#### Abstract

A chiral-NHC-catalyzed dearomatizing reaction of activated N -alkylpyridinium salts with aliphatic aldehydes is described. The resulting acylated 1,4-dihydropyridines have been obtained with complete C 4 regioselectivity and enantioselectivities in the range of $52-78 \%$ ee. The ( $4 R$ ) absolute configuration of the synthesized compounds has been determined by TD-DFT simulation of the Electronic Circular Dichroism spectra.

## Introduction

The development of robust methodologies for the catalytic enantioselective formation of C-C bonds is one of the most investigated topic in organic chemistry to rapidly access enantioenriched structural motifs. ${ }^{1}$ Within this realm, the catalytic asymmetric dearomatization reaction has gained increasing attention over the recent years due to the wide availability of cheap and versatile substrates such as phenols, indoles, pyrroles, pyridines, and (iso)quinolines. ${ }^{2}$ Despite the high synthetic potential of this strategy, a main challenge associated with enantioselective dearomatization is the poor reactivity of substrates toward nucleophilic additions because of the resonance stability energy of the aromatic nucleus as well as the difficult control of the regio- and stereoselectivity in the formation of the target three-dimensional products. A number of transition metal-catalyzed reactions have been reported for the effective enantioselective dearomatization of (hetero)aromatic compounds, ${ }^{3}$ whereas the utilization of organocatalytic approaches are less investigated. ${ }^{4-8}$ After the pioneering works of McMillan, ${ }^{4 \mathrm{a}}$ Jørgensen, ${ }^{4 \mathrm{~b}}$ Jacobsen ${ }^{4 \mathrm{c}}$ and their co-workers on the dearomatization of furans and isoquinolinium salts, only a few contributions have appeared in the literature dealing with the dearomatization of (iso)quinolines, ${ }^{4 b, d}$ indoles, ${ }^{5}$ and of the more demanding pyridines ${ }^{6}$ by conventional organocatalytic strategies (amino, hydrogen-bonding, and anion-binding catalysis). ${ }^{7}$ Umpolung (polarity reversal) catalysis by the use of N -heterocyclic carbenes (NHCs) as organocatalysts ${ }^{9}$ has also been applied to the asymmetric dearomatization of (hetero)aromatic compounds but in a very limited number of recent examples, ${ }^{8}$ mainly involving $\alpha, \beta$-unsaturated aldehydes (enals) as the nucleophiles (homoenolate chemistry) ${ }^{9}$ and/or intramolecular processes (Scheme 1).

The group of Glorius in 2015 developed the dearomatizing annulation reaction of N imino(iso)quinolinium ylides using NHC-generated homoenolates or enolates with elegant switchable reactivity. ${ }^{8 a}$ Later on, simple N -alkyl isoquinolinium salts were demonstrated by Tan and co-workers as suitable substrates for chiral-NHC-catalyzed dearomatizing double Mannich reactions leading to tropanes with four contiguous stereocenters. ${ }^{8 b}$ In addition, the intramolecular dearomatization of benzofurans/benzothiophenes by hydroacylation, and of indoles by oxidative NHC catalysis were efficiently achieved by the groups of Glorius-Neugebauer ${ }^{8 c}$ and Studer, ${ }^{8 d}$ respectively. During the preparation of this manuscript, Rovis and Flanigan disclosed the enantioand diastereoselective addition of enals to N -alkyl pyridinium salts promoted by NHC catalysts ( $\mathrm{a}^{3}$ $d^{3}$ umpolung) ${ }^{10}$ to prepare 1,4-dihydropyridines (DHPs) with good regioselectivity (preferential C-4 functionalization of the pyridine ring). ${ }^{8 e}$ Notably, 1,4-DHPs are privileged structures with a broad spectrum of medicinally relevant properties, including antihypertensive, anticancer, and antimicrobial activity. ${ }^{11}$ In this work, we report a complementary NHC-based approach for the
intermolecular dearomatization of pyridines relying on the $\mathrm{a}^{1}-\mathrm{d}^{1}$ umpolung $^{10}$ of aliphatic aldehydes and leading to enantioenriched C4-acylated 1,4-DHPs with complete regiocontrol over the 1,2addition product and opposite C4 configuration compared to DHPs prepared in the Rovis study (Scheme 1).

