 3) Gambia, Jordan, and Libya for conditional unimproved water, 3) Mexico and Swaziland for sewer or septic sanitation, 4) Mexico for conditional improved sanitation, and 5) Libya and Mozambique for conditional unimproved sanitation.

3.6.1 In-sample validation

To assess the in-sample fit of our model, we calculated mean error (ME, or bias), root-mean-squared-error (RMSE), and 95% coverage of our predictive intervals (the proportion of observed data that fall within our predicted 95% uncertainty intervals). We present these calculations at the first and second administrative-level units for 2000, 2005, 2010, and 2017 for each indicator and country in Appendix Tables 13–18. Appendix Figures 23–40 show in sample prediction versus observed data.

3.6.2 Out-of-sample validation

We examined the predictive validity of our modelling strategy using five-fold out-of-sample cross-validation. Folds were created by randomly assigning entire first administrative-level units, stratified by country, to one of five folds. For each modelling country, we ran the entire modelling process once per fold, in addition to the full in-sample runs described above, generating a complete set of out-of-sample predictions. Using these out-of-sample predictions, we then calculated mean error (ME, or bias), root-mean-squared-error (RMSE, which summarises total variance), and 95% coverage of our predictive intervals (the proportion of observed out-of-sample data that fall within our predicted 95% credible intervals) aggregated to the spatial holdout level. Appendix Figures 41–58 show out-of-sample prediction versus observed data. Similarly, Appendix Tables 19–24 summarise out-of-sample statistics.

4.0 Supplemental analyses

4.1 Counterfactual analysis of diarrhoeal mortality

In order to assess the impacts of changes in access to water and sanitation, we conducted counterfactual analyses in a comparative risk assessment framework of the impact of water and sanitation access on diarrhoeal mortality. First, we used risk ratios from the Global Burden of Diseases, Injuries, and Risk Factors Study 2017⁹ associated with unsafe water and sanitation to calculate the attributable fraction of diarrhoeal deaths to unsafe water and sanitation for each second administrative-level unit in 2017 as follows.

Furthermore, we constructed a counterfactual attributable fraction by conducting the above calculation with levels of water and sanitation access observed in 2000. We calculated the number of deaths averted in 2017 due to changes since 2000 as the difference in the attributable deaths between the observed and the counterfactual (see Appendix Figures 64–65).

$$\begin{aligned} PAF_{counterfactual} &= \frac{\sum(access_{2000} * risk\ ratios) - 1}{\sum(access_{2000} * risk\ ratios)} \\ PAF_{observed} &= \frac{\sum(access_{2017} * risk\ ratios) - 1}{\sum(access_{2017} * risk\ ratios)} \\ Number\ averted &= deaths_{2017} * \frac{(1 - PAF_{observed})}{(1 - PAF_{counterfactual})(PAF_{counterfactual} - PAF_{observed})} \\ Rate\ averted &= \frac{Number\ averted}{Total\ Population} * 1000 \\ Percent\ averted &= \frac{Number\ averted}{Numer\ averted + Observed\ Deaths} \\ Ratio\ averted &= \frac{Number\ averted}{Observed\ Deaths - Number\ Averted} \end{aligned}$$

4.2 Gini coefficient

The Gini coefficient¹¹ is a popular measure of inequality, originally applied to economics. For income inequality, the Gini coefficient assesses the magnitude of disparity between the richest and poorest individuals. In this context, equality corresponds to wealth uniformly distributed across the population, and inequality corresponds to a small number of individuals possessing the majority of the wealth. The Gini coefficient for wealth can be calculated directly from the Lorenz curve, which sorts individuals by their income and plots cumulative percentages of individuals against their corresponding fraction of wealth. For the purposes of this study, “wealth” is defined as improved water or improved sanitation for each second administrative-level unit. The Gini coefficient is then calculated as one minus twice the area under the Lorenz curve. An alternative formulation of the Gini coefficient calculates the relative mean absolute

difference in wealth, and then observes that the Gini coefficient is half the resulting quantity. If x_i is the wealth of the i^{th} individual (out of n individuals), the Gini coefficient, G , is given as:

$$G = \frac{\sum_{i=1}^n \sum_{j=1}^n |x_i - x_j|}{2n \sum_{i=1}^n x_i}$$

Appendix Figure 1. Geospatial modelling flowchart for water and sanitation

The geospatial modelling process consists of four sections. First (in blue), we compile all available survey data that can be referenced to a coordinate/point (eg, survey cluster) or small polygon unit and calculate access to drinking water sources and sanitation facilities at the respective level (Section 1.0). Data matched to polygons are resampled into pseudo points using a k-means clustering algorithm (Section 1.6). Covariates are subsequently merged to the points and pseudo points via a spatial join. Second (green), we use the point data and their associated covariates and a stacked generalisation ensemble model (Section 2.2). The children models, boosted regression trees, generalised additive models, and lasso regression are fit using a 5-fold cross-validation process (Section 3.1). The cross-validated predictions from each model then serve as the covariate values for the main/parent model (spatiotemporal GPR model) (Section 3.1). The predictions from when the child models are fit on all the data (rather than 4/5^{ths} implied by the cross-validation) are then used to create posterior predictions of access to water and sanitation facilities prevalence in a continuous grid for the years 2000–2017 (Section 3.4). Finally (orange), we aggregate our estimates to first administrative-level units (Section 3.4).

Appendix Figure 2. Data processing flow chart

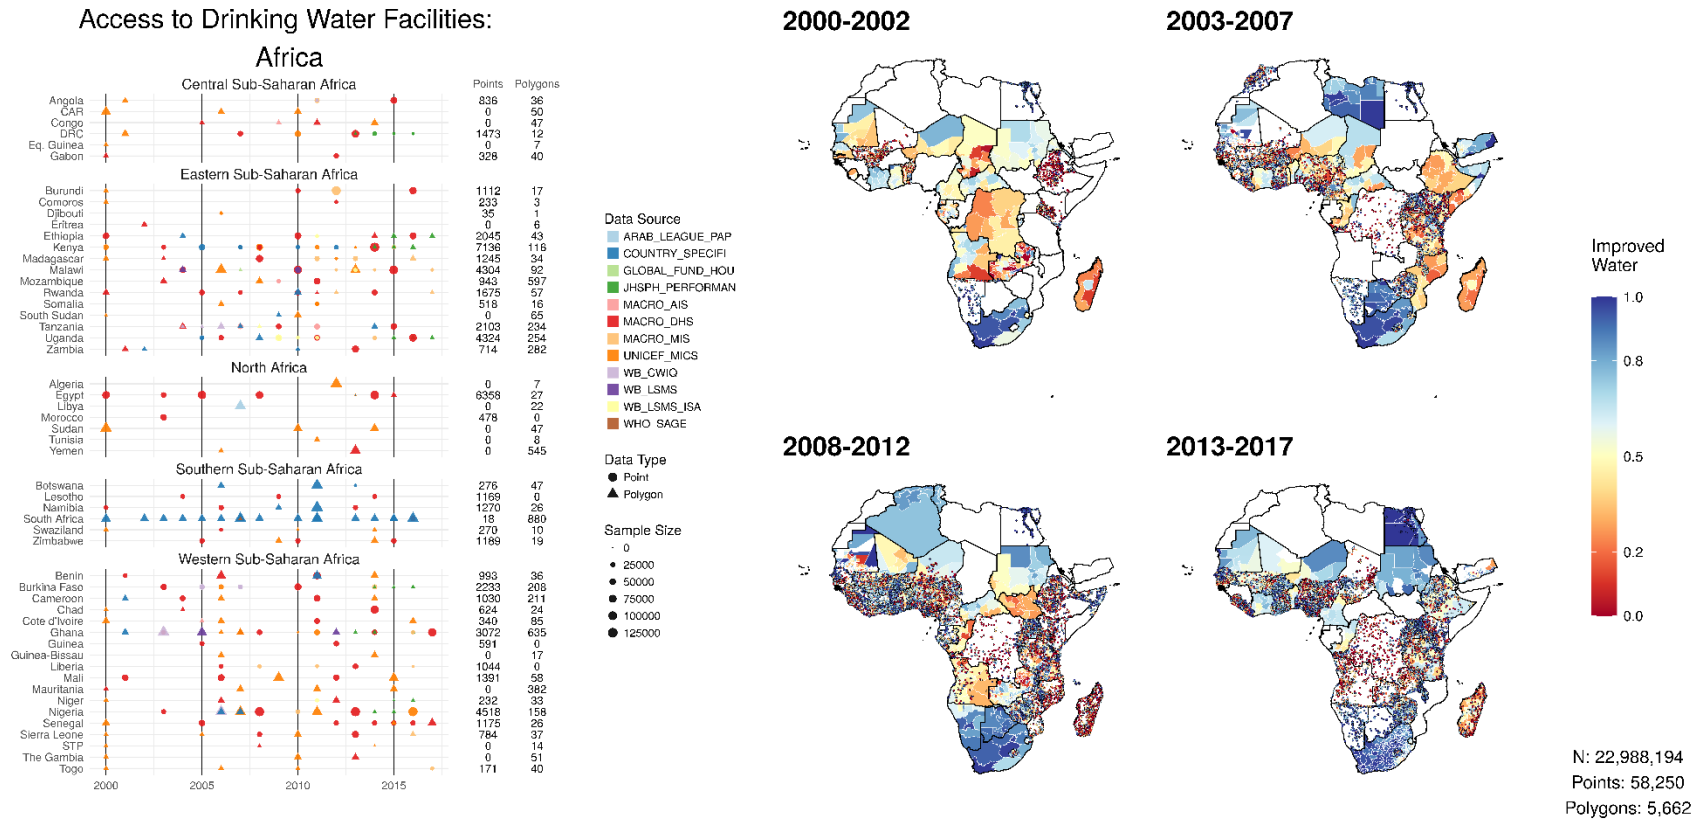

Flow chart of source identification, inclusion, and exclusion criteria. This chart illustrates the database searched for this analysis, the GHDx,¹² the resulting number of potential sources identified from the search, and the number and reasons for excluding sources based on the inclusion criteria for this analysis (Section 1.2). We excluded data after reviewing its data collection methodology and based on evaluating against other available data for the country and known plausibility of change in water and sanitation access.

Appendix Figure 3. Drinking water facility data availability by type and country, 2000–2017

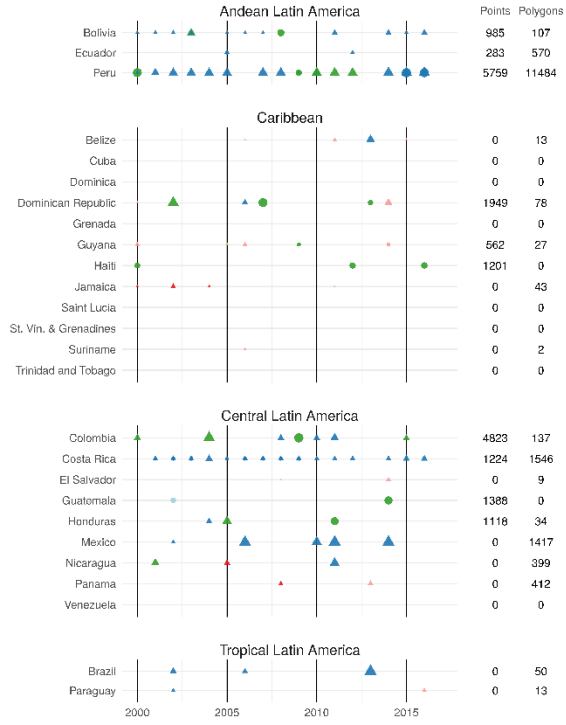

All data are shown by country and year of survey and mapped at their corresponding geopositioned coordinate or area. In the left panel, the total number of points and polygons (areal) for each country are plotted by data source, type, and sample size. Sample size represents the number of individual microdata records for each survey. In the right panel, mean access to drinking water source for the input coordinate or area is mapped. Figure a) shows drinking water facility data availability in Africa by type and country from 2000 to 2017. Figure b) shows drinking water facility data availability in Latin America and the Caribbean by type and country from 2000 to 2017. Figure c) shows drinking water facility data availability in southeast Asia by type and country from 2000 to 2017. Figure d) shows drinking water facility data availability in south Asia by type and country from 2000 to 2017. Figure e) shows drinking water facility data availability in the Middle East and central Asia by type and country from 2000 to 2017.

Appendix Figure 5. Geospatial covariates for water and sanitation

Twenty-three covariate raster layers of possible socioeconomic and environmental correlates of access to improved water and sanitation prevalence were used as inputs for the stacking modelling process. Time-varying (^{TV}) covariates are presented for the year 2017. For the year of production of non-time-varying covariates, please refer to the individual covariate citation in Table 3 for additional detail. Covariates are labelled as follows: access to roads [*access2*], aridity^{TV} [*aridity*], elevation [*elevation*], urban or rural^{TV} [*ghslurbanicity*], growing season length [*growingseason*], irrigation [*irrigation*], time [*year_cov*]. Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as “barren or sparsely vegetated” and had fewer than ten people per 1 × 1-km grid cell, or were not included in these analyses.¹³

Appendix Figure 6. Stacker plots

Below the ensemble modelling process is illustrated. As an example, we have plotted predictions of access to piped water in 2000. Panels **A-C** depict predictions from generalised additive model (**A**), boosted regression trees (**B**), and penalised lasso regression child models (**C**). Panel (**D**) illustrates predictions from our ensemble Bayesian geostatistical model that uses the child model predictions as covariates for prediction.

