11 / KPC.

12

13 **New**  $\beta$ -lactam/ $\beta$ -lactamase inhibitor combinations ( $\beta$ L- $\beta$ LICs) have been recently developed for  
14 the treatment of difficult-to-treat (DTR) infections **caused** by multi-drug-resistant (MDR)  
15 microorganisms.<sup>1</sup> Although **the new**  $\beta$ L- $\beta$ LICs represent a promising effective option for  
16 treatment of DTR infections due to **carbapenemase**-producing *Enterobacterales* (CPE), the  
17 emergence of strains resistant to these molecules poses further considerations in their clinical use  
18 [1]. Recently, a novel **siderophore** cephalosporin, cefiderocol (CFD), has been developed for  
19 treatment of challenging DTR infections due to MDR pathogens. Although CFD exerts potent *in*  
20 *vitro* activity against most MDR Gram-negative microorganisms, recent studies reported the  
21 **increase** of CFD-resistant strains thus limiting its clinical impact [2,3]. In this context,  
22 combination antimicrobial treatments have been proposed to overcome the emergence of DTR  
23 pathogens [4].

24 Aim of this study was to evaluate the *in vitro* activity of CFD in association with  
25 ceftazidime/**avibactam** (CAZ-AVI), meropenem/vaborbactam (MER/VAB), and/or

Formatted: Font: Not Italic

26 imipenem/relebactam (IMI-REL) and fosfomycin (FOS) against a collection of MDR KPC-  
27 producing *K. pneumoniae* (KPC-Kp) clinical isolates.

28 Phenotypic and genotypic characteristics of KPC-Kp strains included in this study are shown in  
29 Table 1 and 2. Strains were grouped accordingly to the antimicrobial susceptibility patterns to  
30 new  $\beta$ L- $\beta$ LICs and CFD (Group 1; CAZ-AVI, MER/VAB, IMI-REL and CFD -resistant; Group  
31 2; CAZ-AVI and CFD -resistant; Group 3; CFD -resistant; Group 4; susceptible to new  $\beta$ L-  
32  $\beta$ LICs and CFD). *In vitro* synergy testing was evaluated by calculating the FIC index (FICI  
33  $\leq 0.5$ , synergy;  $0.5 < \text{FICI} \leq 4$ , indifferent;  $\text{FICI} > 4$ , antagonist) as previously described [5].  
34 Overall, *in vitro* synergistic activity was observed for 28 out of 80 (35%) combinations tested  
35 against CFD-resistant KPC-Kp and for 13 out of 40 (32.5%) against CFD-susceptible strains  
36 (Figure 1). In particular, CFD in combination with CAZ-AVI, MER-VAB, IMI-REL or FOS  
37 showed a synergy rate respectively of 45%, 35%, 45% and 15% against CFD-resistant strains  
38 and 60%, 40%, 30% and 0% against CFD-susceptible KPC-Kp. Importantly, CFD reduced the  
39 MICs of CAZ-AVI, MER-VAB, IMI-REL and FOS respectively of 4, 12, 3.2 and 3.5 -folds  
40 against CFD-resistant strains and of 3.4, 15.6, 2.65 and 2 -fold against CFD-susceptible KPC-Kp  
41 (Figure 2).

42 Examination of the synergy results based on phenotypic traits showed that CFD in combination  
43 with CAZ-AVI exhibited high synergistic activity (FICI  $\leq 0.5$ ) against both KPC-Kp -  
44 susceptible to CFD and  $\beta$ L- $\beta$ LICs or KPC-Kp -resistant to CFD and novel  $\beta$ L- $\beta$ LICs (Figure 3).  
45 Also, CFD in combination with MER-VAB showed higher synergistic values against KPC-Kp  
46 resistant to CFD and at least one  $\beta$ L- $\beta$ LICs. Interestingly, CFD in combination with IMI-REL  
47 exhibited higher FICI than other combinations against KPC-Kp susceptible to  $\beta$ L- $\beta$ LICs and re-  
48 sistant to CFD. Interestingly, CFD restored the IMI-REL activity against 8/9 (88.8%) Kp strains  
49 co-producing mutated KPC and OXA-181 that are resistant to CFD and all  $\beta$ L- $\beta$ LICs.

50 In conclusion, our findings demonstrated that CFD in combination with novel  $\beta$ L- $\beta$ LICs showed  
51 synergistic activity [FICI  $< 0.5$ ] against all KPC-Kp isolates, including CFD -susceptible and -

52 resistant strains. Although CFD exhibited synergistic activity differentially depending on the  
53 phenotypic traits of KPC-Kp strains, here we demonstrated that CFD reduced the MICs for IMI-  
54 REL below the resistance breakpoints against 29 out of 30 (96.6%) KPC-Kp strains. Further  
55 study are necessary to evaluate the clinical impact of this combination and establish the efficacy  
56 of this regimen in the treatment of infections due to KPC-Kp producers.