## Scheme 1. Enantioselective dearomatizations by NHC catalysis

## Results and Discussion

We commenced our study by subjecting $n$-butanal 1a and the readily available N -benzylpyridinium salt 2a bearing a cyano group at the 3-postion to a catalytic amount ( $10 \mathrm{~mol} \%$ ) of the Rovis triazolium salt $\mathbf{C 1}$ and $\mathrm{K}_{3} \mathrm{PO}_{4}$ in toluene (Table 1, entry 1). Gratifyingly, the 1,4-DHP 3aa formed with complete regioselectivity, high yield ( $90 \%$ ), and encouraging enantiomeric excess ( $53 \%$ ee). Hence, the catalyst substituent effect was investigated and we found that the use of the newly synthesized promoter $\mathbf{C} 2$ determined a slightly improved reaction outcome (entry 2), while the Bode precatalyst $\mathbf{C} 3$ produced a remarkable increase of enantioselectivity ( $78 \%$ ee) accompanied, however, by a critical drop of conversion efficiency (entry 3). Pleasantly, the amino-indanol derived triazolium salt $\mathbf{C 4}$ provided 3aa in $81 \%$ yield and $\mathbf{6 9 \%}$ ee (entry 4). Switching to the pyrrole derived triazolium salt $\mathbf{C 5}$ and to its newly prepared analogue $\mathbf{C 6}$ resulted in lower enantioselectivity (entries 5-6), being the precatalyst $\mathbf{C} 5$ completely inactive. The solvent screening with $\mathbf{C 4}$ indicated that an increase of the medium polarity caused a reduction of reaction efficiency (entries 7-9); on the other hand, the use of apolar
$\mathrm{CCl}_{4}$ restored the enantiocontrol by the catalyst ( $74 \%$ ee), albeit at the expense of a diminished yield of 3aa likely due to the low solubility of $\mathbf{2 a}$ (entry 10 ). We next replaced $\mathrm{K}_{3} \mathrm{PO}_{4}$ and observed that nitrogen bases such as diisopropylethylamine (DIPEA) were unable to promote the reaction (entry 11); $\mathrm{Na}_{2} \mathrm{CO}_{3}$ performed better than $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ in terms of enantioselectivity (entries 12-13), thus indicating a sort of influence of the hard/soft character of the metal on the stereochemical outcome of the dearomatization process.

## Table 1. Reaction Optimization ${ }^{a}$

|  |  |  |  |
| :--- | :--- | :--- | :--- |

${ }^{a}$ Reaction conducted with 1.5 equiv. of $\mathbf{1 a}(0.30 \mathrm{mmol})$ and 1.0 equiv. of $\mathbf{2 a}$ in the stated solvent $(0.15 \mathrm{M}) .{ }^{b}$ Isolated yield. ${ }^{c}$ Determined by chiral HPLC. ${ }^{d}$ Reaction run in the presence of LiCl ( 0.5 equiv.). ${ }^{e}$ Reaction run at $0{ }^{\circ} \mathrm{C}$. ${ }^{\circ}$ Reaction run at $-30^{\circ} \mathrm{C} .{ }^{g}$ Reaction run with 2 mmol of $\mathbf{1 a}$.