Appendix Figure 7. Finite elements mesh

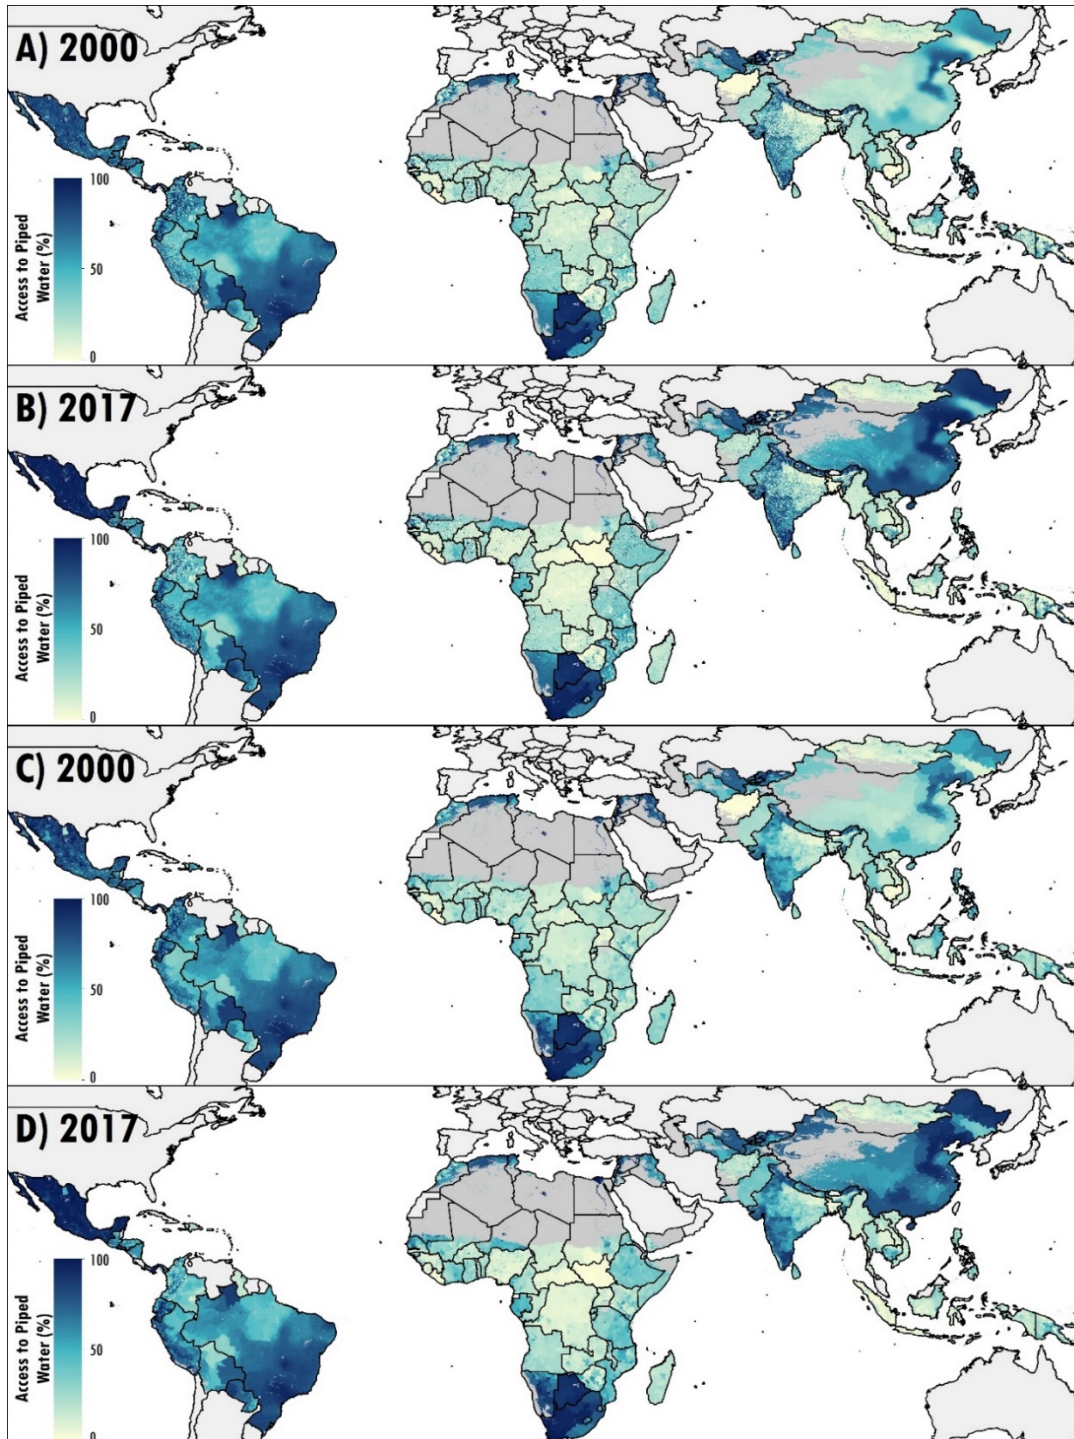

The finite elements mesh used to fit the space-time correlated error for Lesotho is shown as an example. The land area to be modelled over is divided into discrete areas via Delaunay triangulation.

Constrained refined Delaunay triangulation

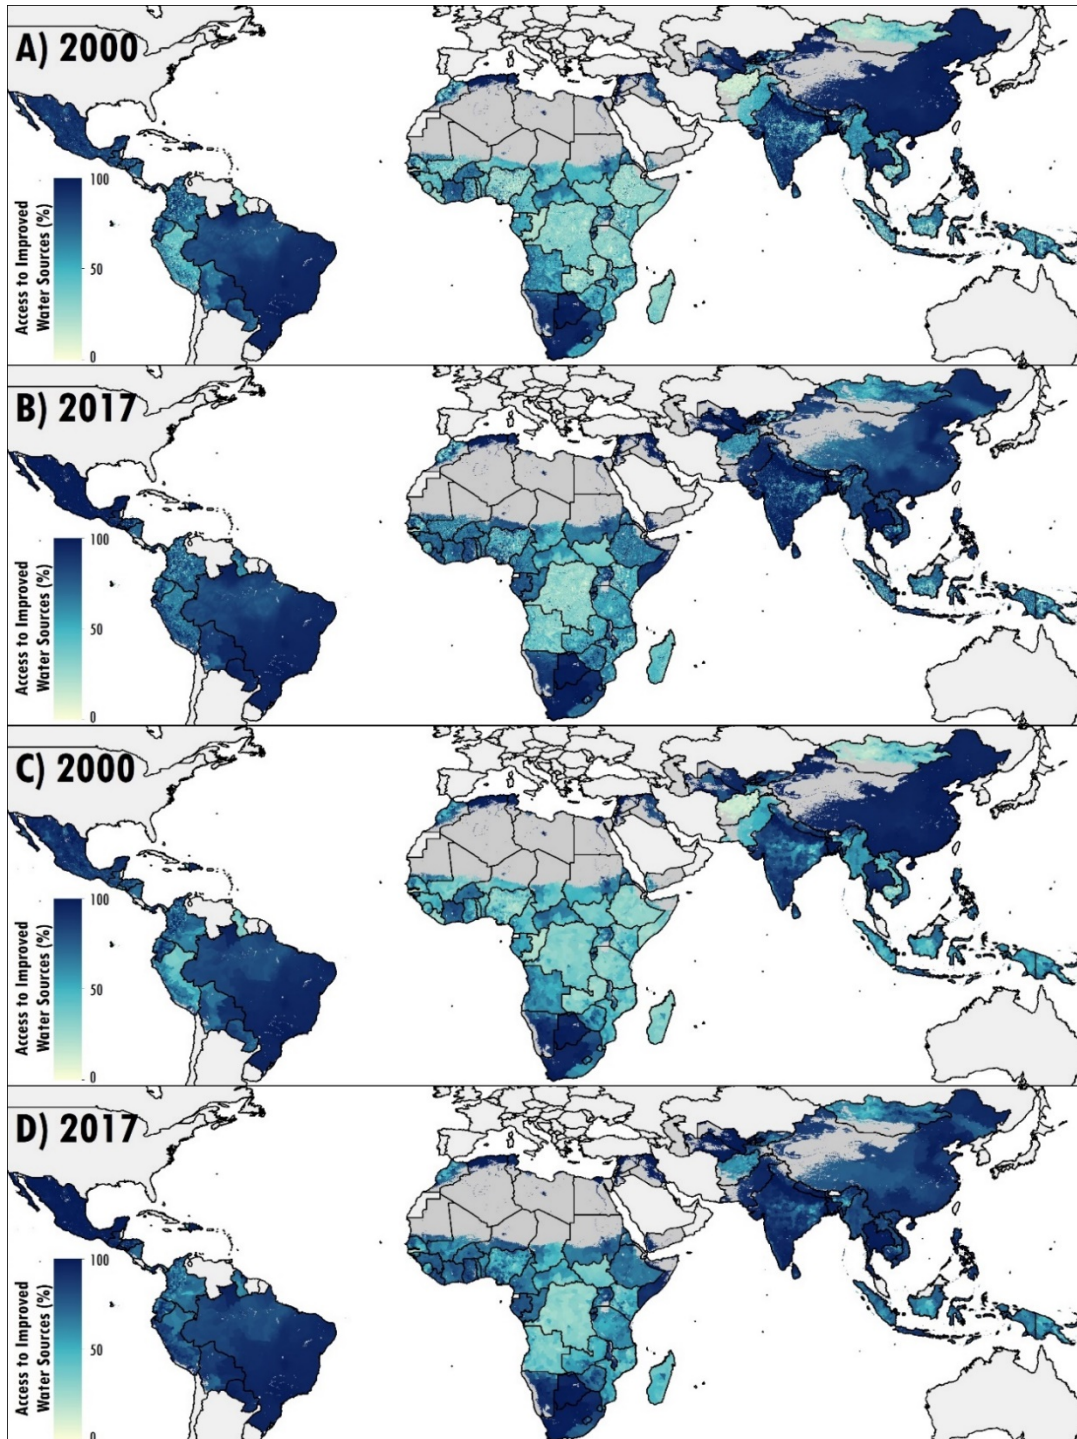

Appendix Figure 8. Mean access to piped water, at 5 × 5-km resolution and second administrative level, 2000 and 2017

Panels a-b present mean access to piped water at the 5 × 5-km resolution in 2000 and 2017. Panels c-d present mean access to piped water at the second administrative level in 2000 and 2017. Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as “barren or sparsely vegetated” and had fewer than ten people per 1 × 1-km grid cell, or were not included in these analyses.^{5,11–15}

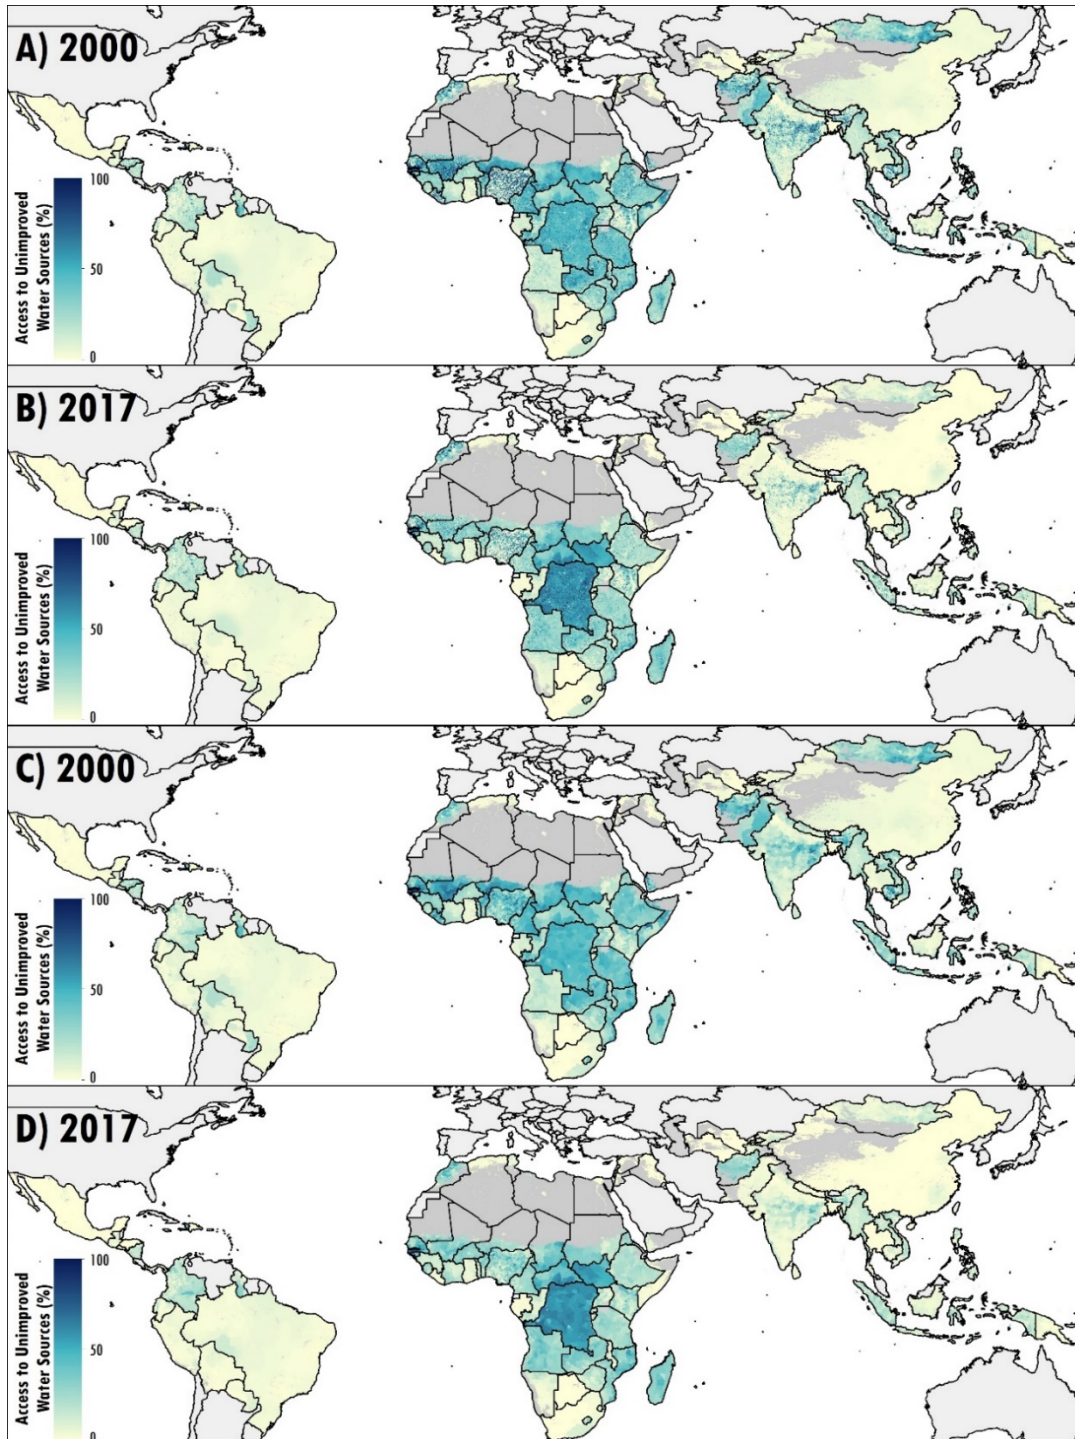

Appendix Figure 9. Mean access to improved water, at 5 × 5-km resolution and second administrative level, 2000 and 2017

