18
19
20 **ABSTRACT**

21 **Background**

22 Single olive cultivar “Olivastro di Bucchianico” extra virgin olive oils, obtained from olives
23 cultivated in a restricted area of the Abruzzo region, Italy. Principally is present in the
24 municipality of Bucchianico and in some neighbouring municipalities in the province of
25 Chieti. There are very few research works in literature describing the morphological and
26 chemical characteristics of this cultivar.

27
28 **Results**

29 A morphological characterization of the plant and the fruit was carried out. In addition, extra
30 virgin olive oil was chemical, physical-chemical and sensory characterized. The conducted

1
2
3 31 analyses were as follows: free acidity, peroxide value, UV spectrophotometric indices,
4
5 32 contents in fatty acid ethyl esters, waxes, tocopherols, fatty acids, triglycerides, sterols,
6
7
8 33 alcohols, phenolic substances, volatile compounds and sensory profile. The analysis of the
9
10 34 volatile compounds was performed using a HS-GC-IMS instrument connected to a nitrogen
11
12
13 35 generator for carrier/drift gas production.
14
15
16 36

17 37 **Conclusion**

18
19
20 38 The results of the chemical analyses showed good levels of nutraceutical components in the
21
22 39 oils that resulted organoleptically well balanced with medium values of fruity, bitter and
23
24 40 pungent. The HS-GC-IMS method based on the analysis of 15 volatile molecules might be a
25
26
27 41 useful tool for a chemometric discrimination of the varietal origin for the oils under
28
29
30 42 investigation.

40 46

41 42 **INTRODUCTION**

43
44
45 48 The olive tree (*Olea europaea L.*) is the oldest fruit tree plant present in the environment
46
47 49 surrounding the Mediterranean and thanks to its nutritional properties and its high
48
49
50 50 economic value is rapidly expanding into new areas of cultivation.

51
52 51 The high environmental variability of the Italian territory allows the presence of many
53
54 52 cultivars of olive trees, estimated about 800 cultivars throughout in all the national
55
56
57 53 territory.^{1,2} Most probably, this number is even greater because there are many local
58
59
60 54 varieties of which few information is available. The enhancement and preservation of such a

1
2
3 55 great germplasm was very important in order to contain genetic erosion and diversify
4
5 56 production on the territory with single cultivar EVOOs.³⁻⁷
6
7
8 57 A regular consumption of extra virgin olive oil has been widely demonstrated to prevent
9
10 58 many diseases, not only due to its fatty acid composition abundant of monounsaturated
11
12 59 fatty acids (MUFA), but also for minor components with health-related properties that can
13
14 60 be defined as nutraceuticals: phenolic compounds, tocopherols, sterols.⁸⁻¹¹ The
15
16 61 concentration of these compounds is variable and strongly influenced by many factors such
17
18 62 as cultivars, pedo-climatic environment, cultivation techniques, time and harvesting system,
19
20 63 extraction technology.¹²⁻¹⁴ Several studies have been carried out to correlate chemical
21
22 64 composition of olive oil with the geographical origin.^{3, 4, 15} At the same time, identification of
23
24 65 olive germplasm is complicated because no references and numerous cases of synonymy
25
26 66 and homonymy for the same cultivars exist. To preserve this genetic diversity within the
27
28 67 European Union, EVOOs have been “linked” to their territory of origin through the creation
29
30 68 of standardized protocols of various types such as PDO (Protected Designations of Origin),
31
32 69 PGI (Protected Geographical Indications) and finally TAF (Traditional Agricultural Food
33
34 70 Products). In this framework, the production of single EVOO cultivars, with relative high
35
36 71 consumption and market relevance, is very important for the protection of the typical
37
38 72 cultivar of a specific area.
39
40
41 73 Morphological descriptors, even if for some traits influenced by external factors, was the
42
43 74 first and principal step for study the genetic diversity within a cultivated plant species and
44
45 75 they represent the phenological traits normally used in taxonomic classification.^{6,16} The
46
47 76 study and recovery of minor cultivars present in particular cultivation areas, is very
48
49 77 interesting and could be a resource to expand the offer of products to consumers. The
50
51 78 cultivars are linked to specific environmental conditions, together with the continuous
52
53
54
55
56
57
58
59
60