The addition of $\mathrm{LiCl}(50 \mathrm{~mol} \%)$ as a cooperative Lewis catalyst ${ }^{12}$ and lowering the reaction temperature left almost unaffected the stereoselectivity (entries 14-16), while the reduction of the catalyst loading to $5 \mathrm{~mol} \%$ afforded 3aa with lower yield but significantly higher ee ( $78 \%$, entry 17 ). This result led us to suppose the reversibility of the dearomatization reaction and/or the occurrence of a partial racemization promoted by the basic catalyst. These hypotheses were excluded by a control experiment (see the Supporting Information), which showed the maintenance of the (stereo)chemical integrity of an authentic sample of 3aa under the optimized reaction conditions of entry 12. Remarkably, the reaction could be scaled up to 2 mmol of $\mathbf{1 a}$ without affecting the yield and enantioselectivity of 3aa, which could be conveniently recovered by simple filtration through a short pad of silica (entry 18). The whole set of investigated conditions of the optimization study including the use of different bases and solvents for the more effective catalysts $\mathbf{C 1}, \mathbf{C 3}$, and $\mathbf{C 4}$ are reported in Table 2.

2a in the stated solvent $(0.15 \mathrm{M}) .{ }^{b}$ Isolated yield. ${ }^{c}$ Determined by chiral HPLC.

Investigation of the scope of the reaction (Table 3) revealed that short-chained aliphatic aldehydes $\mathbf{1 a - c}$ ( $n$-propanal 1b, $n$-pentanal 1c) reacted with 2a affording the corresponding 1,4-DPHs in good
yields and with increasing enantioselectivity (from 60 to $74 \%$ ee), in agreement with the increase of steric hindrance of the linear alkyl substituent. This trend reversed with the medium-chained $n$ hexanal $\mathbf{1 d}(72 \%$ ee), likely because of a less restricted conformational freedom of the $n$-pentyl group in the reaction transition state. Aldehydes $\mathbf{1 e}$ and $\mathbf{1 f}$ bearing substituents at the $\beta$-carbon performed equally well with slightly improved enantioselectivity compared to linear aldehydes. On the other hand, the $\alpha$-branched isobutyraldehyde $\mathbf{1 g}$ was not a competent substrate, while cyclopropanecarboxaldehyde $\mathbf{1 h}$ was well tolerated furnishing the 1,4-DHP 3ha in satisfactory yield and enantioselectivity.

Table 3. Reaction Scope ${ }^{a}$

${ }^{a}$ Reactions conducted with 0.40 mmol of $\mathbf{2}, 1.5$ equiv. of $\mathbf{1}, 1.1$. equiv. of anhydrous sodium carbonate, $10 \mathrm{~mol} \%$ of $\mathbf{C 4}$ in anhydrous Toluene (2 mL ).

The effect of the N -substituent on reactivity of the N -alkyl-3-cyanopyridinium core was also explored with substrates 2b-f. Apparently, it was found a no clear correlation between stereoselectivity and bulkiness of the pyridinium nitrogen group as can be evinced by comparison of the enantiomeric excess within the series of analogous products 3aa, 3ab, 3ac, and 3ad. It is important to emphasize that high selectivities were observed in all the substrate combinations of Table 3; in fact, the moderate yields registered for some 1,4-DHPs 3 were always associated with low conversions of the corresponding substrates $\mathbf{1}$ and $\mathbf{2}$.

Limitations of the disclosed methodology were next investigated considering as reaction partners either pyridiniums salts with different C3 substituents or a model aromatic aldehyde. Indeed, variations of the electron withdrawing group (EWG) at the C 3 position of the N -benzylpyridinium ring (compounds $\mathbf{4 a - d}$; $\mathrm{EWG}=\mathrm{Br}, \mathrm{NO}_{2}, \mathrm{CO}_{2} \mathrm{Me}, \mathrm{CONH}_{2}$ ) resulted in no conversion into the corresponding DHPs 5 using $n$-butanal 1a as the nucleophile (Scheme 2).