Panels a-b present mean access to improved water at the 5 × 5-km resolution in 2000 and 2017. Panels c-d present mean access to improved water at the second administrative level in 2000 and 2017. Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as “barren or sparsely vegetated” and had fewer than ten people per 1 × 1-km grid cell, or were not included in these analyses.^{5,11–15}

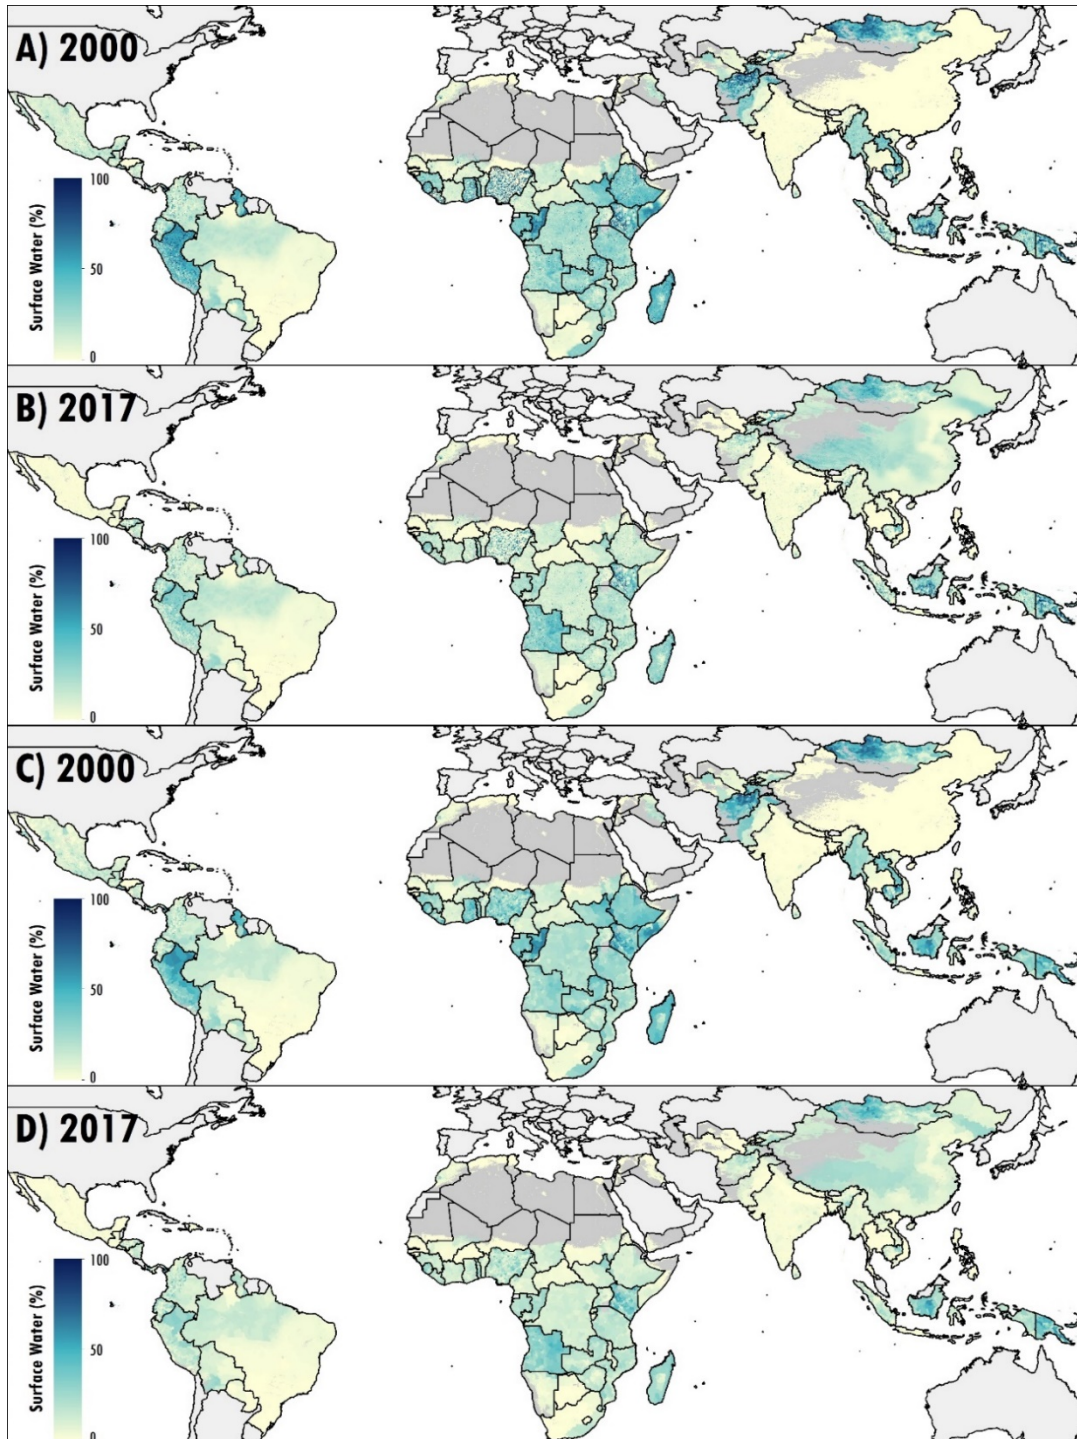

Appendix Figure 10. Mean access to unimproved water, at 5 × 5-km resolution and second administrative level, 2000 and 2017

Panels a-b present mean access to unimproved water at the 5 × 5-km resolution in 2000 and 2017. Panels c-d present mean access to unimproved water at the second administrative level in 2000 and 2017. Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as “barren or sparsely vegetated” and had fewer than ten people per 1 × 1-km grid cell, or were not included in these analyses.^{5,11-15}

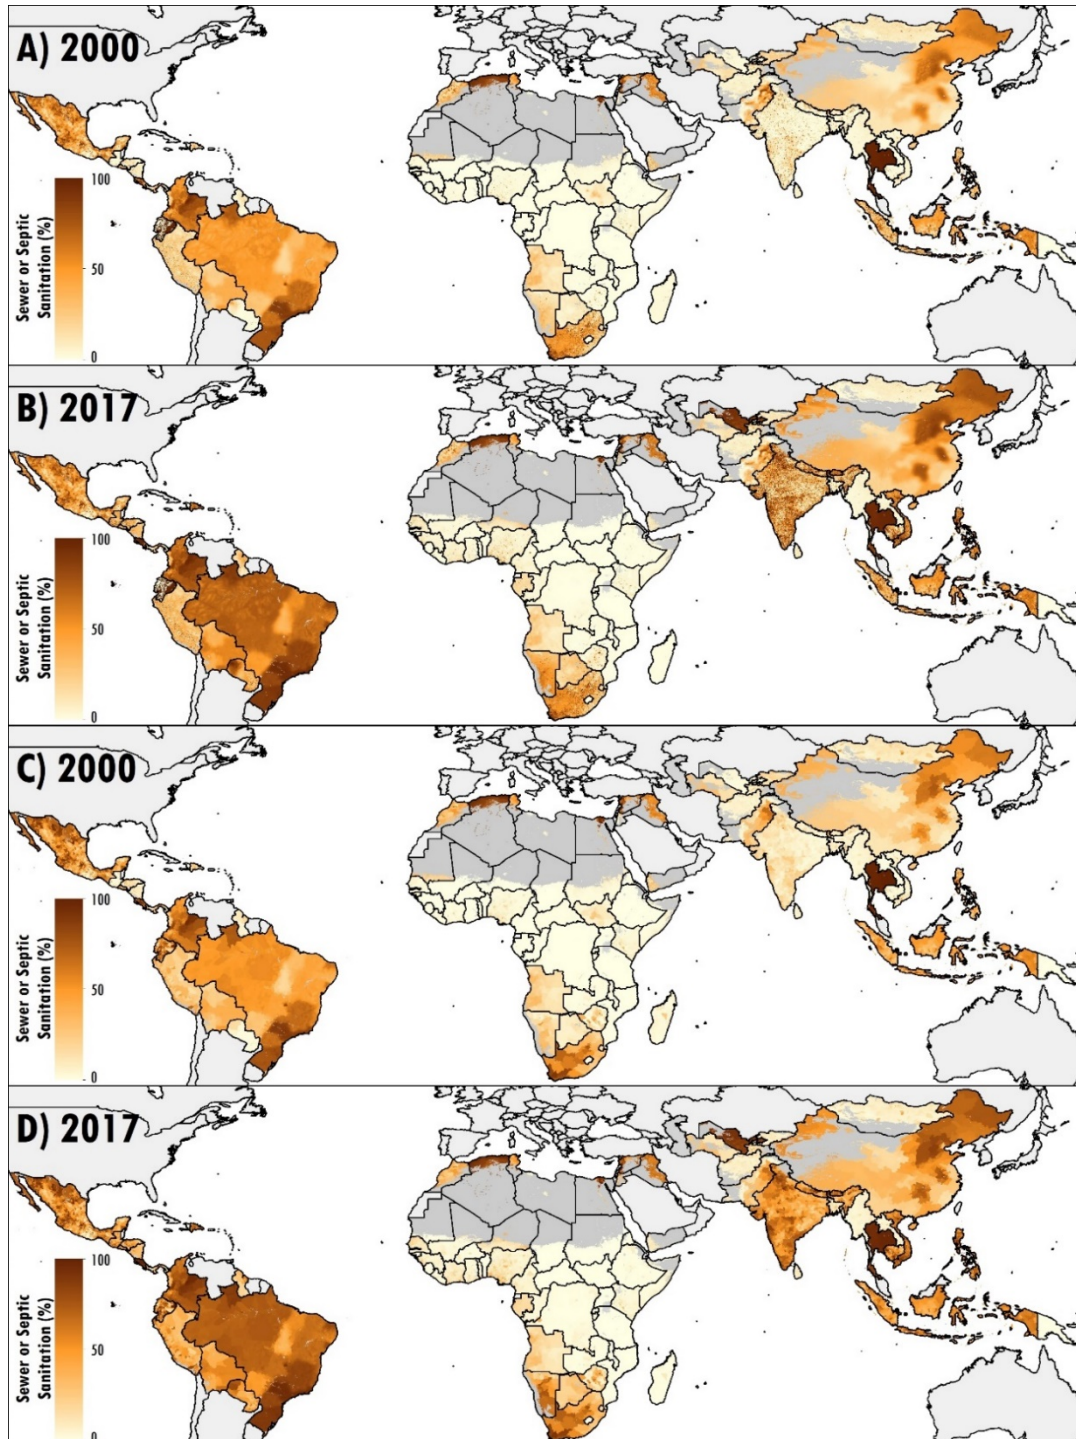

Appendix Figure 11. Mean access to surface water, at 5 × 5-km resolution and second administrative level, 2000 and 2017

Panels a-b present mean access to surface water at the 5 × 5-km resolution in 2000 and 2017. Panels c-d present mean access to surface water at the second administrative level in 2000 and 2017. Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as “barren or sparsely vegetated” and had fewer than ten people per 1 × 1-km grid cell, or were not included in these analyses.^{5,11–15}

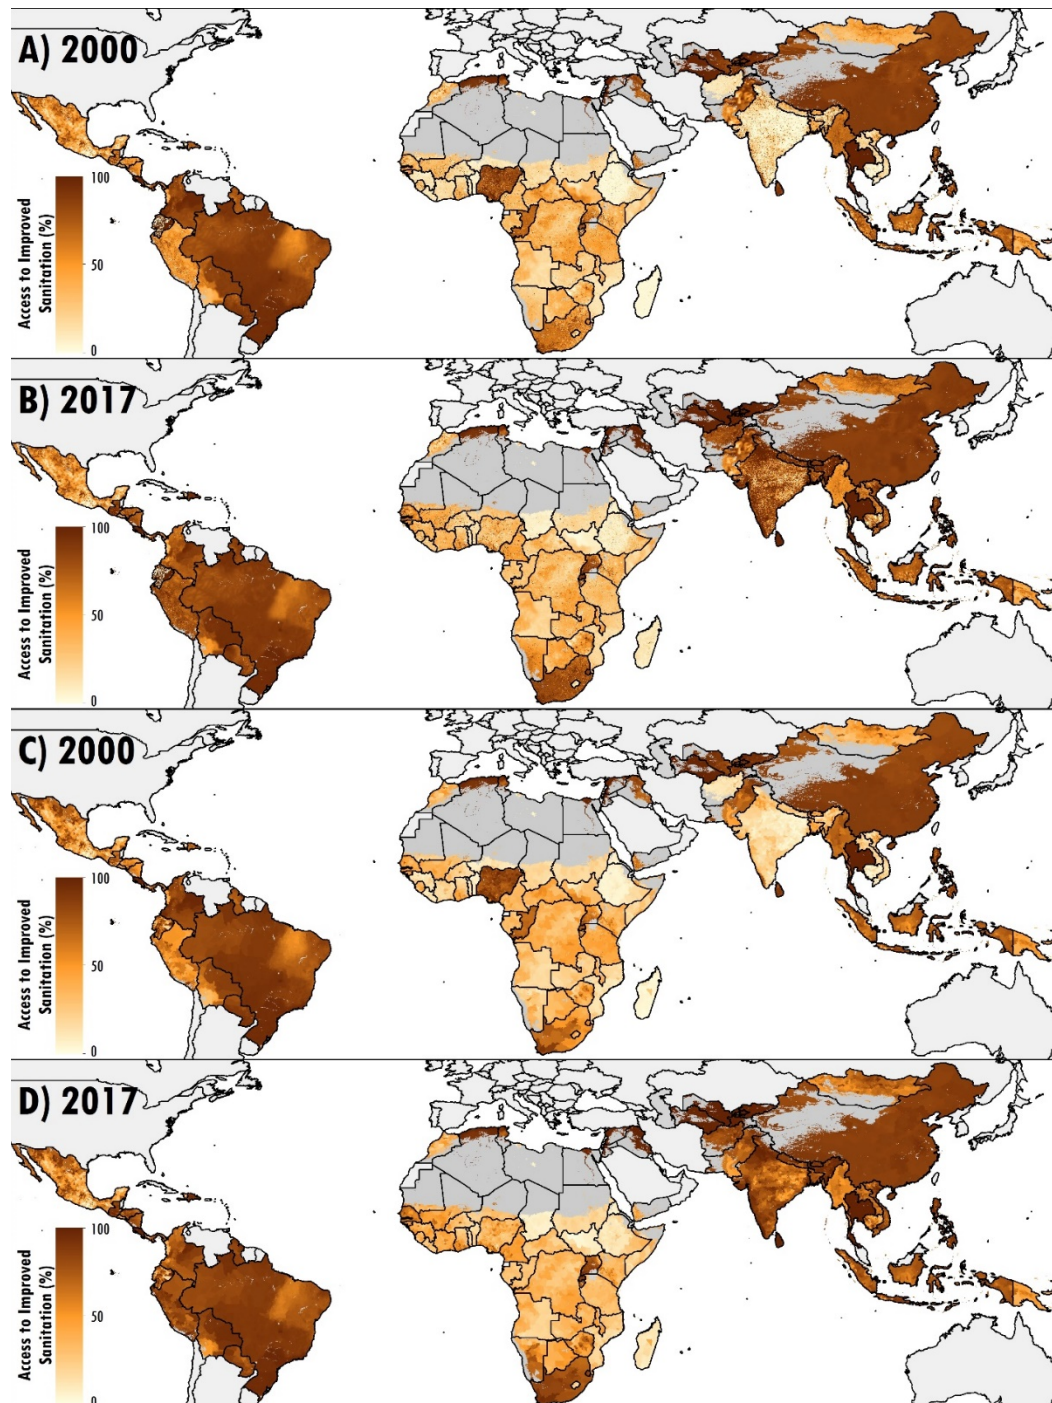

Appendix Figure 12. Mean access to piped sanitation, at 5 × 5-km resolution and second administrative level, 2000 and 2017

