EUROPEAN SOCIETY OF RADIOLOGY

Disclaimer

The ECR 2020 Book of Abstracts is published by the European Society of Radiology (ESR) and summarises the presentations that were accepted to be held at the European Congress of Radiology 2020 (programme status as per January 31, 2020). Due to the outbreak of the coronavirus pandemic, the meeting originally planned for March 2020 could not be held.

Abstracts were submitted by the authors warranting that good scientific practice, copyrights and data privacy regulations have been observed and relevant conflicts of interest declared.

Abstracts reflect the authors' opinions and knowledge. The ESR does not give any warranty about the accuracy or completeness of medical procedures, diagnostic procedures or treatments contained in the material included in this publication. The views and opinions presented in ECR abstracts and presentations, including scientific, educational and professional matters, do not necessarily reflect the views and opinions of the ESR.

In no event will the ESR be liable for any direct or indirect, special, incidental, consequential, punitive or exemplary damages arising from the use of these abstracts.

The Book of Abstracts and all of its component elements are for general educational purposes for health care professionals only and must not take the place of professional medical advice. Those seeking medical advice should always consult their physician or other medical professional.

In preparing this publication, every effort has been made to provide the most current, accurate, and clearly expressed information possible. Nevertheless, inadvertent errors in information can occur. The ESR is not responsible for typographical errors, accuracy, completeness or timeliness of the information contained in this publication.

The ECR 2020 Book of Abstracts is a supplement to Insights into Imaging (1869-4101) and published under the Creative Commons Attribution License 4.0 (CC BY 4.0).

State of the Art Symposia (SA)
Transatlantic Course of ESR and RSNA (TC)

Wednesday, March 11

08:30 - 10:00 **Room X**

Joint Session of the ESR and ESTRO

ESR/ESTRO

Radiology and radiotherapy in liver tumours

ESR/ESTRO-1/ESR/ESTRO-2 08:30
Chairpersons' introduction
R. G. H. Beets-Tan*; Amsterdam/NL (r.beetstan@nki.nl)*
B. J. Slotman*; Amsterdam/NL (bj.slotman@amsterdamumc.nl)*
Session objectives:
1. To learn about the entire spectrum of radiation treatment of liver tumours.
2. To know its indications.
3. To understand the value of imaging as a guidance for these procedures.
4. To learn about the performance in evaluating response.
Author Disclosures:
R. G. H. Beets-Tan: nothing to disclose; B. J. Slotman: Speaker at ViewRay Inc, Research/Grant Support at ViewRay, Research/Grant Support at Varian medical systems

ESR/ESTRO-3 08:35
Stereotactic body radiation therapy (SBRT) in liver tumours
M. Hawkins*; London/UK (maria.hawkins@oncology.ox.ac.uk)*
Learning objectives:
1. To learn about indications for using SBRT in liver tumours.
2. To understand outcomes after SBRT in liver tumours.
3. To appreciate potential toxicities of SBRT in this setting.
4. To become familiar with future directions in SBRT for liver malignancies.
Author Disclosures:
M. Hawkins: nothing to disclose

ESR/ESTRO-4 08:50
MRI-guided RT in liver tumours
L. Boldrini*; Rome/IT (lucaboldrini@hotmail.it)*
Learning objectives:
1. To become familiar with the MRI guided RT workflow.
2. To describe the applications of MRI guided RT in liver tumours.
3. To provide an overview of the existing MRI guided RT evidence and further developments.
Author Disclosures:
L. Boldrini: Advisory Board at IBA, Research/Grant Support at ViewRay, Consultant at KBMS, KBO Lab

ESR/ESTRO-5 09:05
Selective internal radiation therapy (SIRT) for liver tumours
J. I. Bilbao Jaureguizar*; Pamplona/ES (jibilbao@unav.es)*
Learning objectives:
1. To describe the most common indications of radioembolisation (selective internal radiation therapy).
2. To be familiar with the main anatomical and haemodynamical aspects that will lead to a successful technique.
3. To know how complications can be avoided.
Author Disclosures:
J. I. Bilbao Jaureguizar: Speaker at Sirtex Medical

ESR/ESTRO-6 09:20
Post-selective intra-arterial radiation therapy (SIRT) response evaluation: what a radiologist should know
N. Lev Cohain*; Jerusalem/IL (NAAMAL@HADASSAH.ORG.IL)*
Learning objectives:
1. To describe what is the ideal timeframe for a follow-up protocol.
2. To present tumour response assessment after SIRT.
3. To provide an overview of benign post-SIRT imaging findings.
4. To present possible complications.
Author Disclosures:
N. Lev Cohain: nothing to disclose

09:35
Panel discussion: Radiologists and radiotherapists: how can they help each other to achieve the best care for the patient with liver tumours

08:30 - 10:00 **Room N**

Neuro

RC 111

Craniocervical junction

RC 111-1 08:30
Chairperson's introduction
J. van Goethem*; Antwerp (Edegem)/BE (johan.vangoethem@uantwerpen.be)*
Session objectives:
1. To become familiar with the anatomy and congenital anomalies of the craniocervical junction.
2. To recognise fractures and ligamentous injury of the craniocervical junction.
3. To be aware of craniocervical abnormalities in systemic diseases.
Author Disclosures:
J. van Goethem: nothing to disclose

RC 111-2 08:35
A. Congenital abnormalities
A. Rossi*; Genoa/IT (andrearossi@gaslini.org)*
Learning objectives:
1. To become familiar with the congenital bone anomalies and variants of the craniocervical junction.
2. To learn about associated cerebellar and spinal cord abnormalities.
3. To illustrate craniocervical anomalies in syndromes.
Author Disclosures:
A. Rossi: Consultant at Bracco Group, Speaker at Bracco Group, Speaker at Telemedicine Clinic

RC 111-3 08:58
B. Trauma
A. Adams*; London/UK (ashokadams@hotmail.com)*
Learning objectives:
1. To be able to categorise the spectrum of fractures.
2. To develop an understanding of the biomechanics and management options.
3. To appreciate the imaging findings in ligamentous craniocervical injuries.
Author Disclosures:
A. Adams: nothing to disclose

RC 111-4 09:21
C. Systemic diseases and tumours
K.-O. Loevblad*; Geneva/CH (Karl-Olof.Lovblad@hcuge.ch)*
Learning objectives:
1. To recognise craniocervical injuries in rheumatoid arthritis.
2. To differentiate systemic diseases from other pathology involving the craniocervical junction.
3. To become familiar with retro-odontoid pseudotumours without rheumatoid arthritis.
Author Disclosures:
K.-O. Loevblad: nothing to disclose

09:44
Panel discussion: Imaging strategies for assessing the craniocervical junction

09:00 - 10:00 **Coffee & Talk 2**

Coffee & Talk (open forum) Session

Organised by EuroSafe Imaging

C 9

Radiation protection: more opportunities than risks

C 9-1/C 9-2 09:00
Chairpersons' introduction
G. Frija*; Paris/FR (guy.frija@aphp.fr)*
I. Kralik*; Zagreb/HR (ikralik@kbd.hr)*

Wednesday

Session objectives:
1. To highlight the benefit of imaging procedures.
2. To promote clinical guidelines.
3. To promote equipment and software for significant dose reduction.
Author Disclosures:
G. Frija: nothing to disclose, I. Kralik: nothing to disclose

C 9-3 09:05
What is the ideal referral that we wish to receive?
A. Brady*; Cork/IE (adrianbrady@me.com)*
Learning objectives:
1. To outline the importance of providing appropriate clinical information when requesting imaging studies.
2. To emphasise the two-way conversation between referrers and radiologists inherent in good radiology practice.
3. To reinforce the centrality of radiologist input in choosing the most effective use of imaging to answer clinical problems.
Author Disclosures:
A. Brady: nothing to disclose

C 9-4 09:15
Very low dose: a paradigm shift in radiation protection?
R. W. Loose*; Nuremberg/DE (r.loose@mail.de)*
Learning objectives:
1. To highlight the ALARA principle and requirements for diagnostic image quality.
2. To promote and demonstrate the chances of new dose reduction techniques.
3. To outline diagnostic limitations in cases of too-low dose protocols.
Author Disclosures:
R. W. Loose: nothing to disclose

C 9-5 09:25
Defensive medicine: how to avoid inappropriate "rule-out" referrals
F. Kainberger*; Vienna/AT (franz.kainberger@meduniwien.ac.at)*
Learning objectives:
1. To assess the relevance of overutilisation, overdiagnosis, and overtreatment.
2. To use a simple grading for expressing the pre-test probability in referrals for imaging.
3. To assess the usefulness of strategies for reducing the rate of "rule-out" referrals.
Author Disclosures:
F. Kainberger: nothing to disclose

09:35
Open forum discussion

08:30 - 10:00 **Room E**

E³ - Advanced Course: Interactive Teaching Session for Young (and not so Young) Radiologists

E³ 121a
Musculoskeletal tumours

E³ 121a-1 08:30
A. Soft tissue tumours
F. M. H. M. Vanhoenacker*; Antwerp/BE (filip.vanhoenacker@telenet.be)*
Learning objectives:
1. To describe the imaging findings of soft tissue tumours.
2. To list the differential diagnosis of soft tissue tumours and tumour-like conditions.
Author Disclosures:
F. M. H. M. Vanhoenacker: nothing to disclose

E³ 121a-2 09:15
B. Bone tumours
F. B. B. Ergen*; Ankara/TR (bergen@delta-eur.com)*
Learning objectives:
1. To describe imaging findings of musculoskeletal tumours and tumour-like conditions.
2. To recognise imaging pitfalls of musculoskeletal tumours and tumour-like conditions.
Author Disclosures:
F. B. B. Ergen: nothing to disclose

08:30 - 10:00 **Room F1**

E³ - Advanced Course: Interactive Teaching Session for Young (and not so Young) Radiologists

E³ 121b
Emergency and chest radiology

E³ 121b-1 08:30
A. Dyspnoea in oncologic patients: how to approach it
C. M. M. Schaefer-Prokop*; Amersfoort/NL (cornelia.schaeferprokop@gmail.com)*
Learning objectives:
1. To learn about the role of imaging in these patients.
2. To understand the importance of clinical data for narrowing the differential diagnosis.
Author Disclosures:
C. M. M. Schaefer-Prokop: nothing to disclose

E³ 121b-2 09:15
B. Blunt thoracic trauma: from the plain film to CT
A. Oikonomou*; Toronto, ON/CA (anastasia.oikonomou@sunnybrook.ca)*
Learning objectives:
1. To learn about the spectrum of radiological findings in blunt thoracic trauma.
2. To emphasise the importance of CT reformations for the detection of severe complex traumatic injuries.
Author Disclosures:
A. Oikonomou: nothing to disclose

08:30 - 10:00 **Room F2**

GI Tract

RC 101
Colon cancer: a multidisciplinary approach

Moderator:
L. C. O. K. Blomqvist; Stockholm/SE

RC 101-1 08:30
A. What are the expectations from the surgeon?
D. Ignjatovic*; Oslo/NO (dejan.ignjatovic@medisin.uio.no)*
Learning objectives:
1. To learn about the clinical background and surgical techniques for colon cancer.
2. To learn the surgical nomenclature used for the different variants of surgical procedures, in particular that related to the vasculature.
3. To understand how different imaging features on CT related to anatomical vascular variants can affect the surgical procedure.
Author Disclosures:
D. Ignjatovic: nothing to disclose

RC 101-2 09:00
B. My CT protocol for staging colon cancer
A. Drolsum*; Oslo/NO (adrolsum@gmail.com)*
Learning objectives:
1. To demonstrate the CT acquisition protocol relevant for staging of colon cancer that also allows demonstration of bowel vasculature.
2. To learn about the vascular anatomy of the colon and nodal pathways as visualised on CT.
3. To understand how software post-processing can facilitate assessment and demonstration of vascular anatomy.

Author Disclosures:
A. Drolsum: nothing to disclose

RC 101-3 09:30
C. Integrated staging and vascular assessment
A. Negaard*; Lørenskog/NO (anne.negard@ahus.no)*
Learning objectives:
1. To present clinical cases that demonstrates the use of CT to illustrate local and distant staging in a structured report.
2. To demonstrate how the vascular assessment is performed in the same examination.
3. To present typical cases that demonstrate the importance of assessment, both in relation to the extent of disease as well as the vascular anatomy.
Author Disclosures:
A. Negaard: nothing to disclose

08:30 - 10:00 **da Vinci (Room D1)**

Cardiac

RC 103

Imaging the complexity of pulmonary hypertension (PH) "syndrome"

Moderator:
M. Francone; Rome/IT

RC 103-1 08:30
A. Uncoupling right ventricular physiology with cardiovascular magnetic resonance (CMR): from early adaptation to heart failure
F. Pontana*; Lille/FR (fpontana@gmail.com)*
Learning objectives:
1. To review peculiarities of right heart physiology and ventricular interdependence in pulmonary hypertension.
2. To outline early and late morpho-functional changes associate with right ventricular pressure overload.
3. To understand the primary role of CMR in the evaluation of different forms of pulmonary hypertension.
Author Disclosures:
F. Pontana: Speaker at Siemens Healthcare, Speaker at GE Heathcare, Speaker at Bracco, Speaker at Bayer

RC 103-2 09:00
B. Assessment of PH by CT
E. Mershina*; Moscow/RU (elena_mershina@mail.ru)*
Learning objectives:
1. To review the spectrum of currently available techniques, from pulmonary angiography to CT perfusion, with spectral imaging.
2. To list typical and subtle CT imaging parenchymal and vascular features in primary and secondary forms of disease.
3. To review the current role of CT in clinical guidelines for the diagnosis and treatment of pulmonary hypertension.
Author Disclosures:
E. Mershina: nothing to disclose

RC 103-3 09:30
C. Cardiac imaging to monitor therapeutic response and predict outcome
J. Vogel-Claussen*; Hanover/DE (vogel-claussen.jens@mh-hannover.de)*
Learning objectives:
1. To discuss the advances in treatment and importance of imaging to guide therapy.
2. To understand the predictive role of CT and MRI.
3. To analyse the importance and respective roles of CT and MRI to monitor response to therapy.
Author Disclosures:
J. Vogel-Claussen: Consultant at BMBF, Novartis, Boehringer Ingelheim, GSK, Siemens Healthineers, Grant Recipient at BMBF, Novartis, Boehringer Ingelheim, GSK, Siemens Healthineers

08:30 - 10:00 **Darwin (Room D2)**

Radiographers

RC 114

The role of radiographers in ensuring quality in practice

RC 114-1/RC 114-2 08:30
Chairpersons' introduction
J. Ferda*; Plzen/CZ (ferda@fnplzen.cz)*
D. Pekarovic*; Ljubljana/SI (dean.pekarovic@kclj.si)*
Session objectives:
1. To understand the importance of quality in daily practice.
2. To appreciate the role of radiographers in promoting and delivering quality improvements.
3. To promote discussion on practical approaches to developing a quality culture in medical imaging.
Author Disclosures:
J. Ferda: nothing to disclose, D. Pekarovic: nothing to disclose

RC 114-3 08:36
A. The radiographers' role in justification
P. Bezzina*; Malta/MT (paul.bezzina@um.edu.mt)*
Learning objectives:
1. To review the relevant EU legislation.
2. To understand the impact of legislation on the practice of radiographers.
3. To consider the potential for continuous professional development to support justification across modalities.
Author Disclosures:
P. Bezzina: nothing to disclose

RC 114-4 08:59
B. Quality assurance to guarantee safe and secure procedures
M.-L. Ryan*; Dublin/IE (marielouise.ryan@ucd.ie)*
Learning objectives:
1. To review the concept of quality assurance and its impact on enhancing service delivery.
2. To recognise the need for quality assurance to be part of a radiographer's routine practice.
3. To discuss actual examples highlighting the impact of quality assurance on practices.
Author Disclosures:
M.-L. Ryan: nothing to disclose

RC 114-5 09:22
C. Multimodality intervention: the importance of a quality culture
M. Halbwachs*; Strasbourg/FR (madeline.halbwachs@chru-strasbourg.fr)*
Learning objectives:
1. To understand the complexity of imaging quality assurance in multimodality interventional suites.
2. To be aware of how to manage quality assurance in this complex environment.
3. To consider potential continuous professional development needs in multimodality interventional imaging.
Author Disclosures:
M. Halbwachs: nothing to disclose

09:45
Panel discussion: Monitoring and ensuring quality: the professional role of radiographers

08:30 - 10:00 **Descartes (Room D3)**

Special Focus Session

SF 1a

Evaluating oncologic treatment response in clinical practice and trials

SF 1a-1 08:30
Chairperson's introduction
M. Dewey*; Berlin/DE*
Session objectives:
1. To explain the role of imaging in response evaluation in clinical trials and routine.
2. To explain the role of integrating quantitative imaging into clinical practice.
3. To describe the role of quantification of metastases in clinical practice.
Author Disclosures:
M. Dewey: Patent Holder at Patent on fractal analysis of perfusion imaging (jointly with Florian Michallek, PCT/EP2016/071551), Board Member at M.D. is European Society of Radiology (ESR) Research Chair (2019–2022) and the opinions expressed in this presentation are the author's own and do not represent the view of ESR., Grant Recipient at EU (603266-2) DFG (DE 1361/14-1, DE 1361/18-1, BIOQIC GRK 2260/1, Radiomics DE 1361/19-1 and 20-1 in SPP 2177/1), Berlin University Alliance (GC_SC_PC 27), Berlin Institute of Health (Digital Health Accelerator)., Speaker at Canon, Guerbet. , Author at Editor: Cardiac CT (Springer Nature)., Other at Organisation of Hands-on cardiac CT courses (www.ct-kurs.de) , Other at Institutional research agreements: Siemens, General Electric, Philips, Canon.

SF 1a-2 08:40
Insights from trials about endpoints for response evaluation in clinical practice
L. Fournier*; Paris/FR*
Learning objectives:
1. To list the features of trials using imaging for response evaluation.
2. To explain the limitations of applying this knowledge in clinical practice.
3. To describe how to best use imaging for response evaluation.
Author Disclosures:
L. Fournier: Grant Recipient at Invectys, Speaker at General Electric, Speaker at Novartis, Speaker at Janssen, Speaker at Sanofi, Speaker at Bayer, Speaker at Pfizer, Research/Grant Support at Philips, Research/Grant Support at Ariana Pharma, Research/Grant Support at Evolucare

SF 1a-3 09:00
Integrating quantitative imaging into clinical practice
N. deSouza*; Surrey/UK*
Learning objectives:
1. To describe approaches to integrating quantitative imaging into clinical practice.
2. To explain the limitations of quantitative imaging in clinical practice.
3. To describe how to use quantitative imaging for clinical care.
Author Disclosures:
N. deSouza: nothing to disclose

SF 1a-4 09:20
Quantification of bone metastases becomes possible in clinical practice
F. Lecouvet*; Brussels/BE (frederic.lecouvet@uclouvain.be)*
Learning objectives:
1. To explain the possibilities of bone metastasis quantification.
2. To list the limitations of bone metastasis quantification.
3. To describe how to best use bone metastasis quantification in patient care.
Author Disclosures:
F. Lecouvet: nothing to disclose

09:40
Panel discussion: How to best evaluate oncologic response in clinical practice?

08:30 - 10:00 **Room K**

E³ - European Diploma Prep Session

E³ 123

Paediatric

E³ 123-1 08:30
Chairperson's introduction
J.-F. Chateil*; Bordeaux/FR (jean-francois.chateil@chu-bordeaux.fr)*
Session objectives:
1. To understand the imaging features of the most common congenital and neoplastic disorders of the brain in children and adolescents.
2. To describe the imaging presentations of the most common disorders of the lung and mediastinum in the paediatric age group.
3. To become familiar with the imaging features of important congenital, acute, and neoplastic diseases of the abdomen in children and adolescents.
Author Disclosures:
J.-F. Chateil: nothing to disclose

E³ 123-2 08:36
A. Paediatric neuro imaging
M. Argyropoulou*; Ioannina/GR (margyrop@cc.uoi.gr)*
Learning objectives:
1. To describe the normal development of the brain.
2. To explain the most common congenital disorders of the brain.
3. To understand the most common brain tumours in children and adolescents.
Author Disclosures:
M. Argyropoulou: nothing to disclose

E³ 123-3 09:04
B. Paediatric chest imaging
C. Owens*; London/UK (owens.catherine.5@gmail.com)*
Learning objectives:
1. To describe the normal development of the lung and mediastinum.
2. To explain imaging features of congenital disorders of the lung and mediastinum.
3. To understand the imaging manifestations of respiratory distress and bronchopulmonary dysplasia in infants.
4. To describe the most common tumours of the chest in children.
Author Disclosures:
C. Owens: Consultant at Sidra Medicine , Speaker at Sidra

E³ 123-4 09:32
C. Paediatric abdominal imaging
T. A. Watson*; London/UK*
Learning objectives:
1. To understand the imaging features of congenital disorders of the abdomen.
2. To describe the diagnostic evaluation and imaging presentation of the most common emergencies in children according to age.
3. To understand the imaging presentation of the most common oncologic disorders of the abdomen in children.
Author Disclosures:
T. A. Watson: nothing to disclose

08:30 - 10:00 **Room M 4**

E³ - Rising Stars Programme: Basic Session

BS 1

Radiologic anatomy: abdomen

Moderator:
S. Gourtsoyianni; Athens/GR

BS 1-1 08:30
Small bowel
S. A. Taylor*; London/UK (csytaylor@yahoo.co.uk)*

Learning objectives:
1. To appreciate the embryological development of the small bowel.
2. To learn about the anatomy of the small bowel relevant to radiological imaging.
3. To understand the pitfalls of the normal small bowel appearance during imaging interpretation.
Author Disclosures:
S. A. Taylor: Consultant at Robarts plc

BS 1-2 09:00
Anorectal
A. Palkó; *Szeged/HU (palkoand@gmail.com)*
Learning objectives:
1. To review the normal anatomy of the anorectum.
2. To learn how well depicted the different anatomical landmarks of the anorectum are with different available imaging methods.
3. To discuss the clinical scenarios for which it is necessary to be aware of the anatomy of the anorectum.
Author Disclosures:
A. Palkó: nothing to disclose

BS 1-3 09:30
Peritoneum and mesentery
P. K. Prassopoulos; *Thessaloniki/GR (pprasopo@auth.gr)*
Learning objectives:
1. To review the radiologic anatomy of peritoneal ligaments, mesenteries, and omenta on cross-sectional imaging.
2. To describe the most clinically important peritoneal compartments and fluid collections.
3. To discuss the key role of anatomy in the dissemination of malignancies or the restriction of inflammatory processes in the abdomen.
Author Disclosures:
P. K. Prassopoulos: nothing to disclose

08:30 - 10:00 **Room M 5**

E³ - Advanced Course: Artificial Intelligence

E³ 120

Artificial intelligence in radiology: the basics you need to know

E³ 120-1 08:30
Chairperson's introduction: Artificial intelligence, machine learning and deep learning: what is the difference?
G. Langs; *Vienna/AT*
Session objectives:
1. To become familiar with the different definitions of artificial intelligence domains.
2. To understand that most of the current hype in radiology is about deep learning.
3. To learn about the history of deep learning and why it is so popular now.
Author Disclosures:
G. Langs: disclosure/affirmation information not submitted

E³ 120-2 08:36
A. Conventional machine learning vs deep learning
M. de Bruijne; *RotterdamNL (marleen.debruijne@erasmusmc.nl)*
Learning objectives:
1. To understand the difference between machine learning and deep learning.
2. To learn about the various conventional machine learning techniques.
3. To learn about pros and cons of conventional machine learning vs deep learning.
Author Disclosures:
M. de Bruijne: Research/Grant Support at COSMONiO, Research/Grant Support at Quantib, Patent Holder at US8811724, EP2240904A1,EP2240904B1,US8126240B2,US8811724B2,US7844090B2,US7463758B2,, Research/Grant Support at Vertex

E³ 120-3 09:04
B. Training data for deep learning: what is needed?
B. Glocker; *London/UK (b.glocker@imperial.ac.uk)*
Learning objectives:
1. To understand how deep learning algorithms are trained.
2. To learn about methods to perform deep learning in case of limited training data.
3. To understand the limits of deep learning approaches.
Author Disclosures:
B. Glocker: Advisory Board at Definiens AG, Employee at HeartFlow Ltd., Employee at Microsoft Research Ltd., Advisory Board at Kheiron Medical Technologies, Research/Grant Support at HeartFlow Ltd., Grant Recipient at European Research Council, Grant Recipient at National Institute of Health Research, Grant Recipient at Engineering and Physical Sciences Research Council

E³ 120-4 09:32
C. Clinical applications of artificial intelligence (AI) in medical imaging
N. Papanikolaou; *Lisbon/PT (nickolas.papanikolaou@research.fchampalimaud.org)*
Learning objectives:
1. To learn about the current state of the art of AI applications in medical imaging.
2. To focus on the current challenges related to AI development and deployment in clinical conditions.
3. To understand how AI will transform medical imaging in the long term.
Author Disclosures:
N. Papanikolaou: Shareholder at MRIcons LTD, Advisory Board at Advantis Medical Imaging

08:30 - 10:00 **Tech Gate Auditorium**

Special Focus Session

SF 1b

CEUS in children

SF 1b-1 08:30
Chairperson's introduction
M. Wozniak; *Lublin/PL (mwozniak@hoga.pl)*
Session objectives:
1. To learn about the current role of intravenous applications of CEUS (contrast-enhanced ultrasound) in the paediatric population.
2. To understand the technique and current place of contrast-enhanced voiding urosonography (ce-VUS) in children in diagnostic algorithms.
3. To become familiar with the usefulness of CEUS in paediatric trauma.
Author Disclosures:
M. Wozniak: nothing to disclose

SF 1b-2 08:40
Liver and extrahepatic intravenous applications
D. Ključevšek; *Ljubljana/SI (damjana.kljucevsek@siol.net)*
Learning objectives:
1. To learn about the most common indications for intravenous CEUS in children.
2. To become familiar with the technique and the most common findings.
3. To discuss the limitations of the imaging method.
Author Disclosures:
D. Ključevšek: nothing to disclose

SF 1b-3 09:00
Vesicoureteral (VU) reflux
G. Roic; *Zagreb/HR (goran.roic@kdb.hr)*
Learning objectives:
1. To learn about the indications for CEUS in vesicoureteral reflux in children.
2. To become familiar with the technique and the most common findings.
3. To discuss the limitations of the imaging method in reflux evaluation.
Author Disclosures:
G. Roic: nothing to disclose

SF 1b-4 09:20
Traumas
H.-J. Mentzel; *Jena/DE (hans-joachim.mentzel@med.uni-jena.de)*

Learning objectives:
1. To learn about when CEUS may be useful in trauma evaluation in children.
2. To become familiar with the technique and the most common findings.
3. To discuss the limitations of the imaging methods in a trauma setting.
Author Disclosures:
H.-J. Mentzel: Speaker at Bracco, Speaker at Samsung, Investigator at Bayer, Grant Recipient at Sunlight

09:40
Panel discussion: Is off-label use of CEUS in children a cause for concern?