## Scheme 2. Dearomatization of pyridinium salts 4 displaying different C3 substituents

Additionally, the utilization of $p$-chlorobenzaldehyde $\mathbf{6}$ in the dearomatization of pyridinium salt $\mathbf{2 a}$ produced the corresponding 1,4-DHP $7 \mathbf{7 a}$ with low levels of enantioselectivity (up to $50 \%$ ee) using the pre-catalysts C1-C6 and $\mathrm{Na}_{2} \mathrm{CO}_{3}$ as the base (Toluene, RT; Table 4). Interestingly, the formation of a small portion (ca. 5\%) of the 1,2-addition product 8a could be detected in the $\mathbf{2 a} / \mathbf{6}$ coupling, which was better performed using the newly synthesized catalyst $\mathbf{C 2}$ (entry 2 ). On the other hand, the dearomatization of 2a with either benzaldehyde or $p$-anisaldehyde under the conditions of entry 2 (not shown) proved to be impractical because of the poor conversion efficiency ( $<10 \%$ ) of the nucleophilic acylation process. Overall, these results confirmed the lower efficacy of aromatic aldehydes in the disclosed dearomatization method.

Table 4. Dearomatization of pyridinium salt 2a with p-chlorobenzaldehyde $6^{a}$

| Entry $\quad \mathbf{N H C H X}$ |
| :--- |
| 1 |
| 2 |

All the attempts to obtain good enantiopure crystals of the prepared DHPs $\mathbf{3}$ were not successful. For this reason, the absolute configuration was determined by a combination of conformational analysis and theoretical simulations of chiro-optical spectra. Accordingly, the $(4 R)$ stereochemistry of two representative compounds (3ba and 3af) was determined by means of Time-Dependent Density Functional Theory (TD-DFT) simulation of the corresponding Electronic Circular Dichroism (ECD) spectra as duly detailed in the Supporting Information. ${ }^{13}$

A proposed mechanism for the disclosed dearomatization process is shown in Scheme 3. The NHC I generated by deprotonation of triazolium salt $\mathbf{C} 4$ reacts with the aldehyde $\mathbf{1}$ to give the corresponding Breslow intermediate II, which then intercepts the pyridinium salt 2 to afford the adduct III. Deprotonation by the base then leads to the product $\mathbf{3}$ and catalyst turnover.

Scheme 3. Postulated Mechanism

The consumptive off-cycle addition of pyridinium $\mathbf{2}$ to carbene $\mathbf{I}$ reported by the Rovis group in the NHC-catalyzed dearomatization of pyridiniums with enals could be reasonably excluded in our dearomatization process because the presence of acetic acid, which was used in the Rovis study as a necessary additive to regenerate the carbene catalyst, left unchanged the reaction outcome of the model 1a/2a coupling in terms of both conversion efficiency and stereoselectivity. This result can be explained by the higher affinity of carbene I for aliphatic aldehydes $\mathbf{1}$ compared to $\alpha, \beta$-unsaturated counterparts.

Since the conditions reported by the Rovis group for the $\mathrm{a}^{3}-\mathrm{d}^{3}$ umpolung of enals are quite different from those disclosed in this work, the possible formation of a chiral enol intermediate of type II ( $\mathrm{a}^{1}$ $d^{1}$ umpolung) from representative cinnamaldehyde $\mathbf{9}$ was tested in the dearomatization of 2a leading to the DHP 10a (Scheme 4). This control experiment showed no conversion of 2a and, consequently, no reactivity of cinnamaldehyde via both homoenolate and enolate chemistry under our optimized conditions.

## Scheme 4. Dearomatization of pyridinium salt 2a with cinnamaldehyde 9

The C4-acylated 1,4-DHPs 3 display a carbonyl functionality, two enamine-type double bonds, and a cyanide group amenable to further synthetic elaborations for increasing the molecular diversity of the DHP scaffold. As selected modifications, Scheme 5 reports on the chemoselective reductions of 3aa leading to the 1,4-DHP $11 \mathbf{a a}\left(\mathrm{NaBH}_{4}\right)$ and tetrahydropyridine $\mathbf{1 2 a a}\left(\mathrm{H}_{2}, \mathrm{Pd}(\mathrm{OH})_{2}\right) .{ }^{14}$

## Scheme 5 Derivatization of 1,4-DHP 3aa

In conclusion, we have described an organocatalyzed nucleophilic acylation reaction for the dearomatization of activated N -alkylpyridinium salts with simple aliphatic aldehydes under chiral NHC catalysis. The process displays complete C4 regioselectivity and good levels of enantioselectivity allowing the straightforward synthesis of a small collection of hitherto unreported C4-acylated 1,4-DHPs with ( $4 R$ ) absolute configuration as established by CD analysis.