Panels a-b present mean access to piped sanitation at the 5 × 5-km resolution in 2000 and 2017. Panels c-d present mean access to piped sanitation at the second administrative level in 2000 and 2017. Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as “barren or sparsely vegetated” and had fewer than ten people per 1 × 1-km grid cell, or were not included in these analyses.^{5,11–15}

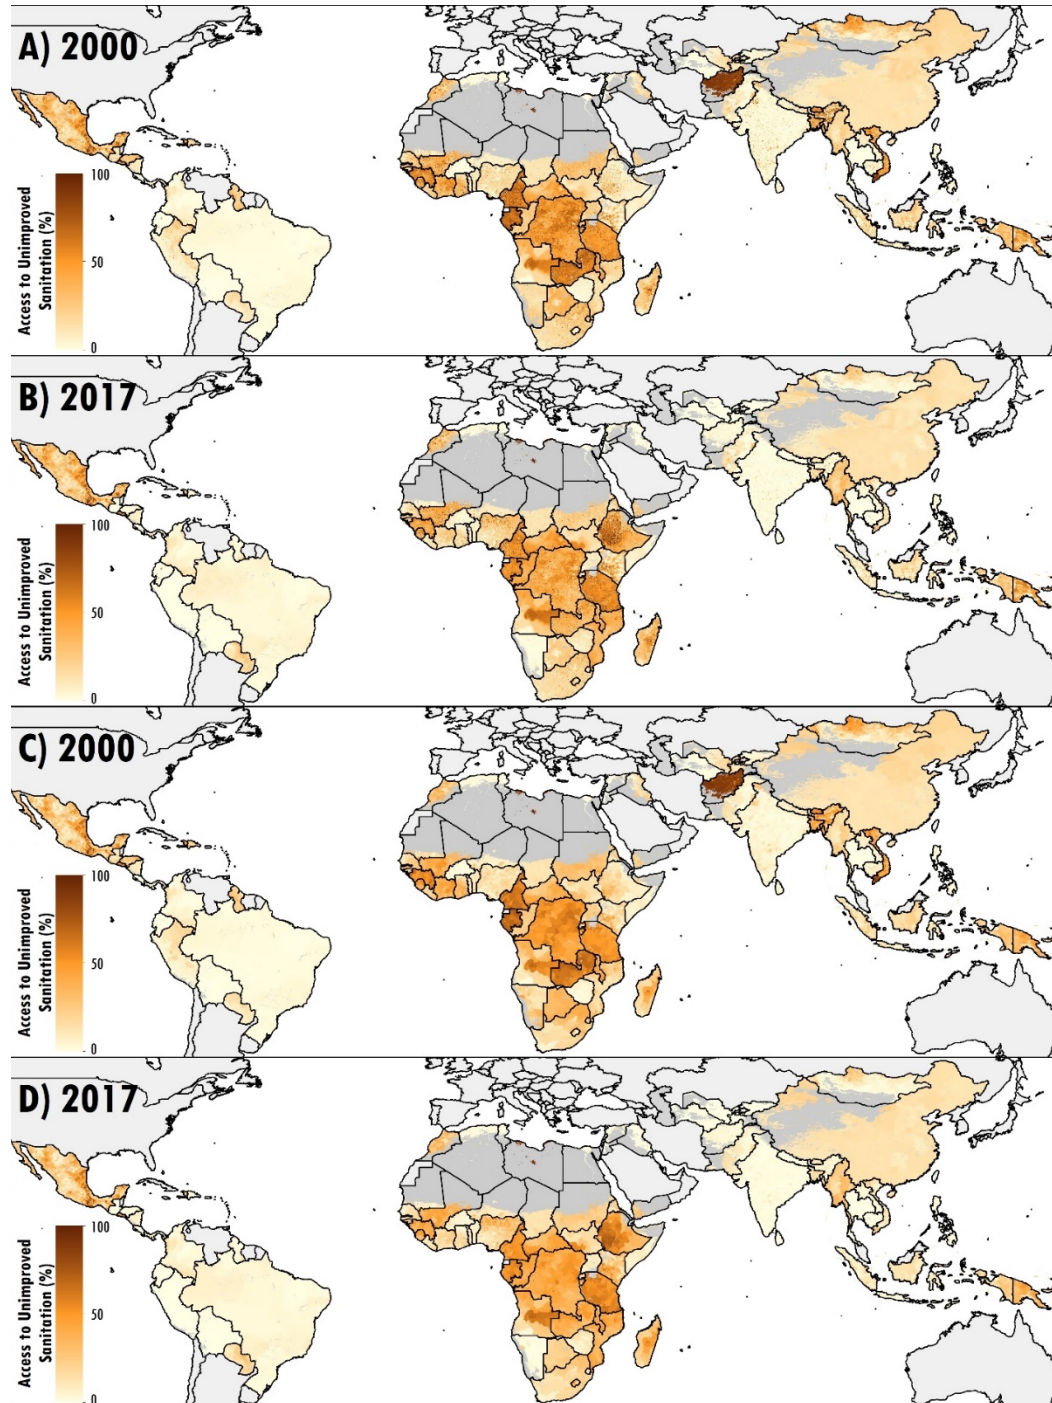

Appendix Figure 13. Mean access to improved sanitation, at 5 × 5-km resolution and second administrative level, 2000 and 2017

Panels **a-b** present mean access to improved sanitation at the 5 × 5-km resolution in 2000 and 2017. Panels **c-d** present mean access to improved sanitation at the second administrative level in 2000 and 2017. Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as “barren or sparsely vegetated” and had fewer than ten people per 1 × 1-km grid cell, or were not included in these analyses^{5,11–15}

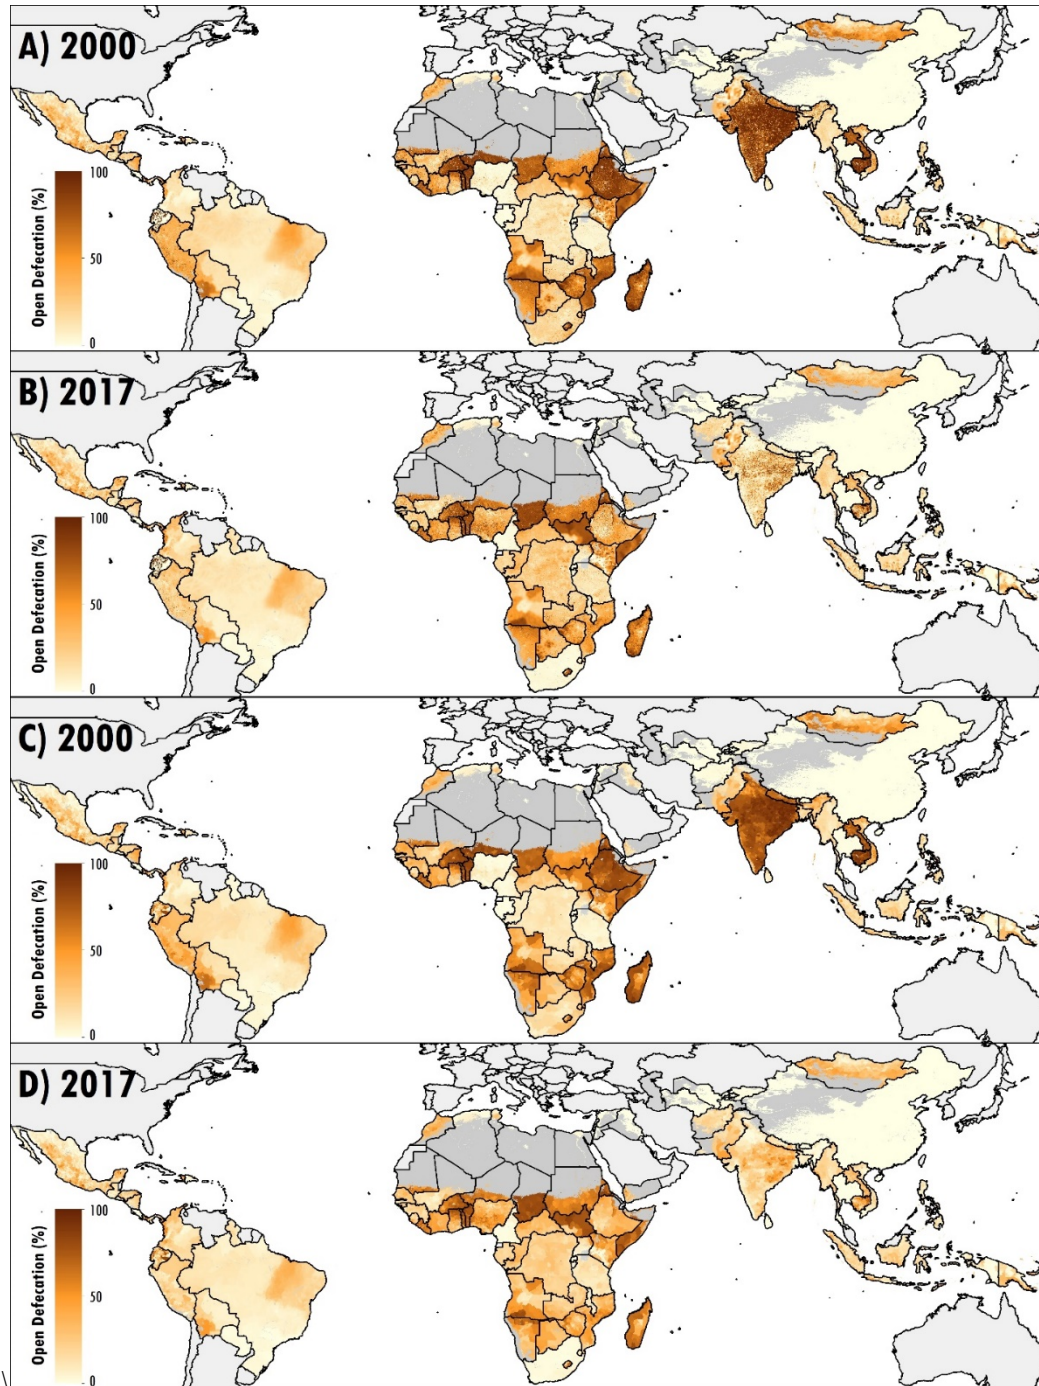

Appendix Figure 14. Mean access to unimproved sanitation, at 5 × 5-km resolution and second administrative level, 2000 and 2017

Panels a-b present mean access to unimproved sanitation at the 5 × 5-km resolution in 2000 and 2017. Panels c-d present mean access to unimproved sanitation at the second administrative level in 2000 and 2017. Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as “barren or sparsely vegetated” and had fewer than ten people per 1 × 1-km grid cell, or were not included in these analyses.^{5,11–15}

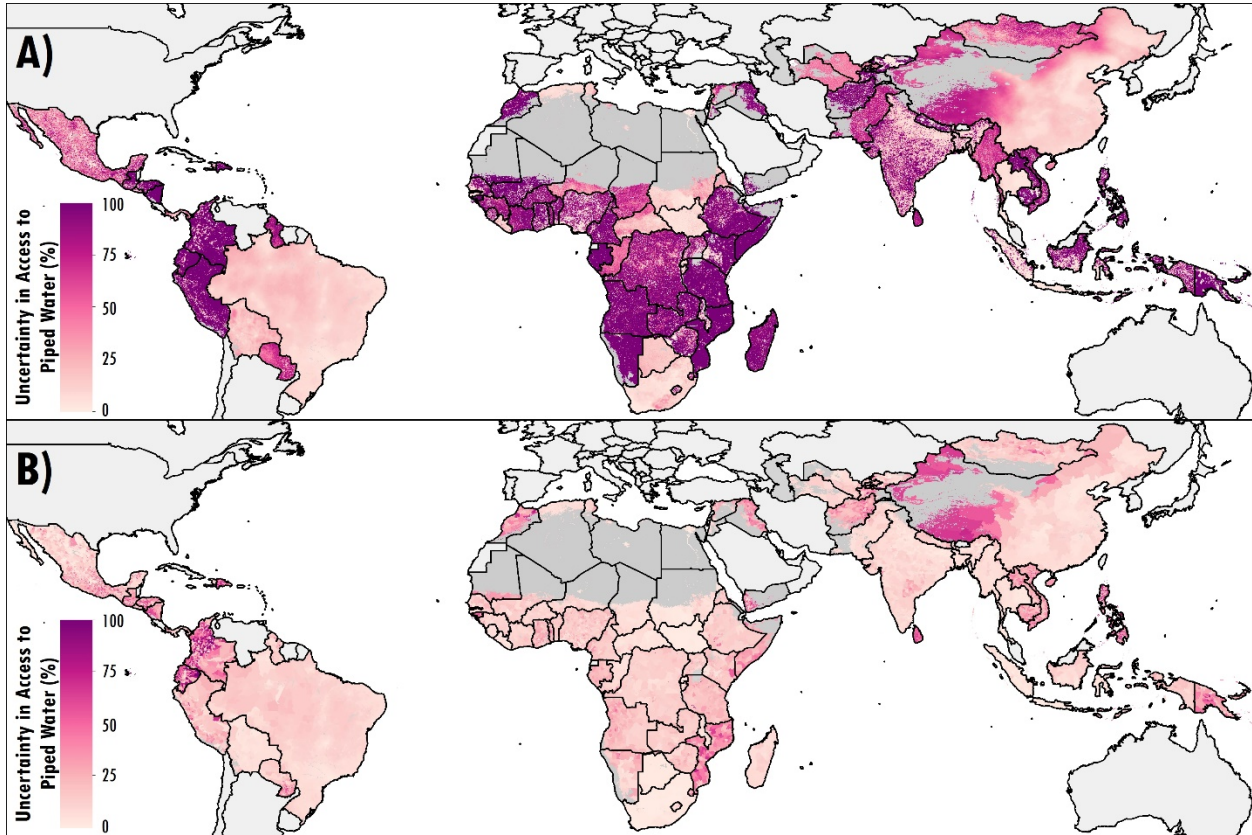

Appendix Figure 15. Mean open defecation, at 5 × 5-km resolution and second administrative level, 2000 and 2017