10:30 - 12:00 **Room N**

Special Focus Session

SF 2a
Prostate embolisation

SF 2a-1 10:30
Chairperson's introduction: New developments in managing benign prostatic disease
H. Hoppe*; Berne/CH (hanno.hoppe@web.de)*
Session objectives:
1. To learn about the results of the underlying cause of prostatic obstruction.
2. To become familiar with the results of current surgical treatments.
3. To learn about the results of current medical therapies.
Author Disclosures:
H. Hoppe: Research/Grant Support at Cook Medical, Research/Grant Support at Boston Scientific

SF 2a-2 10:40
Patient selection and assessment
T. Bilhim*; Lisbon/PT (tiagobilhim@hotmail.com)*
Learning objectives:
1. To learn about the assessment methods and grading systems for prostate outflow obstruction.
2. To learn about consent and who are the optimal patients for treatments.
3. To understand which patients should not be primarily treated with prostate embolisation.
Author Disclosures:
T. Bilhim: Consultant at Merit Medical, Consultant at Terumo, Speaker at Cook, Speaker at Philips, Shareholder at EmbolX

SF 2a-3 10:57
Anatomy, imaging and planning
C. R. Tapping*; Oxford/UK (charles.tapping@ouh.nhs.uk)*
Learning objectives:
1. To become familiar with the normal anatomy and blood supply of the prostate gland.
2. To learn about the pre-procedural imaging methodologies.
3. To understand pre-procedural planning, including blood and drug management.
Author Disclosures:
C. R. Tapping: Speaker at Merit Medical, Speaker at Boston Scientific

SF 2a-4 11:14
Embolisation technique
K. Wilhelm*; Bonn/DE (Kai.wilhelm@johanniter-kliniken.de)*
Learning objectives:
1. To become familiar with the standard equipment required for prostate embolisation.
2. To learn about the techniques for selective cannulation of the prostate arteries.
3. To understand the role of dyna CT, and tricks and tips for embolisation.
Author Disclosures:
K. Wilhelm: nothing to disclose

SF 2a-5 11:31
Outcome and results from trials
F. Wolf*; Vienna/AT (florian.wolf@meduniwien.ac.at)*
Learning objectives:
1. To understand the technical success.
2. To become familiar with short and long term clinical success, and how it compares with medical and surgical techniques.
3. To be aware of the complications.
Author Disclosures:
F. Wolf: nothing to disclose

11:48
Panel discussion: New developments in managing benign prostatic disease

10:30 - 12:00 **Room O**

Abdominal Viscera

RC 201
Benign and malignant lesions in "forgotten organs"

Moderator:
I. Petkovska; New York, NY/US

RC 201-1 10:30
A. Imaging of the spleen
C. S. Reiner*; Zurich/CH*
Learning objectives:
1. To be aware of the most common benign and malignant lesions in the spleen and their differential diagnoses.
2. To know about imaging strategies and protocols with ultrasound, CT, and MRI of the spleen.
3. To know about the management of splenic lesions.
Author Disclosures:
C. S. Reiner: nothing to disclose

RC 201-2 11:00
B. Imaging of mesentery and omentum
M. J. Lahaye*; Amsterdam/NL (MJ.Lahaye@gmail.com)*
Learning objectives:
1. To understand the anatomical landmarks of the mesentery and omentum.
2. To be aware of the most common pathological findings of the mesentery and omentum.
3. To learn to avoid diagnostic mistakes when findings of the mesentery and omentum are seen.
Author Disclosures:
M. J. Lahaye: nothing to disclose

RC 201-3 11:30
C. Imaging of the gallbladder
B. J. Op de Beeck*; Edegem/BE (bart.op.de.beeck@uza.be)*
Learning objectives:
1. To become familiar with most common benign and malignant changes of the gallbladder.
2. To be aware of the strengths and shortcomings of different imaging techniques including ultrasound, CT, and MRI.
3. To understand diagnostic pitfalls of gallbladder imaging.
Author Disclosures:
B. J. Op de Beeck: nothing to disclose

11:00 - 12:00 **Coffee & Talk 2**

Coffee & Talk (open forum) Session
Organised by EuroSafe Imaging

C 10
Quality and safety in paediatric imaging

C 10-1/C 10-2 11:00
Chairpersons' introduction
C. Granata*; Genoa/IT*
D. P. Frush*; Durham, NC/US (dfrush@stanford.edu)*

Session objectives:
1. To understand how to implement best practice in radiation protection of newborns in neonatal intensive care units.
2. To gain an overview on the most important aspects of optimisation of paediatric protocols in CT.
3. To learn how exposure indicators can be used for optimisation in paediatric digital radiography.
Author Disclosures:
C. Granata: Speaker at Guerbet Italia, D. P. Frush: nothing to disclose

C 10-3 11:05
Radiation protection in the neonatal intensive care unit
S. Salerno*; Palermo/IT*
Learning objectives:
1. To learn the requisites of quality for radiologic studies commonly performed in NICU.
2. To gain an overview on related diagnostic reference levels (DRLs) and technique optimisation.
3. To gain an overview on shielding.
Author Disclosures:
S. Salerno: disclosure/affirmation information not submitted

C 10-4 11:15
Optimising protocol parameters in paediatric conventional radiology and CT
E. Sorantin*; Graz/AT (erich.sorantin@medunigraz.at)*
Learning objectives:
1. To appreciate the importance of dose optimisation in children.
2. To learn how to optimise CT protocols in children to avoid the most common pitfalls.
Author Disclosures:
E. Sorantin: nothing to disclose

C 10-5 11:25
Understanding dose indices and exposure indicators in digital radiography
R. Seuri*; HUS, Helsinki/FI (raija.seuri@hus.fi)*
Learning objectives:
1. To understand what exposure indicators are and what they are not.
2. To learn how exposure indicators play a role in ensuring correct use of the equipment and optimising radiation dose in paediatric digital radiology.
Author Disclosures:
R. Seuri: nothing to disclose

11:35
Open forum discussion

10:30 - 12:00 **Room E**

E³ - Rising Stars Programme: Basic Session

BS 2
Radiologic anatomy: chest

Moderator:
F. Rengier; Heidelberg/DE

BS 2-1 10:30
Mediastinal
M. Occhipinti*; Florence/IT (mariaelena.occhipinti@gmail.com)*
Learning objectives:
1. To review the mediastinal anatomy according to old and new classifications.
2. To define "normal" and "abnormal" mediastinal anatomy.
3. To use radiologic anatomy to characterise mediastinal lesions and to stage tumours.
Author Disclosures:
M. Occhipinti: Research/Grant Support at Fondazione Menarini

BS 2-2 11:00
Lungs
C. M. M. Schaefer-Prokop*; Amersfoort/NL (cornelia.schaeferprokop@gmail.com)*
Learning objectives:
1. To know how to interpret mediastinal lines and contours in chest radiography.
2. To become familiar with "signs" in chest radiography helpful for diagnosis.
3. To know the normal appearance of lung parenchyma on CT and to use the anatomy of the secondary lobule for analysis of chest diseases.
Author Disclosures:
C. M. M. Schaefer-Prokop: nothing to disclose

BS 2-3 11:30
Vasculature
I. Žuža*; Kostrena/HR*
Learning objectives:
1. To identify thoracic vascular structures on chest x-rays.
2. To interpret chest vasculature, including aorta and coronary arteries, major aortic branches, and pulmonary arteries and veins by using multidetector CT (MDCT).
3. To review and illustrate the most common variants and anomalies.
4. To discuss the challenges and limitations in interpretation based on particular CT scanning protocols.
Author Disclosures:
I. Žuža: nothing to disclose

10:30 - 12:00 **Room F2**

Musculoskeletal

RC 210
Musculoskeletal tumours

Moderator:
F. B. B. Ergen; Ankara/TR

RC 210-1 10:30
A. Bone tumours and tumour-like conditions
P. G. O'donnell*; St Albans/UK (paulodonnell@nhs.net)*
Learning objectives:
1. To explain the imaging findings of bone tumours.
2. To describe how to differentiate benign from malignant bone lesions.
Author Disclosures:
P. G. O'donnell: nothing to disclose

RC 210-2 11:00
B. Soft tissue tumours
A. Bazzocchi*; Bologna/IT (abazzo@inwind.it)*
Learning objectives:
1. To explain the imaging findings of soft tissue tumours.
2. To describe differential diagnostic considerations in imaging soft tissue tumours.
Author Disclosures:
A. Bazzocchi: nothing to disclose

RC 210-3 11:30
C. Tumours of the spinal column
F. M. H. M. Vanhoenacker*; Antwerp/BE (filip.vanhoenacker@telenet.be)*
Learning objectives:
1. To explain the imaging findings of spinal tumours.
2. To describe differential diagnostic considerations in imaging spinal tumours.
Author Disclosures:
F. M. H. M. Vanhoenacker: nothing to disclose

10:30 - 12:00 **da Vinci (Room D1)**

Special Focus Session

SF 2b

My three most dreaded head and neck requests

SF 2b-1 10:30
Chairperson's introduction
P. Golofit*; Szczecin/PL (piotrgolofit@gmail.com)*
Session objectives:
1. To address the dilemmas of common requests in head and neck radiology.
2. To discuss imaging approaches in tinnitus, lymphadenopathies, and hoarseness.
3. To debate negative imaging findings in symptomatic patients.
Author Disclosures:
P. Golofit: nothing to disclose

SF 2b-2 10:36
Tinnitus
B. Verbist*; Leiden/NL (b.m.verbist@lumc.nl)*
Learning objectives:
1. To review imaging modalities used for the workup of tinnitus.
2. To give an overview of underlying lesions in pulsatile tinnitus.
3. To compare imaging for pulsatile and non-pulsatile tinnitus.
Author Disclosures:
B. Verbist: Grant Recipient at HPTC-Varian consortium, Research/Grant Support at Advanced Bionics, Research/Grant Support at Cochlear

SF 2b-3 10:57
Enlarged lymph nodes
R. Maroldi*; Brescia/IT (roberto.maroldi@unibs.it)*
Learning objectives:
1. To discuss the imaging approach for suspected enlarged lymph nodes.
2. To review the differential diagnoses in lymphadenopathies.
3. To advise when fine needle aspiration cytology or biopsy is needed.
Author Disclosures:
R. Maroldi: nothing to disclose

SF 2b-4 11:18
Hoarseness
E. Vassallo*; Msida/MT (edithvassallo@gmail.com)*
Learning objectives:
1. To explain the value of CT and MRI in the evaluation of hoarseness.
2. To show lesions causing hoarseness.
3. To reflect on the incidence of underlying lesions in hoarseness.
Author Disclosures:
E. Vassallo: nothing to disclose

11:39
Panel discussion: How to deal with symptomatic patients without definite imaging findings?

10:30 - 12:00 **Darwin (Room D2)**

Paediatric

RC 212

Fluoroscopy: a mainstay state of the art in paediatric radiology

RC 212-1 10:30
Chairperson's introduction
N. Mitreska*; Skopje, MK/MK*
Session objectives:
1. To learn about the most common indications for fluoroscopy in neonates, infants and children.
2. To optimise protocols with a special concern for dose management.
3. To be aware of limits and pitfalls.
Author Disclosures:
N. Mitreska: disclosure/affirmation information not submitted

RC 212-2 10:35
A. Use of fluoroscopy in neonates with suspected gastrointestinal pathology
I. Aagenæs*; Oslo/NO (iaagenes@gmail.com)*
Learning objectives:
1. To learn about the most common indications for fluoroscopy in non-urogenital queries in neonates.
2. To become familiar with the technique, findings, and pitfalls for the most common fluoroscopy non-urogenital queries in the neonate.
3. To discuss the best fluoroscopic approach in suspected bowel obstruction in a neonate.
Author Disclosures:
I. Aagenæs: nothing to disclose

RC 212-3 11:00
B. Gastrointestinal and other applications in the older child
J. Barber*; London/UK*
Learning objectives:
1. To learn about the most common indications for fluoroscopy in non-urogenital queries in infant and older children.
2. To become familiar with the technique of the most common fluoroscopy queries in this patient group.
3. To discuss the most common findings and pitfalls.
Author Disclosures:
J. Barber: nothing to disclose

RC 212-4 11:25
C. Urogenital applications
G. Perucca*; Turin, TO/IT (giuliaperucca@yahoo.it)*
Learning objectives:
1. To learn about the indications for fluoroscopy in urogenital queries in children.
2. To become familiar with the technique in fluoroscopic urogenital queries.
3. To discuss the most common findings and pitfalls.
Author Disclosures:
G. Perucca: nothing to disclose

11:50
Panel discussion: When can ultrasound imaging replace fluoroscopy?

10:30 - 12:00 **Descartes (Room D3)**

ESR Ultrasound Subcommittee Session

US 2

Ultrasound (US) incidental findings

Moderators:
C. M. Nyhsen; Haguenau/FR
P. Ricci; Rome/IT

US 2-1 10:30
Thyroid and lymph node
D.-A. A. Clevert*; Munich/DE (Dirk.Clevert@med.uni-muenchen.de)*
Learning objectives:
1. To learn how to manage incidental findings.
2. To appreciate the accuracy of multiparametric ultrasound imaging for immediate diagnosis of incidentaloma.
3. To understand the differential diagnosis and correct or best multimodalities management of incidental findings.
Author Disclosures:
D.-A. A. Clevert: Speaker at Siemens, Bracco, Samsung, Philips, Advisory Board at Philips, Samsung

US 2-2 10:50
Liver and pancreas
M. D'onofrio*; Verona/IT (mirko.donofrio@univr.it)*
Learning objectives:
1. To learn how to manage incidental findings.
2. To appreciate the accuracy of multiparametric ultrasound imaging for immediate diagnosis of incidentaloma.
3. To understand the differential diagnosis and correct or best multimodalities management of incidental findings.

Author Disclosures:
M. D'onofrio: Speaker at Siemens, Speaker at Hitachi, Speaker at Bracco, Advisory Board at Siemens, Research/Grant Support at Hitachi

US 2-3 11:10
Spleen and kidney
M. Bertolotto*; Trieste/IT (bertolot@units.it)*
Learning objectives:
1. To learn how to manage incidental findings.
2. To appreciate the accuracy of multiparametric ultrasound imaging for immediate diagnosis of incidentaloma.
3. To understand the differential diagnosis and correct or best multimodalities management of incidental findings.
Author Disclosures:
M. Bertolotto: nothing to disclose

US 2-4 11:30
Testis and ovary
P. S. Sidhu*; London/UK (paulsidhu@nhs.net)*
Learning objectives:
1. To learn how to manage incidental findings.
2. To appreciate the accuracy of multiparametric ultrasound imaging for immediate diagnosis of incidentaloma.
3. To understand the differential diagnosis and correct or best multimodalities management of incidental findings.
Author Disclosures:
P. S. Sidhu: Advisory Board at Samsung, Consultant at Itreas, Speaker at Bracco, Speaker at Siemens, Speaker at Philips, Speaker at GE Healthcare

11:50
Panel discussion: Diagnostics and treatment

10:30 - 12:00 **Room K**

Neuro

RC 211
Sellar and suprasellar lesions

RC 211-1 10:30
Chairperson's introduction
M. Z. Karlovic Vidakovic*; Mostar/BA (karlovicmarijana@yahoo.com)*
Session objectives:
1. To present an imaging strategy for imaging pituitary adenoma.
2. To learn about anatomical variations and congenital sellar pathology.
3. To become familiar with craniopharyngioma and Rathke cleft cyst.
Author Disclosures:
M. Z. Karlovic Vidakovic: nothing to disclose

RC 211-2 10:35
A. Anatomy, variants and function of the pituitary gland
S. Looby*; Dublin/IE (seamuslooby@beaumont.ie)*
Learning objectives:
1. To review the anatomy of the sellar and parasellar region.
2. To recognise sellar variants.
3. To be able to appropriately image the patient with diabetes insipidus.
Author Disclosures:
S. Looby: nothing to disclose

RC 211-3 10:58
B. Imaging of sellar and suprasellar lesions
Z. Rumboldt*; Rijeka/HR (puz3@yahoo.com)*
Learning objectives:
1. To recognise pituitary and sellar neoplasms other than adenoma.
2. To describe perisellar and suprasellar pathology.
3. To provide an overview of sellar and suprasellar childhood lesions.
Author Disclosures:
Z. Rumboldt: Speaker at Bracco (last time in 2016), Research/Grant Support at Bayer (in 2013)

RC 211-4 11:21
C. Post-treatment findings and follow-up
F. Bonneville*; Toulouse/FR (bonneville.f@chu-toulouse.fr)*
Learning objectives:
1. To become familiar with the different types of pituitary adenoma.
2. To define the most effective imaging strategy for pituitary adenoma.
3. To learn about the role of MRI after surgical and/or medical treatment.
Author Disclosures:
F. Bonneville: nothing to disclose

11:44
Panel discussion: Imaging sellar and suprasellar lesions

10:30 - 12:00 **Room M 1**

Radiographers

RC 214
The role of medical imaging in radiotherapy

RC 214-1/RC 214-2 10:30
Chairpersons' introduction
C. A. Beardmore*; London/UK (charlotteb@sor.org)*
K. Galumyan*; Yerevan/AM*
Session objectives:
1. To understand CT and MRI specifications for treatment and planning.
2. To be aware of imaging positioning verification options.
3. To highlight the radiographers' role in radiotherapy planning and dosimetry.
Author Disclosures:
C. A. Beardmore: nothing to disclose, K. Galumyan: disclosure/affirmation information not submitted

RC 214-3 10:36
A. CT and MRI in treatment and planning
J. G. Couto*; Msida/MT (jose.g.couto@um.edu.mt)*
Learning objectives:
1. To highlight the imaging specifications for planning.
2. To understand the role of CT in current radiotherapy practice.
3. To be familiar with the role of MRI in current radiotherapy practice.
Author Disclosures:
J. G. Couto: nothing to disclose

RC 214-4 10:59
B. Role of imaging in positioning verification
A. Raith*; Vienna/AT (alexander.raith@gmx.at)*
Learning objectives:
1. To discuss the use of different imaging modalities for position verification.
2. To be familiar with modification techniques to address deviations in treatment planning.
3. To identify practical tips for MRI Linac use.
Author Disclosures:
A. Raith: Speaker at FH Campus Wien

RC 214-5 11:22
C. The radiographers' role in radiation planning and dosimetry
N. Rodrigues*; Melres/PT*
Learning objectives:
1. To identify advantages and disadvantages of different methods for radiation planning and dosimetry.
2. To be familiar with strategies to decrease organ risk.
3. To understand the importance of adaptive radiotherapy.
Author Disclosures:
N. Rodrigues: disclosure/affirmation information not submitted

11:45
Panel discussion: The future role of radiographers in radiotherapy treatment and planning: opportunities for the advancement of roles

10:30 - 12:00 **Room M 2**

E³ - Advanced Course: Hot Topics in Emergency Radiology

E³ 218

Pregnancy and postpartum abdominal acute conditions

E³ 218-1 10:30
Chairperson's introduction
M. de la Hoz Polo*; London/UK (mdelahozpolo@gmail.com)*
Session objectives:
1. To review imaging of common acute abdominal and pelvic conditions (medical and surgical) presenting during pregnancy.
2. To review imaging of common postpartum period conditions.
3. To describe the interventional radiology procedures used to treat ante- and postpartum complications of pregnancy.
Author Disclosures:
M. de la Hoz Polo: nothing to disclose

E³ 218-2 10:36
A. The acute abdomen in pregnancy
M. Javitt*; Haifa/IL (m_javitt@rambam.health.gov.il)*
Learning objectives:
1. To briefly describe the role of CT, MRI, and US in the detection of acute abdominal conditions during pregnancy, and radiation dose effect on the foetus (radiation dose, use of contrast agents, suggested protocol, and teratogenicity).
2. To review the imaging findings of abdominal non-pregnancy related complications such as appendicitis, urolithiasis, hepatobilliary conditions (fatty liver of pregnancy, cholestasis in pregnancy, HELLP syndrome), intestinal obstruction, and vascular related complications (ovarian vein thrombosis, splenic artery aneurysm rupture).
3. To review the imaging findings of abdominal pregnancy related complications such as ectopic pregnancy, molar pregnancy, placental abruption, adnexal torsion, and pelvic inflammatory disease.
Author Disclosures:
M. Javitt: nothing to disclose

E³ 218-3 11:04
B. Acute postpartum conditions
A. D. Karaosmanoğlu*; Ankara/TR (alidevrim76@yahoo.com)*
Learning objectives:
1. To become familiar with the normal postpartum appearances on US, CT, and MRI, both immediately and up to 6 weeks postpartum.
2. To review imaging of common postpartum period conditions such as causes of postpartum haemorrhage, retaining products of conception, puerperal septic thrombophlebitis, and other infective/inflammatory puerperal conditions.
3. To discuss protocols for breastfeeding and expressing of breast milk in relation to CT and MRI imaging.
Author Disclosures:
A. D. Karaosmanoğlu: nothing to disclose

E³ 218-4 11:32
C. Interventional radiology in postpartum haemorrhage
R. Patel*; Oxford/UK*
Learning objectives:
1. To briefly review the vascular imaging features that are relevant for planning or verifying transcatheter embolisation of obstetric and gynaecologic conditions.
2. To describe the interventional radiology procedures that are used to treat various complications of pregnancy such ectopic gestational sac, aspiration of symptomatic ovarian cyst, and obstructive uropathy.
3. To describe the interventional radiology procedures that are used to treat various complications of the postpartum period, such as uterine artery embolisation (UAE) for cases of post-partum haemorrhage, drainage of postcesarean abscess collection, and treatment of vesicouterine fistula.
Author Disclosures:
R. Patel: nothing to disclose

10:30 - 12:00 **Room M 3**

Vascular

RC 215

Venous thrombotic disease

RC 215-1 10:30
Chairperson's introduction
M. Krokidis*; Athens/GR (mkrokidis@hotmail.com)*
Session objectives:
1. To understand the importance of the appropriate diagnosis and treatment of acute and chronic venous disease.
2. To become familiar with the optimal diagnostic tools.
3. To learn when and how interventional radiology techniques can help in venous thromboembolic disease.
Author Disclosures:
M. Krokidis: Consultant at Terumo

RC 215-2 10:35
A. Acute deep vein thrombosis: diagnosis, interventional radiology (IR) treatment and outcomes
G. Maleux*; Leuven/BE*
Learning objectives:
1. To learn about the clinical symptoms and diagnosis of deep vein thrombosis (DVT).
2. To become familiar with the different conservative and IR treatment options.
3. To discuss the short-, mid-, and long-term outcomes.
Author Disclosures:
G. Maleux: disclosure/affirmation information not submitted

RC 215-3 10:58
B. Diagnosis and treatment of central venous occlusions
S. D. Qanadli*; Lausanne/CH (Salah.Qanadli@chuv.ch)*
Learning objectives:
1. To learn about clinical symptoms and the appropriate diagnostic tools.
2. To become familiar with which patients IR treatment is indicated.
3. To understand how to treat a central venous occlusion using IR methods.
Author Disclosures:
S. D. Qanadli: nothing to disclose

RC 215-4 11:21
C. Chronic deep vein thrombosis: diagnosis, IR treatment and outcomes
R. Leffroy*; Dijon/FR*
Learning objectives:
1. To learn about the clinical symptoms and diagnosis of chronic DVT.
2. To become familiar with preinterventional imaging and appropriate treatment planning.
3. To discuss different IR techniques and outcomes.
Author Disclosures:
R. Leffroy: disclosure/affirmation information not submitted

11:44
Panel discussion: Should emergency treatment for deep vein thrombosis become part of IR service?

10:30 - 12:00 **Room M 4**

E³ - Advanced Course: Interactive Teaching Session for Young (and not so Young) Radiologists

E³ 221

Paediatric brain imaging

E³ 221-1 10:30
A. Head and neck emergencies in children
A. Rossi*; Genoa/IT (andrearossi@gaslini.org)*
Learning objectives:
1. To become familiar with the different entities.
2. To identify the key imaging findings.

Author Disclosures:
A. Rossi: Advisory Board at Bracco Group, Speaker at Bracco group, Speaker at Telemedicine Clinic

E³ 221-2 11:15
B. Acute neurological child beyond trauma
B. Nedregaard*; Oslo/NO (bnedr@frisurf.no)*
Learning objectives:
1. To become familiar with the most common cause of acute neurological emergencies.
2. To learn the imaging criteria for differentiation.
Author Disclosures:
B. Nedregaard: nothing to disclose

10:30 - 12:00 **Room M 5**

E³ - Advanced Course: Artificial Intelligence

E³ 220

Artificial intelligence for image reconstruction: towards deep imaging?

E³ 220-1 10:30
Chairperson's introduction
D. Le Bihan*; Gif Sur Yvette/FR (denis.lebihan@gmail.com)*
Session objectives:
1. To understand what is hype and what can be expected in deep learning based reconstruction.
2. To understand the impact of artificial intelligence vs other developments in image reconstruction.
3. To learn about the expected developments coming in the next 5 years.
Author Disclosures:
D. Le Bihan: nothing to disclose

E³ 220-2 10:36
A. Deep learning for MRI reconstruction
K. Hammernik*; London/UK (k.hammernik@imperial.ac.uk)*
Learning objectives:
1. To show how with deep learning we can learn the entire MRI reconstruction procedure.
2. To understand the advantages and disadvantages of using deep learning in MRI reconstruction.
3. To show the application of deep learning in the reconstruction of MRI musculoskeletal images.
Author Disclosures:
K. Hammernik: nothing to disclose

E³ 220-3 11:04
B. Deep learning in cardiovascular MRI
D. Rueckert*; London/UK (D.Rueckert@imperial.ac.uk)*
Learning objectives:
1. To understand how MRI acquisition time can be reduced with deep learning.
2. To understand potential artefacts related to deep learning based image reconstruction.
3. To show applications of deep learning in the reconstruction of cardiovascular MRI data.
Author Disclosures:
D. Rueckert: Consultant at IXICO, Consultant at Circle Cardiovascular Imaging, Consultant at Heartflow

E³ 220-4 11:32
C. Deep learning in CT imaging
M. M. Prokop*; Nijmegen/NL (mathias.prokop@radboudumc.nl)*
Learning objectives:
1. To learn how deep learning can be used to improve CT image quality.
2. To understand how deep learning can be used to speed up CT image acquisition.
3. To learn about clinical applications of deep learning based CT reconstruction.
Author Disclosures:
M. M. Prokop: Research/Grant Support at Canon Medical Systems, Research/Grant Support at Siemens Healthineers, Speaker at Bracco, Speaker at Bayer, Speaker at Siemens Healthineers, Speaker at Canon Medical Systems

10:30 - 12:00 **Tech Gate Auditorium**

E³ - ECR Master Class (Molecular Imaging)

E³ 226

Quantitative imaging in oncology

E³ 226-1 10:30
Chairperson's introduction
J. O'Connor*; Manchester/UK (James.O'Connor@manchester.ac.uk)*
Session objectives:
1. To understand the impact of tumour heterogeneity on diagnosis and treatment.
2. To learn the basics of quantifying heterogeneity in tumours.
3. To review the future impact of imaging heterogeneity in tumours.
Author Disclosures:
J. O'connor: Grant Recipient at Cancer Research UK, Owner at Mediknow Ltd

E³ 226-2 10:35
A. Intra- and intertumoural heterogeneity and the impact for cancer diagnostics
M. Eisenblaetter*; Freiburg/DE (michel.eisenblaetter@uniklinik-freiburg.de)*
Learning objectives:
1. To learn about tumour heterogeneity.
2. To review current strategies to explore biological heterogeneity.
3. To understand how this heterogeneity impacts diagnosis and treatment.
Author Disclosures:
M. Eisenblaetter: Speaker at Bracco Imaging Spa, Research/Grant Support at Pfizer Specialty Care

E³ 226-3 11:00
B. Quantitative image biomarkers for targeted tumour therapies
R. Garcia Figueiras*; Santiago de Compostela/ES (roberto.garcia.figueiras@sergas.es)*
Learning objectives:
1. To learn how heterogeneity can be quantified from images.
2. To understand the main classes of heterogeneity on imaging.
3. To review limits and pitfalls of features extraction.
Author Disclosures:
R. Garcia Figueiras: nothing to disclose

E³ 226-4 11:25
C. From quantitative imaging to radiomics and deep learning
H. K. Hahn*; Bremen/DE*
Learning objectives:
1. To learn how to optimise the acquisition of images for quantitative imaging.
2. To understand image processing which may impact quantification.
3. To become familiar with the concepts behind quantification, including machine learning approaches.
Author Disclosures:
H. K. Hahn: disclosure/affirmation information not submitted

11:50
Panel discussion: What can we quantify and why is it essential?