1
2
3 79 extraction technology, which has a strong influence on the chemical characteristics,
4
5 80 oxidative stability and organoleptic characteristics of extra virgin olive oils.^{17,18}
6
7
8 81 Recently an interesting analytical approach has been proposed, based on the determination
9
10 82 of volatile compounds using HS-GC-IMS (Gas Chromatography-Ion Mobility Spectrometry),
11
12 83 to support the organoleptic determination of virgin olive oils by panel test. This method can
13
14 84 realize a fingerprint of the aroma for a possible discrimination of the samples with respect to
15
16 85 the quality grade in a relatively simple, fast and economical way.^{19,20}
17
18
19
20 86 This work was made to analytical study native Olivastro di Bucchianico cultivar from a very
21
22 87 restricted area of Abruzzo, Italy (Figure 1). There are very few research works in literature
23
24 88 describing the morphological and chemical characteristics of this cultivar.^{2,21,22} So, the aim of
25
26 89 this work was to do i) a morphological study of this underexploited local cultivar and
27
28 90 chemical characterization of the produced extra virgin olive oils, ii) to use the HS-GC-IMS
29
30 91 technique for varietal traceability.
31
32
33
34
35
36

37 **MATERIALS AND METHODS**

38 39 40 41 **Morphological description**

42
43 96 The Olivastro di Bucchianico olive cultivar belongs to the municipality of Bucchianico and
44
45 97 neighbouring municipalities in the province of Chieti. Bucchianico, with an altitude of 330 m,
46
47 98 located in the northern part of the provincial territory close to the seaside resorts of Chieti
48
49 99 and Villamagna. Its territory is mainly arable land, but with a large presence of olive groves
50
51 100 and vineyards. The olive-growing area has a temperate hilly climate with winter
52
53 101 temperatures around 6 °C in winter and around 23.5 °C in summer and relatively abundant
54
55 102 rainfall. The Olivastro di Bucchianico olive trees have an assurgent bearing, an average
56
57
58
59
60

1
2
3 103 foliage and high vigour; the tree is of medium size, the fruiting branches have long
4
5 104 internodes. The leaf is a shiny dark green colour, it is wide and short and has no curvature of
6
7
8 105 the blade. The drupe is ellipsoidal with truncated base and sub-conical apex, of small to
9
10 106 medium size ranging from about 1.89 to about 2.31 g, with pulp in percentage varying from
11
12
13 107 77.4 to 82.7 %. The drupes at the harvest, usually conducted in October, are never
14
15 108 completely invaded, with prevalent green and vinous red colours. The drupes show high
16
17
18 109 detachment resistance. The productivity of Olivastro di Bucchianico is medium-high but
19
20 110 altering. These cultivars have a good resistance to parasites, other than caries.²²

111 **Plant material**

112 The olive fruits were handpicked in perfect sanitary conditions at the green stage of ripening
113 at the mid and late October and stored in boxes and bins. Harvesting was performed with
114 use of mechanical facilitators. Seven samples of EVOOs were produced by an extraction
115 system that used two and two half phase centrifugation. The processing temperature was
116 lower than 25° and the average crushing time lower than 45 minutes. The average oil yield
117 was 15%. The oil samples have been preserved in low temperature (15 – 18 °C) in dark-green
118 glass bottles without headspace before the analysis.

119 **Methods**

120 Free acidity, peroxide value, UV spectrophotometric indices, content in fatty acid ethyl
121 esters (FAEEs), waxes, tocopherols, alcohols, phenolic substances, and volatile compounds ,
122 fatty acid and triglyceride compositions, sterol composition and content, and sensory profile
123 were performed on single cultivar EVOO “Olivastro di Bucchianico” samples have undergone
124 analyses. Duplicate analyses were performed on each sample.

125 **Analytical parameters**

1
2
3 126 Free acidity (Annex II), peroxide value (Annex III), ultraviolet spectrophotometric indices
4
5
6 127 (Annex IX), ethyl esters and waxes contents (Annex XX), fatty-acid composition (Annex X.B),
7
8 128 triglyceride composition (Annex XVIII), sterol composition and content (Annex V), and
9
10 129 alcohols content (Annex XIX). were performed according to the official methods of the
11
12
13 130 European Union Commission Regulation EEC/2568/91 and its subsequent modifications.²³