Panels a-b present mean open defecation at the 5 × 5-km resolution in 2000 and 2017. Panels c-d present mean open defecation at the second administrative level in 2000 and 2017. Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as “barren or sparsely vegetated” and had fewer than ten people per 1 × 1-km grid cell, or were not included in these analyses.^{5,11-15}

Appendix Figure 16. 95% uncertainty intervals for access to piped water, at 5 × 5-km resolution and second administrative level, 2017

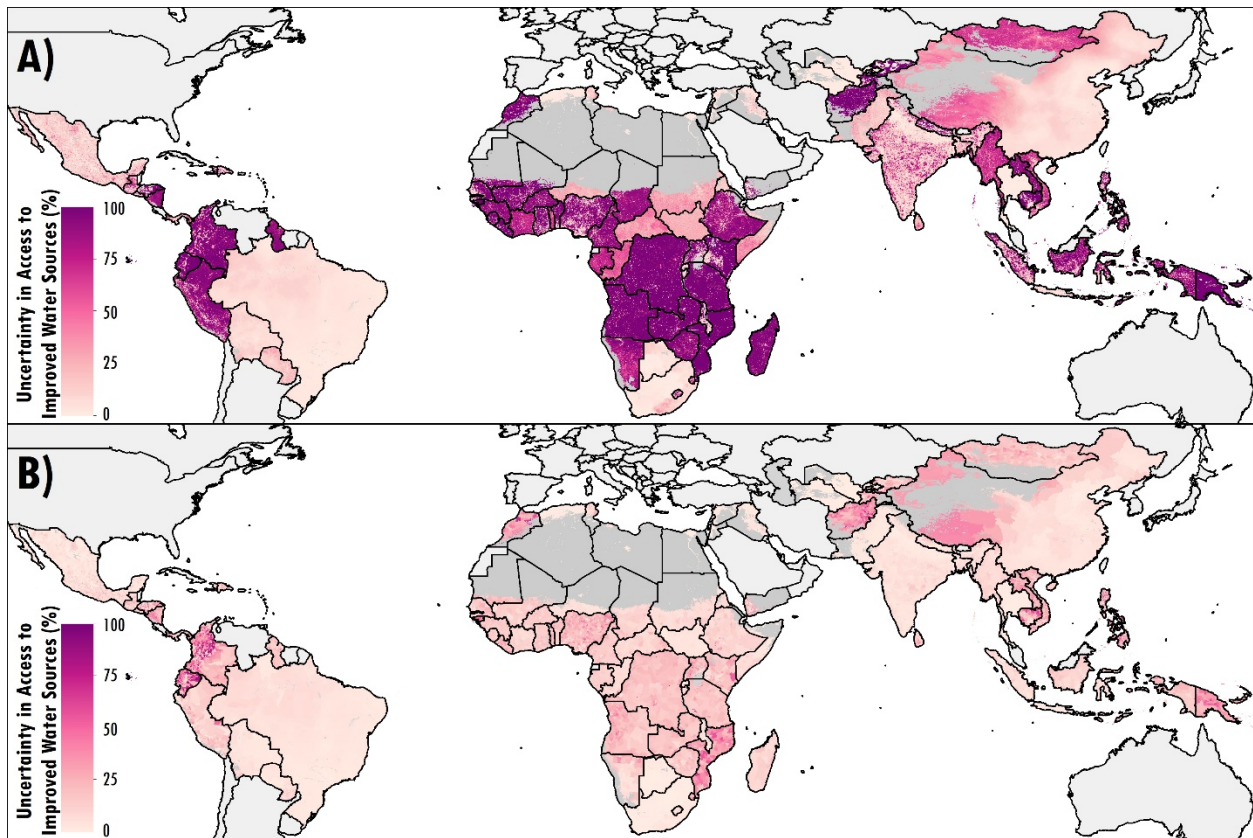

95% uncertainty intervals were calculated as the difference between the 97.5th percentile and the 2.5th percentile of the posterior distribution. Panel A) presents uncertainty at the 5 × 5-km grid cell and panel B) presents uncertainty at the second administrative level. Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as “barren or sparsely vegetated” and had fewer than ten people per 1 × 1-km grid cell, or were not included in these analyses.^{5,11–15}

b

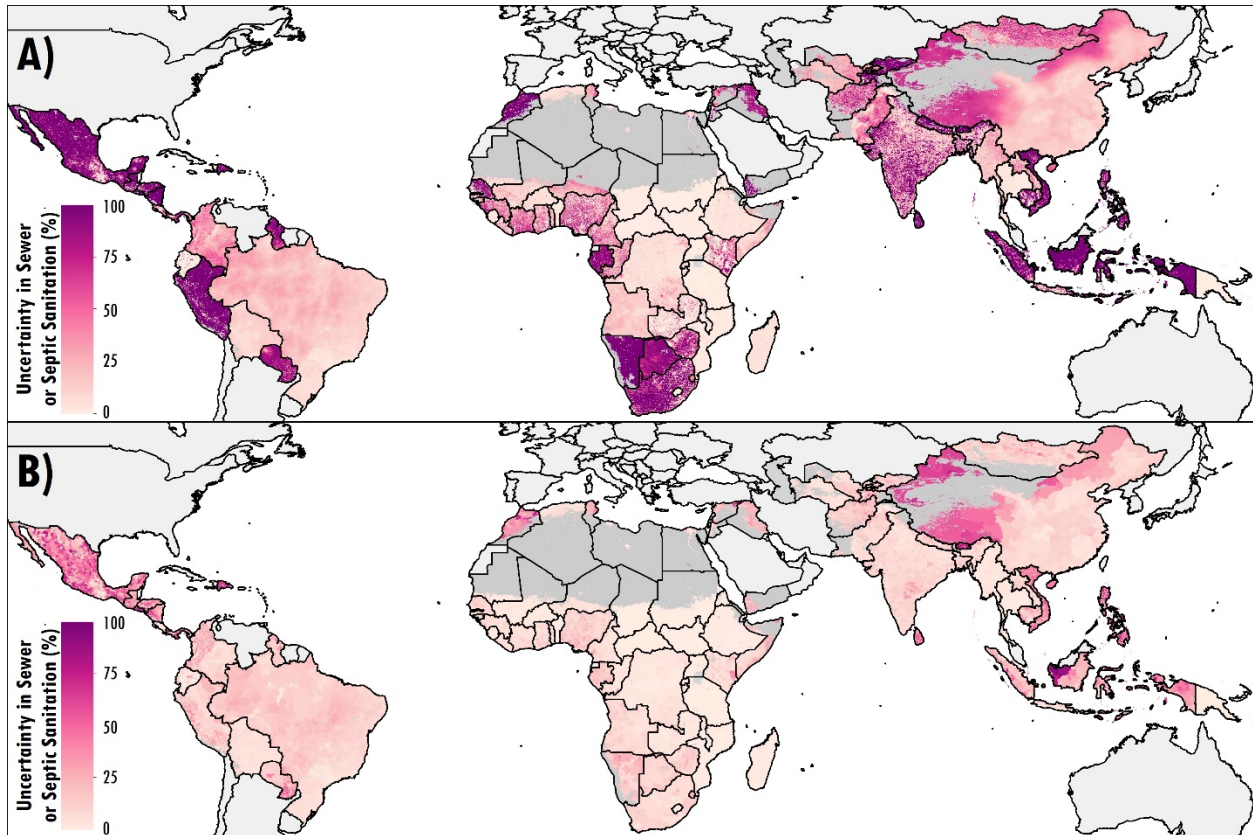

Appendix Figure 17. 95% uncertainty intervals for access to improved water, at 5 × 5-km resolution and second administrative level, 2017

95% uncertainty intervals were calculated as the difference between the 97.5th percentile and the 2.5th percentile of the posterior distribution. Panel **A**) presents uncertainty at the 5 × 5-km grid cell and panel **B**) presents uncertainty at the second administrative level. Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as “barren or sparsely vegetated” and had fewer than ten people per 1 × 1-km grid cell, or were not included in these analyses.^{5,11–15}

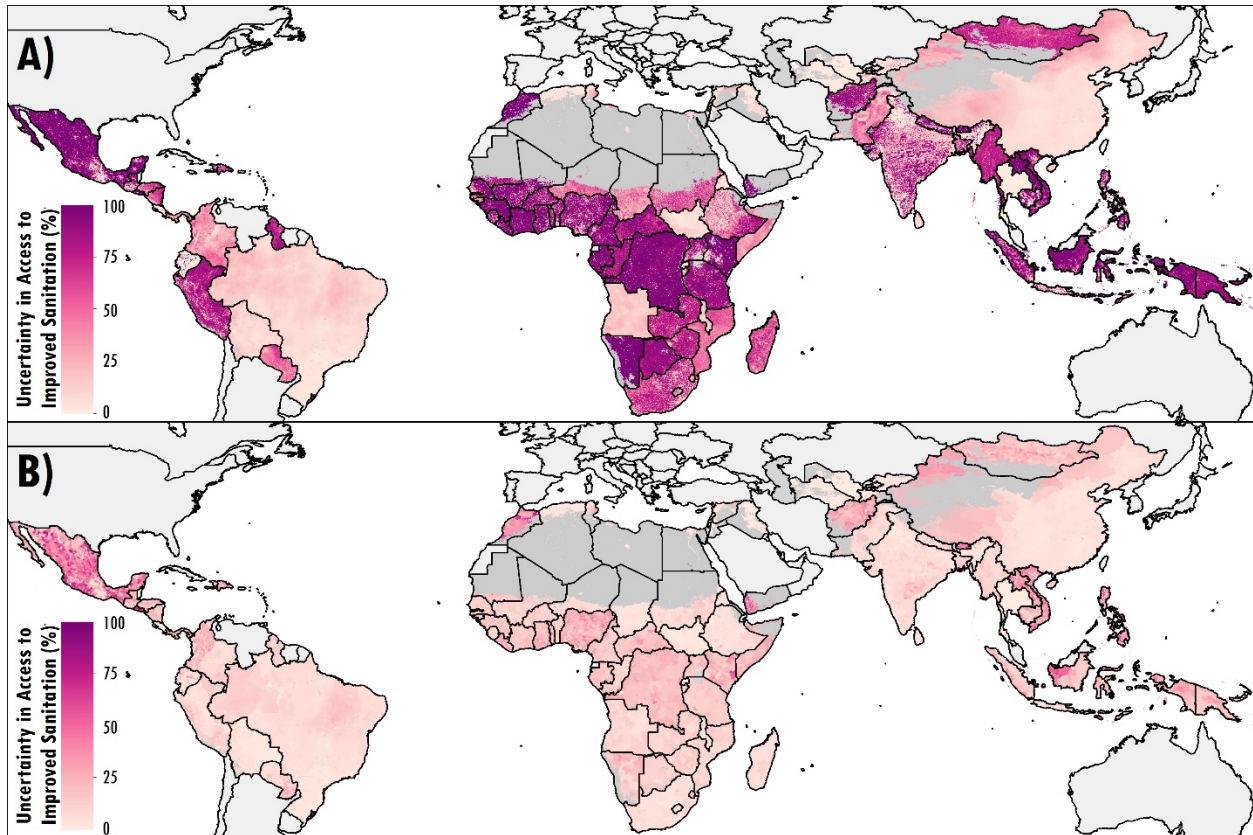

Appendix Figure 18. 95% uncertainty intervals for access to piped sanitation, at 5 × 5-km resolution and second administrative level, 2017

95% uncertainty intervals were calculated as the difference between the 97.5th percentile and the 2.5th percentile of the posterior distribution. Panel A) presents uncertainty at the 5 × 5-km grid cell and panel B) presents uncertainty at the second administrative level. Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as “barren or sparsely vegetated” and had fewer than ten people per 1 × 1-km grid cell, or were not included in these analyses.^{5,11–15}