## Experimental Section

General Experimental Methods. ${ }^{1} \mathrm{H},{ }^{19} \mathrm{~F}$ and ${ }^{13} \mathrm{C}$-NMR spectra were recorded on 300 and 400 MHz spectrometers in $\mathrm{CDCl}_{3}$ and acetone- $d_{6}$ at room temperature. ${ }^{13} \mathrm{C}$ NMR spectra were acquired with ${ }^{1} \mathrm{H}$ broad-band decoupled mode and chemical shifts ( $\delta$ ) are reported in ppm relative to residual solvents signals. Reactions were monitored by TLC on Silica gel $60 \mathrm{~F}_{254}$ with detection by charring with Phosphomolybdic acid. Flash column chromatography was performed on silica gel 60 (230-400 mesh). IR spectra were recorded on a Perkin-Elmer FT-IR Paragon 500. High-resolution mass spectra (HRMS) were recorded in positive ion mode by Agilent 6520 HPLC-Chip Q/TF-MS nanospray using a time-of-flight, a quadrupole or a hexapole unit to produce spectra. Optical rotations were measured at $20 \pm 2{ }^{\circ} \mathrm{C}$ in the stated solvent; $[\alpha]_{\mathrm{D}}$ are given in $10^{-1} \mathrm{deg} \mathrm{cm}{ }^{2} \mathrm{~g}^{-1}$. The enantiomeric ratios were determined by chiral stationary phase HPLC (Phenomenex Lux Amylose $2250 \times 4.6 \mathrm{~mm}$, particle size: $5 \mu \mathrm{~m}$ ), using an UV detector operating at 254 nm . All commercially available reagents were used as received without further purification, unless otherwise stated. Solvents were distilled from appropriate drying agents. Liquid aldehydes 1a-h and bases (DBU, TEA, DIPEA) were freshly distilled before their utilization. Inorganic bases were dried ( $100-120^{\circ} \mathrm{C}, 5 \mathrm{mmHg}, 6$ hours) and stored in a chamber with phosphorus pentoxide $\left(\mathrm{P}_{2} \mathrm{O}_{5}\right)$. Pyridinium salts 2a-f were synthesized as reported in literature from 3-cyanopyridines and the respective benzyl and alkyl bromides. ${ }^{15}$ Catalysts $\mathbf{C 1}$ and C3 were purchased from Sigma Aldrich and used as received. Catalysts $\mathbf{C} 2$ and $\mathbf{C} 6$ were prepared following a modified literature procedure. ${ }^{16,17}$ Catalysts $\mathbf{C} 4^{17 \mathrm{a}, \mathrm{b}}$ and $\mathbf{C 5}{ }^{17 \mathrm{c}, \mathrm{d}}$ are known compounds and were prepared as described. ${ }^{17}$