15 131 **Tocopherols**

17
18 132 For the HPLC determination of the tocopherols²⁴, a solution of 1 g olive oil in 10 mL acetone
19
20 133 was prepared. α -Tocopherol (0.32 $\mu\text{g}/10 \mu\text{L}$) was used as the external standard. The HPLC
21
22 134 analysis was conducted using a high-resolution LC 200 liquid chromatograph equipped with a
23
24 135 Series 200 UV/Vis detector (Perkin Elmer, Waltham, Massachusetts, USA), a 7725 Rheodyne
25
26 136 injector, a 20 μL sample loop, and a Totalchrom workstation for data acquisition (Perkin
27
28 137 Elmer, Waltham, Massachusetts, USA). Separation on a Spherisorb ODS2 column (250 x 4.6
29
30 138 mm I.D., 5 μm ; Waters, Milford, MA, USA) was performed at 25 °C under a constant flow rate
31
32 139 of 1 mL/min with a mobile phase of 0.2% (v/v) H_3PO_4 in water/ methanol/ acetonitrile
33
34 140 (2/49/49, v/v/v). The eluted compounds were detected at 292 nm.

35
36
37
38
39
40 141

42 142 **Phenols composition**

43
44 143 The phenolic compounds were extracted from the olive oil according to the following
45
46 144 method: a 500 μL volume of internal standard solution (0.015 mg/mL syringic acid in
47
48 145 methanol) was added to 2.500 g of oil sample. After removal of the methanol under reduced
49
50 146 pressure at <35 °C, the samples were dissolved in 6 mL hexane and loaded onto solid-phase
51
52 147 extraction columns (Discovery DSC-DIOL 500 mg, 3 mL; Supelco, Bellefonte, PA, USA), which
53
54 148 were previously conditioned with 6 mL methanol and 6 mL hexane. The samples were then
55
56 149 washed with 2 x 3 mL hexane and 4 mL hexane/ ethyl acetate (90/10, v/v), and then eluted

1
2
3 150 with 10 mL methanol. After removal of the methanol in a rotary evaporator at a
4
5
6 151 temperature < 35 °C, the dry residue was taken up with 1 mL methanol/ water (1:1, v/v),
7
8 152 filtered through a 0.45 µm PVDF membrane, and then injected into the HPLC system. The
9
10
11 153 HPLC analysis of the phenolic extracts was carried out using a high-resolution LC 200 liquid
12
13 154 chromatograph, which was equipped with a Series 200 UV/Vis detector (Perkin Elmer,
14
15 155 Waltham, Massachusetts, USA), a 7725 Rheodyne injector, and a 20 µL sample loop, using a
16
17
18 156 Totalchrom workstation for data acquisition (Perkin Elmer, Waltham, Massachusetts, USA).
19
20
21 157 Separation on a Spherisorb ODS2 column (250 x 4.6 mm I.D., 5 µm; Waters, Milford, MA,
22
23 158 USA) was performed at 25 °C at a constant flow rate of 1 mL/min, with mobile phase
24
25 159 mixtures composed of A (0.2% [v/v] H₃PO₄ in water), B (methanol) and C (acetonitrile), at the
26
27
28 160 following ternary gradient program (as A/B/C, v/v/v): 0 min, 96/2/2; 40 min, 50/25/25; 45
29
30 161 min, 40/30/30; 60 min, 0/50/50; 70 min, 0/50/50; 72 min, 96/2/2; 82 min, 96/2/2. The
31
32
33 162 eluted compounds were detected at 280 nm. Previously, 20 µL external calibration standard
34
35 163 was injected into the HPLC system, to calculate the response factors of syringic acid to
36
37
38 164 tyrosol. Then, a volume of 20 µL each sample was injected. Quantification of the phenolic
39
40 165 compounds, expressed as tyrosol as reported in COI/T.20/Doc No 29/2009²⁵, was performed
41
42
43 166 according to the concentration of the internal standard and on the basis of the response
44
45 167 factor of syringic acid to tyrosol.

168

169 **Volatile compounds: HS-GC-IMS analysis**

170 The analysis of the volatile compounds was performed using a HS-GC-IMS Flavourspec®
171 instrument (G.A.S. Dortmund, Dortmund Germany) connected to a nitrogen generator for
172 carrier/drift gas production (Microprogel, Pordenone, Italy). 2.0 g of each sample were
173 weighted, from which 100 µL of the respective headspace was withdrawn using a 2.5 mL