12:45 - 13:45 **Coffee & Talk 1**

Coffee & Talk (open forum) Session

Organised by ESOR

C 1

The scholar and fellow's experience

C 1-1 12:45
Chairperson's introduction
N. I. Traikova*; Plovdiv/BG (nikoletatraikova@gmail.com)*
Author Disclosures:
N. I. Traikova: nothing to disclose

C 1-2 12:50
Visiting scholar in Europe
F. Pesapane*; Milan/IT (filippopesapane@gmail.com)*
Learning objectives:
1. To understand that the mobility of radiology trainees is an indispensable prerequisite to facing new challenges, promoting collaboration among centres/systems that cannot remain isolated, positively impacting the quality of research, and applying artificial intelligence to medical imaging.
2. To become familiar with the need to promote scientific international multicentre collaboration to identify a best practice, to standardise it, and to share it.
3. To learn about ESR's role supporting international training opportunities for young radiologists, enhancing scientific mobility, and promoting cooperation between centres of different countries.
4. To become familiar with the cultural-knowledge and the networks developed during mobility that can be used by the trainees to advance in their career.
Author Disclosures:
F. Pesapane: nothing to disclose

C 1-3 12:50
Visiting scholar in USA
J. Kirchner*; Düsseldorf/DE (Julian.Kirchner@med.uni-duesseldorf.de)*
Learning objectives:
1. To learn about application process for visiting scholar in USA.
2. To understand the usefulness of getting in touch with the American medical system.
3. To appreciate to work with people from all over the world.
Author Disclosures:
J. Kirchner: nothing to disclose

C 1-4 13:04
Exchange Fellow in Europe
N. Bogveradze*; Tbilisi/GE (bogveradze.nino@gmail.com)*
Learning objectives:
1. To learn how to apply for an exchange fellowship program in Europe.
2. To understand the role of the exchange fellowship program for the participant.
3. To become familiar with all aspects of the exchange fellowship program.
4. To appreciate the chance to work in a world-leading team.
Author Disclosures:
N. Bogveradze: nothing to disclose

C 1-5 13:11
Bracco Clinical Fellow
C. Standaert*; Veurne/BE*
Learning objectives:
1. To learn how to apply for a BRACCO clinical fellowship.
2. To become familiar with the practical aspects of preparing a clinical fellowship in the UK such as language requirements, GMC application and housing.
3. To understand the advantages of clinical fellowships in centres of excellence that give the framework to become an expert radiologist in the field and stimulate research.
4. To learn about personal development and growth by conducting a fellowship abroad.
Author Disclosures:
C. Standaert: nothing to disclose

13:18
Open forum discussion

12:45 - 13:45 **Room F1**

E³ - The Beauty of Basic Knowledge: Breast

E³ 24A

Basics of mammography

Moderators:
E. M. Fallenberg; Munich/DE
K. Kinkel; Chêne-Bougeries/CH

E³ 24A-1 12:45
Cookbook for image analysis and interpretation
A. Tardivon*; Paris/FR (anne.tardivon@curie.fr)*
Learning objectives:
1. To assess mammographic image quality and mammographic breast density.
2. To recognise and name main imaging findings using the breast imaging reporting and data system (BIRADS) lexicon.
Author Disclosures:
A. Tardivon: Research/Grant Support at PHRCH -K- 2018

E³ 24A-2 13:15
Differences in mammography techniques and image analysis
S. Zackrisson*; Malmö/SE (sophia.zackrisson@med.lu.se)*
Learning objectives:
1. To learn about the technique and purpose of tomosynthesis compared to digital mammography.
2. To understand differences in reading a screening and diagnostic mammography.
3. To become familiar with work-up possibilities after a positive screening mammography, taking into account psychological consideration.
Author Disclosures:
S. Zackrisson: Speaker at Siemens Healthcare AG, Consultant at Collective Minds Radiology, Founder at Z Imagination AB

12:45 - 13:45 **Coffee & Talk 3**

Coffee & Talk (open forum) Session

C 19

Structured reporting: how to provide the key information - application to thoracic imaging

C 19-1 12:45
Chairperson's introduction
H.-U. Kauczor*; Heidelberg/DE*
Session objectives:
1. To explain the advantages of structured reports.
2. To illustrate their use in dedicated clinical indications.
3. To understand their role for practice and research.
Author Disclosures:
H.-U. Kauczor: Research/Grant Support at Siemens, Philips, Bayer, Speaker at Siemens, Philips, Astra Zeneca, Merck Sharp Dohme, Boehringer Ingelheim

C 19-2 12:50
Pulmonary embolism
B. Ghaye*; Brussels/BE (benoit.ghaye@uclouvain.be)*
Learning objectives:
1. To learn how to comment on the quality of computed tomography angiography (CTA).
2. To be able to indicate the level of arterial obstruction.
3. To learn how to report signs of pulmonary embolism severity.
Author Disclosures:
B. Ghaye: nothing to disclose

C 19-3 12:58
Pulmonary nodules in lung cancer screening
M. Silva*; Parma/IT (mariosilvamed@gmail.com)*

Learning objectives:
1. To learn about which nodule characteristics to report.
2. To be informed of which extranodular findings to report.
3. To understand the importance of mentioning guidelines for management.
Author Disclosures:
M. Silva: nothing to disclose

C 19-4 13:06
Diffuse parenchymal lung disease
H. Prosch; *Vienna/AT (helmut.prosch@meduniwien.ac.at)*
Learning objectives:
1. To become familiar with the pivotal patterns.
2. To learn how to assess change in surveillance or therapy response.
3. To consolidate knowledge about quantitative imaging biomarkers.
Author Disclosures:
H. Prosch: nothing to disclose

13:14
Open forum discussion

12:45 - 13:45 **Room G**

E³ - The Beauty of Basic Knowledge: Pancreas

E³ 25A
Acute pancreatitis

Moderator:
R. Manfredi; Rome/IT

E³ 25A-1 12:45
Atlanta classification of acute pancreatitis
T. L. Bollen; *Nieuwegein/NL (tlbollen@hotmail.com)*
Learning objectives:
1. To understand grading of acute pancreatitis: Atlanta classification.
2. To learn about the clinical impact of Atlanta classification.
3. To understand the follow up of acute pancreatitis.
Author Disclosures:
T. L. Bollen: nothing to disclose

E³ 25A-2 13:15
Role of imaging
C. Triantopoulou; *Athens/GR (ctriantopoulou@gmail.com)*
Learning objectives:
1. To learn about the diagnosis of acute pancreatitis.
2. To understand how to apply Atlanta classification to imaging.
3. To learn about new trends in the diagnosis of acute pancreatitis.
Author Disclosures:
C. Triantopoulou: nothing to disclose

12:45 - 13:15 **Room M 5**

EDiR Session

EDiR 1
An instrument to develop excellence in your career: practical session (part 1)

Moderator:
L. Oleaga Zufiria; Barcelona/ES

EDiR 1-1 12:45
EDiR teaser
L. Oleaga Zufiria; *Barcelona/ES (lauraoleaga@gmail.com)*
Learning objectives:
1. To present the EDiR examination.
2. To show the structure of the EDiR exam.
3. To review some practical cases: multiple response questions, short cases, and CORE cases.
Author Disclosures:
L. Oleaga Zufiria: Consultant at TMC Academy

EDiR 1-2 13:05
Tips from an EDiR holder
A. Pons Escoda; *Barcelona/ES (aponse@hotmail.com)*
Learning objectives:
1. To review ten essential tips to succeed in the EDiR.
2. To highlight the importance of the EDiR.
3. To explain the advantages of having the EDiR.
Author Disclosures:
A. Pons Escoda: nothing to disclose

14:00 - 15:30 **Room N**

EuroSafe Imaging Session

EU 3
Cumulative dose: too often and too much

EU 3-1/EU 3-2 14:00
Chairpersons' introduction
K. Applegate; *Zionsville, IN/US (keapple5123@gmail.com)*
G. Frija; *Paris/FR (guy.frija@aphp.fr)*
Session objectives:
1. To understand the clinical context of cumulative dose.
2. To report on some data from Europe.
3. To propose technical and clinical solutions to avoid a too high cumulative dose.
Author Disclosures:
K. Applegate: nothing to disclose, G. Frija: nothing to disclose

EU 3-3 14:10
Cumulative doses: an awareness problem
J. Vassileva; *Vienna/AT (J.N.Vassileva@gmail.com)*
Learning objectives:
1. To present a summary of the recent data on patient cumulative exposure from recurrent imaging procedures, and the actions proposed during the IAEA meeting on this topic.
2. To ensure medical benefits always exceed risks for patients who need frequent radiological imaging for diagnosing and monitoring their diseases.
Author Disclosures:
J. Vassileva: nothing to disclose

EU 3-4 14:30
Defining scenarios with a risk for cumulative dose
F. Kainberger; *Vienna/AT (franz.kainberger@meduniwien.ac.at)*
Learning objectives:
1. To identify scenarios where patients have an increased probability of reaching or exceeding the cumulative dose limits.
2. To develop methods of early detection of scenarios with a potential higher dose risk, and how alert systems can be implemented.
3. To learn how to document and communicate in situations with a higher risk of cumulative dose with a view on the patient's outcome.
Author Disclosures:
F. Kainberger: nothing to disclose

EU 3-5 14:50
EuroSafe Imaging: opportunities to reduce cumulative doses in children
R. Seuri; *HUS, Helsinki/FI (raija.seuri@hus.fi)*
Learning objectives:
1. To illustrate that there are groups of patients at risk of receiving high cumulative doses during childhood.
2. To understand the role of justification in avoiding unnecessary high cumulative doses.
3. To understand the role of dose tracking in optimisation.
Author Disclosures:
R. Seuri: nothing to disclose

15:10
Panel discussion: Next steps for reducing cumulative doses

14:00 - 15:30 **Room O**

Chest

RC 304

Thoracic emergencies: part 1

Moderator:
B. Ghaye; Brussels/BE

RC 304-1 14:00
A. Chest trauma
M. Brink; *Nijmegen/NL (Mobrink@hotmail.com)*
Learning objectives:
1. To describe the CT features of pulmonary contusion.
2. To learn about signs of diaphragmatic rupture.
3. To know when to suspect and how to confirm aortic injury.
Author Disclosures:
M. Brink: Grant Recipient at Canon Medical Systems, Speaker at Canon Medical Systems

RC 304-2 14:22
B. Lung ultrasound: only for the intensive care doctors?
D. Lichtenstein; *Paris/FR (D.Licht@free.fr)*
Learning objectives:
1. To become familiar with the normal and abnormal findings.
2. To be aware of the limits of lung ultrasound.
3. To learn how to incorporate lung ultrasound in the diagnostic workup of intensive care patients.
Author Disclosures:
D. Lichtenstein: nothing to disclose

RC 304-4 14:45
C. Infectious emergencies
I. J. Hartmann; *Zwijndrecht/NL (i.j.c.hartmann@gmail.com)*
Learning objectives:
1. To learn about signs of invasive fungal infections.
2. To review the signs of pneumocystis infection.
3. To learn about acute viral infections of the chest.
Author Disclosures:
I. J. Hartmann: nothing to disclose

RC 304-3 15:07
D. Diagnosing pulmonary embolism (PE)
G. Aviram; *Tel-Aviv/IL (aviramgalit@hotmail.com)*
Learning objectives:
1. To learn about optimising CT angiography indications.
2. To be aware of the causes of imaging inconclusiveness.
3. To learn how to identify signs of acute right ventricular dysfunction.
Author Disclosures:
G. Aviram: Research/Grant Support at Philips Healthcare

14:00 - 15:30 **Room E**

E³ - Rising Stars Programme: Basic Session

BS 3

Musculoskeletal: essentials of trauma imaging

Moderator:
A. S. Vieira; Porto/PT

BS 3-1 14:00
Fractures and dislocations in the extremities
R. Sutter; *Zurich/CH*
Learning objectives:
1. To describe imaging features of fractures and dislocations.
2. To list imaging findings that help in identifying subtle fractures.
3. To explain imaging features of fracture healing and non-healing.
Author Disclosures:
R. Sutter: nothing to disclose

BS 3-2 14:30
Acetabular fractures demystified
Ü. Aydingöz; *Ankara/TR (ustunaydingoz@yahoo.com)*
Learning objectives:
1. To describe the rationale behind the classification of acetabular fractures.
2. To explain imaging findings of acetabular fractures important for the orthopaedist.
Author Disclosures:
Ü. Aydingöz: nothing to disclose

BS 3-3 15:00
Cervical spine trauma
P. J. MacMahon; *Dublin/IE (pmacmahon@mater.ie)*
Learning objectives:
1. To describe the mechanisms of cervical spine injury.
2. To explain imaging findings of cervical spine injury.
Author Disclosures:
P. J. Macmahon: nothing to disclose

14:00 - 15:30 **Room F1**

Oncologic Imaging

RC 316

Peritoneal carcinomatosis: the role of imaging in detection and treatment planning?

Moderator:
M. J. Lahaye; Amsterdam/NL

RC 316-1 14:00
A. Detection and characterisation: tips and tricks
L. Fournier; *Paris/FR*
Learning objectives:
1. To become familiar with imaging strategies for assessment of peritoneal carcinomatosis.
2. To discuss multimodal concepts for detection and characterisation.
3. To learn about the limitations of non-invasive imaging approaches.
Author Disclosures:
L. Fournier: Grant Recipient at Invectys, Speaker at General Electric, Speaker at Sanofi, Speaker at Bayer, Speaker at Pfizer, Speaker at Novartis, Speaker at Janssen, Research/Grant Support at Philips, Research/Grant Support at Ariana Pharma, Research/Grant Support at Evolucare

RC 316-2 14:30
B. Surgical view: citoreductive surgery
A.-S. Bats; *Paris/FR (anne-sophie.bats@aphp.fr)*
Learning objectives:
1. To understand the surgeon's view on imaging strategies.
2. To learn about surgical strategies for treatment of peritoneal carcinomatosis.
3. To discuss the role of the radiologist in preoperative management.
Author Disclosures:
A.-S. Bats: nothing to disclose

RC 316-3 15:00
C. Imaging in treatment planning and follow-up
G. Zamboni; *Verona/IT (gzamboni@hotmail.com)*
Learning objectives:
1. To become familiar with the role of imaging for systemic and local treatment planning.
2. To discuss the value of imaging modalities.
3. To understand the limitations and pitfalls of imaging.
Author Disclosures:
G. Zamboni: nothing to disclose

14:00 - 15:30 **Room F2**

Breast

RC 302

New developments in mammographic breast imaging

RC 302-1 14:00
Chairperson's introduction
M. Sklair-Levy*; Ramat Gan/IL (miri.sklairlevy@sheba.health.gov.il)*
Session objectives:
1. To recognise the advantages and disadvantages of digital breast tomosynthesis and contrast enhanced mammography techniques.
2. To learn about the challenges between different 3D mammography systems.
3. To understand the future potential of new breast imaging techniques in lesion assessment.
Author Disclosures:
M. Sklair-Levy: nothing to disclose

RC 302-2 14:05
A. Tomo, 2D-Synthetic and artefacts: is it the same in all machines?
I. Sechopoulos*; Nijmegen/NL (ioannis.sechopoulos@radboudumc.nl)*
Learning objectives:
1. To know the different scan and reconstruction protocols.
2. To learn the impact on resolution and lesion delineation.
3. To get an idea of adequate quality control in tomosynthesis.
Author Disclosures:
I. Sechopoulos: Research/Grant Support at Siemens Healthcare, Research/Grant Support at Canon Medical Systems, Speaker at Siemens Healthcare, Speaker at Hologic Inc.

RC 302-3 14:28
B. Contrast mammography alone or combined with tomosynthesis: which is the way to go?
P. Clauser*; Vienna/AT (clauser.p@hotmail.it)*
Learning objectives:
1. To learn the basics of contrast enhanced mammography.
2. To understand the role of these new techniques in different clinical settings.
3. To learn about the new potential of combining mammography with molecular imaging, optical imaging, and texture analysis.
Author Disclosures:
P. Clauser: Speaker at Siemens

RC 302-4 14:51
C. Phase-contrast mammography and future techniques
M. Stampanoni*; Zurich/CH (marco.stampanoni@psi.ch)*
Learning objectives:
1. To understand the technique of phase-contrast breast imaging.
2. To learn about the potential in lesion differentiation.
3. To get an idea of further implementation and developments.
Author Disclosures:
M. Stampanoni: Board Member at GratXray AG, Shareholder at GratXray AG

15:14
Panel discussion: Mammography, digital breast tomosynthesis, and contrast-enhanced mammography: where will we stand in 10 years?

14:00 - 15:00 **Coffee & Talk 3**

Coffee & Talk (open forum) Session

Organised by WHO

C 34

Oncologic imaging and the World Health Organisation (WHO)

C 34-1 14:00
Chairperson's introduction
E. Denton*; Norwich/UK (erika.denton@nnuh.nhs.uk)*
Session objectives:
1. To understand how the International Agency for Research on Cancer IARC at The World Health Organisation currently collaborates with radiology experts.
2. To understand the outputs and publications from IARC and how imaging involvement is proposed and how radiology will be reflected in future governance and publications.
3. To understand current oncologic imaging standards for reporting.
Author Disclosures:
E. Denton: nothing to disclose

C 34-2 14:05
The work of the World Health Organisation in oncologic imaging
I. A. Cree*; Lyons/FR (creei@iarc.fr)*
Learning objectives:
1. To understand work of the World Health Organisation Classification of Tumours Editorial Board.
2. To understand the publications produced by the WHO for oncological reporting and where imaging will be represented.
Author Disclosures:
I. A. Cree: nothing to disclose

C 34-3 14:15
How do radiologists currently standardise oncologic reporting?
A. Rockall*; London/UK (a.rockall@imperial.ac.uk)*
Learning objectives:
1. To understand the standards radiologists currently use to report oncologic imaging.
2. To understand how international standards might impact oncologic imaging.
Author Disclosures:
A. Rockall: Speaker at Guerbet

14:25
Open forum discussion

14:00 - 15:30 **da Vinci (Room D1)**

Genitourinary

RC 307

The retroperitoneal "non-renal" mass

RC 307-1 14:00
Chairperson's introduction
M. Bertolotto*; Trieste/IT (bertolot@units.it)*
Session objectives:
1. To understand the imaging features of primary retroperitoneal tumours.
2. To know the imaging role in patients with "functioning" adrenal lesions.
3. To be able to recognise non-neoplastic retroperitoneal diseases and to guide patient management.
Author Disclosures:
M. Bertolotto: nothing to disclose

RC 307-2 14:05
A. Imaging primary retroperitoneal tumours
G. Heinz*; St. Pölten/AT (gertraud.heinz@stpoelten.lknoe.at)*
Learning objectives:
1. To know the imaging findings that allow recognising a mass as retroperitoneal.
2. To understand how to differentiate among different retroperitoneal tumours.
3. To be able to provide guidance to the surgical approach of these lesions.
Author Disclosures:
G. Heinz: nothing to disclose

RC 307-3 14:28
B. The "functioning" adrenal mass
A. Cieszanowski*; Warsaw/PL (andrzej.cieszanowski@wum.edu.pl)*
Learning objectives:
1. To understand the role of radiology in patients with "functioning" adrenal tumours.
2. To know how to look for small/difficult to see "functioning" lesions.
3. To know how to provide guidance to the surgeon who is planning a minimally invasive surgical approach.

Author Disclosures:
A. Cieszanowski: Speaker at Philips, Speaker at Siemens, Speaker at Bayer, Speaker at GE

RC 307-4 14:51
C. "Non-neoplastic" retroperitoneal diseases
M. Scaglione*; Middlesborough/UK (mscaglione@tiscali.it)*
Learning objectives:
1. To know the imaging features of retroperitoneal abscesses and haematomas.
2. To understand the role of imaging in patients with retroperitoneal fibrosis.
3. To understand how radiology can help planning management of these lesions.
Author Disclosures:
M. Scaglione: nothing to disclose

15:14
Panel discussion: Highlights in non-renal retroperitoneal masses

14:00 - 15:30 **Darwin (Room D2)**

EFRS Workshop

EFRS WS 3
Growing radiography research

Moderators:
A. England; Manchester/UK
J. McNulty; Dublin/IE

EFRS WS 3-1 14:00
Building research collaboration: my top tips
C. Buissink*; Groningen/NL (c.buissink@pl.hanze.nl)*
Learning objectives:
1. To explore key considerations to establishing good research collaborations.
2. To appreciate how to avoid unsuccessful collaborations.
Author Disclosures:
C. Buissink: nothing to disclose

EFRS WS 3-2 14:15
The EFRS Research Hub
L. A. Rainford*; Dublin/IE (louise.rainford@ucd.ie)*
Learning objectives:
1. To understand the purpose of the EFRS Research Hub.
2. To review aspects of the EFRS Research Hub launched at ECR 2019.
3. To consider future opportunities and the value of the EFRS Research Hub.
Author Disclosures:
L. A. Rainford: nothing to disclose

EFRS WS 3-3 14:30
Grant writing: my top tips
K. Knapp*; Exeter/UK (K.M.Knapp@exeter.ac.uk)*
Learning objectives:
1. To explore key considerations for writing a successful grant application.
2. To consider intellectual property issues when writing a grant.
3. To understand the common pitfalls in grant writing.
Author Disclosures:
K. Knapp: Author at Carver's Medical Imaging, Research/Grant Support at Wellcome / Stryker

EFRS WS 3-4 14:45
Considering doctoral studies: my top tips
J. McNulty*; Dublin/IE (jonathan.mcnulty@ucd.ie)*
Learning objectives:
1. To learn about the current status of doctoral opportunities across Europe.
2. To explore key considerations to make before commencing doctoral studies.
Author Disclosures:
J. McNulty: nothing to disclose

EFRS WS 3-5 15:00
Making the most of the EFRS Radiographer Research Network
A. England*; Manchester/UK (A.England@salford.ac.uk)*
Learning objectives:
1. To learn about the EFRS Radiographer Research Network.
2. To consider how the EFRS Radiographer Research Network could support research-related activities.
Author Disclosures:
A. England: nothing to disclose

15:15
Panel discussion: Is radiographer research essential for all radiographers?

14:00 - 15:30 **Room G**

GI Tract

RC 301
Imaging the acute abdomen: new insights

Moderator:
D. E. Malone; Dublin/IE

RC 301-1 14:00
A. Acute mesenteric ischaemia
M. Ronot*; Clichy/FR (maxime.ronot@aphp.fr)*
Learning objectives:
1. To learn about the different types of acute mesenteric ischaemia and the clinical conditions in which they occur.
2. To understand how the imaging features are related to the underlying pathophysiology.
3. To appreciate the role of endovascular interventional procedures in the management of acute mesenteric ischaemia.
Author Disclosures:
M. Ronot: nothing to disclose

RC 301-2 14:30
B. Low-dose abdominal CT for evaluating suspected appendicitis
K. H. Lee*; Seongnam/KR (kholeemail@gmail.com)*
Learning objectives:
1. To emphasise the need for reducing radiation exposure in adolescents and young adults with suspected appendicitis.
2. To critically review published evidence indicating that low-dose CT is comparable with normal-dose CT for diagnostic performance and clinical outcome.
3. To review low-dose CT imaging techniques and other practical issues for the successful implementation of low-dose CT in practice.
Author Disclosures:
K. H. Lee: Grant Recipient at Korea Health Technology R&D Project through the Korea Health Industry Development Institute of the Ministry of Health & Welfare, , Grant Recipient at Seoul National University Bundang Hospital, Grant Recipient at Dasol Life Science, Grant Recipient at Bracco Imaging Korea, Grant Recipient at GE Healthcare Medical Diagnostics, Korea, Grant Recipient at Mid-Career Researcher Program of National Research Foundation of Korea

RC 301-3 15:00
C. Acute colonic diverticulitis
S. Schmidt*; Lausanne/CH (sabine.schmidt@chuv.ch)*
Learning objectives:
1. To review the typical and atypical imaging features of acute colonic diverticulitis and their influence on patient management.
2. To become familiar with the complications and the most important differential diagnoses of acute colonic diverticulitis.
3. To understand the importance of image-guided interventions for the management of complicated acute colonic diverticulitis.
Author Disclosures:
S. Schmidt: nothing to disclose

14:00 - 15:30 **Room K**

E³ - European Diploma Prep Session

E³ 323

Interventional

E³ 323-1 14:00
Chairperson's introduction
J. I. Bilbao; *Pamplona/ES (jibilbao@unav.es)*
Session objectives:
1. To understand the principles and techniques of angiography and image-guided interventions.
2. To become familiar with the most common percutaneous and intra-arterial interventions in oncology.
3. To describe the most common vascular interventions.
Author Disclosures:
J. I. Bilbao Jaureguizar: Speaker at Sirtex Medical

E³ 323-2 14:06
A. Basic principles of angiography and image-guided interventions
L. Cambj-Sapunar; *Split/HR*
Learning objectives:
1. To describe the normal anatomy and normal variants of the arterial and venous vascular system.
2. To understand the importance of pre-procedure planning and selection of image guidance techniques.
3. To explain basic percutaneous image-guided techniques, including arterial access as well as biopsy and drainage.
Author Disclosures:
L. Cambj-Sapunar: nothing to disclose

E³ 323-3 14:34
B. Image-guided interventions in oncology
T. Bilhim; *Lisbon/PT (tiagobilhim@hotmail.com)*
Learning objectives:
1. To describe the basic technical methodological principles and indications of imaging-guided interventions in oncological disorders, including thermal ablation techniques.
2. To understand the principles and indications for vascular interventions in cancer, e.g., transarterial treatment of liver tumours.
3. To become familiar with post-treatment follow-up, highlighting normal and abnormal pathological imaging findings.
Author Disclosures:
T. Bilhim: Consultant at Merit Medical, Consultant at Terumo, Speaker at Cook, Speaker at Philips, Shareholder at EmbolX

E³ 323-4 15:02
C. Vascular interventions
D. Kuhelj; *Ljubljana/SI (dimitrij.kuhelj@guest.arnes.si)*
Learning objectives:
1. To become familiar with the pretreatment imaging flow-chart in atherosclerotic diseases.
2. To describe indications and techniques for arterial angioplasty and stenting.
3. To explain techniques of arterial embolisation and coiling, as well as thromboaspiration.
Author Disclosures:
D. Kuhelj: Speaker at ABBOTT

14:00 - 15:30 **Room M 2**

E³ - Advanced Course: Hot Topics in Emergency Radiology

E³ 318

Assessing neurological complications and brain death in ICU patients

E³ 318-1 14:00
Chairperson's introduction
M. C. Çalli; *Izmir/TR (cem.calli@gmail.com)*
Session objectives:
1. To become familiar with common and less frequent neurological complications in ICU patients.
2. To be able to proactively help the ICU team to best diagnose and manage these complications.
3. To become familiar with the protocols in imaging of brain death and potential organ donation.
Author Disclosures:
M. C. Çalli: nothing to disclose

E³ 318-2 14:05
A. CT and MRI in neurologically impaired ICU patients
F. J. A. Meijer; *Nijmegen/NL (Anton.Meijer@radboudumc.nl)*
Learning objectives:
1. To understand the main neurological complication in intensive care patients.
2. To understand the value of MRI in coma patients with unclear brain pathology.
3. To understand how different imaging sequences of CT and MRI can help to identify and classify neurological complications.
Author Disclosures:
F. J. A. Meijer: Speaker at Canon Medical Systems at ECR 2020

E³ 318-3 14:30
B. Brain death evaluation
O. Bronov; *Moscow/RU (doctorbronov@gmail.com)*
Learning objectives:
1. To become familiar with the most typical constellations.
2. To learn about appropriate imaging protocols.
3. To understand the context of transplantation units and imaging of potential organ donors.
Author Disclosures:
O. Bronov: nothing to disclose

E³ 318-4 14:55
C. Imaging of potential organ donors
S. Roosendaal; *Amsterdam/NL (stefanmed@fastmail.nl)*
Learning objectives:
1. To learn about correct indication.
2. To learn about appropriate imaging protocols.
3. To be able proceed appropriately in the case of inconclusive findings.
Author Disclosures:
S. Roosendaal: nothing to disclose

15:20
Panel discussion: Combined imaging of brain death and organ donation: is this feasible?

14:00 - 15:30 **Room M 3**

Head and Neck

RC 308

Head and neck imaging: when does it become abnormal?