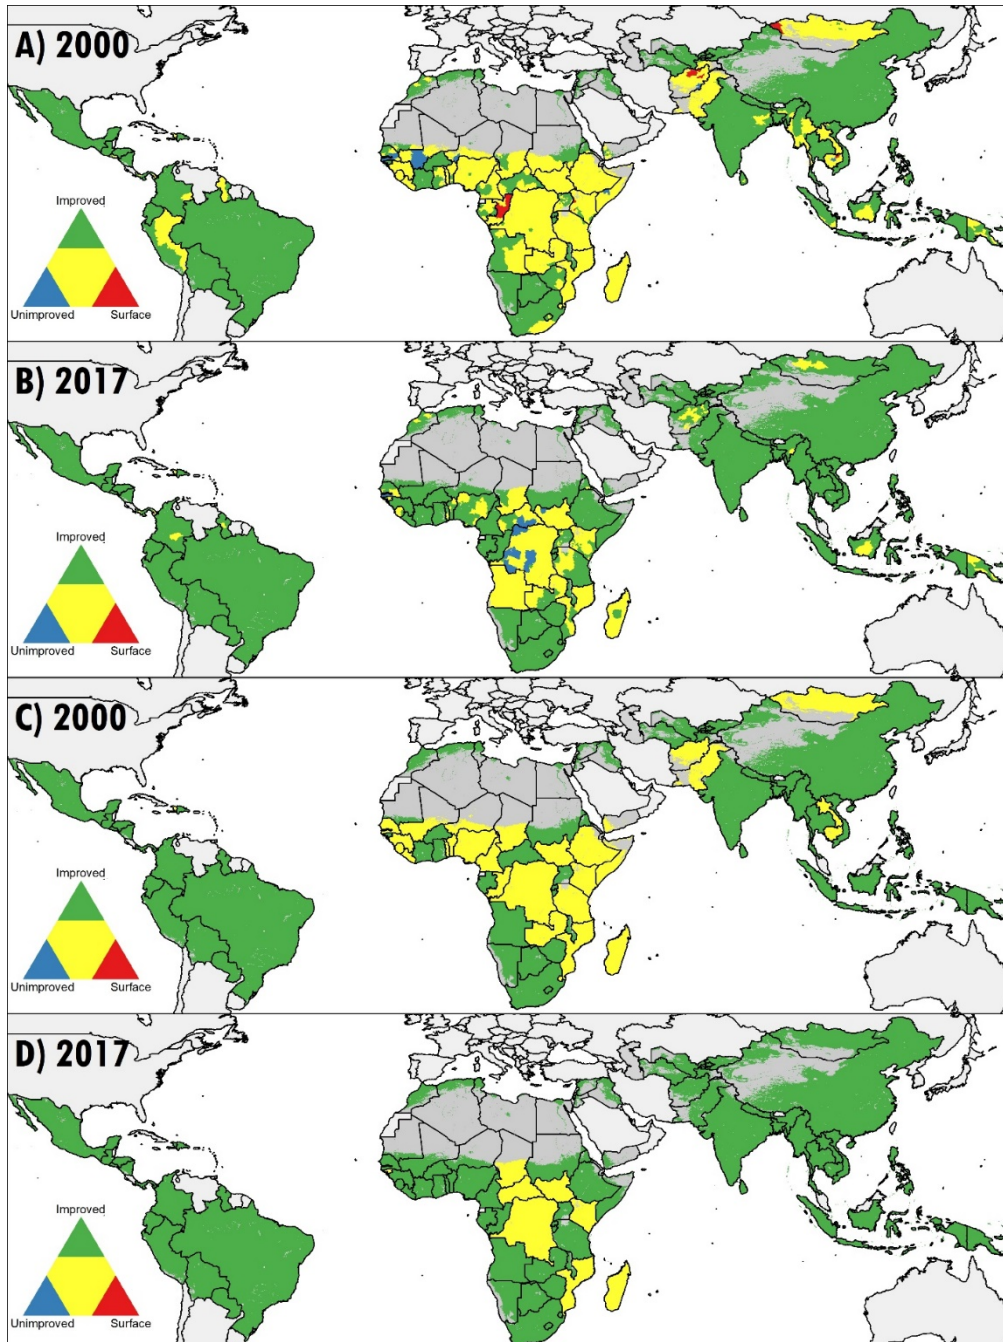

Appendix Figure 19. 95% uncertainty intervals for access to improved sanitation, at 5 × 5-km resolution and second administrative level, 2017

95% uncertainty intervals were calculated as the difference between the 97.5th percentile and the 2.5th percentile of the posterior distribution. Panel A) presents uncertainty at the 5 × 5-km grid cell and panel B) presents uncertainty at the second administrative level. Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as “barren or sparsely vegetated” and had fewer than ten people per 1 × 1-km grid cell, or were not included in these analyses.^{5,11–15}

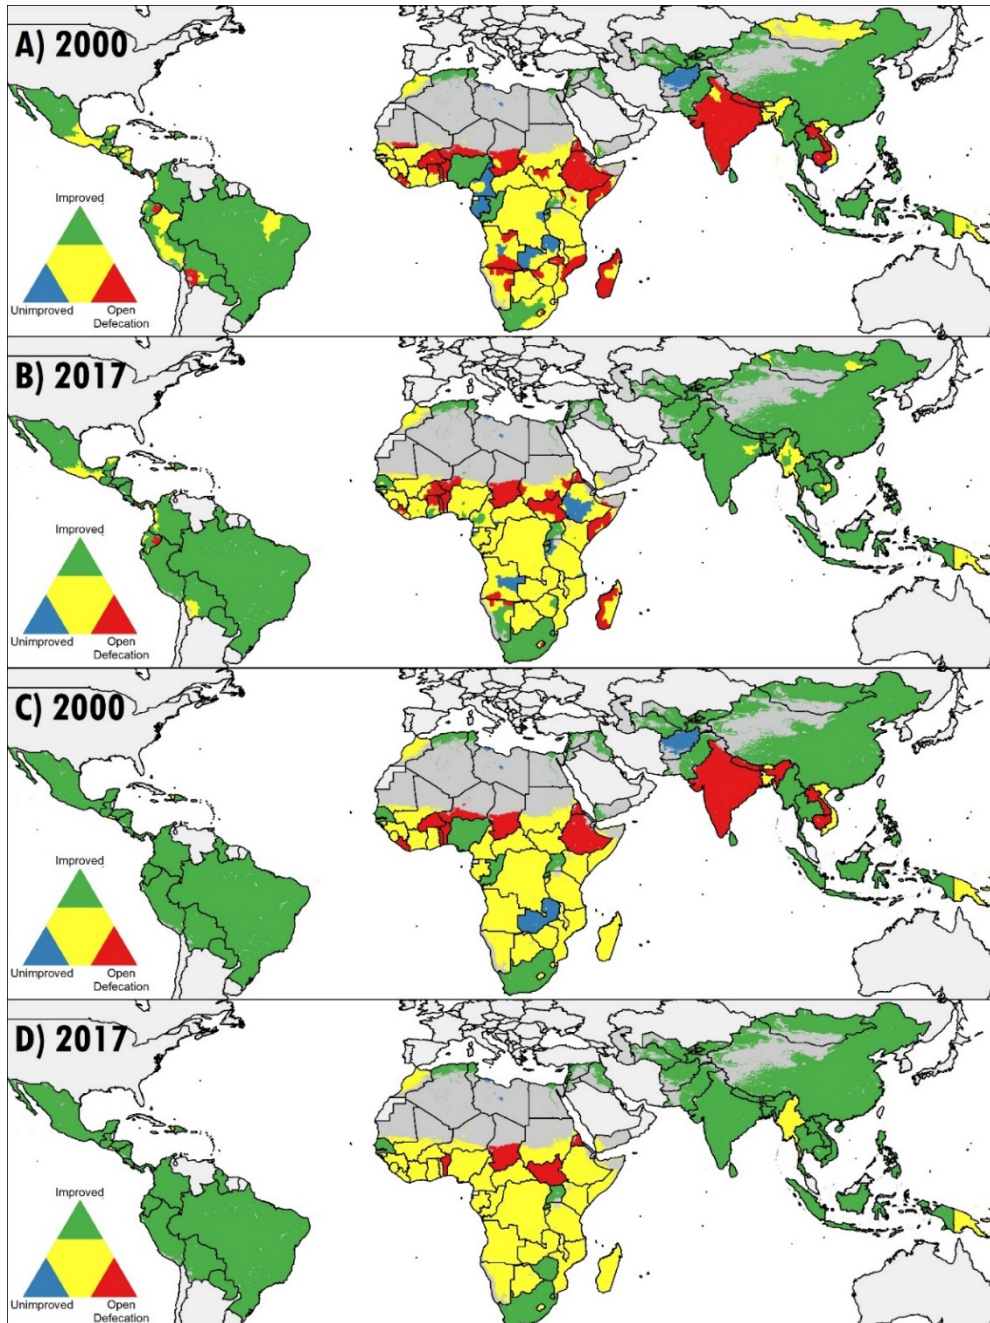

Appendix Figure 20. Ternary water, at the first administrative and national level, 2000 and 2017

The co-distribution of improved, unimproved, and no facility access is shown for water at the first administrative-level (A: 2000, B: 2017) and national level (C: 2000, D: 2017). Green denotes first administrative-level units where the majority of the population (>60%) had access to improved facilities, blue denotes >60% reliance on unimproved, and red denotes >60% having no facility access. Yellow indicates that there was no single dominant facility type used by >60% of the unit's population. Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as "barren or sparsely vegetated" and had fewer than ten people per 1×1 -km grid cell, or were not included in these analyses.^{5,11–15}

Appendix Figure 21. Ternary sanitation, at the first administrative and national level, 2000 and 2017

The co-distribution of improved, unimproved, and no facility access is shown for sanitation at the first administrative-level (A: 2000, B: 2017) and national level (C: 2000, D: 2017). Green denotes first administrative-level units where the majority of the population (>60%) had access to improved facilities, blue denotes >60% reliance on unimproved, and red denotes >60% having no facility access. Yellow indicates that there was no single dominant facility type used by >60% of the unit's population. Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as "barren or sparsely vegetated" and had fewer than ten people per 1×1 -km grid cell, or were not included in these analyses.^{5,11–15}

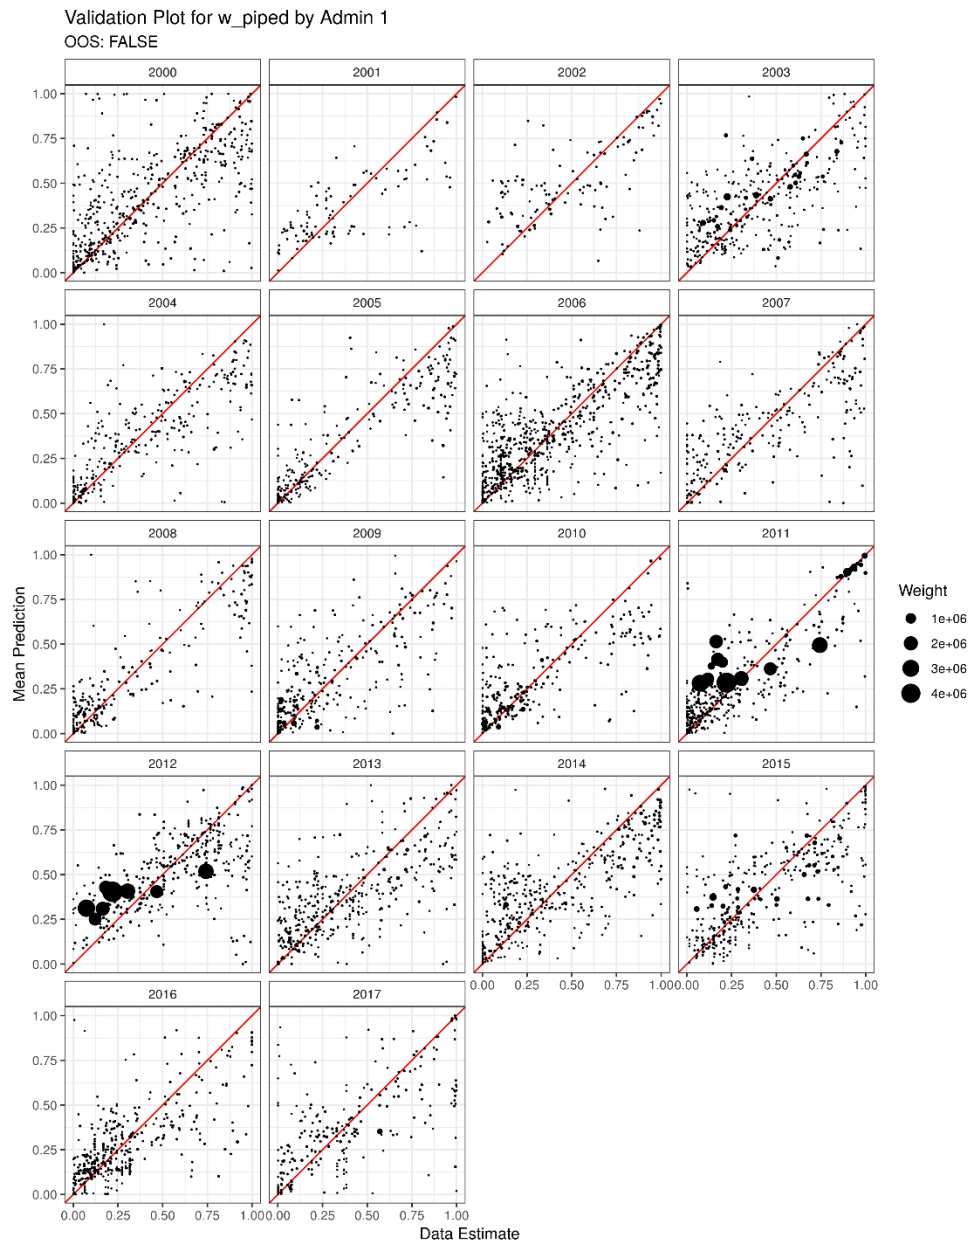

Appendix Figures 22–39. In sample prediction comparisons

For each indicator modelled, predictions were generated for each of the INLA model as described above before being harmonized to national trends (Section 3.6.1). These predictions were compared against the data to generate scatter plots for comparison. This analysis was conducted at country, first administrative, and second administrative geographical scales where the predictions and the dataset were aggregated to the corresponding scale prior to plotting for comparison. In the following analyses, certain countries were excluded due to data sparsity for the particular analytical framework as follows: 1) Bolivia, Brazil, Gabon, Indonesia, Cambodia, Madagascar, Peru, Papua New Guinea, Tanzania, South Africa, and Vietnam for piped water, 2) Bolivia, Brazil, Botswana, Central African Republic, Gambia, Indonesia, Kyrgyzstan, Morocco, and Mongolia for conditional improved water, 3) Gambia, Jordan, and Libya for conditional unimproved water, 3) Mexico and Swaziland for sewer or septic sanitation, 4) Mexico for conditional improved sanitation, and 5) Libya and Mozambique for conditional unimproved sanitation.

We plotted the correlation between our country level estimates of access to improved water to the Joint Monitoring Programme's estimates of country level access to improved water. Country level estimates are represented as points and coloured by the GBD region the country is in.

