Italian Journal of Animal Science

The *Italian Journal of Animal Science* is an international peer-reviewed open access journal publishing original scientific papers, reviews and short communications.

The journal serves as essential reading for animal scientists, technicians and all those who research animal production.

The journal encourages submissions of international relevance on the following subjects:

- Animal derived food quality and safety
- Animal genetics and breeding
- Aquaculture, poultry, companion and wild game animals
- Livestock systems, management and environment
- Non-ruminant or ruminant nutrition and feeding
- Production physiology and functional biology of farmed, companions and wild game animals.
- Animal behavior
- Animal welfare
- In vitro studies that have an application to farmed livestock

Manuscripts must address topics based on research at molecular, cellular, organ, whole animal and production system levels. Manuscripts discussing milk or meat analysis and compositions must show a direct link to either livestock production system, product quality, animal feeding/nutrition, animal genetics or breeding. Manuscripts describing laboratory animal models will be considered where the study highlights a potential benefit to farmed livestock.

Submissions discussing epidemiology, parasitology, infective diseases, food-borne diseases do not fit with the aims and scope of the journal.

Meeting reviews, book reviews and conference supplements are also published, as well as news and guidelines from the Animal Science and Production Association (ASPA). We welcome submissions from ASPA members and non-members alike.

Article publishing charge

The standard article publishing charge (APC) for this journal is US\$900 / €795 / £690. Depending on your location, these charges may be subject to local taxes.

For members of the Animal Science and Production Association, the publication fee is US\$450 / €400 / £345. Depending on your location, these charges may be subject to local taxes. There are no submission charges for this journal.

Peer Review Statement

The publication of manuscripts is subject to the approval of referees and in agreement with the Editorial Advisory Board's opinions. All peer review is single blind and submission should be online via ScholarOne Manuscripts. Referees will be selected from among qualified scientists in the international scientific community.

Submitting your paper

This journal uses ScholarOne Manuscripts (previously Manuscript Central) to peer review manuscript submissions. Please read the guide for ScholarOne authors before making a submission. Please submit your paper in the author centre at <https://mc.manuscriptcentral.com/tjas>

Foreword

The 23rd Congress of the Animal Science and Production Association (ASPA) is hosted in Sorrento, a wonderful location near Naples, where sea and mountain, deep valleys and citrus groves plateaux draw a unique, fantastic landscape. The Congress is organized by the Department of Veterinary Medicine and Animal Production of the University of Naples "Federico II" in cooperation with other Italian scientific Institutions, such as the Universities of Foggia, Bari "Aldo Moro" and Basilicata; the Council for Agricultural Research and Economics – CREA PCM (Rome) and the "Istituto Zooprofilattico Sperimentale del Mezzogiorno" (IZSM).

This edition of the ASPA Congress has received a total of 338 scientific contributions: 178 oral presentations and 160 posters have been selected. The Congress sessions with their relative number of papers are listed as follows: Animal breeding and genomics (90); Animal Physiology, Health and Welfare (101); Animal Products (68); Livestock Systems (55); Environmental Sustainability (24).

The scientific program is enriched by 18 main lectures, covering all the main topics.

Nuclear Magnetic Resonance (NMR) spectroscopy represents a versatile technique that allows gathering, in a single spectrum, quantitative and qualitative information on the metabolic profile of a tissue. In the present study, ¹H-NMR was applied to quantify free amino acids, histidine compounds and metabolites involved in energy-generating pathways in *Pectoralis major* muscles affected by growth-related abnormalities (White Striping – WS, Wooden Breast – WB and Spaghetti Meat – SM). The study was conducted on a single flock of 48 days old broiler chickens (Ross 308, females, average live weight 2.8 kg) classified into the following groups: Normal (NORM), WS, WB and SM. The increased ($p<.001$) concentration of free amino acids observed in WS, WB and SM likely results from the degenerative processes taking place within these muscles as well as from a concurrent attempt of the tissue to overcome necrosis and repair the damaged fibres. This is corroborated by the significantly higher ($p<.001$) glutamine and glutamate content found in WS, WB and SM previously observed in *mdx* mice and dystrophic muscles and hypothesised to be related to the intense regenerative processes associated to these conditions. In addition, significantly higher ($p<.001$) glycine and branched amino acids (namely valine, leucine, isoleucine and proline) were found in WS, WB and SM thus suggesting an increased collagen synthesis and an intense extracellular matrix remodelling within these muscles. With regard to the histidine compounds, the lower ($p<.001$) levels of anserine and carnosine found in abnormal muscles confirms that oxidative stress can contribute to the aetiology of breast muscle abnormalities in broilers. Besides, WS, WB and SM exhibited significant variations in the metabolites involved in energy-generating pathways (lower lactate, creatine and inosine-5-monophosphate) thus supporting the assumption of metabolism perturbations associated to the development of these conditions. However, since no distinctive metabolites were found, similar causative mechanisms leading to WS, WB and SM can be hypothesised. In conclusion, the adoption of ¹H-NMR spectroscopy allowed to corroborate earlier findings (i.e. oxidative stress and perturbation of energy metabolism) and provide novel insight (i.e. higher content of free branched amino acids) into metabolic pathways

involved in the development of growth-related abnormalities which are nowadays of great importance for the broiler industry.

Goats were domesticated ~10,000 years ago from their bezoar wild ancestor *Capra aegagrus*. These founder animals spread out from domestication centres in Europe, Asia, and Africa during the next few thousand years, which resulted in many populations becoming locally adapted to diverse environmental constraints such as heat, altitude, disease resistance, etc. After a very long period of soft selection for production traits, the situation changed dramatically with the emergence of the breed concept about 200 years ago. Selection pressure was strongly increased, and gene flow between populations (or newly formed breeds) was seriously reduced, leading to the fragmentation of the initial gene pool. Currently, there are more than 1000 goat breeds worldwide, 18% of which are either threatened or already extinct.

Through the generation of domestic breeds sequence data and their analysis together with existing data of domestic and wild animals, VarGoats collaborative project aims at becoming the first step of a 1000 goat genomes project. VarGoats Consortium is coordinated by the Institut National de la Recherche Agronomique INRA (France), and includes an international team of partners (Laboratoire d'Ecologie Alpine, France; Parco Tecnologico Padano, Italy; Agricultural Research Service, USDA, USA; International Goat Genome consortium; African Goat Improvement Network; Roslin Institute and the Centre for Tropical Livestock Genetics and Health, UK). At present, a dataset containing 829 goat