Moderator:
N. Thieme; Berlin/DE

RC 308-1 14:00
A. Normative measures in the temporal bone
F. Veillon; *Strasbourg/FR (francis.veillon@chru-strasbourg.fr)*
Learning objectives:
1. To learn about the normal appearance of the temporal bone.
2. To understand how to assess when the anatomy is abnormal.
3. To show clinical cases where structures are too large or too small.
Author Disclosures:
F. Veillon: nothing to disclose

RC 308-2 14:22
B. Normative measures in the orbit
R. Kohler; *Sion/CH*

Learning objectives:
1. To understand differences in the size and shape of the eye.
2. To learn about the normal appearance and anatomic variations of the optic nerve.
3. To use clinical cases to discuss normative measures of the soft tissue structures in the orbit.
Author Disclosures:
R. Kohler: Grant Recipient at not yet known

RC 308-3 14:45
C. Anatomical variations of importance in dental implant planning
S. Cappabianca*; Naples/IT (salvatore.cappabianca@unicampania.it)*
Learning objectives:
1. To discuss the role of cone beam CT in dental imaging.
2. To review anatomical variations of the mandibular canal and interforaminal region.
3. To show examples of implant injuries.
Author Disclosures:
S. Cappabianca: nothing to disclose

RC 308-4 15:07
D. Growing up or growing wrong
B. Verbist*; Leiden/NL (b.m.verbist@lumc.nl)*
Learning objectives:
1. To learn about the normal development of the head and neck area.
2. To understand how to assess clinically-relevant developmental defects.
3. To highlight important variants using clinical cases.
Author Disclosures:
B. Verbist: Grant Recipient at HPTC-Varian consortium, Research/Grant Support at Advanced Bionics, Research/Grant Support at Cochlear

14:00 - 15:30 **Room M 4**

E³ - Advanced Course: Interactive Teaching Session for Young (and not so Young) Radiologists

E³ 321

Paediatric radiology for the general radiologist

E³ 321-1 14:00
A. Pitfalls in paediatric chest and abdomen
B. Coley*; Columbus, OH/US (brian.coley@cchmc.org)*
Learning objectives:
1. To review the basic principles of the paediatric chest radiographs through common mistakes.
2. To emphasise pitfalls when imaging the paediatric abdomen.
3. To learn to avoid the most common pitfalls.
Author Disclosures:
B. Coley: Author at Elsevier, Board Member at Neoview

E³ 321-2 14:45
B. Paediatric musculoskeletal imaging: normal variants or real injuries?
F. M. Saez Garmendia*; Bilbao/ES (fersaez@yahoo.com)*
Learning objectives:
1. To become familiar with the normal variants.
2. To identify the key imaging findings to differentiate between normal variants and disease.
3. To learn how to integrate age, location, and clinical history with the radiological features before establishing a diagnosis.
Author Disclosures:
F. M. Saez Garmendia: nothing to disclose

14:00 - 15:30 **Room M 5**

E³ - Advanced Course: Artificial Intelligence

E³ 320

Artificial intelligence and translations to clinical practice

E³ 320-1 14:00
Chairperson's introduction
W. J. Niessen*; Rotterdam/NL (w.niessen@erasmusmc.nl)*
Session objectives:
1. To become familiar with international initiatives to bring machine learning and radiology communities together.
2. To discuss how societies such as ESR, RSNA, and ACR should work together with the machine learning community to bring artificial intelligence into clinical practice.
3. To understand the complementary nature of data science and medical imaging.
Author Disclosures:
W. J. Niessen: Shareholder at Quantib BV, Founder at Quantib BV, Consultant at Quantib BV

E³ 320-2 14:06
A. Artificial intelligence (AI) use cases
K. Dreyer*; Boston, MA/US*
Learning objectives:
1. To introduce the audience to the AI use cases as developed by the American College of Radiology.
2. To learn about an ecosystem for developing AI algorithms that can be translated to clinical practice.
3. To discuss hurdles and proposed solutions in getting AI techniques regulatory approved.
Author Disclosures:
K. Dreyer: nothing to disclose

E³ 320-3 14:34
B. Challenges to objectively compare performance of AI applications
L. Maier-Hein*; Heidelberg/DE (l.maier-hein@dkfz-heidelberg.de)*
Learning objectives:
1. To learn the outcomes of a review of more than 150 challenges in medical imaging.
2. To learn about the metrics allowing the objective evaluation of AI algorithm performance.
3. To understand how new developments in AI challenges help to objectively evaluate the performance of algorithms.
Author Disclosures:
L. Maier-Hein: nothing to disclose

E³ 320-4 15:02
C. How far are we in getting AI into clinical practice?
L. Marti-Bonmati*; Valencia/ES (Luis.Marti@uv.es)*
Learning objectives:
1. To critically review the current level of AI adoption in clinical practice.
2. To understand the need of data scientists working in radiology departments.
3. To discuss what next steps need to be taken in order to increase take-up in clinical practice.
Author Disclosures:
L. Marti-Bonmati: nothing to disclose

16:00 - 17:30 **Room X**

Imaging Informatics

RC 405

Effect of the EU General Data Protection Regulations (GDPR): moving patients' data across hospitals, regions, countries

Moderator:
O. Ratib; Geneva/CH

RC 405-1 16:00
A. The GDPR: an overview
C. D. Becker; *Geneva/CH*
Learning objectives:
1. To learn about the content of the GDPR.
2. To understand the effects of GDPR for scientific use of imaging data.
3. To become familiar with the terminology as used in GDPR.
Author Disclosures:
C. D. Becker: nothing to disclose

RC 405-2 16:25
B. Transferring patients' data across hospitals, regions, countries: pros and cons
E. Kotter; *Freiburg/DE (elmar.kotter@uniklinik-freiburg.de)*
Learning objectives:
1. To understand how imaging data can be shared.
2. To learn about the influence of GDPR on data sharing.
3. To appreciate the challenges when sharing imaging data.
Author Disclosures:
E. Kotter: nothing to disclose

RC 405-3 16:50
C. Anonymous or pseudo-anonymous 2D-3D data: is privacy really warranted?
T. de Bondt; *Antwerp/BE (timo.debondt@gmail.com)*
Learning objectives:
1. To learn about the methods to de-identify (imaging) data.
2. To understand the pitfalls of de-identification methods.
3. To understand how to approach de-identification for research.
Author Disclosures:
T. de Bondt: nothing to disclose

RC 405-4 17:10
D. Management of data for clinical trials
D. Regge; *Candiolo-Torino/IT*
Learning objectives:
1. To learn about data management for clinical trials.
2. To understand imaging biobank concepts.
3. To appreciate the requirements for building proper imaging biobanks.
Author Disclosures:
D. Regge: Speaker at GE Medical Systems

16:00 - 17:00 **Coffee & Talk 1**

Coffee & Talk (open forum) Session

Organised by ESOR

C 2

Quality and standards

Moderator:
H.-U. Kauczor; Heidelberg/DE

C 2-1 16:00
What a fellow should learn about "Quality and Standards"
A. Brady; *Cork/IE (adrianbrady@me.com)*
Learning objectives:
1. To understand the need for common standards in the delivery of radiology services.
2. To learn about the ways the quality of radiological service delivery can be measured and enhanced.
3. To appreciate the benefits of patient satisfaction and safety when maintaining quality standards in radiology.
Author Disclosures:
A. Brady: nothing to disclose

C 2-2 16:10
What a fellow wants to learn about "Quality and Standards"
M. Marolt Music; *Ljubljana/SI (mmusic@onko-i.si)*
Learning objectives:
1. To understand the importance of quality control in a radiology department.
2. To become familiar with radiology standards in a fellow's daily practice.
3. To consider the role of radiology fellows in improving quality in radiology.
Author Disclosures:
M. Marolt Music: nothing to disclose

C 2-3 16:20
Role of radiographers in "Quality and Standards"
H. H. Hjemly; *Sorumsand/NO (hakon@radiograf.no)*
Learning objectives:
1. To learn about radiographers' scope of practise related to quality assurance and quality control in medical imaging.
2. To understand the essential role radiographers have in the radiological team to assure the delivery of safe, cost-effective, and high-quality diagnostic imaging.
3. To become familiar with recommended learning objectives related to quality and standards for radiography students.
Author Disclosures:
H. H. Hjemly: nothing to disclose

C 2-4 16:30
Role of structured reporting to foster "Quality and Standards"
W. Sommer; *Munich/DE*
Learning objectives:
1. To learn about different forms of structured reporting.
2. To understand the implication of structured reporting on report quality and completeness.
Author Disclosures:
W. Sommer: Founder at Smart Reporting GmbH, CEO at Smart Reporting GmbH

16:40
Open forum discussion

16:00 - 17:30 **Room N**

EuroSafe Imaging Session

EU 4a

Why do we need to know radiation doses in imaging procedures?

Moderator:
G. N. Paulo; Coimbra/PT

EU 4a-1 16:00
Chairperson's introduction
E. Vaño; *Madrid/ES (eliseov@med.ucm.es)*
Session objectives:
1. To highlight the importance of the dosimetric aspects for the optimisation of imaging procedures as required by the European directive.
2. To recognise the differences between the dosimetric quantities used for diagnostic reference levels and those used for the epidemiological studies and population dose evaluation.
3. To identify the benefits and limitations of the automatic patient dose registries in imaging procedures.
Author Disclosures:
E. Vaño: nothing to disclose

EU 4a-2 16:10
Relevance of patient dose evaluation in the MEDIRAD project
J. Damilakis*; Iraklion/GR (John.Damilakis@med.uoc.gr)*
Learning objectives:
1. To learn about the objectives of the MEDIRAD project and the expected impact on radiology practice.
2. To appreciate the potential of the automatic patient dose registries to improve epidemiological research.
3. To understand the role of the different dosimetric tools developed and used by MEDIRAD to improve the accuracy of patient dose evaluations.
Author Disclosures:
J. Damilakis: Research/Grant Support at European Commission H2020

EU 4a-3 16:25
Diagnostic reference levels in paediatrics
C. Granata*; Genoa/IT*
Learning objectives:
1. To learn the importance of patient dose reduction in paediatric imaging and the relevance of the European guidelines on diagnostic reference levels.
2. To appreciate the difficulties in collecting and analysing patient dose values in paediatric imaging, but the need to audit these doses.
3. To understand the importance of guidelines to improve the radiation protection in paediatric imaging and the evaluation of population dose in paediatrics.
Author Disclosures:
C. Granata: Speaker at Guerbet Italia

EU 4a-4 16:40
Diagnostic reference levels (DRLs) and image quality: the need to use clinical indication
E. P. Efstathopoulos*; Alimos/GR (stathise@med.uoa.gr)*
Learning objectives:
1. To learn what diagnostic reference levels are and what they are not, and the limitations of DRLs.
2. To appreciate the trade-off between radiation dose and image quality.
3. To understand the need for the establishment of clinical indication-based DRLs.
Author Disclosures:
E. P. Efstathopoulos: nothing to disclose

EU 4a-5 16:55
Optimisation and radiation dose in medical imaging
R. M. Sanchez*; Madrid/ES (robertomariano.sanchez@salud.madrid.org)*
Learning objectives:
1. To learn that the new European directive requires estimating, registering, and analysing patient dose values for medical imaging.
2. To appreciate the role of automatic patient dose registries in optimisation, and the impact of new technology in reducing patient doses in medical imaging.
3. To understand the differences between the different dosimetric quantities to optimise the imaging procedures and to estimate population doses.
Author Disclosures:
R. M. Sanchez: nothing to disclose

17:10
Panel discussion: What basic dosimetric information in medical imaging has to be known by the referrers, by the radiologists, and by the patients?

16:00 - 17:30 **Room O**

Chest

RC 404
Thoracic emergencies: part 2

Moderator:
G. Mostbeck; Vienna/AT

RC 404-1 16:00
A. Emergencies in thoracic oncology
C. Beigelman-Aubry*; Lausanne/CH*
Learning objectives:
1. To learn about various causes of dyspnea in thoracic oncology.
2. To learn about cardiac complications of thoracic malignancies.
3. To learn how to suggest an appropriate differential diagnosis.
Author Disclosures:
C. Beigelman-Aubry: Speaker at Gilead, Speaker at Boehringer, Speaker at Astra Zeneca

RC 404-2 16:22
B. Haemoptysis
A. Khalil*; Paris/FR (antoine.khalil@aphp.fr)*
Learning objectives:
1. To understand the role of multidetector CT angiography.
2. To learn about the planning of endovascular interventions.
Author Disclosures:
A. Khalil: nothing to disclose

RC 404-3 16:45
C. Non-ischaemic cardiac emergencies
C. Loewe*; Vienna/AT (christian.loewe@meduniwien.ac.at)*
Learning objectives:
1. To learn how to evaluate acute pericarditis.
2. To learn how to explore patients with suspected myocarditis.
3. To learn about takotsubo features on MRIs.
Author Disclosures:
C. Loewe: Speaker at Siemens Healthineers; , Speaker at BRACCO, Speaker at GE Healthcare

RC 404-4 17:07
D. Postoperative and iatrogenic complications
J. D. Dodd*; Dublin/IE (jonniedodd@gmail.com)*
Learning objectives:
1. To learn about signs of bronchopleural fistula and lobar torsion.
2. To review the signs of chemotherapy-induced pulmonary toxicity.
3. To learn about thoracic complications of interventional radiology.
Author Disclosures:
J. D. Dodd: Speaker at Boehringer Ingelheim, Research/Grant Support at St. Vincent's Foundation, Research/Grant Support at FP7 Program of the European Commission

16:00 - 17:30 **Coffee & Talk 2**

EuroSafe Imaging Session

EU 4b
Building capacity and quality/safety awareness in Africa

Moderators:
M. Abdel-Wahab; Vienna/AT
S. Abdulrazak; Vienna/AT
G. Frija; Paris/FR

C11-1/C 11-2/C 11-3 16:00
Introduction
B. Brkljačić*; Zagreb/HR*
G. Frija*; Paris/FR (guy.frija@aphp.fr)*
S. Abdulrazak*; Vienna/AT*
Author Disclosures:
B. Brkljačić: disclosure/affirmation information not submitted, G. Frija: nothing to disclose, S. Abdulrazak: disclosure/affirmation information not submitted

C 11-4 16:20
Strengthening radiology in Africa: the IAEA multifactorial approach
D. Paez*; Vienna/AT (d.paez@iaea.org)*
Learning objectives:
1. To provide an overview of IAEA's capacity building activities in Africa.
2. To learn how African countries can concretely benefit from IAEA support.
3. To explore synergies between IAEA, ESR, and Africa.
Author Disclosures:
D. Paez: nothing to disclose

C 11-5 16:30
IAEA policy in Africa
P. Johnston*; Vienna/AT*
Learning objectives:
1. To provide an overview of IAEA's efforts to promote radiation protection in patients in Africa.
2. To understand the challenges and opportunities to improve patient safety in Africa through the demonstration of successful examples.
3. To provide a roadmap for improving radiation protection of patient activities in Africa.
Author Disclosures:
P. Johnston: disclosure/affirmation information not submitted

C 11-6 16:40
African Society of Radiology (ASR) expectations
T. El-Diasty*; Mansoura/EG (teldiasty@hotmail.com)*
Learning objectives:
1. To understand the role of the African Society of Radiology in promoting quality and safety in radiology practice in Africa.
2. To understand the needs of different African countries.
3. To discuss methods of promoting the exchange of knowledge between African countries via ESR and IAEA.
Author Disclosures:
T. El-Diasty: nothing to disclose

C 11-7 16:50
EuroSafe Imaging Star concept in Africa
B. Mansouri*; Algiers/DZ (boudjema.mansouri@gmail.com)*
Learning objectives:
1. To integrate the AFROSAFE Rad Stars initiative into the AFROSAFE Rad radiation safety campaign (action plan 2019-2021).
2. To define new criteria and rates adapted for the specificities of African countries, the practice of medical imaging, and the implementation of radiation protection.
3. To learn about the impact of EuroSafe Imaging on the launch of AFROSAFE Rad Stars.
Author Disclosures:
B. Mansouri: nothing to disclose

C 11-8/**C 11-9** 17:00
Introducing ESR iGuide Clinical Decision Support in Africa
D. Husseiny Salama; *Cairo/EG*,
M. Kawooya; *Kampala/UG*
Author Disclosures:
D. Husseiny Salama: disclosure/affirmation information not submitted,
M. Kawooya: disclosure/affirmation information not submitted

C 11-10 17:15
EuroSafe Imaging: ISR vision for imaging in Africa
G. Frija; *Paris/FR*
Author Disclosures:
G. Frija: disclosure/affirmation information not submitted

17:25
Discussion

16:00 - 17:30 **Room E**

Pros & Cons Session

PS 427
Breast cancer: to screen or not to screen?

PS 427-1 16:00
Chairperson's introduction
F. J. Gilbert*; Cambridge/UK (fjg28@cam.ac.uk)*
Session objectives:
1. To understand how the effectiveness of breast screening is assessed.
2. To learn about the key controversies for and against screening.
3. To decide whether or not the benefits outweigh the harms of breast screening.
Author Disclosures:
F. J. Gilbert: Consultant at Alphabet Inc., Equipment Support Recipient at GE Healthcare, Grant Recipient at Hologic, Research/Grant Support at GE Healthcare, Research/Grant Support at Bayer

PS 427-2 16:05
A. The evidence for breast screening
M. Broeders*; Nijmegen/NL (mireille.broeders@radboudumc.nl)*
Learning objectives:
1. To understand the evidence from population trials.
2. To learn about the effectiveness and potential benefits of breast screening.
3. To become familiar with the rational for screening and types of cancers detected.
Author Disclosures:
M. Broeders: Employee at Dutch Expert Centre for Screening, Nijmegen, the Netherlands, Speaker at Hologic, Siemens

PS 427-3 16:30
B. The evidence against breast screening
P. Autier*; Dardilly/FR (philippe.autier@i-pri.org)*
Learning objectives:
1. To understand overdiagnosis and overtreatment in relation to screening.
2. To learn about the potential harms of screening.
3. To become familiar with the costs associated with screening.
Author Disclosures:
P. Autier: nothing to disclose

16:55
Discussion

16:00 - 17:30 **Room F1**

E³ - Advanced Course: Interactive Teaching Session for Young (and not so Young) Radiologists

E³ 421
Imaging of the liver

E³ 421-1 16:00
A. CT and MRI liver imaging reporting and data system (LIRADS): how to use it and what to expect
A. Darnell*; Barcelona/ES (andarnel@clinic.cat)*
Learning objectives:
1. To become familiar with LIRADS categories, definitions, and algorithms.
2. To discuss the confusing features of LIRADS with examples.
3. To understand what the probability of hepatocellular carcinoma is for each LIRADS category.
Author Disclosures:
A. Darnell: Speaker at Bayer

E³ 421-2 16:45
B. Focal lesions in non-cirrhotic liver: how to diagnose, differentiate and manage
G. Brancatelli*; Palermo/IT (gbranca@yahoo.com)*
Learning objectives:
1. To learn how to differentiate focal liver lesions in non-cirrhotic patients with CT and MRI.
2. To know how to manage non-cirrhotic patients with focal liver lesions.
Author Disclosures:
G. Brancatelli: Consultant at Bayer, Speaker at Bayer, Other at General Electric, Other at Bracco

16:00 - 17:30 **Room F2**

Musculoskeletal

RC 410
Imaging of chronic forefoot pain

Moderator:
M. S. Posadzy; Poznan/PL

RC 410-1 16:00
A. Articular disorders
M. Shahabpour*; Brussels/BE (maryam.shahabpour@uzbrussel.be)*

Learning objectives:
1. To explain the disease spectrum and pathophysiology of articular sources of chronic forefoot pain.
2. To describe the imaging findings of articular disorders that present with chronic forefoot pain.
Author Disclosures:
M. Shahabpour: nothing to disclose

RC 410-2 16:30
B. Extra-articular source of pain
G. Bierry*; Strasbourg/FR (guillaume.bierry@chru-strasbourg.fr)*
Learning objectives:
1. To explain the disease spectrum and pathophysiology of extra-articular sources of chronic forefoot pain.
2. To describe the imaging findings of extra-articular conditions that are present in chronic forefoot pain.
Author Disclosures:
G. Bierry: Advisory Board at General Electric

RC 410-3 17:00
C. Imaging-guided percutaneous treatment of forefoot pain
R. L. Cazzato*; Strasbourg/FR (gigicazzato@hotmail.it)*
Learning objectives:
1. To explain the rationale behind the imaging-guided percutaneous treatment of forefoot pain.
2. To describe the imaging-guided percutaneous procedures for the treatment of forefoot pain.
Author Disclosures:
R. L. Cazzato: nothing to disclose

16:00 - 17:00 **Coffee & Talk 3**

Coffee & Talk (open forum) Session

C 20

Imaging biobanks: from concept to implementation

C 20-1 16:00
Chairperson's introduction: What is an imaging biobank?
E. Neri*; Pisa/IT (emanueleneri1@gmail.com)*
Session objectives:
1. To define an imaging biobank.
2. To describe ESR activities in imaging biobanks.
3. To provide a brief overview of imaging biobank trials in Europe.
Author Disclosures:
E. Neri: Advisory Board at QUIBIM, Speaker at GE/Healthcare

C 20-2 16:06
HORIZON 2020 PRIMAGE biobank
L. Marti-Bonmati*; Valencia/ES (Luis.Marti@uv.es)*
Learning objectives:
1. To describe the scope of the PRIMAGE project.
2. To report the ongoing activities.
3. To foresee the expected impact.
Author Disclosures:
L. Marti-Bonmati: Research/Grant Support at H2020

C 20-3 16:14
Dutch biobank
A. van der Lugt*; Rotterdam/NL (a.vanderlugt@erasmusmc.nl)*
Learning objectives:
1. To describe the population imaging trial in Rotterdam.
2. To discuss the expected impact of the trial.
3. To discuss the pros and cons of population imaging (incidental findings, costs, etc.).
Author Disclosures:
A. van der Lugt: Grant Recipient at Stryker, Grant Recipient at Medtronic, Grant Recipient at Penumbra, Grant Recipient at Ceronovus, Grant Recipient at Siemens, Grant Recipient at GE Healthcare, Grant Recipient at Philips Healthcare

C 20-4 16:22
Artificial intelligence (AI) for analysis in large-scale population studies: UK biobank
D. Rueckert*; London/UK (D.Rueckert@imperial.ac.uk)*
Learning objectives:
1. To report the rationale of the UK biobank.
2. To describe the imaging workflow used.
3. To discuss the application of AI tools.
Author Disclosures:
D. Rueckert: Consultant at IXICO, Consultant at Circle Cardiovascular Imaging, Consultant at Heartflow

16:30
Open forum discussion

16:00 - 17:30 **da Vinci (Room D1)**

Physics in Medical Imaging

RC 413

Blue skies and current trends in digital radiography (DR), computed tomography (CT) and interventional radiology (IR)

RC 413-1 16:00
Chairperson's introduction: Overview of multi-front development in x-ray
J. Sjöberg*; Stockholm/SE (johan.a.sjoberg@sll.se)*
Session objectives:
1. To learn about existing technologies.
2. To learn about state of the art in x-ray imaging modalities.
3. To predict future developments.
Author Disclosures:
J. Sjöberg: nothing to disclose

RC 413-2 16:05
A. Updates and future perspectives to DR technology
J. I. Peltonen*; Helsinki/FI (juha.peltonen@hus.fi)*
Learning objectives:
1. To learn about existing DR technologies.
2. To learn about state of the art in DR imaging.
3. To predict future developments in DR imaging.
Author Disclosures:
J. I. Peltonen: nothing to disclose

RC 413-3 16:28
B. Updates and future perspectives to CT technology
M. Kachelrieß*; Heidelberg/DE (marc.kachelriess@dkfz.de)*
Learning objectives:
1. To learn about existing CT technologies.
2. To learn about state of the art in CT imaging.
3. To predict future developments in CT imaging.
Author Disclosures:
M. Kachelrieß: nothing to disclose

RC 413-4 16:51
C. Updates and future perspectives to IR and angiography technology
N. Marshall*; Leuven/BE (nicholas.marshall@uzleuven.be)*
Learning objectives:
1. To learn about existing IR technologies.
2. To learn about state of the art in IR.
3. To predict future developments in IR.
Author Disclosures:
N. Marshall: nothing to disclose

16:14
Panel discussion: What can we expect from new detectors, equipment designs and post-processing/reconstruction?

16:00 - 17:30 **Darwin (Room D2)**

EFRS Workshop

EFRS WS 4

Public and patient involvement (PPI)

Moderators:
C. A. Beardmore; London/UK
E. Briers; Brussels/BE

EFRS WS 4-1 16:00
The patient's perspective: considering our voice
E. Briers*; Brussels/BE (erikbriers@telenet.be)*
Learning objectives:
1. To learn how to improve engagement with the public and patients in relation to delivering quality medical imaging, interventional radiology, and radiotherapy services.
2. To discuss what matters to patients within medical imaging, interventional radiology, and radiotherapy services.
3. To learn how to capture effective patient feedback for continuous service improvement.
Author Disclosures:
E. Briers: nothing to disclose

EFRS WS 4-2 16:18
Patient, public and practitioner partnerships at a national level: a UK case study
R. Harris*; London/UK (rachelh@sor.org)*
Learning objectives:
1. To learn about the development of a guiding principles strategy for partnership working.
2. To describe the key priorities within the strategy.
3. To consider the steps in supporting implementation of the principles at a national level.
Author Disclosures:
R. Harris: nothing to disclose

EFRS WS 4-3 16:33
Public and patient involvement in education and training
H. Precht*; Middelfart/DK (hepr@ucl.dk)*
Learning objectives:
1. To learn about the importance of patient engagement in education and training.
2. To consider how the public and patients can contribute to radiographers' education.
3. To understand how patient feedback helps support professional and service development.
Author Disclosures:
H. Precht: nothing to disclose

EFRS WS 4-4 16:48
Public and patient involvement in research
A. Negrouk*; Brussles/BE*
Learning objectives:
1. To understand how the public and patients can help research trial and protocol development.
2. To learn how patients and researchers can work together in managing research projects.
3. To understand how patients can help disseminate research results at the end of a study.
Author Disclosures:
A. Negrouk: nothing to disclose

EFRS WS 4-5 17:03
The role of the EFRS in supporting public and patient engagement
J. McNulty*; Dublin/IE (jonathan.mcnulty@ucd.ie)*
Learning objectives:
1. To consider the opportunities for patient, public, and practitioner engagement at the European level.
2. To showcase ongoing activity that will help support improved patient and public partnerships.
3. To learn about future EFRS plans for partnership working.
Author Disclosures:
J. McNulty: nothing to disclose

17:18
Panel discussion: Public and patient involvement: are we doing enough?

16:00 - 17:30 **Descartes (Room D3)**

Radiographers

RC 414

Practical magnetic resonance imaging tips for radiographers

RC 414-1/RC 414-2 16:00
Chairpersons' introduction
A. I. Holodny*; New York, NY/US*
V. G. Syrgiamiotis*; Goudi/GR (syrgiamiotisvasilis@gmail.com)*
Session objectives:
1. To understand practical tips to optimise MRI examinations at 3 Tesla.
2. To be aware of practical tips applicable to paediatric examinations.
3. To discuss the latest issues in MRI safety and how these can be better managed.
Author Disclosures:
A. I. Holodny: disclosure/affirmation information not submitted, V. G. Syrgiamiotis: nothing to disclose

RC 414-3 16:06
A. Practical tips to optimise your examinations at 3 Tesla
J. Podobnik*; Ljubljana/SI (janez.podobnik@kclj.si)*
Learning objectives:
1. To review MRI at 3 Tesla, the benefits it provides, and the associated challenges.
2. To recognise artefacts related to 3 Tesla MRI and to be aware of how these can be reduced.
3. To be familiar with tips for examination optimisation at 3 Tesla.
Author Disclosures:
J. Podobnik: nothing to disclose

RC 414-4 16:29
B. Practical tips in paediatric MRI
U. Weinberger*; Vienna/AT (ulrike.weinberger@fh-campuswien.ac.at)*
Learning objectives:
1. To be aware of special patient care considerations for paediatric patients in MRI.
2. To be familiar with MRI examinations which are routinely, and often exclusively, performed on paediatric patients.
3. To understand methods for paediatric image optimisation in routine practice.
Author Disclosures:
U. Weinberger: Speaker at FH Campus Wien

RC 414-5 16:52
C. What is new in MRI safety?
V. M. F. Silva*; Porto/PT (vitorsoft@gmail.com)*
Learning objectives:
1. To be familiar with key MRI safety issues.
2. To understand how recent and future developments are introducing new safety issues.
3. To be aware of how new safety issues should be managed, and to understand the importance of continuous professional development in MRI safety.
Author Disclosures:
V. M. F. Silva: nothing to disclose

17:15
Panel discussion: How can we ensure MRI radiographers keep up to date with evolving safety requirements?

16:00 - 17:30 **Room G**

Genitourinary

RC 407

Acute and chronic pelvic pain

RC 407-1 16:00
Chairperson's introduction
O. Nikolic*; Novi Sad/RS (nikolic.olivera@gmail.com)*
Session objectives:
1. To learn about the cause of acute and chronic pelvic pain.
2. To understand what the radiologist needs to know about imaging findings in pelvic pain.
Author Disclosures:
O. Nikolic: nothing to disclose

RC 407-2 16:05
A. Acute pelvic pain
M. Basta Nikolic*; Novi Sad/RS (drmarijanabastanikolic@gmail.com)*
Learning objectives:
1. To discuss gynaecological disorders causing acute pelvic pain and differential diagnosis.
2. To present a radiological approach in management of acute pelvic pain.
Author Disclosures:
M. Basta Nikolic: nothing to disclose

RC 407-3 16:24
B. Chronic non-endometriotic pelvic pain
M. M. Otero-Garcia*; Vigo/ES (Maria.Milagros.Otero.Garcia@sergas.es)*
Learning objectives:
1. To know the different causes of chronic pelvic pain.
2. To understand what the radiologist can offer to the clinical referee in patients with chronic pelvic pain.
Author Disclosures:
M. M. Otero-Garcia: nothing to disclose

RC 407-4 16:43
C. Endometriosis
R. A. Kubik-Huch*; Baden/CH (rahel.kubik@ksb.ch)*
Learning objectives:
1. To learn about the clinical features of endometriosis with an emphasis on chronic pelvic pain.
2. To become familiar with the increasing role of MRI for the workup and management of endometriosis.
3. To learn how to optimise MRI of the female pelvis in patients with suspected endometriosis.
4. To illustrate the MRI features of ovarian and peritoneal endometriosis.
Author Disclosures:
R. A. Kubik-Huch: nothing to disclose

RC 407-5 17:02
D. Embolisation of pelvic congestion syndrome
R. Uberoi*; Oxford/UK (raman.uberoi@ouh.nhs.uk)*
Learning objectives:
1. To understand the pathophysiology underlying pelvic congestion syndrome.
2. To learn about the common presentations.
3. To learn about the treatment options, particularly venous embolisations.
Author Disclosures:
R. Uberoi: Grant Recipient at Gore, Advisory Board at Minova, Grant Recipient at Vascutek, Investigator at Vascutek

17:21
Panel discussion: What radiologists have to know in female pelvic pain imaging

16:00 - 17:30 **Room K**

Paediatric

RC 412

Intensive care paediatric radiology: the very sick neonate

RC 412-1 16:00
Chairperson's introduction
S. Stafrace*; Doha/QA (samstafrace01@gmail.com)*
Session objectives:
1. To learn about the most common neurological emergencies in intensive care neonates.
2. To understand the wide variety of thoracic devices that may be used in these patients.
3. To discuss the role of US in abdominal emergencies in the critically ill child.
Author Disclosures:
S. Stafrace: nothing to disclose

RC 412-2 16:05
A. Neuroimaging in the neonatal intensive care unit
M. Argyropoulou*; Ioannina/GR (margyrop@cc.uoi.gr)*
Learning objectives:
1. To learn the most common neurological emergencies in the intensive care patient.
2. To understand the preferential use of US and MRI as imaging techniques.
3. To discuss the key findings that may be useful for differential diagnosis.
Author Disclosures:
M. Argyropoulou: nothing to disclose

RC 412-3 16:30
B. Chest imaging in the ICU: tubes and catheters
M. L. L. Lobo*; Lisbon/PT (mluisalobo@gmail.com)*
Learning objectives:
1. To learn the crucial role of simple views in critically ill children.
2. To understand the variety of devices used in the intensive care unit.
3. To discuss how to avoid the most common pitfalls.
Author Disclosures:
M. L. L. Lobo: nothing to disclose

RC 412-4 16:55
C. Emergencies in the critically ill neonate: abdominal US applications and beyond
M. Riccabona*; Graz/AT*
Learning objectives:
1. To learn about typical body (abdomen, chest and other) emergencies that can be addressed by US in the neonatal intensive care unit (NICU).
2. To understand some typical findings that may help in disease characterisation.
3. To appreciate the considerable impact on prognosis and survival of the critically ill neonate.
Author Disclosures:
M. Riccabona: nothing to disclose

17:20
Panel discussion: Is there a role for FAST scan in the paediatric ICU?