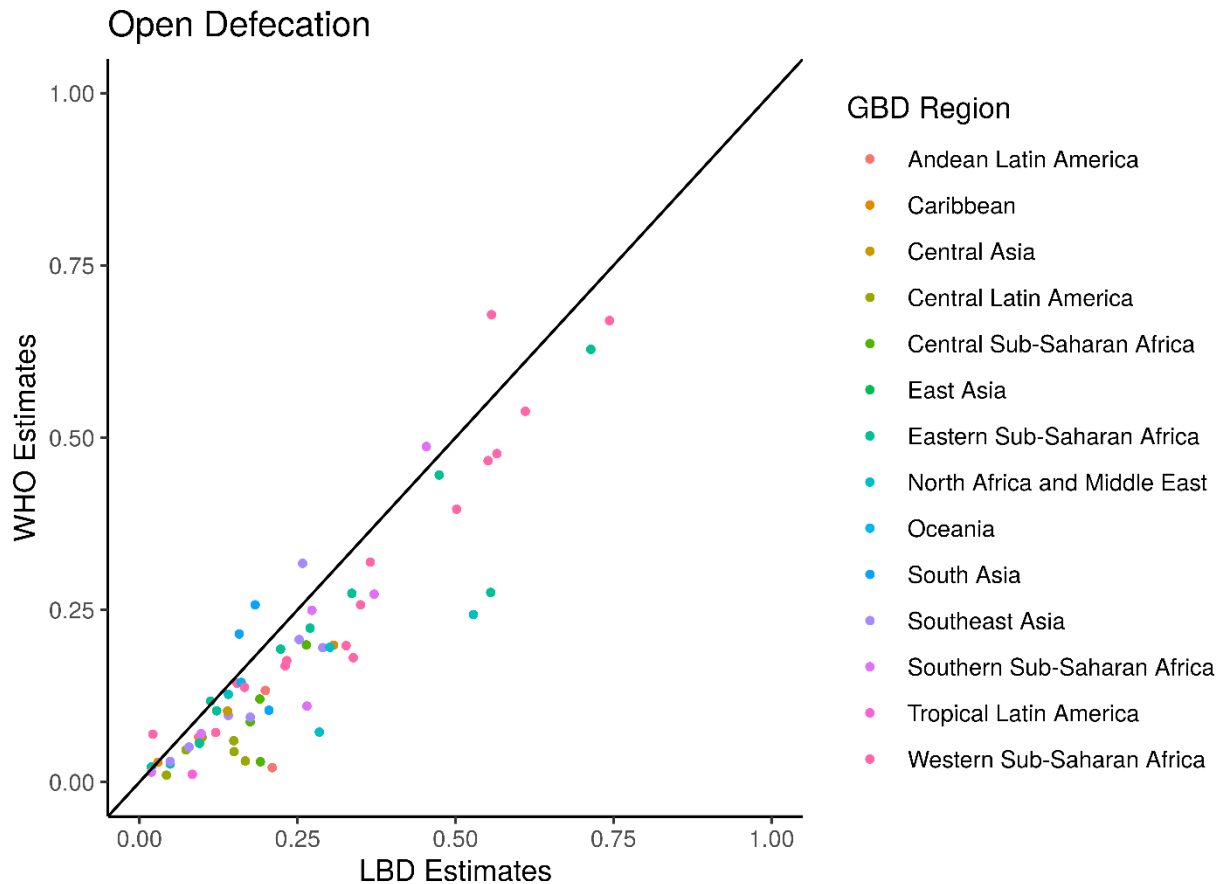

Appendix Figure 58. Correlation between improved sanitation and World Health Organization Joint Monitoring Programme improved sanitation estimates

We plotted the correlation between our country level estimates of access to improved sanitation to the Joint Monitoring Programme’s estimates of country level access to improved sanitation. Country level estimates are represented as points and coloured by the GBD region the country is in.

Appendix Figure 59. Correlation between open defecation and World Health Organization Joint Monitoring Programme open defecation estimates

We plotted the correlation between our country level estimates of open defecation to the Joint Monitoring Programme's estimates of country level open defecation. Country level estimates are represented as points and coloured by the GBD region the country is in.

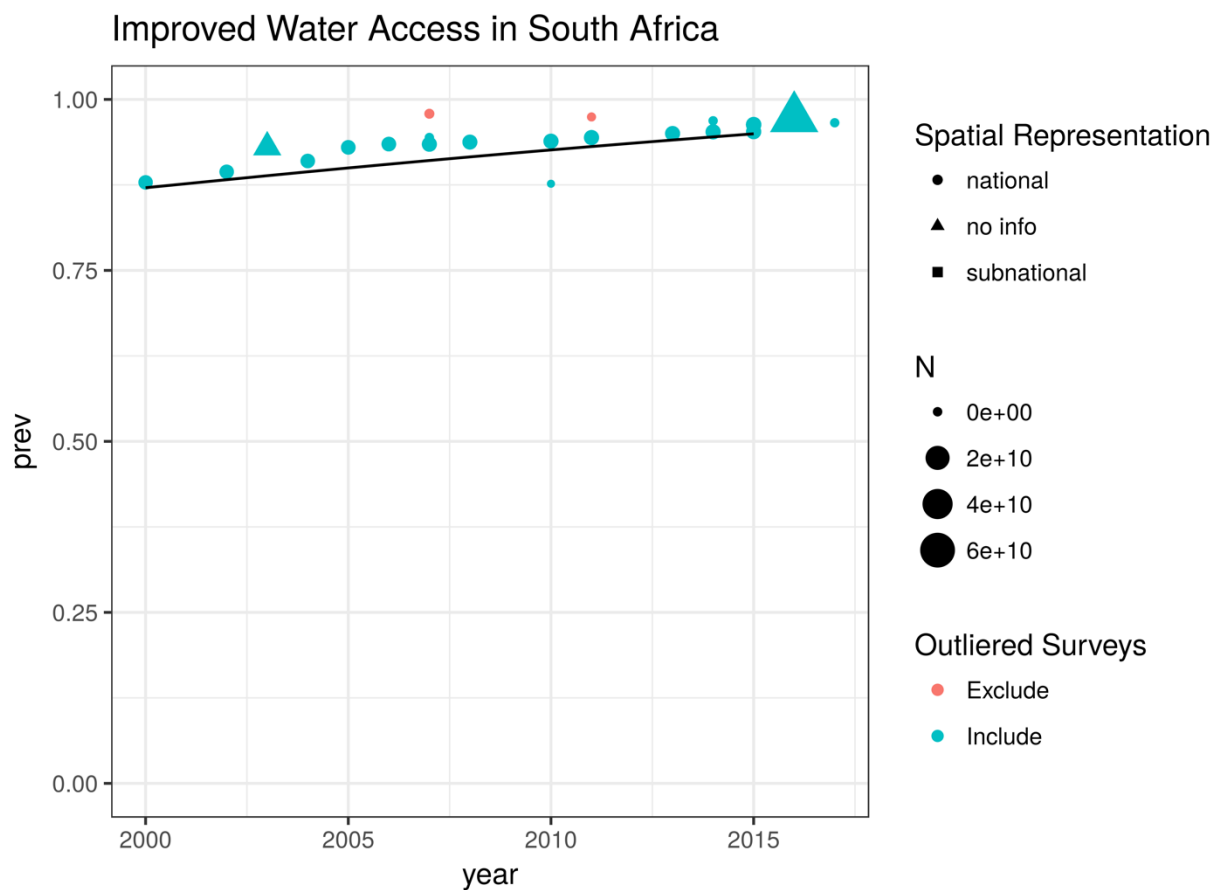

Appendix Figure 60. All indicator data validation plot

This is an example of a country-specific, indicator-specific data quality validation plot for South Africa. Data vetting procedures are fully explained in Section 1.8.2, outlining how surveys were either included or excluded for the final dataset based on these validation plots. Each survey is shown aggregated to the country level by survey year. Each individual survey is represented by a circle, and each level of the indicator is represented by a different colour.

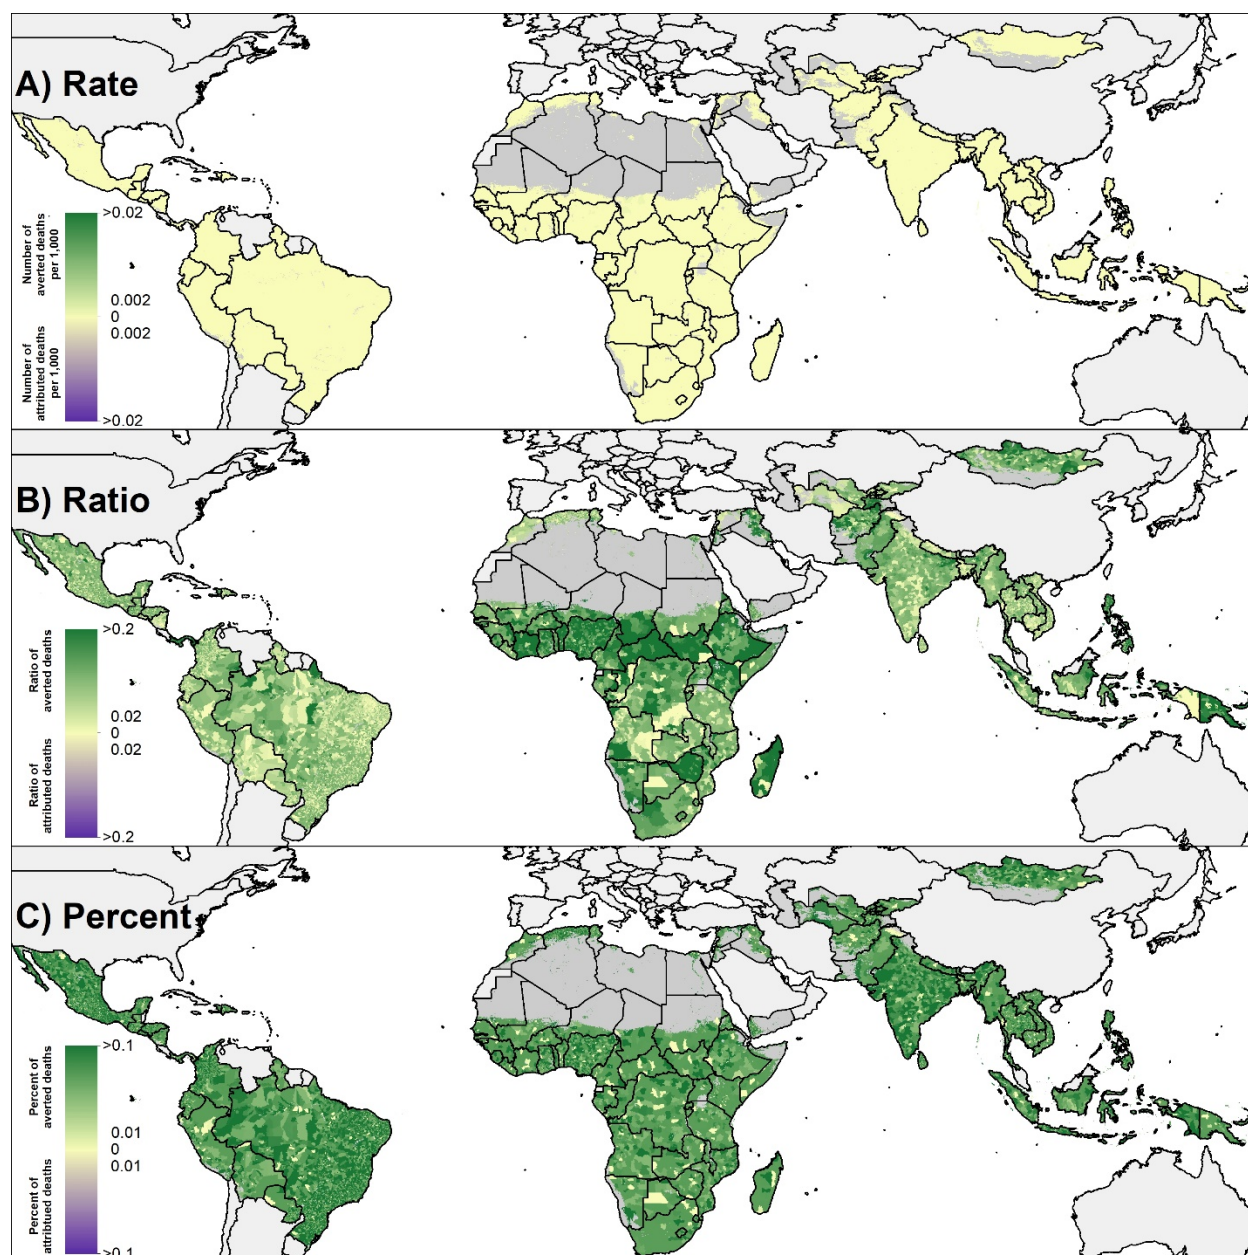

Appendix Figure 61. Indicator-specific data validation plot

This is an example of a country-specific data-quality validation plot for South Africa for access to improved water sources. Each individual survey is represented by a circle or triangle respective of its spatial representativeness. The black line represents the WHO Joint Monitoring Programme trend line. Surveys in blue represent included surveys, while surveys in pink are excluded due to being off trend.