1
2
3 174 Hamilton syringe with a 51 mm needle, through an autosampler unit, HT2000H (HTA s.r.l.,
4
5
6 175 Brescia, Italy), and introduced in a splitless heated injector (2 mm ID, 6.5 mm OD × 78.5 mm
7
8 176 fused quartz glass). From here, the analytes of the headspace are subjected to a double
9
10
11 177 sequential separation: GC, passed into a low polar column FS-SE-54-CB-0.5, 30 m, 0.32 mm
12
13 178 ID, film thickness 0.5 µm (94% methyl-5% phenyl-1% vinylsilicone); IMS (equipped with a
14
15 179 tritium ionizing radioactive source at 5000 V), passed into a 9.8 cm long drift tube
16
17
18 180 (Gesellschaft für Analytische Sensorsysteme mbH, G.A.S.; Dortmund, Germany).²⁰

181 **Sensorial profile**

182 The evaluation of olive oils was performed under the conditions described in European
183 Union Commission Regulation EEC/2568/91 and its subsequent modifications (Annex XII) by
184 the CREA-Research Centre for Engineering and Agro-Food Processing of Pescara Panel
185 recognized by the International Olive Oil Council (IOC) and the Ministry of Agricultural, Food
186 and Forestry Policies (MiPAAF). Each taster of the panel has smelled and tasted the oil under
187 consideration, according to the profile sheet of the Annex XII and to COI/T.20/DOC. 22 –
188 2005.²⁶ The attributes evaluated were fruity, pungent, bitter, aromatic herbs, tomato,
189 artichoke, almond and grass/leave. Each attribute was evaluated on a scale from 0.0 to 10.0
190 and statistically processed by calculation of median; the confidence intervals was used
191 considering the attributes with a robust coefficient of variation of 20.0 % or less.

192

193 **Statistical analyses**

194 A heat map (3D chromatogram) was obtained from each sample, from which it was possible
195 to extrapolate a data matrix. Subsequently, processing this data matrix using statistical
196 software Unscrambler X, version 10.4, it was possible to perform a PCA (Principal
197 Component Analysis).

198

199 RESULTS AND DISCUSSION

200 The analyses for quality indices (Table 1) allowed for all samples of “Olivastro di Bucchianico”
201 to be classified as EVOOs according to EC Regulation (EEC, 1991 and following amendments).
202 Free acidity of the samples was in the range from 0.08 to 0.24 % of oleic acids, peroxide
203 values between 6.2 to 8.8 meqO₂/kg. Mean values of the specific extinction parameters K₂₃₂,
204 K₂₇₀ and ΔK were respectively 1.66, 0.12 and -0.003, so within the EVOO limit according to EC
205 regulation. The FAEE content of 2.6 mg/kg is well below the established EU limit for EVOO
206 (35 mg/kg). These fat-soluble compounds are a valuable indicator of oil quality resulting
207 from improper agronomic and technological practices, in particular from fermentation and
208 degradation processes.^{27,28} The waxes content was low, with a range from 27 to 40 mg/kg,
209 typical of extra virgin olive oils. Total tocopherols content was medium-high, around 264
210 mg/kg (range 218-337 mg/kg). Composition and content of these substances depend e.g. on
211 several agronomic factors, olive processing conditions and the storage.²⁹⁻³² Extra virgin olive
212 oil is one of the foods richest in vitamin E (tocopherols) and the most representative is α-
213 tocopherol, which accounts for about 90% of the total tocopherols with vitaminic and
214 antioxidant actions.

215 The fatty acid composition presented in Table 2 was within EU Regulation limits for olive oils.
216 Oleic, palmitic and linoleic and stearic acids were the most abundant with mean values
217 respectively of 74.71%, 11.94%, 7.81 % and 3.02 %.³³ These values are typical of olive oils:
218 oleic acid not less than 73% and linoleic acid not more than 10% with an oleic/linoleic ratio >
219 7. Monounsaturated fatty acids values (Σ MUFAs) in “Olivastro di Bucchianico” cv was high,
220 mean around 75.88% with the maximum value 78.14% and minimum value 73.82%. The
221 oleic acid is extremely important for a healthy and balance diet, leading to an increase in

1
2
3 222 oxidative stability, antihypertensive activity, and low-density lipoprotein (LDL) cholesterol–
4
5
6 223 lowering effects.³⁴ In defining the nutritional properties and varietal characterization of the
7
8 224 EVOOs, it is also important MUFA/SFAs ratio, that in the single cultivar studied is average of
9
10 225 4.82.³⁵ The composition of triglycerides, useful for the characterization of single cultivar, was
11
12
13 226 reported in Table 3. As can be seen from this table the most represented compounds are:
14
15 227 PLP + OOO + PoPP (42.48%), SOL + POO (23.61%) and OOL + LnPP (12.07%).