16:00 - 17:30 **Room M 1**

Molecular Imaging

RC 406

Merging the best: hybrid imaging

Moderator:
G. Antoch; Düsseldorf/DE

RC 406-1 16:00
A. Hybrid imaging with SPECT/CT
A. Scarsbrook*; York/UK (a.scarsbrook@nhs.net)*

Wednesday

Learning objectives:
1. To learn the basic principles of hybrid SPECT/CT imaging.
2. To understand what complementary information can be provided by SPECT/CT.
3. To learn the clinical applications of SPECT/CT.
Author Disclosures:
A. Scarsbrook: nothing to disclose

RC 406-2 16:30
B. Hybrid imaging with PET/MRI
F. Kiessling; *Aachen/DE (fkiessling@ukaachen.de)*
Learning objectives:
1. To learn the basic principles of hybrid PET/MRI.
2. To understand what new information can be provided by PET/MRI.
3. To learn about emerging clinical applications of PET/MRI.
Author Disclosures:
F. Kiessling: Speaker at RWTH Aachen University

RC 406-3 17:00
C. Hyperpolarised MRI
F. A. Gallagher; *Cambridge/UK (fag1000@cam.ac.uk)*
Learning objectives:
1. To learn the basic principles of hyperpolarisation.
2. To understand what new information can be provided by hyperpolarised MRI.
3. To learn about oncological and non-oncological applications of hyperpolarised MRI.
Author Disclosures:
F. A. Gallagher: Grant Recipient at GSK, Research/Grant Support at GE Healthcare

16:00 - 17:30 **Room M 2**

E³ - Advanced Course: Hot Topics in Emergency Radiology

E³ 418

Non-neurological complications in intensive care patients

E³ 418-1 16:00
Chairperson's introduction
M.-A. Weber; *Rostock/DE (marc-andre.weber@med.uni-rostock.de)*
Session objectives:
1. To become familiar with common and less frequent complications in ICU patients.
2. To be able to proactively help the ICU team to best diagnose and manage these complications.
3. To become familiar with common diagnostic questions, treatments, and interventions arising in ICU.
Author Disclosures:
M.-A. Weber: nothing to disclose

E³ 418-2 16:06
A. The white chest and severe dyspnoea
M. Herman; *Olomouc/CZ (miroslav.herman@fnol.cz)*
Learning objectives:
1. To understand the physiopathology of the severe respiratory complications in emergency and ICU scenarios.
2. To know when a computed tomography can be decisive.
3. To learn the differential diagnosis patterns for the imaging findings in chest x-ray and CT.
Author Disclosures:
M. Herman: nothing to disclose

E³ 418-3 16:34
B. Acute abdominal complications
M. Scaglione; *Middlesborough/UK (mscaglione@tiscali.it)*
Learning objectives:
1. To become familiar with the most common requests: infection, bleeding, ischaemia, leakage, and obstruction.
2. To learn about the different imaging protocols (when to use intravenous and enteral contrast agent).
3. To learn the main imaging findings.
Author Disclosures:
M. Scaglione: nothing to disclose

E³ 418-4 17:02
C. Image-guided interventions in ICU patients
L. Appelbaum; *Jerusalem/IL (liata@hadassah.org.il)*
Learning objectives:
1. To learn about the role of emergency CT/US-guided intervention.
2. To learn about the optimal utilisation of materials, equipment, and imaging including low-dose CT.
3. To learn the management of patients after failed interventional treatments.
Author Disclosures:
L. Appelbaum: nothing to disclose

16:00 - 17:30 **Room M 3**

Head and Neck

RC 408

Imaging of eye and orbital pathologies

Moderator:
M. Lemmerling; Beervelde/BE

RC 408-1 16:00
A. Traumatic lesions of the eye and orbit
A. Ailianou; *Neuchâtel/CH (a_ailianou@yahoo.com)*
Learning objectives:
1. To become familiar with imaging features of orbital fractures.
2. To learn about traumatic lesions of the eye and orbital soft tissues.
3. To review acute and chronic complications after orbital trauma.
Author Disclosures:
A. Ailianou: nothing to disclose

RC 408-2 16:30
B. Infection and inflammation in the eye and orbit
K. Erb-Eigner; *Berlin/DE (Katharina.Erb@charite.de)*
Learning objectives:
1. To become familiar with infections and inflammation in different orbital structures.
2. To discuss imaging features of infection and inflammation in the eye and orbit.
3. To learn how to reach the final diagnosis.
Author Disclosures:
K. Erb-Eigner: nothing to disclose

RC 408-3 17:00
C. Benign and malignant masses of the eye and orbit
P. de Graaf; *Amsterdam/NL (p.degraaf@amsterdamumc.nl)*
Learning objectives:
1. To discuss advanced imaging techniques in tumoural orbit lesions.
2. To review intraocular tumours.
3. To become familiar with intraorbital masses.
Author Disclosures:
P. de Graaf: nothing to disclose

16:00 - 17:30 **Room M 5**

E³ - Advanced Course: Artificial Intelligence

E³ 420

Radiomics: principles and applications

E³ 420-1 16:00
Chairperson's introduction
S. Klein*; Rotterdam/NL (s.klein@erasmusmc.nl)*
Session objectives:
1. To become familiar with the basic principles of radiomics.
2. To understand that radiomics is a specific branch of machine learning.
3. To learn about the difference between radiomics and deep learning.
Author Disclosures:
S. Klein: nothing to disclose

E³ 420-2 16:06
A. Radiomics: images are data!
G. Cicchetti*; Rome/IT (cicchetti.giuseppe88@gmail.com)*
Learning objectives:
1. To understand the design of a pipeline to develop a radiomics signature.
2. To learn about the current state of the art in radiomics.
3. To learn about the impact of radiomics for precision medicine.
Author Disclosures:
G. Cicchetti: nothing to disclose

E³ 420-3 16:34
B. Radiomics applications
T. Penzkofer*; Berlin/DE*
Learning objectives:
1. To learn about the state of the art of radiomics in prostate cancer.
2. To learn about the state of the art of radiomics in gliomas.
3. To learn about other promising application areas of radiomics.
Author Disclosures:
T. Penzkofer: Research/Grant Support at research agreements (no personal payments, outside of submitted work) with AGO, Aprea AB, ARCAGY-GINECO, Astellas Pharma Global Inc (APGD), Astra Zeneca, Clovis Oncology, Inc., Dohme Corp, Holaira, Incyte Corporation, Karyopharm, Lion Biotechnologies, In

E³ 420-4 17:02
C. Multicentre studies for more robust radiomics signatures
M. P. A. Starmans*; Rotterdam/NL (m.starmans@erasmusmc.nl)*
Learning objectives:
1. To introduce a framework for rapid development of radiomics signatures.
2. To explain how the parameters of a radiomics pipeline can be automatically optimised.
3. To show the performance of the framework for a number of applications.
Author Disclosures:
M. P. A. Starmans: nothing to disclose

16:00 - 17:30 **Tech Gate Auditorium**

Special Focus Session

SF 4

Interventional radiology in oncology

SF 4-1 16:00
Chairperson's introduction
N.N.
Session objectives:
1. To become familiar with current percutaneous ablation and embolisation techniques.
2. To learn about the clinical indications of percutaneous ablation and embolisation.
3. To understand the advantages and limitations of each ablation and embolisation technique.
Author Disclosures: -

SF 4-2 16:05
Ablation techniques in the lung
C. A. Ridge*; Dublin/IE (caroleridge@hotmail.com)*
Learning objectives:
1. To become familiar with current percutaneous ablation techniques in the lung.
2. To learn about the clinical indications of percutaneous ablation in lung lesions.
3. To understand the advantages and limitations of each ablation technique.
Author Disclosures:
C. A. Ridge: Research/Grant Support at Siemens

SF 4-3 16:30
Ablation and embolisation techniques in the liver
P. L. L. Pereira*; Heilbronn/DE (philippe.pereira@slk-kliniken.de)*
Learning objectives:
1. To become familiar with current percutaneous ablation and embolisation techniques in the liver.
2. To learn about the clinical indications of percutaneous ablation and embolisation in liver tumours.
3. To understand the advantages and limitations of each ablation and embolisation technique.
Author Disclosures:
P. L. L. Pereira: Advisory Board at Bayer, Roche, BMS, Terumo, Siemens, Medtronic, Consultant at Medtronic, Terumo, Grant Recipient at Siemens Healthineers, BTG, Terumo, Research/Grant Support at Siemens Healthineers, BTG, Terumo, Speaker at Sirtex, Guerbet, Terumo, Angiodynamics, Pharmacept, Medtronic

SF 4-4 16:55
Ablation techniques in the bone
A. Gangi*; Strasbourg/FR (Afshin.Gangi@chru-strasbourg.fr)*
Learning objectives:
1. To become familiar with current percutaneous ablation techniques in the bone.
2. To learn about the clinical indications of percutaneous ablation in bone lesions.
3. To understand the advantages and limitations of each ablation technique.
Author Disclosures:
A. Gangi: Other at Proctoring BTG

17:20
Panel discussion: The role of interventional radiologist in the treatment of lung, liver and bone lesions

Thursday, March 12

08:30 - 10:00 **Room B**

E³ - Rising Stars Programme: Basic Session

BS 5a

Abdominal viscera: abdominal emergencies

Moderator:
A. Palkó; Szeged/HU

BS 5a-1 08:30
Perforation of the GI tract
V. Maniatis; *Aabenraa/DK (vmaniatis67@gmail.com)*
Learning objectives:
1. To review the aetiologies of perforation.
2. To present current imaging techniques for evaluation of perforation.
3. To describe the typical features of perforation.
Author Disclosures:
V. Maniatis: nothing to disclose

BS 5a-2 09:00
Bowel obstruction
A. Filippone; *Pescara/IT (filipponea378@gmail.com)*
Learning objectives:
1. To review the most common causes of bowel obstruction.
2. To present current imaging techniques for evaluation of bowel obstruction.
3. To become familiar with the typical findings of bowel obstruction.
Author Disclosures:
A. Filippone: Employee at Bracco Imaging S.p.A.

BS 5a-3 09:30
Vascular emergencies
V. E. Sinitsyn; *Moscow/RU (vsini@mail.ru)*
Learning objectives:
1. To review the most common causes.
2. To present current imaging techniques.
3. To be familiar with the role of interventional radiology.
Author Disclosures:
V. E. Sinitsyn: nothing to disclose

08:30 - 10:00 **Room C**

Chest

RC 504

Lung nodule management in 2020

RC 504-1 08:30
Chairperson's introduction
R.-I. Milos; *Vienna/AT (ruxandra-iulia.milos@meduniwien.ac.at)*
Session objectives:
1. To avoid common errors in nodule categorisation or measurement.
2. To summarise the recent knowledge about nodule management.
3. To understand the place of risk prediction models.
Author Disclosures:
R.-I. Milos: nothing to disclose

RC 504-2 08:35
A. Radiological assessment
T. Frauenfelder; *Zurich/CH (thomas.frauenfelder@usz.ch)*
Learning objectives:
1. To learn how to recognise false nodules.
2. To learn how to classify lung nodules as solid, part solid, or non-solid.
3. To be aware of the typical and atypical characteristics of perifissural opacities.
Author Disclosures:
T. Frauenfelder: nothing to disclose

RC 504-3 08:58
B. Computer-aided diagnosis (CAD) and artificial intelligence (AI) perspective
A. R. Larici; *Rome/IT (annarita.larici@unicatt.it)*
Learning objectives:
1. To review the capabilities and limitations of CAD for the detection of lung nodules.
2. To learn about the performance of AI in the detection and characterisation of lung nodules.
3. To understand the basic concepts of machine learning as applied to imaging.
4. To summarise currently available machine learning techniques in radiology.
Author Disclosures:
A. R. Larici: Advisory Board at Boehringer-Ingelheim, Speaker at Boehringer-Ingelheim, MSD, Roche, GE, Astra Zeneca

RC 504-4 09:21
C. Management guidelines
A. Bankier; *Boston, MA/US (alexander.bankier@umassmemorial.org)*
Learning objectives:
1. To review the incidentally-found nodule management guidelines.
2. To become familiar with the LungRADS classification of screen-detected nodules.
3. To learn about Brock and Herder and other prediction models for evaluating the malignancy risk.
Author Disclosures:
A. Bankier: Consultant at Daiichi Pharmaceutical, Consultant at Spiration (Olympus)

09:44
Panel discussion: What do radiologists need to better manage pulmonary nodules?

08:30 - 10:00 **Room X**

Professional Challenges Session

PC 5

Audit and value in clinical radiology: enhancing quality

PC 5-1 08:30
Chairperson's introduction
A. Brady; *Cork/IE (adrianbrady@me.com)*
Session objectives:
1. To provide an ESR perspective on clinical audit.
2. To discuss the benefits of multidisciplinary working.
3. To consider existing programmes for national audit.
Author Disclosures:
A. Brady: nothing to disclose

PC 5-2 08:35
Developing and implementing a national audit programme
J. Suutari; *Helsinki/FI*
Learning objectives:
1. To consider potential obstacles to national audit programme development.
2. To discuss the establishment of a national audit model.
3. To emphasise the benefits associated with a large scale, national audit.
Author Disclosures:
J. Suutari: nothing to disclose

PC 5-3 08:55
Audit and quality improvement: the UK perspective
D. Howlett; *Eastbourne/UK (david.howlett@nhs.net)*
Learning objectives:
1. To review the existing UK radiology audit/quality improvement (QI) programme.
2. To demonstrate the UK experience in clinical audit.
3. To consider the challenges and benefits of multiagency collaboration in radiology audit.
Author Disclosures:
D. Howlett: nothing to disclose

PC 5-4 09:15
Clinical audit: the radiographer's perspective
G. N. Paulo; *Coimbra/PT (graciano@estescoimbra.pt)*
Learning objectives:
1. To discuss multidisciplinary working in the context of clinical audit.
2. To consider mechanisms of facilitating multidisciplinary involvement.
3. To evaluate multidisciplinary audit in practice.
Author Disclosures:
G. N. Paulo: nothing to disclose

PC 5-5 09:35
Adding value in radiology
J. P. Borgstede; *Colorado Springs, CO/US (borgrad@msn.com)*
Learning objectives:
1. To discuss "value" in radiology.
2. To consider the importance of adding value in radiological practice.
3. To evaluate wider concepts of value and their relationship to QI.
Author Disclosures:
J. P. Borgstede: nothing to disclose

09:55
Panel discussion: Auditing: cumbersome formality or beneficial value-adding activity?

09:00 - 10:00 **Coffee & Talk 1**

Coffee & Talk (open forum) Session
Organised by ESOR

C 3
Imaging research: making the most of our opportunities

C 3-1 09:00
Chairperson's introduction
V. Goh; *London/UK (vicky.goh@kcl.ac.uk)*
Session objectives:
1. To understand that research is central to evidence-based medicine.
2. To appreciate the different types of research in radiology and how radiologists have approached this in their practice.
3. To learn how to maximise opportunities and understand how artificial intelligence is shaping future research.
Author Disclosures:
V. Goh: Research/Grant Support at Siemens, Speaker at Siemens

C 3-2 09:05
Why is imaging research important?
G. Cook; *London/UK (gary.cook@kcl.ac.uk)*
Learning objectives:
1. To understand that research is central to evidence-based medicine.
2. To appreciate the basic principles of imaging research.
3. To learn the different types of research in radiology.
Author Disclosures:
G. Cook: Consultant at NanoMab Technology, Research/Grant Support at NanoMab Technology, Research/Grant Support at Theragnostics Ltd, Research/Grant Support at Serac Healthcare Ltd

C 3-3 09:15
Why should you undertake a PhD?
D. Caruso; *Rome, LT/IT (dcaruso85@gmail.com)*
Learning objectives:
1. To understand the reason behind the decline of interest in an academic career.
2. To learn about the qualities of a successful PhD.
3. To appreciate the skills that a PhD program will provide you.
Author Disclosures:
D. Caruso: nothing to disclose

C 3-4 09:25
Being an academic radiologist: what does this really mean in practice?
S. Gourtsoyianni; *Athens/GR (sgty76@gmail.com)*
Author Disclosures:
S. Gourtsoyianni: nothing to disclose

C 3-5 09:35
Research in the artificial intelligence era: how can we compete?
K. G. Foley; *Llantrisant/UK*
Learning objectives:
1. To learn about the central role that radiologists have in artificial intelligence research.
2. To understand the importance of collaboration in imaging research.
Author Disclosures:
K. G. Foley: Grant Recipient at Welsh Government & Intel

C 3-6 09:45
Making the most of interdisciplinary research: artificial intelligence and beyond
V. Goh; *London/UK (vicky.goh@kcl.ac.uk)*
Learning objectives:
1. To appreciate how interdisciplinary research is important to advancing knowledge.
2. To be aware of the opportunities available to radiologists.
3. To understand how this could work in the artificial intelligence era and beyond.
Author Disclosures:
V. Goh: Research/Grant Support at Siemens, Speaker at Siemens

09:55
Open forum discussion

08:30 - 10:00 **Room N**

E³ - ECR Master Class (Paediatric)

E³ 526a
Whole-body MRI in children

E³ 526a-1 08:30
Chairperson's introduction
G. Roic; *Zagreb/HR (goran.roic@kdb.hr)*
Session objectives:
1. To discuss the technical challenges in whole-body MRI (WBMRI) in children.
2. To get an overview of the applications of WBMRI in children in oncological and inflammatory conditions.
3. To discuss the future of WBMRI and whole-body hybrid imaging in children.
Author Disclosures:
G. Roic: nothing to disclose

E³ 526a-2 08:35
A. Technical considerations: the basics
L. Tanturri de Horatio; *Rome/IT (laura.tanturri@opbg.net)*
Learning objectives:
1. To learn about the software and hardware for WBMRI.
2. To understand the choice of protocol in WBMRI in children.
3. To discuss technical challenges in paediatric WBMRI.
Author Disclosures:
L. Tanturri de Horatio: nothing to disclose

E³ 526a-3 08:53
B. Whole-body MRI in oncological conditions
A. S. Littooij; *Utrecht/NL (alittooij@hotmail.com)*
Learning objectives:
1. To learn about WBMRI in staging and response evaluation in children with cancer.
2. To understand typical findings.
3. To discuss how WBMRI may replace other imaging modalities.
Author Disclosures:
A. S. Littooij: nothing to disclose

E³ 526a-4 09:11
C. Whole-body MRI in musculoskeletal inflammation
E. V. Brandis; *Oslo/NO (elisabeth@vonbrandis.net)*
Learning objectives:
1. To learn about the indications for WBMRI in children with musculoskeletal inflammation.
2. To understand typical findings and differential diagnosis including normal variants that may mimic disease.
3. To discuss current clinical practice for WBMRI in non-bacterial osteomyelitis.

Author Disclosures:
E. V. Brandis: nothing to disclose

E³ 526a-5 09:29
D. The future role of MR-PET
S. Gatidis*; Tübingen/DE (sergios.gatidis@med.uni-tuebingen.de)*
Learning objectives:
1. To learn about the current clinical and scientific state of the art.
2. To learn about the limitations and pitfalls of MR-PET.
3. To discuss future developments.
Author Disclosures:
S. Gatidis: nothing to disclose

09:47
Panel discussion: Whole-body MRI in children: what to expect in the future?

08:30 - 10:00 **Room O**

Joint Session of the ESR and EFLM

ESR/EFLM
Integrated diagnostics: are we ready for it?

ESR/EFLM-1 08:30
Chairpersons' introduction (part 1)
A.-M. Simundic*; Zagreb/HR (am.simundic@gmail.com)*
Session objectives:
1. To present EFLM and its aims.
2. To appreciate the major challenges in laboratory medicine.
3. To explain the rationale behind featured topics.
Author Disclosures:
A.-M. Simundic: nothing to disclose

ESR/EFLM-2 08:35
Chairpersons' introduction (part 2)
B. Brkljačić*; Zagreb/HR (boris@brkljacic.com)*
Session objectives:
1. To identify the potential benefits of a partnership between EFLM and ESR.
2. To understand the major overlaps of laboratory medicine and radiology where integrated diagnostics could aid in patient management.
3. To identify major challenges in radiology as a diagnostic discipline.
Author Disclosures:
B. Brkljačić: nothing to disclose

ESR/EFLM-3/ESR/EFLM-4 08:40
Can we improve patient outcome by integrating radiology and laboratory medicine?
M. Neumaier*; Mannheim/DE (michael.neumaier@medma.uni-heidelberg.de)*
S. O. Schönberg*; Mannheim/DE*
Learning objectives:
1. To become familiar with the term "integrated diagnostics".
2. To learn why the current diagnostic approach needs improvement.
3. To understand how integrated diagnostics can improve patient outcome.
Author Disclosures:
M. Neumaier: nothing to disclose, S. O. Schönberg: nothing to disclose

ESR/EFLM-5 09:00
How to improve cancer detection through integrated diagnostics?
V. Haselmann*; Mannheim/DE*
Learning objectives:
1. To learn the biomarkers available for improved cancer diagnostics in the medical laboratory.
2. To appreciate the impact of detection of nucleic acids in body fluids for clinical decision-making and therapy stratification.
3. To understand the synergistic effects of integrated diagnostics for improved follow-up of systemic disease and the potentials for early detection of cancer in primary diagnosis.
Author Disclosures:
V. Haselmann: nothing to disclose

ESR/EFLM-6 09:15
Diagnosing heart failure: is there a better way?
P. Collinson*; London/UK (paul.collinson@stgeorges.nhs.uk)*
Learning objectives:
1. To understand the current limitations of biomarkers used to diagnose heart failure.
2. To appreciate the impact of heart failure biomarker measurement for clinical decision-making and therapy stratification.
3. To identify opportunities for combining radiological and laboratory investigations for more efficient management of patients with heart failure.
Author Disclosures:
P. Collinson: nothing to disclose

ESR/EFLM-7 09:30
Integrating blood biomarkers and radiology to achieve optimal detection and management of pulmonary embolism
G. Lippi*; Verona/IT (giuseppe.lippi@univr.it)*
Learning objectives:
1. To learn the diagnostic performance, clinical significance, and biological and analytical drawbacks of laboratory tests currently used for diagnosing and managing pulmonary embolism.
2. To appreciate the role of thrombus-targeted fibrinolysis as a promising theranostic approach in diagnosing and managing pulmonary embolism.
3. To understand the potentialities of combining radiological and laboratory investigations for more efficient management of patients with pulmonary embolism.
Author Disclosures:
G. Lippi: nothing to disclose

09:45
Panel discussion: Integrating the diagnostic strategies in radiology and laboratory medicine: a "nice to have" or a necessity?

08:30 - 10:00 **Studio 2020**

Genitourinary

RC 507
Imaging in pregnancy

RC 507-1 08:30
Chairperson's introduction
G. Masselli*; Rome/IT (gabriele.masselli@uniroma1.it)*
Session objectives:
1. To understand how to safely perform imaging procedures in pregnant women.
2. To become familiar with the most relevant pathological conditions in pregnancy.
3. To learn about the indications of imaging procedures in pregnancy.
Author Disclosures:
G. Masselli: nothing to disclose

RC 507-2 08:35
A. Safety issues in pregnancy: what radiologists need to know
C. Bourgioti*; Athens/GR (charisbourgioti@yahoo.com)*
Learning objectives:
1. To learn about safe radiology practices and procedures in pregnant women.
2. To understand how to minimise the radiation burden in pregnant women.
3. To learn how and when to use contrast media in pregnancy.
Author Disclosures:
C. Bourgioti: nothing to disclose

RC 507-3 08:58
B. Imaging acute abdomen in pregnancy
M. Weston*; Leeds/UK (michael.weston2@nhs.net)*
Learning objectives:
1. To become familiar with the different causes of acute abdominal pain in pregnancy.
2. To learn about the imaging features of the different causes of acute abdominal pain in pregnancy.
3. To learn how to use different imaging modalities in the setting of acute abdominal pain in pregnancy.
Author Disclosures:
M. Weston: nothing to disclose

RC 507-4 09:21
C. Imaging the placenta
H. C. Addley; *Cambridge/UK (helenclareaddley@hotmail.co.uk)*
Learning objectives:
1. To understand the appearance of the placenta with different imaging modalities.
2. To become familiar with the imaging appearance of the most common pathological conditions of the placenta.
3. To discuss the added value of cross-sectional imaging in the evaluation of placental abnormalities.
Author Disclosures:
H. C. Addley: nothing to disclose

09:44
Panel discussion: How should we image the pregnant woman, and when?

08:30 - 09:30 **Coffee & Talk 2**

Coffee & Talk (open forum) Session

Jointly organised by WHO and EuroSafe Imaging

C 12

Using CT in asymptomatic people: are we doing more harm than good?