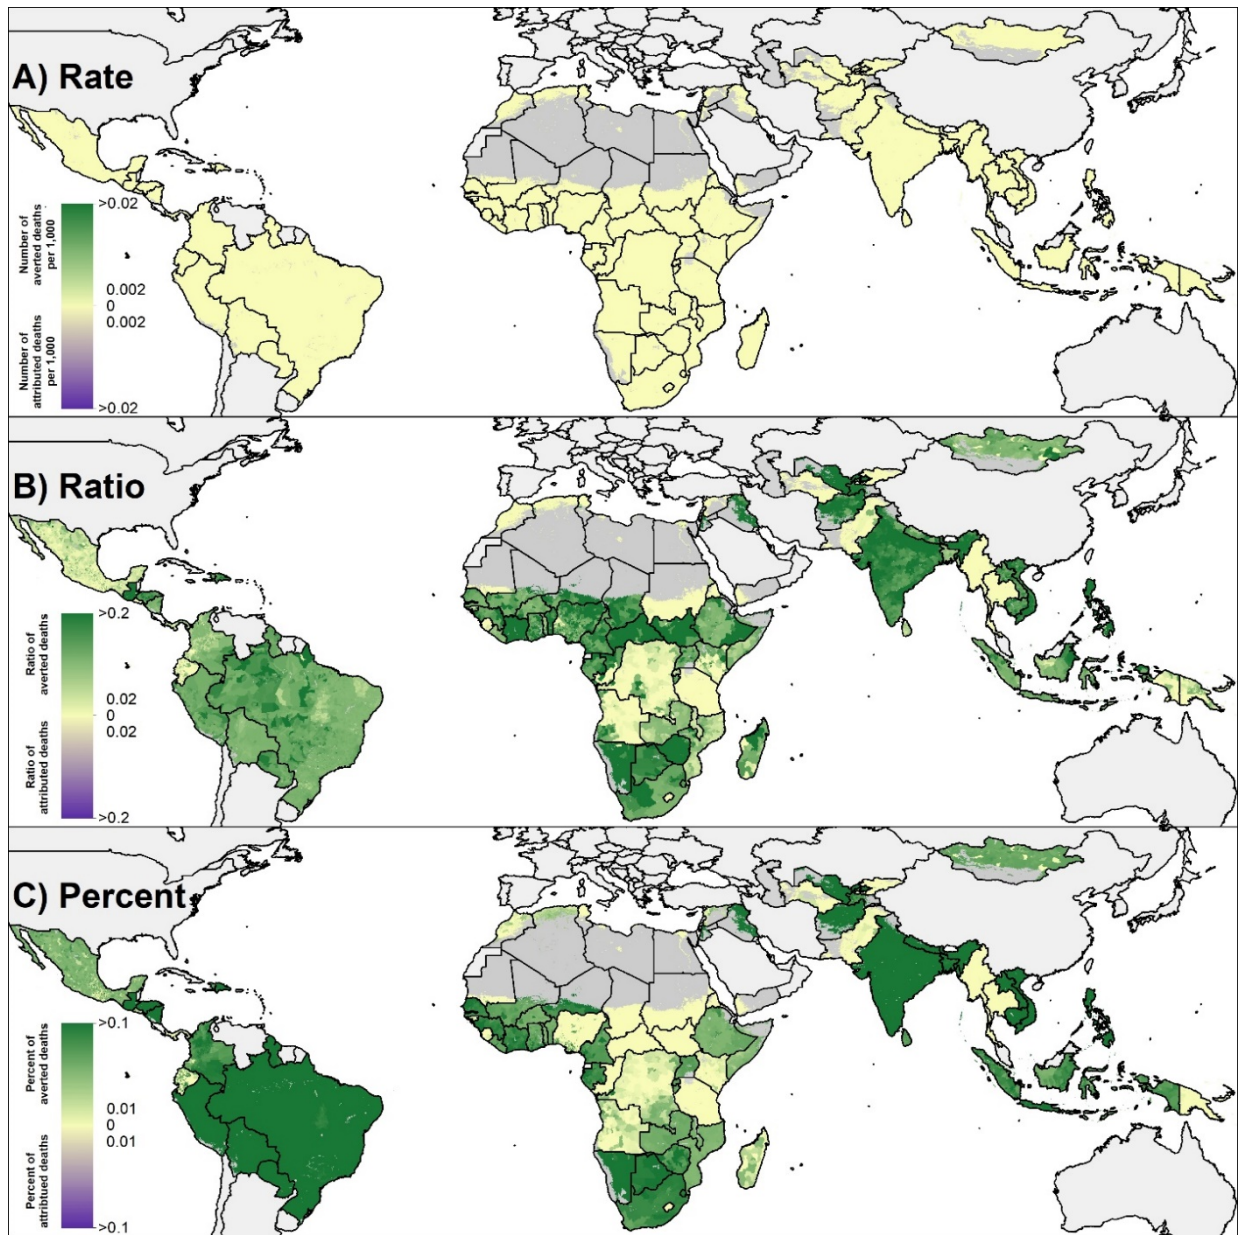

Appendix Figure 62. Rate, ratio, and percentage of deaths averted by access to improved drinking water facility at the second-administrative-unit level

Deaths are calculated under the counterfactual scenario where access to safe water and sanitation remained at the values observed in the year 2000. The deaths caused (purple) and averted (green) per 1,000 population given access levels observed in 2017 is shown for water (A). The ratio of deaths caused (purple) and averted (green) due to changes in access levels compared to 2000 to the change in diarrheal disease deaths overall compared to 2000 is shown for water (B). Lastly, the percent of deaths caused (purple) or averted (green) out of total diarrheal disease deaths in 2017 is mapped for water (C). Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as “barren or sparsely vegetated” and had fewer than ten people per 1×1 -km grid cell, or were not included in these analyses.^{5,11-15}

Appendix Figure 63. Rate, ratio, and percentage of deaths averted by access to improved sanitation facility at the second-administrative-unit level

Deaths are calculated under the counterfactual scenario where access to safe water and sanitation remained at the values observed in the year 2000. The deaths caused (purple) and averted (green) per 1,000 population given access levels observed in 2017 is shown for sanitation (A). The ratio of deaths caused (purple) and averted (green) due to changes in access levels compared to 2000 to the change in diarrheal disease deaths overall compared to 2000 is shown for sanitation (B). Lastly, the percent of deaths caused (purple) or averted (green) out of total diarrheal disease deaths in 2017 is mapped for sanitation (C). Maps reflect administrative boundaries, land cover, lakes, and population; grey-coloured grid cells were classified as “barren or sparsely vegetated” and had fewer than ten people per 1×1 -km grid cell, or were not included in these analyses.^{5,11–15}

Appendix Table 1. Compliance with the Guidelines for Accurate and Transparent Health Estimates Reporting

Item #	Checklist item	Reported on page #
Objectives and funding		
1	Define the indicator(s), populations (including age, sex, and geographic entities), and time period(s) for which estimates were made.	Manuscript: Methods section. Appendix: Sections 1.0, 2.1.
2	List the funding sources for the work.	Manuscript: Methods section.
Data Inputs		
<i>For all data inputs from multiple sources that are synthesised as part of the study:</i>		
3	Describe how the data were identified and how the data were accessed.	Manuscript: Methods section. Appendix: Sections 1.0, 2.1.
4	Specify the inclusion and exclusion criteria. Identify all ad-hoc exclusions.	Manuscript: Methods section. Appendix: Section 1.0.
5	Provide information on all included data sources and their main characteristics. For each data source used, report reference information or contact name/institution, population represented, data collection method, year(s) of data collection, sex and age range, diagnostic criteria or measurement method, and sample size, as relevant.	Manuscript: Methods section. Appendix: Sections 1.0, 2.1; Appendix Figures 4, 5; http://ghdx.healthdata.org/record/ihme-data/lmic-wash-access-geospatial-estimates-2000-2017
6	Identify and describe any categories of input data that have potentially important biases (e.g., based on characteristics listed in item 5).	Manuscript: Methods section. Appendix: Section 1.8.
<i>For data inputs that contribute to the analysis but were not synthesised as part of the study:</i>		
7	Describe and give sources for any other data inputs.	Appendix: Sections: 1.0, 2.1
<i>For all data inputs:</i>		
8	Provide all data inputs in a file format from which data can be efficiently extracted (e.g., a spreadsheet rather than a PDF), including all relevant meta-data listed in item 5. For any data inputs that cannot be shared because of ethical or legal reasons, such as third-party ownership, provide a contact name or the name of the institution that retains the right to the data.	Available at http://ghdx.healthdata.org/record/ihme-data/lmic-wash-access-geospatial-estimates-2000-2017
Data analysis		
9	Provide a conceptual overview of the data analysis method. A diagram may be helpful.	Manuscript: Methods section. Appendix Figure 1.
10	Provide a detailed description of all steps of the analysis, including mathematical formulae. This description should cover, as relevant, data cleaning, data pre-processing, data adjustments and weighting of data sources, and mathematical or statistical model(s).	Manuscript: Methods section. Appendix: Sections 1.4-3.6.
11	Describe how candidate models were evaluated and how the final model(s) were selected.	Appendix: Section 3.5.
12	Provide the results of an evaluation of model performance, if done, as well as the results of any relevant sensitivity analysis.	Appendix: Section 3.0.
13	Describe methods for calculating uncertainty of the estimates. State which sources of uncertainty were, and were not, accounted for in the uncertainty analysis.	Appendix: Section 3.0.
14	State how analytic or statistical source code used to generate estimates can be accessed.	Available at https://github.com/ihmeuw/lbd/tree/wash-lmic-2020
Results and Discussion		
15	Provide published estimates in a file format from which data can be efficiently extracted.	Raster files for spatial data and CSVs of first and second administrative-level estimates to be made available at http://ghdx.healthdata.org/record/ihme-data/lmic-wash-access-geospatial-estimates-2000-2017
16	Report a quantitative measure of the uncertainty of the estimates (e.g., uncertainty intervals).	Manuscript: Methods section. Appendix: Section 3.4
17	Interpret results in light of existing evidence. If updating a previous set of estimates, describe the reasons for changes in estimates.	Manuscript: Discussion section.
18	Discuss limitations of the estimates. Include a discussion of any modelling assumptions or data limitations that affect interpretation of the estimates.	Manuscript: Discussion section.

Appendix Table 2. List of countries included in analysis, stratified by Socio-demographic Index

Low SDI	Low-middle SDI	Middle SDI	High-middle SDI
Afghanistan	Angola	Algeria	China

Bangladesh	Bhutan	Botswana	Libya
Benin	Bolivia	Brazil	
Burkina Faso	Cambodia	Colombia	
Burundi	Cameroon	Costa Rica	
Central African Republic	Dominican Republic	Ecuador	
Chad	Egypt	Gabon	
Comoros	El Salvador	Indonesia	
Côte d'Ivoire	Ghana	Jordan	
Democratic Republic of the Congo	Guatemala	Mexico	
Eritrea	Guyana	Mongolia	
Ethiopia	Honduras	Namibia	
Guinea	India	Panama	
Guinea-Bissau	Iraq	Paraguay	
Haiti	Kenya	Peru	
Liberia	Kyrgyzstan	Philippines	
Madagascar	Laos	South Africa	
Malawi	Lesotho	Sri Lanka	
Mali	Mauritania	Syria	
Mozambique	Morocco	Thailand	
Nepal	Myanmar	Tunisia	
Niger	Nicaragua	Turkmenistan	
Papua New Guinea	Nigeria	Uzbekistan	
Rwanda	Pakistan	Vietnam	
Senegal	Republic of the Congo		
Sierra Leone	Sudan		
Somalia	Swaziland (eSwatini)		
South Sudan	Tajikistan		
Tanzania	Timor-Leste		
The Gambia	Zambia		
Togo	Zimbabwe		
Uganda			
Yemen			

Appendix Table 3. Covariates used in modelling framework

A variety of socioeconomic and environmental variables were used to predict access to water and sanitation facilities. Where available, the finest spatiotemporal resolution of gridded datasets was used.

Covariate	Temporal resolution	Source	Reference
Travel time to nearest settlement	Static	Oxford	Weiss, D. J. <i>et al.</i> A global map of travel time to cities to assess inequalities in accessibility in 2015. <i>Nature</i> 533 , 333-336 (2018). Available at: https://map.ox.ac.uk/research-project/accessibility_to_cities/

Appendix Table 6. Fixed parameters used for boosted regression trees

Parameter	Value
Tree Complexity	5
Learning Rate	0.0025
Bag Fraction	0.8
Number of Trees	5000

Appendix Table 7. Fitted parameters by region for model of access to piped water

Lower, median, and upper quantiles (0.025%, 0.50%, 0.975%) are displayed for the main parameters by region. The first four columns provide information on the fixed effects: the intercept (int) and the covariates (gam, gbm, and enet) corresponding to the predicted ensemble rasters. Fitted values for the spatiotemporal field are shown in the next two columns. Countries are abbreviated by their ISO3 codes.

	Quantiles	int	gam	gbm	lasso	Nominal range	Nominal variance

Appendix Table 8. Fitted parameters by region for model of access to improved water

Lower, median, and upper quantiles (0.025%, 0.50%, 0.975%) are displayed for the main parameters by region. The first four columns provide information on the fixed effects: the intercept (int) and the covariates (gam, gbm, and enet) corresponding to the predicted ensemble rasters. Fitted values for the spatiotemporal field are shown in the next two columns. Countries are abbreviated by their ISO3 codes.

Appendix Table 9. Fitted parameters by region for model of access to unimproved water

Lower, median, and upper quantiles (0.025%, 0.50%, 0.975%) are displayed for the main parameters by region. The first four columns provide information on the fixed effects: the intercept (int) and the covariates (gam, gbm, and enet) corresponding to the predicted ensemble rasters. Fitted values for the spatiotemporal field are shown in the next two columns. Countries are abbreviated by their ISO3 codes.

Appendix Table 10. Fitted parameters by region for model of access to piped sanitation

Lower, median, and upper quantiles (0.025%, 0.50%, 0.975%) are displayed for the main parameters by region. The first four columns provide information on the fixed effects: the intercept (int) and the covariates (gam, gbm, and enet) corresponding to the predicted ensemble rasters. Fitted values for the spatiotemporal field are shown in the next two columns. Countries are abbreviated by their ISO3 codes.

Appendix Table 11. Fitted parameters by region for model of access to improved sanitation

Lower, median, and upper quantiles (0.025%, 0.50%, 0.975%) are displayed for the main parameters by region. The first four columns provide information on the fixed effects: the intercept (int) and the covariates (gam, gbm, and enet) corresponding to the predicted ensemble rasters. Fitted values for the spatiotemporal field are shown in the next two columns. Countries are abbreviated by their ISO3 codes.

Appendix Table 12. Fitted parameters by region for model of access to unimproved sanitation

Lower, median, and upper quantiles (0.025%, 0.50%, 0.975%) are displayed for the main parameters by region. The first four columns provide information on the fixed effects: the intercept (int) and the covariates (gam, gbm, and enet) corresponding to the predicted ensemble rasters. Fitted values for the spatiotemporal field are shown in the next two columns. Countries are abbreviated by their ISO3 codes.

Appendix Table 25a-b. Risk ratios used in counterfactual analyses

We present the risk ratios used in our counterfactual analyses as adapted from the Global Burden of Diseases, Risk Factors, and Injuries 2017⁹.

Appendix Table 26. Risk ratios associated with access to water facilities.

Water Facility Category	Risk Ratio
Piped, boiled/filtered	1
Piped, solar/chlorinated	1.65
Piped, untreated	2.4
Other Improved, boiled/filtered	1.12
Other Improved, solar/chlorinated	1.85
Other Improved, untreated	2.69
Unimproved or Surface, boiled/filtered	1.36
Unimproved or Surface, solar/chlorinated	2.25
Unimproved or Surface, untreated	3.28

Appendix Table 27. Risk ratios associated with access to water facilities.

Sanitation Facilities	Risk Ratio
Sewer or Septic	1
Other Improved	2.595
Unimproved or Open Defecation	3.242

Managing the estimation or publications process

Simon I. Hay, Robert C. Reiner Jr., Brigette F. Blacker, Molly K. Miller-Petrie, Paulina A. Lindstedt, Natalie Cormier, Puja C. Rao

Writing the first draft of the manuscript

Aniruddha Deshpande, Molly K. Miller-Petrie

Primary responsibility for this manuscript focused on: applying analytical methods to produce estimates

Aniruddha Deshpande

Primary responsibility for this manuscript focused on: seeking, cataloguing, extracting, or cleaning data; designing or coding figures and tables

Aniruddha Deshpande, Paulina A. Lindstedt, Mathew M. Baumann, Alexandria Brown, Gregory M. Garcia, James R. Albright, Kimberly B. Johnson, Robert C. Reiner Jr.

Providing data or critical feedback on data sources