16
17
18 228 Sterols composition of “Olivastro di Bucchianico” was shown in Table 4. The most
19
20 229 representative sterols have been β -sitosterol (85.8%), Δ -5-avenasterol (6.5%) and
21
22 230 campesterol (3.0%). The value of apparent β -sitosterol, the sum of β -sitosterol and four
23
24 231 adjacent phytosterols (clerosterol, sitostanol, Δ -5-avenasterol and Δ -5,24-stigmastadienol),
25
26 232 was 94.6% superior at EC legal minimal limits established. High levels of apparent β -
27
28 233 sitosterol have a positive effect on reducing total plasma cholesterol and LDL cholesterol.^{36,37}
29
30 234 Total sterols (1274 mg/kg) were superior to the lower limit established by EC legislation
31
32 235 (1000 mg/kg). Sterols and triglycerides can characterize the different EVOOs.^{38,39} In the
33
34 236 unsaponifiable fraction of olive oil, the presence of both diterpenic alcohols (with 20 carbon
35
36 237 atoms) and triterpenic alcohols (with 30 carbon atoms) has been determined (Table 5),
37
38 238 which make up to 25-30%. Among the first ones the most represented is the Phytol (318.4
39
40 239 mg/kg), partly coming from the degradation of chlorophyll. The composition of the
41
42 240 triterpenic fraction seems to be specific to the botanical family from which the oil is
43
44 241 derived.⁴⁰ It is mainly composed of cycloartenol (380.4 mg/kg) and 24-Methylen-cycloartanol
45
46 242 (317.9 mg/kg) followed by β -amyrin + butyrospermol (90.2 mg/kg) and α -amyrin (1.2
47
48 243 mg/kg). The alcoholic composition also includes citrostadienol (218.8 mg/kg), a 4-
49
50 244 methylsterol, and total aliphatic alcohols whose content (140 mg/kg) is below the limit laid
51
52 245 down in the EU standard for EVOOs. In “Olivastro di Bucchianico” the most abundant
53
54
55
56
57
58
59
60

1
2
3 246 phenols (Table 6) are 3,4 DHPEA-EDA (76.3 mg/kg), p-HPEA-EDA (65.3 mg/kg), pinoresinol
4
5
6 247 and 1-acetoxypinoresinol (58.9 mg/kg), 3,4-DHPEA-EA,H (37.8 mg/kg). Many studies report
7
8 248 how derivatives of oleuropein and ligstroside, 3,4-DHPEA-EA and p-HPEA-EDA show
9
10 249 antioxidant and health properties.^{41,42} Moreover, secoiridoids and lignans have effect on the
11
12
13 250 bitter and pungent attributes in EVOOs.⁴³⁻⁴⁵ The total phenols content was medium (306
14
15 251 mg/kg).^{46,47} In Figure 2 sensory profile of “Olivastro di Bucchianico” was reported. It was
16
17
18 252 characterized by medium perceptions of fruity, with well-balanced notes of bitter and
19
20 253 pungent. Medium notes of grass/leave and almond were present with mean value
21
22
23 254 respectively 2.2 and 3.0 and low notes of artichoke, aromatic herbs and tomato with mean
24
25 255 value respectively 2.2, 0.6 and 0.6.
26
27
28 256 In order to verify the discriminatory potential of the HS-GC-IMS method on EVOOs oils on
29
30 257 the basis of the cultivars they belong to, Olivastro di Bucchianico samples were analyzed
31
32
33 258 together with other single cultivar oils from Central and Southern Italy. In particular, 10
34
35 259 EVOOs of the Canino, Ogliarola, Coratina, Moraiolo and Peranzana cultivars (2 samples of
36
37 260 each cultivar) were subjected to HS-GC-IMS analysis at the same time as Olivastro. From the
38
39
40 261 heat maps obtained, only 15 volatile compounds, selected within the European H2020
41
42 262 project OLEUM and commented on Valli et al., 2020, were considered. Their respective
43
44
45 263 signals present in the form of a monomer and/or dimer in the chromatogram were
46
47 264 highlighted using VOCal software (Gesellschaft für Analytische Sensorsysteme mbH, G.A.S.;
48
49 265 Dortmund, Germany). Using a specific function of this software, it was possible to export the
50
51
52 266 results as data matrix (Table 7 and Table 8) which was used for the construction of a PCA.
53
54 267 Figure 3 shows the scores plot obtained from the PCA (explained variance PC1 and PC2:
55
56 268 70%). The 7 Olivastro di Bucchianico EVOOs resulted separated from the other 10 analyzed
57
58
59
60

1
2
3 269 samples, showing a promising discrimination of this cultivar based on the volatile profile
4
5
6 270 with respect to the others.