C 12-1 08:30
Chairperson's introduction
M. D. R. D. R. Perez; *Geneva/CH (perezm@who.int)*
Session objectives:
1. To review the status and trends in the use of CT in asymptomatic people for individual health assessment (IHA).
2. To discuss the potential benefits and harms of CT-IHA practice in different scenarios, and the associated challenges in terms of quality and safety of health care.
3. To propose a framework for enhancing justification, regulatory compliance, and clinical governance of CT-IHA practices.
Author Disclosures:
M. D. R. D. R. Perez: nothing to disclose

C 12-2 08:40
Setting the scene
G. Frija; *Paris/FR (guy.frija@aphp.fr)*
Learning objectives:
1. To define individual health assessment.
2. To see where imaging and, especially, CT are implied.
3. To see how to improve current existing guidelines.
Author Disclosures:
G. Frija: nothing to disclose

C 12-3 08:50
Individual health assessment (IHA) in the regulations
N.N.
Learning objectives:
1. To describe the specific requirements for exposure of asymptomatic individuals in the Euratom Basic Safety Standards Directive.
2. To describe the specific requirements for exposure of asymptomatic individuals in the International Basic Safety Standards.
3. To discuss the implications and challenges of these standards regarding justification, optimisation, and referral guidelines.
Author Disclosures: -

C 12-4 09:00
Korean experience
M.-J. Kim; *Anyang-si/KR*
Learning objectives:
1. To outline cultural and societal approaches in Korea to IHA as part of health care provision.
2. To describe briefly the findings relating to thyroid screening conducted outside a national screening programme.
3. To discuss the potential evaluation of IHA provided by NECA or similar organisations, including the value added and the challenges faced.
Author Disclosures:
M.-J. Kim: disclosure/affirmation information not submitted

C 12-5 09:10
Open forum discussion
J. Griebel; *Neuherberg/DE (jgriebel@bfs.de)*
Author Disclosures:
J. Griebel: nothing to disclose

08:30 - 10:00 **Room E**

Musculoskeletal

RC 510

MRI of the knee

Moderator:
E. Oei; Rotterdam/NL

RC 510-1 08:30
A. Anterior knee pain
M. Tzalonikou; *Athens/GR*
Learning objectives:
1. To describe the normal anatomy and MRI appearances of the anterior knee structures (including the extensor mechanism, fat pads and synovial plicae).
2. To explain the imaging appearances of pathological conditions that present with anterior knee pain.
Author Disclosures:
M. Tzalonikou: nothing to disclose

RC 510-2 09:00
B. Meniscal abnormalities: obvious and subtle
P. Omoumi; *Lausanne/CH (Patrick.Omoumi@chuv.ch)*
Learning objectives:
1. To describe the anatomy of the menisci and the classification of meniscal tears.
2. To explain unusual imaging appearances of meniscal tears and potential pitfalls.
Author Disclosures:
P. Omoumi: nothing to disclose

RC 510-3 09:30
C. Cruciate and collateral ligaments
A. P. Parkar; *Bergen/NO (apparkar@gmail.com)*
Learning objectives:
1. To describe the normal anatomy and MRI appearances of the cruciate and collateral ligaments.
2. To explain the imaging appearances of pathological conditions involving the cruciate and collateral ligaments.
3. To specify the indirect signs that occur with ligament injury.
Author Disclosures:
A. P. Parkar: nothing to disclose

08:30 - 10:00 **Room F1**

E³ - Advanced Course: Interactive Teaching Session for Young (and not so Young) Radiologists

E³ 521

Small bowel imaging

E³ 521-1 08:30
A. CT and MR enterography: my technical tips for preparation and scanning
A. J. J. Madureira; *Porto/PT*
Learning objectives:
1. To understand the importance of proper preparation for enterography.
2. To be familiar with technical details that ensures high imaging quality.
Author Disclosures:
A. J. J. Madureira: nothing to disclose

E³ 521-2 09:15
B. Detection of small bowel involvement in patients with peritoneal carcinomatosis before hyperthermic intraperitoneal chemotherapy (HIPEC)?
M. R. Torkzad; *Stockholm/SE (michael.torkzad@gmail.com)*
Learning objectives:
1. To understand how to optimise imaging techniques to detect peritoneal involvement of the small bowel.
2. To be familiar the various imaging characteristics of peritoneal involvement of the small bowel.
Author Disclosures:
M. R. Torkzad: nothing to disclose

08:30 - 10:00 **Room F2**

Special Focus Session

SF 5
MRI of rectal carcinoma

SF 5-1 08:30
Chairperson's introduction
I. Blazic; *Belgrade/RS (ivanablazic@yahoo.com)*
Session objectives:
1. To understand the role of magnetic resonance imaging in rectal cancer patient management.
2. To learn how MRI findings influence the initial therapeutic approach in rectal cancer patients.
3. To discuss the report on post neoadjuvant treatment MRI findings and its impact on further therapeutic approach in patients with rectal cancer.
Author Disclosures:
I. Blazic: nothing to disclose

SF 5-2 08:36
Keynote lecture: The disappearing rectal cancer: the radio-surgical challenge of our time
R. J. Heald; *Southampton/UK (bill.heald@me.com)*
Learning objectives:
1. Up to a third of rectal cancers undergoing chemoradiotherapy may achieve complete regression so that post-treatment MRI may save them from surgery.
2. The radiologist must increasingly understand the regression process and timing of the replacement of cancer by scar tissue.
3. Tumour regression grading (TRG) and its relationship to endoscopic and histological criteria must be understood. A new sign, the split scar (SSS), may be a predictor of the permanence of the regression.
Author Disclosures:
R. J. Heald: nothing to disclose

SF 5-3 08:56
Rectal cancer revisited: Dutch perspective
R. G. H. Beets-Tan; *Amsterdam/NL (r.beetstan@nki.nl)*
Learning objectives:
1. To explain rectal cancer patient management in the Netherlands and the role of the radiologist in the multidisciplinary team.
2. To understand the importance of rectal cancer MRI and how MRI findings influence clinical decisions.
3. To discuss current pitfalls and challenges in rectal cancer imaging and ways to overcome them.
Author Disclosures:
R. G. H. Beets-Tan: nothing to disclose

SF 5-4 09:14
Rectal cancer revisited: UK perspective
G. Brown; *London/UK (gina.brown@rmh.nhs.uk)*
Learning objectives:
1. To explain rectal cancer patient management in the UK and the role of the radiologist in the multidisciplinary team.
2. To understand the importance of rectal cancer MRI and how MRI findings influence clinical decisions.
3. To discuss current pitfalls and challenges in rectal cancer imaging and ways to overcome them.
Author Disclosures:
G. Brown: nothing to disclose

SF 5-5 09:32
Rectal cancer: old challenges, new tools
L. C. O. K. Blomqvist; *Stockholm/SE (lennart.k.blomqvist@gmail.com)*
Learning objectives:
1. To offer an overview of advanced imaging techniques and new modalities applied in rectal cancer imaging.
2. To explain the advantages and drawbacks of different modalities.
3. To discuss future perspectives in imaging of rectal cancer.
Author Disclosures:
L. C. O. K. Blomqvist: Founder at Collective Minds Radiology

09:50
Panel discussion: Role of the radiologist in diagnosis and management of rectal cancer

08:30 - 09:15 **Coffee & Talk 3**

Coffee & Talk (open forum) Session

C 21
Statistics resources for radiology research

C 21-1 08:30
Chairperson's introduction
Ü. Aydingöz; *Ankara/TR (ustunaydingoz@yahoo.com)*
Session objectives:
1. To list books, journal articles, and internet sources for learning and applying statistics.
2. To describe how books, journal articles, and online sources can be used for statistical analysis in radiology research.
3. To explain the current controversy regarding the use of the p-value in statistics.
Author Disclosures:
Ü. Aydingöz: nothing to disclose

C 21-2 08:35
Books and journal articles for learning and applying statistics in radiology research
G. Di Leo; *San Donato Milanese/IT (gianni.dileo77@gmail.com)*
Learning objectives:
1. To list books and journal articles for learning and applying statistics.
2. To describe how books and online articles can be used for statistical analysis in radiology research.
Author Disclosures:
G. Di Leo: Author at Springer Verlag

C 21-3 08:45
Internet sources for learning and applying statistics in radiology research
V. Wieske; *Berlin/DE*
Learning objectives:
1. To list internet sources for learning and applying statistics.
2. To describe how internet sources can be used for statistical analysis in radiology research.
Author Disclosures:
V. Wieske: Research/Grant Support at Grant support from the FP7 Program of the European Commission for the randomized multicenter DISCHARGE trial (603266-2, HEALTH-2012.2.4.-2)

C 21-4 08:55
The p-value controversy in statistics: what the radiologist needs to know
T. Akıncı D'Antonoli; *Basel/CH (drtugba@hotmail.com)*
Learning objectives:
1. To explain the uses and misuses of the p-value in statistical analyses.
2. To describe the ways to overcome the misuse of the p-value in statistical analyses.
Author Disclosures:
T. Akıncı D'Antonoli: nothing to disclose

09:05
Open forum discussion

08:30 - 10:00 **da Vinci (Room D1)**

E³ - ECR Master Class (Cardiac)

E³ 526b

Cardiac imaging in arrhythmia and sudden cardiac death

E³ 526b-1 08:30
Chairperson's introduction
P. Donato*; Coimbra/PT (donato.pj@gmail.com)*
Session objectives:
1. To learn about existing imaging biomarkers to prevent sudden cardiac death.
2. To understand how to face the challenge of arrhythmia in cardiac imaging.
3. To become familiar with the prerequisites for MRI in patients with active implants.
Author Disclosures:
P. Donato: nothing to disclose

E³ 526b-2 08:35
A. The role of cardiovascular magnetic resonance (CMR) in sudden cardiac death
D. Piotrowska-Kownacka*; Warsaw/PL*
Learning objectives:
1. To become familiar with the pathophysiology of sudden cardiac death.
2. To introduce CMR biomarkers to prevent sudden cardiac death.
3. To learn how to perform and how to interpret CMR to prevent sudden cardiac death.
Author Disclosures:
D. Piotrowska-Kownacka: nothing to disclose

E³ 526b-3 09:00
B. Preventing sudden cardiac death with CT: pure theory or new diagnostic paradigm?
K. Gruszczyńska*; Katowice/PL (kgruszczynska@poczta.onet.pl)*
Learning objectives:
1. To learn what to look for in CT to prevent sudden cardiac death.
2. To get an overview about existing evidence of cardiac CT in this indication.
3. To discuss the possible future role of cardiac CT in preventing sudden cardiac death.
Author Disclosures:
K. Gruszczyńska: nothing to disclose

E³ 526b-4 09:25
C. Imaging to drive electrophysiology procedures
G. Pontone*; Milan/IT (gianluca.pontone@ccfm.it)*
Learning objectives:
1. To learn about the importance of early identification of potentially lethal arrhythmias.
2. To become familiar with tips and tricks for successful CMR in patients with arrhythmia.
3. To understand the role of imaging for planning of electrophysiological procedures.
Author Disclosures:
G. Pontone: nothing to disclose

09:50
Panel discussion: Should we screen, who should we screen and how should we screen in order to prevent sudden cardiac death?

08:30 - 10:00 **Darwin (Room D2)**

ISRRT meets Japan

Meets 5

Radiography profession performance and future challenges in Japan

Presiding:
H. H. Hjemly; Sorumsand/NO
D. E. Newman; Fargo, ND/US

Meets 5-1/Meets 5-2 08:30
Chairpersons' introduction
H. H. Hjemly*; Sorumsand/NO (hakon@radiograf.no)*
D. E. Newman*; Fargo, ND/US (donnaenewman@gmail.com)*
Session objectives:
1. To recognise the demographics and patient accessibility to health care services in the country.
2. To understand the infrastructure of imaging health services and their contribution to the primary and hospital health services to sustain the population and individual health.
3. To inform on the role of the professional society in influencing the future educational programme of radiographers in the country.
4. To inform on how the professional society supports and promotes the radiographers' role in the community and the health care system.
5. To receive information on radiography career structure and opportunities for professional development of radiographers in Japan.
6. To appreciate the radiographers' post-graduation professional requirements and relevant opportunities, and to keep up to date with evidence-based practice in imaging services.
7. To inform on what society believes about artificial intelligence, and what preparatory action have been undertaken (if any) to get radiographers ready to embrace the changes.
Author Disclosures:
H. H. Hjemly: nothing to disclose, D. E. Newman: nothing to disclose

Meets 5-3 08:35
Education system and career structure of radiological technologists in Japan
N. Kodama*; Niigata/JP (n_kodama@jart.or.jp)*
Learning objectives:
1. To explain the education and license system of radiological technologists in Japan.
2. To understand current problems of radiological technologist education, especially clinical training.
3. To explain the career structure of radiological technologists in Japan.
4. To understand the expansion of the work of radiological technologist in the future.
5. To inform on task shifting (delegation of medical practice) to radiological technologist in Japan.
6. To inform on the relationship between radiological technologists and artificial intelligence (AI).
Author Disclosures:
N. Kodama: Board Member at The Japan Association of Radiological Technologists

Meets 5-4 08:53
Latest optimal CT imaging technology and radiation dose reduction
T. Masuda*; Hiroshima/JP (takanorimasuda@yahoo.co.jp)*
Learning objectives:
1. To explain the outlines of a brief history of CT equipment.
2. To understand the current problems of radiation dose in Japan compared to other countries by using diagnostic reference levels (DRLs).
3. To understand the latest CT imaging technology and radiation dose reduction methods for maintaining image quality and diagnostic accuracy.
4. To inform about artificial intelligence for machine and deep learning.
5. To learn about how to use machine and deep learning in the clinical CT examination.
Author Disclosures:
T. Masuda: nothing to disclose

Meets 5-5 09:11
The role of radiological technologists in emergency medicine: a contribution of ultrasound
A. Kasuya*; Kariya/JP (akihirokasuya1224@gmail.com)*

Learning objectives:
1. To learn about the current status of emergency imaging in Japan.
2. To appreciate the usefulness of ultrasound by radiological technologists in emergency imaging.
3. To share the ultrasound educational program by sonographers.
Author Disclosures:
A. Kasuya: nothing to disclose

Meets 5-6 09:29
Radiation therapy in Japan: current status and recent topics of radiation therapy in Japan
H. Monzen*; OsakaSayama/JP (hmon@med.kindai.ac.jp)*
Learning objectives:
1. To recognise the scale of the cancer burden in Japan, and a brief history of radiotherapy.
2. To understand current problems and recent research topics for radiological technologists.
3. To inform on accreditation guidelines for radiotherapy technologists.
4. To receive information on radiotherapy technologists' carrier structure and opportunities for professional development for radiotherapy technologists.
5. To appreciate the role of radiotherapy technologists and their professional requirements: knowledge of the special techniques and safety protocols for precision radiation therapy, including intensity-modulated radiation therapy, stereotactic radiation therapy, and image-guided radiation therapy.
6. To inform on research topics: new materials and methods for radiotherapy as part of an academic-industrial alliance.
7. To learn about how to use machine learning and knowledge-based radiation treatment plans in volumetric modulated arc therapy.
Author Disclosures:
H. Monzen: Speaker at Kindai University

09:47
Panel discussion: How will you describe the future opportunities and challenges for radiographers in Japan? Do you think the emerging technology will change the profession, and in what way?

08:30 - 10:00 **Descartes (Room D3)**

Paediatric

RC 512

Optimising the management of children with cancer: how to improve?

RC 512-1 08:30
Chairperson's introduction
K. Rosendahl*; Bergen/NO (karen.rosendahl@unn.no)*
Session objectives:
1. To discuss the role of SPECT/CT and PET/MRI in diagnosis and follow-up of children with cancer.
2. To get an overview of indications for nuclear medicine in paediatric oncology.
3. To understand the clinical significance of hybrid imaging in children.
Author Disclosures:
K. Rosendahl: nothing to disclose

RC 512-2 08:36
A. The role of SPECT and SPECT/CT
B. Johnsen*; Bergen/NO (boel.johnsen@helse-bergen.no)*
Learning objectives:
1. To learn the differences of SPECT-CT and PET-CT in paediatric oncology.
2. To understand the molecular basis of the different radiotracers available.
3. To gain insight into future directions.
Author Disclosures:
B. Johnsen: nothing to disclose

RC 512-3 08:59
B. Can PET/MRI replace PET/CT?
H. R. Nadel*; Vancouver, BC/CA (hnadel@stanford.edu)*
Learning objectives:
1. To become familiar with the differences between PET/MR and PET/CT in children.
2. To learn about optimising protocols for paediatric PET/MR.
3. To be able to identify specific indications for PET/MR in children with cancer.
Author Disclosures:
H. R. Nadel: Consultant at Beacon BIoscience, Inc D/B/A ICON Medical Imaging

RC 512-4 09:22
C. Radiation doses and patient exposure issues
H. Kertész*; Vienna/AT (hunor.kertesz@meduniwien.ac.at)*
Learning objectives:
1. To understand the source of the total effective dose for hybrid imaging techniques.
2. To appreciate recent advances of PET imaging technologies/methodologies that could lower the effective patient dose.
3. To understand the novel image reconstruction algorithms for PET image reconstruction that could lead to the same image quality with less injected activity.
4. To review clinically viable approaches to dose reduction in oncology PET/CT examinations.
Author Disclosures:
H. Kertész: nothing to disclose

09:45
Panel discussion: The future direction of nuclear medicine imaging in paediatric oncology

08:30 - 10:00 **Room G**

Physics in Medical Imaging

RC 513

Demystifying MRI: things you always wanted to know

Moderator:
P. Gilligan; Dublin/IE

RC 513-1 08:30
A. Basic MRI: the building blocks of pulse sequences
A. G. Webb*; Leiden/NL (a.webb@lumc.nl)*
Learning objectives:
1. To learn about how NMR signals are produced.
2. To understand the basic concepts of relaxation.
3. To learn about the operation of inversion recovery and spin echo pulse sequences.
Author Disclosures:
A. G. Webb: nothing to disclose

RC 513-2 09:00
B. MRI basic concepts: how to turn signals into images
D. J. Lurie*; Aberdeen/UK (d.lurie@abdn.ac.uk)*
Learning objectives:
1. To learn how magnetic field gradients encode spatial information.
2. To understand the main ways in which field gradients are used.
3. To appreciate the basic concepts of data collection and image reconstruction in MRI.
Author Disclosures:
D. J. Lurie: Research/Grant Support at GE Healthcare

RC 513-3 09:30
C. Practical MRI: a toolkit of standard MR pulse sequences
I. Seimenis*; Athens/GR (iseimen@med.uoa.gr)*
Learning objectives:
1. To learn about common types of MR pulse sequence.
2. To understand the difference between gradient echo and spin echo.
3. To appreciate the factors influencing choice of pulse sequence.
Author Disclosures:
I. Seimenis: nothing to disclose

08:30 - 10:00 **Room K**

E³ - European Diploma Prep Session

E³ 523

Head and neck

E³ 523-1 08:30
Chairperson's introduction
M. G. Mack*; Munich/DE (m.mack@radiologie-muenchen.de)*
Session objectives:
1. To become familiar with the anatomy and imaging presentation of the most common disorders of the temporal bone and skull base.
2. To understand the imaging presentation of common inflammatory and neoplastic disorders of the nose, paranasal sinuses, and nasopharynx.
3. To describe the typical imaging features of the most common neoplastic disorders of the oral cavity, oropharynx, hypopharynx, and larynx.
Author Disclosures:
M. G. Mack: nothing to disclose

E³ 523-2 08:36
A. Temporal bone and skull base
A. Trojanowska*; Lublin/PL*
Learning objectives:
1. To differentiate the anatomy, normal variants, and congenital disorders of the temporal bone.
2. To understand the causes and imaging features of hearing and vestibular disorders.
3. To describe the imaging presentation of the most common tumours of the skull base.
Author Disclosures:
A. Trojanowska: disclosure/affirmation information not submitted

E³ 523-3 09:04
B. Nose, paranasal sinuses and nasopharynx
F. A. Pameijer*; Utrecht/NL (f.a.pameijer@umcutrecht.nl)*
Learning objectives:
1. To describe the anatomy and normal variants of the nose, paranasal sinuses, and nasopharynx.
2. To differentiate the imaging features of acute and chronic inflammatory changes of the nose and paranasal sinuses.
3. To understand the imaging features of benign and malignant tumours of the nose, paranasal sinuses, and nasopharynx.
Author Disclosures:
F. A. Pameijer: nothing to disclose

E³ 523-4 09:32
C. Oral cavity, oropharynx, hypopharynx and larynx
M. Becker*; Geneva/CH*
Learning objectives:
1. To describe the normal imaging anatomy of the oral cavity, oropharynx, hypopharynx, and larynx.
2. To understand the imaging features of tumours of the oral cavity and oropharynx.
3. To understand the imaging features of tumours of the hypopharynx and larynx.
Author Disclosures:
M. Becker: nothing to disclose

08:30 - 10:00 **Room M 1**

Joint Session of the ESR and UEMS

ESR/UEMS

Visibility of imaging professionals in the EU

ESR/UEMS-1/ESR/UEMS-2 08:30
Chairpersons' introduction
M. Adriaensen*; Heerlen/NL (miraude@gmail.com)*
L. Bonomo*; Rome/IT (lorenzo.bonomo.md@gmail.com)*
Session objectives:
1. To describe the role of the UEMS and ESR within the EU.
2. To understand the differences between the ESR and the UEMS.
3. To understand the importance of cooperation between ESR and UEMS.
Author Disclosures:
M. Adriaensen: nothing to disclose, L. Bonomo: nothing to disclose

Putting your interests first: two approaches, one goal

ESR/UEMS-3 08:36
The ESR approach
L. E. Derchi*; Genoa/IT (derchi@unige.it)*
Learning objectives:
1. To understand the structure of the ESR.
2. To understand the differences between the ESR and the UEMS.
3. To understand the importance of UEMS/ESR political involvement in the EU affairs.
Author Disclosures:
L. E. Derchi: nothing to disclose

ESR/UEMS-4 08:41
The UEMS approach
B. Maillet*; Brussels/BE (bernie.mail@skynet.be)*
Learning objectives:
1. To understand the structure of the UEMS.
2. To understand the differences between the ESR and the UEMS.
3. To understand the importance of UEMS/ESR political involvement in the EU affairs.
Author Disclosures:
B. Maillet: nothing to disclose

What does the EU mean for me? A radiologist's guide

ESR/UEMS-5 08:46
To be or not to be at the table: why advocacy matters for radiologists?
K. Riklund*; Umeå/SE (katrine.riklund@umu.se)*
Learning objectives:
1. To understand the concept of advocacy.
2. To understand the importance of advocacy at the EU level.
3. To understand the influence of EU directives on national legislation and daily practice.
Author Disclosures:
K. Riklund: Board Member at CMRAD AB, Board Member at Dicom Port AB

ESR/UEMS-6/ESR/UEMS-7 08:54
Creating a European radiology workforce: the value of qualifications across borders
C. Catalano*; Rome/IT (carlo.catalano@uniroma1.it)*
V. Papalois*; London/UK*
Learning objectives:
1. To understand the value of qualifications across borders and mobility of health care workers.
2. To understand the three levels of the European Legislation process.
3. To understand the influence of EU directives on national legislation and daily practice.
Author Disclosures:
C. Catalano: nothing to disclose, V. Papalois: disclosure/affirmation information not submitted

ESR/UEMS-8 09:10
Setting European standards for radiology: making your qualifications count at home and abroad
L. Oleaga Zufiria*; Barcelona/ES (lauraoleaga@gmail.com)*
Learning objectives:
1. To get an overview of the existing European Training Curriculum in radiology.
2. To know about the value of the European Diploma in Radiology (EDiR).
3. To learn about the European Training Assessment Programme (ETAP) 2.0.
Author Disclosures:
L. Oleaga Zufiria: Consultant at TMC Academy

ESR/UEMS-9 09:18
Setting European standards for interventional neuroradiology: the UEMS ETR in INR
M. Sąsiadek*; Wroclaw/PL (marek.sasiadek@umed.wroc.pl)*

Learning objectives:
1. To learn about a harmonised, comprehensive, structured, and balanced set of standards for interventional neuroradiology.
2. To understand the importance of a European training programme in interventional neuroradiology.
3. To defend the professional interests of interventional neuroradiologists in Europe.
Author Disclosures:
M. Sąsiadek: nothing to disclose

ESR/UEMS-10 09:26
Setting European standards for ultrasound: which way to go?
P. Ricci*; Rome/IT (paolo.ricci@uniroma1.it)*
Learning objectives:
1. To understand the importance of a set of recommendations and guidelines for the training of non-radiologists in ultrasound.
2. To learn about the importance of improving the medical services of ultrasound, avoiding malpractice, and protecting patient safety.
3. To learn about the involvement of ESR and UEMS in the field of ultrasound.
Author Disclosures:
P. Ricci: Board Member at UEMS

Staying ahead of the curve with CME/CPD

ESR/UEMS-11 09:34
The importance of CME/CPD across Europe: the role of EACCME
V. Papalois*; London/UK*
Learning objectives:
1. To understand the difference between Continuing Medical Education (CME) and Continuing Professional Development (CPD).
2. To learn about the European Accreditation Council for Continuing Medical Education (EACCME).
3. To learn about the Accreditation Council in Imaging (ACI).
Author Disclosures:
V. Papalois: disclosure/affirmation information not submitted

ESR/UEMS-12 09:42
Which kind of European CME/CPD do the radiologists want to gain?
M. A. Lucic*; Sremska Kamenica/RS (milos.a.lucic@gmail.com)*
Learning objectives:
1. To know about the existence of European CME credits (ECMEC).
2. To learn about the importance of credits in different European countries.
3. To predict future trends in CME/CPD within the field of radiology.
Author Disclosures:
M. A. Lucic: Research/Grant Support at Secretariat for Science and Technology Development of the Autonomous Province of Vojvodina; Grant Nr. 142-451-2151/2019

09:50
Panel discussion: The state of radiology in the EU

08:30 - 10:00 **Room M 2**

E³ - Advanced Course: Hot Topics in Emergency Radiology

E³ 518

The role of radiology in the management of mass casualty incidents

E³ 518-1 08:30
Chairperson's introduction
A. Blanco Barrio*; Murcia/ES (anablancowhite@gmail.com)*
Session objectives:
1. To understand the mass casualty patient pathway from scene to hospital.
2. To understand how a lack of advanced planning can make radiology a roadblock to forward patient flow and can increase mortality and morbidity.
3. To learn which imaging protocols to use to make rapid, brief, accurate diagnoses in multiple casualties.
4. To learn about communication, including communication failure, during a mass casualty incident.
Author Disclosures:
A. Blanco Barrio: nothing to disclose

E³ 518-2 08:36
A. Before the disaster: preparations and standards
F. Mück*; Munich/DE (fabian.mueck@donau-isar-klinikum.de)*
Learning objectives:
1. To understand how to establish the capabilities and limitations of the emergency radiology department.
2. To learn how to decide what protocols to use in case of a mass casualty incident.
3. To learn the importance of the disaster management plan and team practice.
Author Disclosures:
F. Mück: nothing to disclose

E³ 518-3 09:04
B. CT findings of mass casualty incidents, terror attacks and assaults
E. A. Dick*; London/UK (elizabethdick2010@gmail.com)*
Learning objectives:
1. To learn about the typical injuries of knife or gunshot wounds.
2. To understand the physics of bomb blasts and the corresponding injuries.
3. To appreciate the role of radiology in disaster settings and to discuss scenarios of biological, chemical, or radiation attacks.
Author Disclosures:
E. A. Dick: Board Member at European Society of Emergency Radiology, Speaker at Guerbert

E³ 518-4 09:32
C. The role of interventional radiology in mass casualty incidents
A. Bloom*; Jerusalem/IL (allan@hadassah.org.il)*
Learning objectives:
1. To present the unique features of interventional radiology in mass casualty incident settings.
2. To provide examples of interventional radiology use in mass casualty incidents.
3. To present new tools used for the treatment of patients.
Author Disclosures:
A. Bloom: nothing to disclose

08:30 - 10:00 **Room M 3**

E³ - Rising Stars Programme: Basic Session

BS 5b

Career opportunities for radiographers

Moderator:
J. McNulty; Dublin/IE

BS 5b-1 08:30
The specialised paediatric radiographer
J. Gardling*; Lund/SE (jenny.gardling@med.lu.se)*
Learning objectives:
1. To become familiar with the key differences in paediatric patient care.
2. To appreciate the additional knowledge, skills, and attributes of a paediatric radiographer.
3. To understand the need for education, training, and continuous professional development for specialised paediatric radiographers.
Author Disclosures:
J. Gardling: nothing to disclose

BS 5b-2 08:55
Radiographers in ultrasound
G. Harrison*; London/UK (gillhaha@gmail.com)*
Learning objectives:
1. To understand the ultrasound education and training requirements.
2. To become familiar with the potential scope of practice for, and impact of, sonographers.
3. To identify the sonographers' role within medical imaging and the wider multidisciplinary team.
Author Disclosures:
G. Harrison: Employee at Society and College of Radiographers. Employee at City, University of London

BS 5b-3 09:20
The radiation protection officer
E. Gruppetta*; Msida/MT (egrupetta@yahoo.co.uk)*
Learning objectives:
1. To understand the education and training needs of the radiation protection officer (RPO).
2. To become familiar with the important roles and responsibilities of the RPO across different modalities.
3. To highlight the responsibilities of an RPO within a wider medical imaging team.
Author Disclosures:
E. Gruppetta: nothing to disclose

09:45
Panel discussion: Things to consider when starting your career

08:30 - 10:00 **Room M 4**

Neuro

RC 511

Brain tumours: new things you should know

RC 511-1 08:30
Chairperson's introduction
D. Zlatareva*; Sofia/BG (dorazlat@yahoo.com)*
Session objectives:
1. To become familiar with the new World Health Organisation (WHO) classification for brain neoplasms.
2. To appreciate the role of the radiologist in the diagnostic workup of glioma.
3. To understand perfusion imaging and its role in diagnosis and follow-up of glioma.
Author Disclosures:
D. Zlatareva: nothing to disclose

RC 511-2 08:35
A. Low grade glioma
M. Smits*; Rotterdam/NL (marion.smits@erasmusmc.nl)*
Learning objectives:
1. To become familiar with the changes in the new WHO classification for low grade glioma.
2. To understand the role of functional imaging and perfusion imaging in the diagnostic workup of low grade glioma.
3. To present the differential diagnosis and pitfalls in imaging low grade glioma.
Author Disclosures:
M. Smits: Speaker at GE Healthcare (honorarium paid to institution), Consultant at reviewer for Parexel Ltd (honorarium paid to institution)