(5aS, 10bR)-9-Bromo-2-(perfluorophenyl)-5a,10b-dihydro-4H,6H-indeno[2,1-b][1,2,4]triazolo[4,3-d][1,4]oxazin-2-ium tetrafluoroborate (C2). To a flame-dried round-bottomed flask with (4aR,9aS)-6-bromo-4,4a,9,9a-tetrahydroindeno[2,1-b][1,4]oxazin-3(2H)-one ( $1.00 \mathrm{~g}, 3.7 \mathrm{mmol}, 1.0$ equiv.) in dichloromethane ( 25 mL ), trimethyloxonium tetrafluoroborate ( $0.55 \mathrm{~g}, 3.7 \mathrm{mmol}, 1.0$ equiv.) was added in one portion. The suspension was stirred until a homogeneous was achieved ( $5-6$ hours), then (perfluorophenyl)hydrazine ( $0.73 \mathrm{~g}, 3.7 \mathrm{mmol}, 1.0$ equiv.) was added and the reaction was allowed to stir an additional 16 h at which point the reaction was concentrated. After installing a reflux
condenser, triethyl orthoformate ( $2.00 \mathrm{~mL}, 18.5 \mathrm{mmol}, 5.0$ equiv.) and chlorobenzene ( 25 mL ) were added and the mixture was heated to reflux in an oil bath for 48 h . The solution was concentrated, triturated with $\mathrm{DCM} / \mathrm{Et}_{2} \mathrm{O}$ for 4 h , and filtrated to afford the desired triazolium salt $\mathbf{C 2}(1.00 \mathrm{~g}, 49 \%)$ as a $\tan$ solid. $[\alpha]_{\mathrm{D}}=-44.4\left(c 1.0\right.$, acetone); m.p. $\left({ }^{\circ} \mathrm{C}\right): 191-193 ;{ }^{1} \mathrm{H}$ NMR ( 400 MHz , acetone- $\left.d_{6}\right) \delta$ 11.27 ( $\mathrm{s}, \mathrm{br}, 1 \mathrm{H}$ ), $7.76(\mathrm{~s}, 1 \mathrm{H}), 7.60(\mathrm{~d}, \mathrm{~J}=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.43(\mathrm{~d}, \mathrm{~J}=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.40(\mathrm{~d}, \mathrm{~J}=4.1 \mathrm{~Hz}$, 1H), 5.44 (d, J = $16.5 \mathrm{~Hz}, 1 \mathrm{H}$ ), 5.28 (d, J = $16.5 \mathrm{~Hz}, 1 \mathrm{H}$ ), $5.22-5.18$ (m, 1H), 3.52 (dd, J = 17.3, 4.1 $\mathrm{Hz}, 1 \mathrm{H}), 3.27(\mathrm{~d}, \mathrm{~J}=17.3 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}\{1 \mathrm{H}\}$ NMR $\left(101 \mathrm{MHz}\right.$, acetone $\left.-d_{6}\right) \delta 151.6,146.3,140.4$, $139.6,137.7,132.6,129.4,127.7,127.5,120.1,77.5,62.2,60.1,36.7 .{ }^{19}$ F NMR ( 376 MHz , acetone$\left.d_{6}\right) \delta-146.42--146.88(\mathrm{~m}, 2 \mathrm{~F}),-149.58(\mathrm{tt}, \mathrm{J}=18.0,2.5 \mathrm{~Hz}, 1 \mathrm{~F}),-151.94(\mathrm{~s}, 4 \mathrm{~F}),-161.63(\mathrm{ddd}, \mathrm{J}=$ $20.9,18.0,2.5 \mathrm{~Hz}, 2 \mathrm{~F}$ ). (S)-5-benzhydryl-2-(perfluorophenyl)-6,7-dihydro-5H-pyrrolo[2,1-c][1,2,4]triazol-2-ium tetrafluoroborate (C6). To a flame-dried round-bottomed flask with the (S)-5-benzhydrylpyrrolidin-