7
8 271

9
10 272 **CONCLUSIONS**

11
12 273 The herein performed analytical study conducted on cv. Olivastro di Bucchianico EVOOs,
13
14 274 obtained from olives cultivated in restricted area of the Abruzzo region (Italy) highlighted
15
16 275 interesting compositional characteristics. Samples showed an average medium-high content
17
18 276 of total tocopherols (264 mg/kg), high monounsaturated fatty acids values, around 75.88%
19
20 277 and a good oleic/linoleic ratio (9.57). The average total phenols content was medium, 306
21
22 278 mg/kg. Sensory profile of “Olivastro di Bucchianico” was characterized by medium
23
24 279 perceptions of fruity, with well-balanced notes of bitter and pungent, accentuated hints of
25
26 280 grass/leave and almond with mean value respectively, 2.2 and 3.0 and low intensity notes of
27
28 281 artichoke, aromatic herbs and tomato. The research was extended to the analysis of volatile
29
30 282 compounds by HS-GC-IMS for verifying the discriminatory potential of the method according
31
32 283 to the cultivar. In particular, Olivastro di Bucchianico cv EVOOs samples were analyzed as
33
34 284 well as other 10 single cultivars of the Canino, Ogliarola, Coratina, Moraiolo and Peranzana
35
36 285 cv. The chemometric analysis of the data allowed to distinguish the Olivastro di Bucchianico
37
38 286 cv EVOOs from the others. This preliminary study put in evidence the compositional
39
40 287 characteristics of the studied single cultivar EVOOs, in order to propose a characterization
41
42 288 study to the competent institutions. This contribution can also be evaluated for the purpose
43
44 289 of defining the specifications PDOs, PGIs, PATs.

Table 1. Qualitative characteristics of the EVOOs from Olivastro di Bucchianico cv.

Determinations:	Mean	Max	Min	S. D.
Free acidity (% oleic acid)	0.15	0.24	0.08	0.06
Peroxide value (mEqO ₂ /kg)	7.5	8.8	6.2	1.0
K ₂₃₂	1.66	1.98	1.44	0.17
K ₂₇₀	0.12	0.20	0.07	0.043
ΔK	-0.003	-0.002	-0.004	0.001
FAEE (mg/kg)	2.6	4.3	0.1	1.7
Waxes (mg/kg)	33	40	27	5
Tocopherols (mg/kg)	264	337	218	47

S.D.: standard deviation

Table 2. Fatty acid composition of the EVOOs from Olivastro di Bucchianico cv.

Fatty acid composition (%):	Mean	Max	Min	S.D.
Myristic acid (C14:0)	0.01	0.01	0.00	0.004
Palmitic acid (C16:0)	11.94	14.14	10.89	1.30
Palmitoleic acid (C16:1)	0.71	1.00	0.52	0.19
Heptadecanoic acid (C17:0)	0.12	0.15	0.08	0.03
Heptadecenoic acid (C17:1)	0.18	0.26	0.12	0.04
Stearic acid (C18:0)	3.02	3.17	2.82	0.14
Oleic acid (C18:1)	74.71	77.12	72.46	1.66
Linoleic acid (C18:2)	7.81	8.32	6.63	0.60
Arachic acid (C20:0)	0.46	0.54	0.42	0.04
Linolenic acid (C18:3)	0.58	0.64	0.53	0.04
Eicosenoic acid (C20:1)	0.27	0.31	0.24	0.03
Behenic acid (C22:0)	0.11	0.19	0.06	0.04
Lignoceric acid (C24:0)	0.08	0.15	0.04	0.04
Oleic/linoleic	9.57	10.93	9.27	0.99
∑ SFAs	15.74	17.69	14.69	1.11
∑ MUFAs	75.88	78.14	73.82	1.51
∑ PUFAs	8.39	8.93	7.17	0.62
MUFAs/SFAs	4.82	5.03	4.42	0.42

SFAs: saturated fatty acids; MUFAs: monounsaturated fatty acids; PUFAs: polyunsaturated fatty acids; S.D.: standard deviation

Table 3. Triglycerides composition of the EVOOs from Olivastro di Bucchianico cv.

Triglycerides composition (%):	Mean	Max	Min	S.D.