RC 511-3 08:58
B. High grade glioma
T. A. Yousry*; London/UK (t.yousry@ucl.ac.uk)*
Learning objectives:
1. To become familiar with the changes in the new WHO classification for high grade glioma.
2. To describe the different findings in true progression and pseudoprogression.
3. To learn about the role of radiomics in imaging high grade glioma.
Author Disclosures:
T. A. Yousry: Speaker at Hikma, Research/Grant Support at Wellcome, MRC, Stroke Association, British Hear Foundation, NIHR BRC, Other at Paraxel International, Biogen, Speaker at ParadigmMS

RC 511-4 09:21
C. Posterior fossa tumours
S. L. Kumar*; Singapore/SG*
Learning objectives:
1. To become familiar with the changes in the new WHO classification for posterior fossa neoplasms.
2. To learn about the role of diffusion and perfusion imaging in posterior fossa tumours.
3. To list the various posterior fossa neoplasms in adults and children.
Author Disclosures:
S. L. Kumar: nothing to disclose

09:44
Panel discussion: Radiomics in brain tumour imaging

08:30 - 10:00 **Room M 5**

E³ - Advanced Course: Artificial Intelligence

E³ 520

Artificial intelligence and clinical decision support

E³ 520-1 08:30
Chairperson's introduction
A. Alberich-Bayarri*; Valencia/ES (angel@quibim.com)*
Session objectives:
1. To become familiar with the different parts of the workflow where artificial intelligence may play a role.
2. To understand the challenges of using artificial intelligence for decision support.
3. To learn about the process required to get artificial intelligence empowered diagnoses to the clinic.
Author Disclosures:
A. Alberich-Bayarri: CEO at QUIBIM SL, Board Member at QUIBIM SL, Founder at QUIBIM SL

E³ 520-2 08:36
A. Clinical decision support workflow improved by artificial intelligence (AI)
E. R. Ranschaert*; Turnhout/BE (erik.ranschaert@gmail.com)*
Learning objectives:
1. To learn how decision support workflow can be supported and improved by AI.
2. To understand the different workflow parts in which AI can play a role.
3. To discuss how to evaluate the clinical value of AI in decision support.
Author Disclosures:
E. R. Ranschaert: Consultant at Barco NV, Consultant at Robovision BVBA, Shareholder at Osimis SA, Shareholder at Diagnose.me BV

E³ 520-3 09:04
B. Data mining and machine learning for integrated clinical decision support
G. Boland*; Wellesley, MA/US (gboland@partners.org)*
Learning objectives:
1. To understand how data mining can help in clinical decision support.
2. To learn about the needs and limitations of standardisation for AI assisted clinical decision support.
3. To learn about the state of the art in AI assisted clinical decision support.
Author Disclosures:
G. Boland: Consultant at Siemens Healthineers

E³ 520-4 09:32
C. AI to predict treatment response
N. deSouza*; Surrey/UK*
Learning objectives:
1. To understand the role of AI in moving towards precision medicine.
2. To understand the current potential of AI for monitoring response.
3. To understand how to manage AI in a clinical workflow as a decision support tool.
Author Disclosures:
N. deSouza: nothing to disclose

09:30 - 10:15 **Coffee & Talk 3**

Coffee & Talk (open forum) Session

C 22

How to organise research in radiology

C 22-1 09:30
Chairperson's introduction
F. A. Gallagher*; Cambridge/UK (fag1000@cam.ac.uk)*
Session objectives:
1. To understand the challenges of being a successful researcher in radiology.
2. To become familiar with the skills required for imaging research.
3. To learn how to develop a research group.
Author Disclosures:
F. A. Gallagher: Grant Recipient at GSK, Research/Grant Support at GE Healthcare

C 22-2 09:35
A research group as a small business: managing and running research
G. P. Krestin*; Rotterdam/NL*
Learning objectives:
1. To understand how to manage a research group.
2. To understand how to acquire funding for research.
3. To learn how to write a successful grant.
Author Disclosures:
G. P. Krestin: Consultant at Bracco Imaging, Board Member at Quantib BV, Research/Grant Support at GEHC, Research/Grant Support at Bayer AG, Research/Grant Support at Siemens Healthineers

C 22-3 09:43
Starting an academic career: balancing clinical work and research
R. A. Woitek*; Cambridge/UK (ramona.woitek@meduniwien.ac.at)*
Learning objectives:
1. To learn the challenges of being a clinician and a researcher.
2. To become familiar with the leadership skills required to be an excellent researcher.
3. To understand how to develop a career in academic radiology.
Author Disclosures:
R. A. Woitek: nothing to disclose

09:51
Open forum discussion: the challenges of clinical research and how to succeed

10:30 - 11:00 **Forum (Room A)**

Plenary Lecture

PL 1

Imaging at a different scale: the wide lives of our cells

Presiding:
B. Brkljačić; Zagreb/HR

PL 1-1 10:30
Imaging at a different scale: the wild lives of our cells
R. Weissleder*; Boston, MA/US (rweissleder@mgh.harvard.edu)*
Author Disclosures:
R. Weissleder: Advisory Board at Accure Health, Consultant at Alivio Therapeutics, Advisory Board at Bioanalytix, Advisory Board at Elsevier Inc., Advisory Board at Lumicell, Advisory Board at Moderna Therapeutics, Consultant at Moderna Therapeutics, Advisory Board at Seer Bioscience, Advisory Board at Tarveda Therapeutics, Consultant at Tarveda Therapeutics

12:45 - 13:45 **Room B**

E^3 - The Beauty of Basic Knowledge: Breast

E^3 24B

Basis of breast ultrasound and multimodality readings

Moderators:
P. Kapetas; Vienna/AT
K. Kinkel; Chêne-Bougeries/CH

E^3 24B-1 12:45
Practical ultrasound of the breast: how I do it
A. Athanasiou*;Athens/GR (aathanasiou@mitera.gr)*
Learning objectives:
1. To learn about patient positioning and image quality control.
2. To understand the value of colour Doppler ultrasound and elastography.
3. To learn about applying ultrasound breast imaging reporting and data systems (BIRADS).
Author Disclosures:
A. Athanasiou: nothing to disclose

E^3 24B-2 13:15
Integrating ultrasound findings into the final mammography report
J. Lee*; New York, NY/US (jiyon_L@hotmail.com)*
Learning objectives:
1. To understand how to assess concordance between mammography and ultrasound results.
2. To learn to give a final recommendation (no further action required, short-term follow-up, biopsy, other imaging modality, etc.).
Author Disclosures:
J. Lee: nothing to disclose

12:45 - 13:45 **Room C**

E^3 - The Beauty of Basic Knowledge: Pancreas

E^3 25B

Chronic pancreatitis

Moderator:
C. Matos; Lisbon/PT

E^3 25B-1 12:45
How to diagnose and classify
G. Zamboni*; Verona/IT (gzamboni@hotmail.com)*
Learning objectives:
1. To learn about the diagnosis of chronic pancreatitis.
2. To understand the classification of chronic pancreatitis.
3. To appreciate the role of imaging in the follow-up of chronic pancreatitis.
Author Disclosures:
G. Zamboni: nothing to disclose

E^3 25B-2 13:15
Functional evaluation of chronic pancreatitis
M. A. Bali*; Brussels/BE (mbali@ulb.ac.be)*
Learning objectives:
1. To appreciate functional evaluation of chronic pancreatitis.
2. To learn about the role of imaging in recurrent pancreatitis.
Author Disclosures:
M. A. Bali: nothing to disclose

12:45 - 13:45 **Coffee & Talk 1**

Coffee & Talk (open forum) Session

Organised by ESOR

C 4

ESOR and its role in online education

C 4-1 12:45
Chairperson's introduction
C. Loewe*; Vienna/AT (christian.loewe@meduniwien.ac.at)*
Author Disclosures:
C. Loewe: Speaker at Siemens Healthineers, Speaker at BRACCO, Speaker at GE Healthcare

C 4-2 12:50
ESR Education on demand: how does it work, what is there for you
S. Barter*; Bedford/UK*
Learning objectives:
1. To learn about the relaunched ESR Education on Demand Platform.
2. To appreciate what's new in 2020.
3. To understand the functionality and feedback for the user.
4. To become familiar with the personalised learning progress feature.
Author Disclosures:
S. Barter: nothing to disclose

C 4-3 13:05
ESOR in ESR Connect: where is the future?
V. Vilgrain*; Clichy/FR (valerie.vilgrain@aphp.fr)*
Learning objectives:
1. To learn about ESR Connect.
2. To understand online education ESOR in ESR Connect.
3. To appreciate the future developments of online education ESOR.
Author Disclosures:
V. Vilgrain: Speaker at Hopsital Beaujon

13:20
Open forum discussion

12:45 - 13:45 **Coffee & Talk 2**

Coffee & Talk (open forum) Session

Organised by EuroSafe Imaging

C 13

ESR iGuide: more appropriate imaging through clinical decision support

C 13-1 12:45
Chairperson's introduction: Update on Croatia adoption
B. Brkljačić; *Zagreb/HR (boris@brkljacic.com)*
Session objectives:
1. To understand the impact of clinical decision support on appropriate imaging utilisation.
2. To learn about the implementation of evidence-based guidelines in clinical practice.
3. To learn from user and healthcare provider experiences in Europe and the Middle East.
Author Disclosures:
B. Brkljačić: nothing to disclose

C 13-2 12:53
Medical imaging decision and support study (MIDAS)
T. J. Kroencke*; Augsburg/DE*
Learning objectives:
1. To learn about the history of initiatives to guide tailored and appropriate imaging, and reduce waste and harm to patients.
2. To understand why radiologists need to spearhead development of clinical decision support in imaging as a component of value-based radiology.
3. To appreciate decision support as a possible method to promote the appropriate, meaningful, value-based, and personalised use of medical imaging.
4. To become familiar with the MIDAS study: a multi-centre study that evaluates the impact of iGuide on overuse and inappropriate use of imaging tests.
Author Disclosures:
T. J. Kroencke: Grant Recipient at Research Grant, Innovationsfunds Germany

C 13-3 13:01
ESR iGuide implementation in Saudi Arabia
F. Garni*; Riyadh/SA*
Learning objectives:
1. To understand the problem with ordering radiology exams in Saudi government hospitals i.e. MNG-HA.
2. To explain the operational, clinical, and technical challenges in implementing CDSS for diagnostic services such as radiology.
3. To discuss why MNG-HA did a proof of concept (PoC).
4. To detail the impact of PoC on operational and clinical factors, and costs.
5. To explain the full implantation approach and the lesson learned.
Author Disclosures:
F. Garni: disclosure/affirmation information not submitted

C 13-4 13:09
ESR guideline localisation and version upgrade experience
H. Stahlbrandt*; Eksjo/SE (henriettae@stahlbrandt.com)*
Learning objectives:
1. To learn about iGuide and its versions as a tool for more appropriate imaging and what goes on in the background.
2. To understand why and how to upgrade iGuide.
3. To appreciate the value of iGuide and its localisation tools.
4. To become familiar with the value of iGuide and its localisation tools.
Author Disclosures:
H. Stahlbrandt: nothing to disclose

13:17
Open forum discussion

12:45 - 13:45 **Coffee & Talk 3**

Coffee & Talk (open forum) Session

Organised by ESR Publications

C 23

How to get my manuscript accepted: tips and tricks from the editors

C 23-1 12:45
Chairperson's introduction
M. Smits*; Rotterdam/NL (marion.smits@erasmusmc.nl)*
Session objectives:
1. To interact with the editors-in-chief of the ESR journals.
2. To discuss all elements of scientific peer review.
3. To understand what to consider when submitting a manuscript.
4. To learn how to respond to referees' comments.
Author Disclosures:
M. Smits: Consultant at reviewer for Parexel Ltd (honorarium paid to institution), Speaker at GE Healthcare (honorarium paid to institution)

C 23-2 12:50
How to "polish" a submission
Y. Menu*; Paris/FR (yves.menu@aphp.fr)*

Learning objectives:
1. To learn the importance of the cover letter.
2. To understand how the title and key points are instrumental in drawing the reader's attention.
3. To become familiar with the optimal construction of the introduction and the discussion.
4. To be able to differentiate what should be in the "Material and Method" or in the "Results" sections.
5. To learn how a bibliography should be built and checked.
Author Disclosures:
Y. Menu: nothing to disclose

C 23-3 12:55
How to reply to reviewers' criticism
F. Sardanelli*; Milan/IT*
Learning objectives:
1. What to do when the reviewer is right.
2. What to do when the reviewer is wrong.
3. What to do when two reviewers disagree.
4. Making the revised manuscript easier to read.
Author Disclosures:
F. Sardanelli: Advisory Board at Bracco, Research/Grant Support at Bayer, Bracco, General Electric, Speaker at Bayer, Bracco, General Electric

C 23-4 13:00
How to manage critical reviews
L. Marti-Bonmati*; Valencia/ES (Luis.Marti@uv.es)*
Learning objectives:
1. To understand how critical reviews should be conducted.
2. To learn how critical reviews are reviewed.
3. To be able to manage levels of evidence and recommendations.
Author Disclosures:
L. Marti-Bonmati: nothing to disclose

13:05
Open forum discussion

12:45 - 13:15 **Room M 5**

EDiR Session

EDiR 2

An instrument to develop excellence in your career: practical session (part 2)

Moderator:
L. Oleaga Zufiria; Barcelona/ES

EDiR 2-2 12:45
EDiR teaser
L. Oleaga Zufiria*; Barcelona/ES (lauraoleaga@gmail.com)*
Learning objectives:
1. To present the EDiR examination.
2. To show the structure of the EDiR exam.
3. To review some practical cases: multiple response questions, short cases, and CORE cases.
Author Disclosures:
L. Oleaga Zufiria: Consultant at TMC Academy

EDiR 2-3 13:05
Tips from an EDiR holder
C. J. Tolman*; Rotterdam/NL (christinetolman@hotmail.nl)*
Learning objectives:
1. To review ten essential tips to succeed in the EDiR.
2. To highlight the importance of the EDiR.
3. To explain the advantages of having the EDiR.
Author Disclosures:
C. J. Tolman: nothing to disclose

14:00 - 15:30 **Room B**

Neuro

RC 711

Inflammatory and infectious central nervous system (CNS) pathology

RC 711-1 14:00
Chairperson's introduction
A. M. Koc*; Izmir/TR (alimuratkoc@gmail.com)*
Session objectives:
1. To understand the role of imaging in the diagnosis and monitoring of inflammatory and infectious diseases of the central nervous system.
2. To learn basic principles in the use of imaging in neuroinfection and neuroinflammation.
3. To appreciate the added value of imaging in addition to clinical findings and laboratory tests, including cerebrospinal fluid analysis.
Author Disclosures:
A. M. Koc: nothing to disclose

RC 711-2 14:05
A. Autoimmune encephalitis
P. Demaerel*; Leuven/BE*
Learning objectives:
1. To describe the imaging pattern of autoimmune encephalitis.
2. To learn about imaging patterns in autoimmune pathology.
3. To appreciate the role of imaging in a multidisciplinary and multimodal approach.
Author Disclosures:
P. Demaerel: nothing to disclose

RC 711-3 14:28
B. Infectious encephalitis
A. Zimny*; Wroclaw/PL (abernac@wp.pl)*
Learning objectives:
1. To learn about the correct choice of imaging modalities and image acquisition parameters for the detection and monitoring of infectious diseases of the central nervous system.
2. To understand the benefits and challenges of image pattern recognition for diagnostic purposes.
3. To appreciate the heterogeneity of the disease spectrum, and challenges to interpreting imaging findings in the context of clinical presentation and possible comorbidities.
Author Disclosures:
A. Zimny: nothing to disclose

RC 711-4 14:51
C. Inflammatory and infectious myelitis
M. M. Thurnher*; Vienna/AT (majda.thurnher@meduniwien.ac.at)*
Learning objectives:
1. To learn about the spectrum of infectious diseases of the spinal cord and their most characteristic imaging features.
2. To understand the difficulties in image acquisition and image interpretation.
3. To appreciate the clinical relevance of early diagnosis and therapeutic intervention.
Author Disclosures:
M. M. Thurnher: Speaker at Biogen, Speaker at Guerbet, Speaker at Bracco

15:14
Panel discussion: Ask the expert: is imaging the key diagnostic modality for an early and specific diagnosis of infectious diseases leading to a better functional outcome?

14:00 - 15:30 **Room C**

Special Focus Session

SF 7a

Addressing challenges in imaging of larger patients

SF 7a-1/SF 7a-2 14:00
Chairpersons' introduction
V. Løgager; *Herlev/DK (Vibeke.Loegager@regionh.dk)*
J. McNulty; *Dublin/IE (jonathan.mcnulty@ucd.ie)*
Session objectives:
1. To consider the impact of an increasingly overweight population and increased obesity on medical imaging examinations and service provision.
2. To evaluate how we can optimise imaging in this population across different modalities.
Author Disclosures:
V. Løgager: nothing to disclose, J. McNulty: nothing to disclose

SF 7a-3 14:06
Key considerations in general radiography examinations of larger patients
K. Knapp; *Exeter/UK (K.M.Knapp@exeter.ac.uk)*
Learning objectives:
1. To discuss the impact of patient size on image quality and dose.
2. To review the limitations and opportunities presented by state-of-the-art equipment.
3. To explore key optimisation steps for the examination of larger patients, children and adults, in general radiography.
Author Disclosures:
K. Knapp: Author at Carver's Medical Imaging, Grant Recipient at Wellcome, Stryker

SF 7a-4 14:24
Modification of ultrasound technique and protocols for larger patients
B. Kraus; *Vienna/AT*
Learning objectives:
1. To discuss the impact of patient size on ultrasound technique and image quality.
2. To consider current ultrasound technology, systems, and probes.
3. To explore key optimisation steps, techniques and protocols, for the examination of larger patients.
Author Disclosures:
B. Kraus: nothing to disclose

SF 7a-5 14:42
Diagnostic image quality considerations for larger patients in computed tomography
S. J. Foley; *Dublin/IE (shane.foley@ucd.ie)*
Learning objectives:
1. To discuss the impact of patient size on image quality and dose for paediatric and adult examinations.
2. To review the limitations and opportunities presented by state-of-the-art equipment.
3. To explore key optimisation steps, techniques and protocols, for the examination of larger patients.
Author Disclosures:
S. J. Foley: nothing to disclose

SF 7a-6 15:00
Optimal imaging of larger patients in magnetic resonance imaging
E. Thiry; *Strasbourg/FR (thiry_elise@outlook.fr)*
Learning objectives:
1. To discuss the impact of patient size on image quality in MRI.
2. To consider current scanner, coil, and sequence design in terms of larger patients.
3. To explore key optimisation steps, techniques and protocols, for the examination of larger patients.
Author Disclosures:
E. Thiry: nothing to disclose

15:18
Panel discussion: How such patient diversity can impact on daily practice and how we can improve our services?

14:00 - 15:30 **Room N**

Physics in Medical Imaging

RC 713

Current and future trends in personalised clinical dosimetry

RC 713-1 14:00
Chairperson's introduction
E. T. Samara; *Sion/CH (elina.samara@hopitalvs.ch)*
Session objectives:
1. To understand the needs for personalised dosimetry.
2. To learn about existing and new methodologies used for patient dosimetry.
3. To understand the challenges for the implementation of patient-specific dosimetry.
Author Disclosures:
E. T. Samara: nothing to disclose

RC 713-2 14:05
A. Breast imaging dosimetry
I. Sechopoulos; *Nijmegen/NL (ioannis.sechopoulos@radboudumc.nl)*
Learning objectives:
1. To understand the current method to estimate organ dose in mammography and its limitations.
2. To understand breast dosimetry in emerging modalities.
3. To learn about upcoming approaches in breast dosimetry.
Author Disclosures:
I. Sechopoulos: Research/Grant Support at Siemens Healthcare, Research/Grant Support at Canon Medical Systems, Speaker at Siemens Healthcare, Speaker at Hologic Inc.

RC 713-3 14:25
B. Patient dosimetry in CT
S. Edyvean; *Didcot/UK (Sue.Edyvean@phe.gov.uk)*
Learning objectives:
1. To review the basic dose quantities in CT.
2. To understand the limitation of the basic dose quantities in describing patient doses in CT.
3. To learn about potential physical, computational, and monitoring methods in personalised CT dosimetry.
Author Disclosures:
S. Edyvean: nothing to disclose

RC 713-4 14:45
C. Patient dosimetry in cone beam computed tomograph (CBCT)
R. Pauwels; *Aarhus/DK (pauwelsruben@hotmail.com)*
Learning objectives:
1. To review the basic dose quantities that has been applied in CBCT scanners.
2. To understand how the current dose quantities relate to actual patient dose in different CBCT applications.
3. To learn about the possible future methods in personalised CBCT dosimetry and dose monitoring.
Author Disclosures:
R. Pauwels: Consultant at International Atomic Energy Agency

RC 713-5 15:00
D. Patient dose in fluoroscopy and interventional radiology
A. Trianni; *Udine/IT (annalisa.trianni@asuiud.sanita.fvg.it)*
Learning objectives:
1. To review the fundamental patient dosimetry quantities.
2. To learn about calculation of patient dose for interventional procedures.
3. To learn about real-time patient dose monitoring strategies.
Author Disclosures:
A. Trianni: nothing to disclose

15:20
Panel discussion: The future of patient-specific dosimetry

14:00 - 15:30 **Room O**

Children in Focus

IF 7

The patient journey: from foetus to adulthood

IF 7-1 14:00
Chairperson's introduction
C. Owens; *London/UK (owens.catherine.5@gmail.com)*
Session objectives:
1. To set the scene for the Children in Focus sessions.
2. To emphasize the importance of investment in the future of our world.
3. To introduce the programme.
Author Disclosures:
C. Owens: nothing to disclose

IF 7-2 14:05
In memoriam Prof. Helen M.L. Carty
A. T. Carty; *Liverpool/UK*
Author Disclosures:
A. T. Carty: nothing to disclose

IF 7-3 14:07
From Women in Focus to Children in Focus
H. Hricak; *New York/US*
Author Disclosures:
H. Hricak: Speaker at Memorial Sloan Kettering Cancer Center, Board Member at IBA

IF 7-4 14:12
Inspiration behind Children in Focus
B. Brkljačić; *Zagreb/HR (boris@brkljacic.com)*
Author Disclosures:
B. Brkljačić: nothing to disclose

IF 7-5 14:17
The foetus: from imagination to imaging
L. E. Derchi; *Genoa/IT (derchi@unige.it)*
Learning objectives:
1. To learn the status of the unborn child in history.
2. To appreciate the historical understanding of life in utero.
3. To present images from carvings, paintings and illustrations along human history.
Author Disclosures:
L. E. Derchi: nothing to disclose

IF 7-6 14:35
The impact of advanced medical intervention on childhood malignancy: where we are now and why we need to be here
P. Veys; *London/UK (paul.veys@gosh.nhs.uk)*
Learning objectives:
1. To learn how we have moved on over the decades to more sophisticated, less toxic therapies for cancer treatment in childhood.
2. To appreciate the importance and human impacts of these advances.
3. To understand the vital differences we are making with more bespoke treatments and the impact on the individual.
Author Disclosures:
P. Veys: Grant Recipient at Servier, Grant Recipient at Medical Research Council, Grant Recipient at Wellcome, Advisory Board at Novartis

IF 7-7/**IF 7-8** 14:53
My personal journey through childhood cancer in pictures: a ten year marathon
O. Parry; *London/UK,*
P. Parry; *London/UK*
Learning objectives:
1. To learn how it feels to be a child with cancer.
2. To appreciate the personal journey taken over time and the consequences to the individual.
3. To understand the impact of historical therapy on future adult life.
Author Disclosures:
O. Parry: disclosure/affirmation information not submitted, P. Parry: disclosure/affirmation information not submitted

15:11
Panel discussion: Where are we now and what has really changed?

14:00 - 15:30 **Room E**

E³ - Advanced Course: Interactive Teaching Session for Young (and not so Young) Radiologists

E³ 721a

Errare humanum est

E³ 721a-1 14:00
A. Errors in chest radiograph
D. Tack; *Braine-L'Alleud/BE (denis.tack@skynet.be)*
Learning objectives:
1. To learn to recognise ambiguous signs in plain films.
2. To learn to avoid the most common pitfalls in reading plain chest films.
Author Disclosures:
D. Tack: nothing to disclose

E³ 721a-2 14:45
B. Errors in CT of the chest
J. Vilar; *Valencia/ES (vilarsamper@gmail.com)*
Learning objectives:
1. To learn to interpret ambiguous chest CT signs.
2. To learn to avoid the most common pitfalls in reading chest CT images.
Author Disclosures:
J. Vilar: nothing to disclose

14:00 - 15:30 **Room F1**

E³ - ECR Master Class (Neuro)

E³ 726

How to implement MRI neuro advanced techniques at home

Moderator:
I. Tsougos; Larissa/GR

E³ 726-1 14:00
A. Practical approach to cerebral perfusion techniques
H. R. R. Jäger; *London/UK*
Learning objectives:
1. To understand the essentials in MRI perfusion techniques.
2. To describe how to interpret the data in brain perfusion MRI.
3. To know the limitations of perfusion MRI studies.
Author Disclosures:
H. R. R. Jäger: disclosure/affirmation information not submitted

E³ 726-2 14:30
B. How to read spectroscopy
C. Hoffmann; *Tel Hashomer/IL (chen.hoffmann@sheba.health.gov.il)*
Learning objectives:
1. To describe the role of 1H spectroscopy in daily practice.
2. To become familiar with 1H spectroscopic imaging and post processing techniques.
3. To be aware of other MRI spectroscopy techniques e.g. 31P.
Author Disclosures:
C. Hoffmann: nothing to disclose

E³ 726-3 15:00
C. How to read diffusion tensor imaging (DTI)
R. Gasparotti*; Brescia/IT (roberto.gasparotti@unibs.it)*
Learning objectives:
1. To learn the principals of DTI in neuroradiology.
2. To appreciate the practical value of DTI in different neurological disorders.
3. To be familiar with pitfalls of diffusion-weighted imaging (DWI) and DTI – common language with neurosurgeons.
Author Disclosures:
R. Gasparotti: nothing to disclose

14:00 - 15:00 **Coffee & Talk 3**

Coffee & Talk (open forum) Session

Organised by ESR Publications

C 24

How to get my manuscript accepted: getting help from reporting guidelines

C 24-1 14:00
Chairperson's introduction
Y. Menu*; Paris/FR (yves.menu@aphp.fr)*
Session objectives:
1. To learn about the concept of different reporting guidelines and how they are adapted to specific types of research.
2. To understand why these guidelines are most useful when considered early in the study/manuscript preparation, avoiding major errors in the construction of the manuscript.
3. To be aware that these guidelines are useful for reviewers and editors.
Author Disclosures:
Y. Menu: nothing to disclose

C 24-2 14:03
Why are STARD and STROBE useful and how do they help authors and editors?
F. Sardanelli*; Milan/IT*
Learning objectives:
1. To learn about the definition of these guidelines.
2. To understand the major benefit of including these guidelines early in the study.
3. To be aware of other guidelines that may be useful for specific purposes, like CONSORT or ARRIVE.
Author Disclosures:
F. Sardanelli: Advisory Board at Bracco, Research/Grant Support at Bayer, Bracco, General Electric, Speaker at Bayer, Bracco, General Electric

C 24-3 14:08
What is PRISMA, and what is the recipe for a relevant meta-analysis?
M. Dewey*; Berlin/DE*
Learning objectives:
1. To understand the relationship between systematic review and meta-analysis.
2. To become familiar with the PRISMA checklist and flow diagram, and to understand how they can provide useful guidance for authors towards a successful meta-analysis.
3. To assess PRISMA as a tool for critical appraisal of published systematic reviews.
Author Disclosures:
M. Dewey: Grant Recipient at EU (603266-2) DFG (DE 1361/14-1, DE 1361/18-1, BIOQIC GRK 2260/1, Radiomics DE 1361/19-1 and 20-1 in SPP 2177/1), Berlin University Alliance (GC_SC_PC 27), Berlin Institute of Health (Digital Health Accelerator)., Patent Holder at Patent on fractal analysis of perfusion imaging (jointly with Florian Michallek, PCT/EP2016/071551), Speaker at Canon, Guerbet. , Author at Editor: Cardiac CT (Springer Nature)., Other at Organisation of Hands-on cardiac CT courses (www.ct-kurs.de) , Other at Institutional research agreements: Siemens, General Electric, Philips, Canon.