2-one ( $0.5 \mathrm{~g}, 2.00 \mathrm{mmol}, 1$ equiv.) in dichloromethane ( 20 mL ), trimethyloxonium tetrafluoroborate ( $0.33 \mathrm{~g}, 2.20 \mathrm{mmol}, 1.1$ equiv.) was added and the reaction mixture was stirred overnight at room temperature. Then, (perfluorophenyl)hydrazine ( $0.44 \mathrm{~g}, 2.20 \mathrm{mmol}, 1.1$ equiv.) was added to the mixture, which was stirred overnight and then concentrated. After installing a reflux condenser, triethyl orthoformate ( $1.1 \mathrm{~mL}, 10 \mathrm{mmol}, 5.0$ equiv.) and acetonitrile $(15 \mathrm{~mL})$ were added and the reaction mixture was heated at reflux and stirred at this temperature overnight. The solvent was removed in vacuo and the product was precipitated from EtOAc/hexane to give $\mathbf{C 6}(0.63 \mathrm{~g}, 57 \%)$ as an off-white powder. $[\alpha]_{\mathrm{D}}=+52.1$ (c 1.1, acetone); m.p. $\left({ }^{\circ} \mathrm{C}\right)$ : 232-234; ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , acetone$\left.d_{6}\right) \delta 9.01(\mathrm{~s}, \mathrm{br}, 1 \mathrm{H}), 7.69-7.53(\mathrm{~m}, 4 \mathrm{H}), 7.47-7.37(\mathrm{~m}, 4 \mathrm{H}), 7.36-7.24(\mathrm{~m}, 2 \mathrm{H}), 6.18(\mathrm{ddd}, \mathrm{J}=$ $11.1,7.8,5.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.74(\mathrm{~d}, \mathrm{~J}=11.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.59-3.33(\mathrm{~m}, 2 \mathrm{H}), 3.23-3.02(\mathrm{~m}, 1 \mathrm{H}), 2.83-$ $2.66(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}\{1 \mathrm{H}\}$ NMR $\left(101 \mathrm{MHz}\right.$, acetone- $\left.d_{6}\right) \delta 164.6,142.4,140.2,139.9,129.6,129.1,128.2$ (2C), 128.1, 127.6, 65.2, 54.8, 32.7, 21.3. ${ }^{19}$ F NMR ( 376 MHz , acetone- $d_{6}$ ) $\delta-146.69-147.21$ (m, 2F), -149.93 (tt, J = 15.0, 3.0 Hz, 1F), -151.93 (s, 4F), -161.87--162.42 (m, 2F). General procedure for the dearomatization of pyridinium salts $\mathbf{2}$ with aldehydes 1. Procedure A (Asymmetric). To a stirred suspension of pyridinium salt 2 ( $0.40 \mathrm{mmol}, 1$ equiv.) and pre-catalyst C4 ( $0.04 \mathrm{mmol}, 0.1$ equiv.) in anhydrous Toluene ( 2 mL ), freshly distilled aldehyde $\mathbf{1}$ ( 0.60 mmol , 1.5 equiv.) was added under Argon followed by addition of anhydrous sodium carbonate ( 0.44 mmol , 1.1 equiv.) under an argon environment. The resulting suspension was vigorously stirred at room temperature for 16 hours, then diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{~mL})$, and filtered through a short pad of silica gel. The resulting residue was purified by flash column chromatography on silica gel (cyclohexane/EtOAc mixture) to afford the DHP 3.
Procedure B (Racemic). To a stirred suspension of pyridinium salt 2 ( $0.40 \mathrm{mmol}, 1$ equiv.) and commercially available (Sigma-Aldrich) 6,7-dihydro-2-pentafluorophenyl-5H-pyrrolo[2,1-c]-1,2,4triazolium tetrafluoroborate pre-catalyst ( $0.04 \mathrm{mmol}, 0.1$ equiv.) in anhydrous Toluene ( 2 mL ), freshly distilled aldehyde $\mathbf{1}$ ( $0.60 \mathrm{mmol}, 1.5$ equiv.) was added under Argon followed by addition of anhydrous sodium carbonate ( $0.44 \mathrm{mmol}, 1.1$ equiv.) under an argon environment. The resulting suspension was vigorously stirred at room temperature for 16 hours, then diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{~mL})$, and filtered through a short pad of silica gel. The resulting residue was purified by flash column chromatography on silica gel (cyclohexane/EtOAc mixture) to afford the racemic DHP $\mathbf{3}$ with comparable yield to that of the enantiopure counterpart.

(R)-1-Benzyl-4-butyryl-1,4,5,6-tetrahydropyridine-3-carbonitrile (12aa). A vigorously stirred mixture of DHP 3aa ( $53 \mathrm{mg}, 0.20 \mathrm{mmol}$, 1 equiv.), $\mathrm{Pd}(\mathrm{OH})_{2} / \mathrm{C}(20 \% \mathrm{w} / \mathrm{w}, 20 \mathrm{mg})$, and $\mathrm{MeOH}(3$ mL ) was degassed under vacuum and saturated with hydrogen (by a $\mathrm{H}_{2}$-filled balloon) three times. The mixture was vigorously stirred at room temperature for 10 h , then filtered on Celite, and concentrated; the resulting residue was purified by flash column chromatography on silica gel (cyclohexane/EtOAc mixture 8:2) to afford 12aa ( $50 \mathrm{mg}, 95 \%$ ) as a yellow oil; HPLC (Phenomenex Lux Amylose 2): $n$-hexane $/ i$ - $\operatorname{PrOH} 80: 20,1.0 \mathrm{~mL} / \mathrm{min}, ~ \lambda=254 \mathrm{~nm}, \mathrm{t}_{\text {maj }}=15.5 \mathrm{~min}, \mathrm{t}_{\text {min }}=17.3 \mathrm{~min}$, e.r. $85: 15) ;[\alpha]_{\mathrm{D}}=-39.1\left(c 1.0, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.42-7.28(\mathrm{~m}, 2 \mathrm{H}), 7.20-$ $7.12(\mathrm{~m}, 2 \mathrm{H}), 7.03(\mathrm{~s}, 1 \mathrm{H}), 4.28(\mathrm{~s}, 2 \mathrm{H}), 3.24-3.18(\mathrm{~m}, 1 \mathrm{H}), 3.13(\mathrm{dd}, \mathrm{J}=12.2,3.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.06-$ $2.95(\mathrm{~m}, 1 \mathrm{H}), 2.78-2.51(\mathrm{~m}, 2 \mathrm{H}), 2.16(\mathrm{ddt}, \mathrm{J}=13.4,3.8,2.8 \mathrm{~Hz}, 1 \mathrm{H}), 1.71-1.50(\mathrm{~m}, 3 \mathrm{H}), 0.92(\mathrm{t}$, $\mathrm{J}=7.4 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}\{1 \mathrm{H}\} \mathrm{NMR}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 209.9,148.0,135.7,129.0,128.2,127.4,123.2$, 69.7, 59.7, 43.7, 43.3, 42.5, 21.6, 17.1, 13.7. FT-IR (neat, $\mathrm{cm}^{-1}$ ): $v_{\max } 2961,2874,2182,1709,1617$, 1423, 1360, 1124. HRMS (ESI) $m / z:[\mathrm{M}+\mathrm{Na}]^{+}$Calcd for $\mathrm{C}_{17} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{NaO}$ 291.1473; Found: 291.1487.

## Acknowledgments

We gratefully acknowledge the University of Ferrara (Fondi FAR) for financial support. Thanks are also given to Paolo Formaglio for NMR experiments and to Tatiana Bernardi for HRMS analyses.

## Supporting Information

The Supporting Information is available free of charge on the ACS Publications website. compound characterization data, TD-DFT simulations of ECD spectra (PDF)

(14) The reduction of 1,4-DHP 3aa to the corresponding piperidine with excess triethyl silane and trifluoroacetic acid was also attempted as described in Ref. 8e with the aim to subsequently elaborate the cyanide functionality; this approach, however, afforded the tetrahydropyridine 12aa in racemic form likely because of the presence of the C 4 carbonyl functionality. Unfortunately, the same reduction strategy applied to the 1,4-DHP 11aa bearing a C4 hydroxyl group delivered a complex mixture of uncharacterized by-products.