C 24-4 14:13
Can we elaborate guidelines or a checklist for radiomics studies?
D. Pinto Dos Santos*; Cologne/DE (daniel.pinto-dos-santos@uk-koeln.de)*
Learning objectives:
1. To learn about the most common weaknesses in published/submitted manuscripts dealing with artificial intelligence/radiomics.
2. To understand how reporting guidelines can help authors avoid these errors by providing a checklist.
3. To be aware of ongoing efforts in adapting reporting guidelines to the field of artificial intelligence.
Author Disclosures:
D. Pinto Dos Santos: Advisory Board at Cook Medical, Advisory Board at mediaire GmbH

14:18
Open forum discussion

14:00 - 15:30 **da Vinci (Room D1)**

Special Focus Session

SF 7b

How radiologists can help the infertile couple

SF 7b-1 14:00
Chairperson's introduction
M. Studniarek*; Gdansk/PL (mstud@gumed.edu.pl)*
Session objective:
1. To learn about infertility: definition, epidemiology, infertility types and mechanisms, patients' expectations.
Author Disclosures:
M. Studniarek: nothing to disclose

SF 7b-2 14:04
Andrology expert's view on the role of radiology in infertility
D. Jezek*; Zagreb/HR (davor.jezek@mef.hr)*
Learning objectives:
1. To learn about male infertility problems and causes.
2. To understand when infertility is reversible and the role of accurate diagnosis, adequate medication when needed, and surgical and interventional radiology procedures in solving infertility problems from a clinical point of view.
3. To become familiar with the role of the andrologist, and the information needed by clinicians in decision making.
Author Disclosures:
D. Jezek: nothing to disclose

SF 7b-3 14:19
Imaging the infertile men: when and how?
M. Bertolotto*; Trieste/IT (bertolot@units.it)*
Learning objectives:
1. To learn about the radiological evaluation of infertile men. When, why, and what should be examined.
2. To understand the clinician's expectations and when radiologists can help.
3. To become familiar with the radiological procedures helpful in the diagnosis, and differentiation of infertility causes: radiological signs of varicocele, obstructive and non-obstructive azoospermia, where and how to find cryptorchid testis.
Author Disclosures:
M. Bertolotto: nothing to disclose

SF 7b-4 14:39
Imaging the infertile women: when and how?
R. Forstner*; Salzburg/AT (r.forstner@salk.at)*
Learning objectives:
1. To learn the various causes of female infertility.
2. To understand the appropriate use of MRI in assessing infertility.
3. To illustrate uterine and extrauterine conditions impairing fertility.
Author Disclosures:
R. Forstner: nothing to disclose

SF 7b-5 14:59
Interventional radiology in male and female infertility
R. Uberoi*; Oxford/UK (raman.uberoi@ouh.nhs.uk)*

Learning objectives:
1. To learn about the contemporary methods of infertility treatment including in vitro fertilisation.
2. To understand the main differences between radiological methods and other methods applied in infertility. How interventional radiologists can help in female or male infertility.
3. To become familiar with the methodology of interventional radiology procedures applied in the diagnosing and treatment of male and female infertility.
Author Disclosures:
R. Uberoi: Grant Recipient at Gore, Grant Recipient at Terumo

14:19
Panel discussion: What is the role of the radiologist in the workup of infertility?

14:00 - 15:30 **Darwin (Room D2)**

Special Focus Session

SF 7c
BasiCardiac for non-cardiac radiologists

SF 7c-1 14:00
Chairperson's introduction
L. Natale*; Rome/IT (luigi.natale@unicatt.it)*
Session objectives:
1. To familiarise general radiologists with cardiac findings in ungated chest CT.
2. To discuss the major indication for gated cardiac CT.
3. To explain MR imaging of myocardial infarction.
4. To review the MR role in acute chest pain with normal coronary arteries.
Author Disclosures:
L. Natale: nothing to disclose

SF 7c-2 14:05
Cardiac findings in ungated chest CT
K. Nikolaou*; Tübingen/DE (Konstantin.Nikolaou@med.uni-tuebingen.de)*
Learning objectives:
1. To refresh knowledge surrounding cardiac anatomy and normal variants.
2. To review common pathological cardiac findings.
3. To become familiar with possible relationships between lung and cardiac findings.
Author Disclosures:
K. Nikolaou: Research/Grant Support at Siemens Healthcare, Bracco, GE, Bayer

SF 7c-3 14:25
Coronary artery disease: how, why, and when a cardiac CT?
R. Vliegenthart*; Groningen/NL (r.vliegenthart@umcg.nl)*
Learning objectives:
1. To discuss the technical aspects of gated cardiac CT.
2. To be familiar with the appropriateness criteria for CT use in cardiac diseases.
3. To understand the most frequent indication to cardiac CT.
Author Disclosures:
R. Vliegenthart: Research/Grant Support at Institutional research grant, Siemens Healthineers

SF 7c-4 14:45
CMR: characterising myocardial damage
M. Francone*; Rome/IT (marco.francone@uniroma1.it)*
Learning objectives:
1. To become familiar with basic MR sequences to detect myocardial damage.
2. To learn about the differential diagnosis of ischemic and non ischemic cardiomyopathies.
3. To recognise the prognostic implications of MRI data.
Author Disclosures:
M. Francone: nothing to disclose

SF 7c-5 15:00
Acute chest pain with normal coronaries: a clear indication for CMR
M. Gutberlet*; Leipzig/DE (matthias.gutberlet@helios-gesundheit.de)*
Learning objectives:
1. To review differential diagnosis of acute chest pain.
2. To understand the role of CMR in characterisation of acute presentation and normal invasive coronary angiography.
3. To become familiar with prognostic implications of MRI data in acute settings.
Author Disclosures:
M. Gutberlet: Speaker at Bayer, Philips, Siemens, Bracco and Circle

15:15
Panel discussion: The heart is not a black hole in the chest

14:00 - 15:30 **Descartes (Room D3)**

Genitourinary

RC 707
Prostate cancer management: pushing the diagnostic frontier

RC 707-1 14:00
Chairperson's introduction
O. Ratib*; Geneva/CH (osman.Ratib@hcuge.ch)*
Session objectives:
1. To learn about the state of the art of prostate cancer imaging.
2. To understand how to skip the hurdles of implementing this into European and national prostate cancer guidelines.
3. To learn the next steps in the evolution of imaging of prostate cancer.
Author Disclosures:
O. Ratib: nothing to disclose

RC 707-2 14:05
A. The role of MRI
V. Panebianco*; Rome/IT (valeria.panebianco@uniroma1.it)*
Learning objectives:
1. To illustrate the evolution of MRI in terms of technical and standardisational improvement.
2. To understand the clinical impact of MRI in the era of the prostate imaging reporting and data system (PI-RADS).
3. To become familiar with the MRI strategies for risk-adapted prostate cancer diagnosis.
Author Disclosures:
V. Panebianco: nothing to disclose

RC 707-3 14:25
B. The role of molecular imaging: PSMA-PET/CT and PET/MR
H.-P. Schlemmer*; Heidelberg/DE*
Learning objectives:
1. To become familiar with the key clinical issues and imaging strategies for risk-adapted prostate cancer diagnosis.
2. To understand the significance and complementary roles of whole-body MRI and PSMA-PET/CT for tumour detection, (re)staging, as well as therapy planning and monitoring.
3. To learn the clinical indications for risk-adapted whole-body PSMA-PET/CT and PET/MRI according to current guidelines.
Author Disclosures:
H.-P. Schlemmer: Advisory Board at Siemens Healthineers, Advisory Board at Bayer, Grant Recipient at Siemens Healthineers, Grant Recipient at Bayer, Speaker at Siemens Healthineers, Speaker at Bayer

RC 707-4 14:45
C. Theranostic approaches to prostate cancer management
H. Ilhan*; Munich/DE (harun.ilhan@med.lmu.de)*
Learning objectives:
1. To review and evaluate current approaches for hybrid imaging in prostate cancer.
2. To analyse the impact of imaging on several therapeutic approaches for prostate cancer.
3. To look ahead for future approaches for prostate cancer theranostics.
Author Disclosures:
H. Ilhan: Advisory Board at Bayer, Research/Grant Support at Novartis, Speaker at Bayer, Speaker at Sirtex Medical

15:05
Panel discussion: Investigating patients with suspected and proven prostate cancer in 2025

14:00 - 15:30 **Room G**

Multidisciplinary Session

MS 7a

Multidisciplinary team for breast cancer

MS 7a-1 14:00
Chairperson's introduction
G. Ivanac*; Zagreb/HR (gordana.augustan@gmail.com)*
Session objectives:
1. To highlight the importance of multidisciplinary breast teams in the diagnosis and treatment of breast cancer.
2. To introduce the EU guidelines for breast centres.
3. To introduce the 'key disciplines' for a multidisciplinary breast centre.
Author Disclosures:
G. Ivanac: nothing to disclose

MS 7a-2 14:03
Radiologist's perspective
E. Divjak*; Zagreb/HR*
Learning objectives:
1. To learn about the role of different imaging modalities in detecting and characterising breast lesions precisely.
2. To understand the importance of needle biopsy and of pathologic "b-classification" in the management of women with breast cancer.
3. To understand the role of a multidisciplinary approach based on case presentation.
Author Disclosures:
E. Divjak: nothing to disclose

MS 7a-3 14:21
Pathologist's perspective
C. Tomasovic-Loncaric*; Zagreb/HR (ctomasov@kbd.hr)*
Learning objectives:
1. To learn about the advantages and deficiencies of pathological examination in the non-invasive diagnosis of breast lesions.
2. To understand the impact of the recommended standard surgical and radiological procedures on the accuracy of pathological diagnosis.
3. To understand the impact of good communication with radiologists and clinicians on the accuracy of pathological diagnosis.
Author Disclosures:
C. Tomasovic-Loncaric: nothing to disclose

MS 7a-4 14:39
Surgeon's perspective
R. Zic*; Zagreb/HR*
Learning objectives:
1. To learn about different surgical options in the treatment of breast cancer patients.
2. To understand the rationale behind current perioperative and adjuvant treatment approaches.
3. To understand the principles of individualised treatment according to the biology of breast cancer.
Author Disclosures:
R. Zic: disclosure/affirmation information not submitted

MS 7a-5 14:57
Oncologist's perspective
N. Dedic-Plavetic*; Zagreb/HR (ndedic@kbc-zagreb.hr)*
Learning objectives:
1. To learn about the current medical treatment options and modalities.
2. To understand the indications for the neoadjuvant treatment approach and the appropriate modalities.
3. To understand the interactions of known predictive factors, current neoadjuvant/adjuvant treatment options, and prognosis within an interdisciplinary treatment concept.
Author Disclosures:
N. Dedic-Plavetic: Advisory Board at Roche, Advisory Board at Mylan, Investigator at Roche, Speaker at Roche, Advisory Board at Novartis, Speaker at Pfizer, Speaker at Novartis, Investigator at Roche, Advisory Board at Pfizer

MS 7a-6 15:15
Multidisciplinary case presentation and discussion
G. Ivanac*; Zagreb/HR (gordana.augustan@gmail.com)*
Author Disclosures:
G. Ivanac: nothing to disclose

14:00 - 15:30 **Room K**

Multidisciplinary Session

MS 7b

Liver transplantation in patients with hepatocellular carcinoma: a multidisciplinary approach

MS 7b-1 14:00
Chairperson's introduction
I. G. Lupescu*; Bucharest/RO (ilupescu@gmail.com)*
Session objectives:
1. To highlight the crucial role of the multidisciplinary team (MDT) in prompt early diagnosis, staging of hepatocellular carcinoma (HCC), and formulating an individualised treatment plan.
2. To present the key role of the radiologist in the MDT in pre-transplant and post-transplant liver evaluation of patients with HCC.
3. To discuss the gastroenterologist's and the surgeon's point of view for liver transplantation in patients with "early-stage" HCC.
Author Disclosures:
I. G. Lupescu: nothing to disclose

MS 7b-2 14:06
Surveillance of hepatocelular carcinoma in patients with cirrhosis and indications for liver transplantation: the gastroenterologist's perspective
L. Gheorghe*; Bucharet/RO (drlgheorghe@gmail.com)*
Learning objectives:
1. To redefine the appropriate candidates and the current methodology for HCC surveillance in cirrhosis.
2. To update the recommendations for liver transplantation in patients with HCC.
3. To discuss the management of patients with liver cirrhosis and hepatocellular carcinoma while on the transplant wait list.
Author Disclosures:
L. Gheorghe: Speaker at Fundeni Clinical Institute, Gastroenterology and Hepatology Center; Carol Davila University of Medicine and Pharmacy

MS 7b-3 14:28
Imaging and interventional radiology in preoperative liver transplantation: from diagnosis to bridging
R. L. Dumitru*; Bucharest/RO (radu.dumitru@gmail.com)*
Learning objectives:
1. To raise awareness of the radiological findings and their role in patient preparation.
2. To identify the normal and variant hepatic arterial, hepatic venous, portal venous, and bile duct anatomy.
3. To become familiar with interventional radiology (IR) procedures for patients on the waiting list for liver transplantation (ablation, TACE).
Author Disclosures:
R. L. Dumitru: nothing to disclose

MS 7b-4 14:43
The point of view of the surgeon: what the surgeon needs to know?
I. Popescu*; Bucharest/RO*
Learning objectives:
1. To describe the different types of liver transplantation.
2. To emphasise the importance of knowing, prior to the liver transplantation, the anatomical vascular and biliary tree variants.
3. To discuss current surgical techniques and their importance in pre-transplantation evaluation.

Author Disclosures:
I. Popescu: disclosure/affirmation information not submitted

MS 7b-5 15:05
Post-transplant complications: from diagnosis to treatment
C. M. Grasu*; Bucharest/RO (mugur.grasu@gmail.com)*
Learning objectives:
1. To identify the normal post-transplantation imaging findings.
2. To discuss post-transplantation complications and their imaging characteristics.
3. To present interventional radiology techniques in liver translate complications.
Author Disclosures:
C. M. Grasu: Consultant at Boston Scientific, Consultant at Terumo Europe NV, Speaker at Bayer

MS 7b-6 15:20
Multidisciplinary case presentation and discussion
I. G. Lupescu*; Bucharest/RO (ilupescu@gmail.com)*
Author Disclosures:
I. G. Lupescu: nothing to disclose

14:00 - 15:30 **Room M 2**

E³ - Advanced Course: Interactive Teaching Session for Young (and not so Young) Radiologists

E³ 721b
Head and neck imaging

E³ 721b-1 14:00
A. Cystic neck lesions
A. Borges*; Lisbon/PT (borgalexandra@gmail.com)*
Learning objectives:
1. To become familiar with the differential diagnosis.
2. To know the usefulness of the biochemistry of fine needle aspiration in the differential diagnosis.
Author Disclosures:
A. Borges: nothing to disclose

E³ 721b-2 14:45
B. Non-traumatic head and neck emergencies
A. Rovira Cañellas*; Barcelona/ES (alex.rovira@idi.gencat.cat)*
Learning objectives:
1. To become familiar with the most common cause of emergencies.
2. To learn the imaging criteria for differentiation.
Author Disclosures:
A. Rovira Cañellas: nothing to disclose

14:00 - 15:30 **Room M 3**

ESOR Session

ESOR
Education in research

Moderators:
M. Fuchsjäger; Graz/AT
V. Vilgrain; Clichy/FR

ESOR-1 14:00
Introduction
M. Fuchsjäger*; Graz/AT (michael.fuchsjaeger@medunigraz.at)*
Author Disclosures:
M. Fuchsjäger: nothing to disclose

ESOR-2 14:05
ESOR in action 2020
V. Vilgrain*; Clichy/FR (valerie.vilgrain@aphp.fr)*
Learning objectives:
1. To become familiar with ESOR.
2. To learn about ESOR activities in 2020.
3. To understand the new topics of the ESOR Educational Programme.
Author Disclosures:
V. Vilgrain: Speaker at Hospital Beaujon

ESOR-3 14:10
Getting involved in clinical trials: it is never too early
V. Goh*; London/UK (vicky.goh@kcl.ac.uk)*
Learning objectives:
1. To understand the rationale for clinical trials.
2. To learn about the different types of clinical trials.
3. To appreciate the role of radiologists in clinical trials.
Author Disclosures:
V. Goh: Research/Grant Support at Siemens, Speaker at Siemens

ESOR-4 14:30
The importance of networking in research
C. Catalano*; Rome/IT (carlo.catalano@uniroma1.it)*
Author Disclosures:
C. Catalano: nothing to disclose

ESOR-5 14:50
My experience: Bracco research fellowship
Ž. Snoj*; Ljubljana/SI (ziga.snoj@gmail.com)*
Learning objectives:
1. To appreciate the opportunity of a research fellowship.
2. To become familiar with research fellowship goals.
3. To gain insight into the fellowship course based on the scholar's experience.
Author Disclosures:
Ž. Snoj: nothing to disclose

15:00
Awards

14:00 - 15:30 **Room M 4**

State of the Art Symposium

SA 7
Musculoskeletal ultrasound of the extremities

SA 7-1 14:00
Chairperson's introduction
G. M. Allen*; Oxford/UK (gina_m_allen@btinternet.com)*
Session objectives:
1. To describe the anatomical considerations for ultrasonography of the extremities.
2. To define the pathologic conditions whereby diagnostic ultrasonography of the extremities is utilised.
3. To explain the ultrasonography findings of the pathologic conditions of the extremities.
Author Disclosures:
G. M. Allen: nothing to disclose

SA 7-2 14:06
Tendons, ligaments and retinaculae of the wrist and hand
M. Faruch-Bilfeld*; Toulouse/FR (mariefaruch@hotmail.com)*
Learning objectives:
1. To describe the anatomical considerations for ultrasonography of the wrist and hand.
2. To define the pathologic conditions whereby diagnostic ultrasonography of the tendons, ligaments and retinaculae of the wrist and hand is utilised.
3. To explain the ultrasonography findings of the pathologic conditions of the tendons, ligaments and retinaculae of the wrist and hand.
Author Disclosures:
M. Faruch-Bilfeld: nothing to disclose

SA 7-3 14:24
Tendons, ligaments and retinaculae of the ankle and foot
G. M. Allen; *Oxford/UK (gina_m_allen@btinternet.com)*
Learning objectives:
1. To describe the anatomical considerations for ultrasonography of the ankle and foot.
2. To define the pathologic conditions whereby diagnostic ultrasonography of the tendons, ligaments and retinaculae of the ankle and foot is utilised.
3. To explain the ultrasonography findings of the pathologic conditions of the tendons, ligaments and retinaculae of the ankle and foot.
Author Disclosures:
G. M. Allen: nothing to disclose

SA 7-4 14:42
Soft tissue masses
E. Drakonaki; *Iraklion/GR (drakonaki@yahoo.gr)*
Learning objectives:
1. To describe the anatomical considerations for ultrasonography of the soft tissues in the extremities.
2. To define the soft tissue masses whereby diagnostic ultrasonography is utilised in the extremities.
Author Disclosures:
E. Drakonaki: nothing to disclose

SA 7-5 15:00
Peripheral nerve disorders
C. Martinoli; *Genoa/IT (carlo.martinoli@unige.it)*
Learning objectives:
1. To describe the anatomical considerations for ultrasonography of the nerves in the extremities.
2. To define the pathologic conditions whereby diagnostic ultrasonography of the nerves in the extremities is utilised.
3. To explain the ultrasonography findings of the pathologic conditions of the nerves in the extremities.
Author Disclosures:
C. Martinoli: nothing to disclose

15:18
Panel discussion: How can we, as radiologists, best serve the interest of the patient in musculoskeletal ultrasound of the extremities while protecting our turf?

14:00 - 15:30 **Room M 5**

E³ - Advanced Course: Artificial Intelligence

E³ 720

Challenges and solutions for introducing artificial intelligence (AI) in daily clinical workflow

E³ 720-1 14:00
Chairperson's introduction
E. Kotter; *Freiburg/DE (elmar.kotter@uniklinik-freiburg.de)*
Session objectives:
1. To become familiar with the current state of AI implementation in radiology departments.
2. To understand how you can start implementing AI based solutions.
3. To learn about challenges and pitfalls in implementing AI in your department.
Author Disclosures:
E. Kotter: nothing to disclose

E³ 720-2 14:06
A. Implementation of AI algorithms in picture archiving and communication systems (PACS)
W. B. Veldhuis; *Utrecht/NL (w.veldhuis@umcutrecht.nl)*
Learning objectives:
1. To learn about how you can start experimenting with AI in daily clinical routine.
2. To learn about developments to integrate multiple AI tools within one framework.
3. To learn about processes to evaluate AI algorithms for clinical use cases.
Author Disclosures:
W. B. Veldhuis: Founder at QuantibU BV

E³ 720-3 14:27
B. How to best complement human intelligence with AI
C. J. Herold; *Vienna/AT (Christian.Herold@meduniwien.ac.at)*
Learning objectives:
1. To understand current and emerging concept for AI and machine learning in imaging.
2. To explore whether it is possible to success fully integrate AI into clinical practice today.
3. To learn how the radiologists can be assisted by AI.
Author Disclosures:
C. J. Herold: CEO at Medical University of Vienna

E³ 720-4 14:48
C. AI, ethics and radiology
A. Brady; *Cork/IE (adrianbrady@me.com)*
Learning objectives:
1. To understand ethical aspects related to data use in AI.
2. To learn about possible bias in AI algorithms.
3. To learn how to prepare radiology policies for AI.
Author Disclosures:
A. Brady: nothing to disclose

E³ 720-5 15:09
D. AI in radiology: culture change
H. Fleishon; *Atlanta, GA/US (hfleishon@outlook.com)*
Learning objectives:
1. To review possible changes in radiology practices and departments due to implementation of AI workflows.
2. To present possible impact of AI on radiology macroeconomics.
3. To discuss educational innovations to introduce AI into radiology resident training.
Author Disclosures:
H. Fleishon: nothing to disclose

14:00 - 15:30 **Tech Gate Auditorium**

Imaging Informatics

RC 705

Everything you need to know about 3D post-processing

RC 705-1 14:00
Chairperson's introduction
E. Sorantin; *Graz/AT*
Session objectives:
1. To learn about the state-of-the-art information regarding 3D post-processing.
2. To understand how 3D post-processing can be used optimally in daily clinical practice.
3. To appreciate how automated 3D post-processing and quantification will lead to increased use of 3D visualisations for diagnostics and therapy planning over 2D viewing.
Author Disclosures:
E. Sorantin: nothing to disclose

RC 705-2 14:05
A. 3D post-processing in 2020
A. Alberich-Bayarri; *Valencia/ES (angel@quibim.com)*
Learning objectives:
1. To learn about recent advances in 3D post-processing techniques.
2. To understand how these techniques can now be used in clinical practice.
3. To learn new tips and tricks to use in your daily practice.
Author Disclosures:
A. Alberich-Bayarri: CEO at QUIBIM SL, Board Member at QUIBIM SL, Founder at QUIBIM SL

RC 705-3 14:28
B. Making better use of your 3D package: tips and tricks
P. M. van Ooijen*; Groningen/NL (p.m.a.van.ooijen@umcg.nl)*
Learning objectives:
1. To learn about the functionality of state-of-the-art 3D packages.
2. To understand the pitfalls in use of 3D post-processing.
3. To appreciate the need for training in 3D post-processing techniques.
Author Disclosures:
P. M. van Ooijen: nothing to disclose

RC 705-4 14:51
C. Interpretation of 3D processing results: from image to volume reading
T. Frauenfelder*; Zurich/CH (thomas.frauenfelder@usz.ch)*
Learning objectives:
1. To learn about different developments in creating 3D anatomical and functional models for diagnostic and therapy planning purposes.
2. To understand the pros and cons of such technologies.
3. To appreciate that automated 3D image analysis will lead to new ways in which diagnosis and therapy planning will be performed.
Author Disclosures:
T. Frauenfelder: nothing to disclose

16:14
Panel discussion: Will we still look at 2D images in 10 years' time?

16:00 - 17:30 **Room B**

E³ - Rising Stars Programme: Basic Session

BS 8
Genitourinary

Moderator:
L. E. Derchi; Genoa/IT

BS 8-1 16:00
Adrenal pathologies
M. Stajgis*; Poznan/PL (stajgis@gmail.com)*
Learning objectives:
1. To review the most common pathologies.
2. To present current imaging techniques for evaluation of adrenal pathologies.
3. To demonstrate the most important findings of the common adrenal pathologies.
Author Disclosures:
M. Stajgis: nothing to disclose

BS 8-2 16:30
Prostate cancer
B. Hamm*; Berlin/DE*
Learning objectives:
1. To review the most common pathologies.
2. To present current imaging techniques for evaluation of the prostate.
3. To demonstrate the most important findings of prostate pathologies.
Author Disclosures:
B. Hamm: disclosure/affirmation information not submitted

BS 8-3 17:00
Foetal MRI
D. Prayer*; Vienna/AT (daniela.prayer@meduniwien.ac.at)*
Learning objectives:
1. To learn about the indications of foetal MRI.
2. To describe the foetal MRI technique.
3. To illustrate the imaging features in most common foetal pathologies.
Author Disclosures:
D. Prayer: nothing to disclose

16:00 - 17:30 **Room on demand Room C or Room M 3**

Musculoskeletal

RC 810
Inflammatory and infectious diseases of the spine: how to differentiate from degeneration

Moderator:
I. Engele; Riga/LV

RC 810-1 16:00
A. Spondyloarthritis: a diagnostic chameleon
V. Zubler*; Zurich/CH*
Learning objectives:
1. To explain the disease spectrum and pathophysiology of spondyloarthritides.
2. To describe the imaging findings of spondyloarthritides.
Author Disclosures:
V. Zubler: nothing to disclose

RC 810-2 16:30
B. Crystals: may also affect the spine
M. Reijnierse*; Leiden/NL (m.reijnierse@lumc.nl)*
Learning objectives:
1. To explain the disease spectrum and pathophysiology of crystal deposition diseases that affect the spine.
2. To describe the imaging findings of crystal deposition diseases that affects the spine.
Author Disclosures:
M. Reijnierse: nothing to disclose

RC 810-3 17:00
C. Infection: imaging, indication and techniques for biopsy
J.-L. Drape*; Paris/FR (jean-luc.drape@cch.aphp.fr)*
Learning objectives:
1. To describe the imaging findings of spinal infection.
2. To explain the biopsy indication and techniques in spinal infection.
Author Disclosures:
J.-L. Drape: Speaker at HOPITAL COCHIN

16:00 - 17:00 **Coffee & Talk 1**

Coffee & Talk (open forum) Session
Organised by the European Board of Radiology (EBR)

C 35
ETAP 2.0: a certification of excellence for radiology training departments

C 35-1 16:00
Chairperson's introduction
D. Negru*; Iasi/RO (draneg@gmail.com)*
Session objectives:
1. To learn about ETAP 2.0.
2. To understand the importance of the assessment of training programmes.
3. To learn about facts and figures of ETAP.
Author Disclosures:
D. Negru: nothing to disclose

C 35-2 16:10
Steps for the certification
A. Montvila*; Kaunas/LT (montvila.antanas@gmail.com)*
Learning objectives:
1. To show the phases of the ETAP 2.0 certification process.
2. To learn how to prepare for the audit process.
3. To learn how the outcome of the certification is determined.
Author Disclosures:
A. Montvila: Board Member at European Junior Doctors Association

C 35-3 16:30
Benefits of getting ETAP 2.0 certified
J. Kraft*; Leeds/UK (Jeannette.Kraft@nhs.net)*
Learning objectives:
1. To know the different reasons for obtaining the certification.
2. To check the quality of the training programme.
3. To learn how to improve the training programme.
Author Disclosures:
J. Kraft: nothing to disclose

16:50
Open forum discussion

16:00 - 17:30 **Room N**

EuroSafe Imaging Session

EU 8
European study on clinical diagnostic reference levels (DRLs) (EUCLID) project: final results

Moderators:
J. Damilakis; Iraklion/GR
G. Frija; Paris/FR

EU 8-1 16:00
An overview of the EUCLID project
J. Damilakis*; Iraklion/GR (John.Damilakis@med.uoc.gr)*
Learning objectives:
1. To understand why clinical DRLs are needed in adult imaging.
2. To learn about the EUCLID methodology of establishing DRLs.
3. To give an overview of the EUCLID results.
Author Disclosures:
J. Damilakis: Research/Grant Support at European Commission

EU 8-2 16:15
EUCLID clinical DRLs values in CT and European comparisons
V. Tsapaki*; Nea Ionia/GR (virginia@otenet.gr)*
Learning objectives:
1. To present EUCLID CT data analysis in the attempt to define EUCLID CT DRLs.
2. To compare with existing clinical CT DRLs.
3. To present the challenges and limitations, as well as methods, to improving surveys for DRLs determination.
Author Disclosures:
V. Tsapaki: nothing to disclose

EU 8-3 16:30
EUCLID clinical DRLs values in interventional radiology and European comparisons
W. Jaschke*; Innsbruck/AT (werner.jaschke@i-med.ac.at)*
Learning objectives:
1. To learn the differences between clinical DRL and DRL.
2. To report the EUCLID clinical DRL values in interventional radiology.
3. To provide information on DRL values for procedures in Europe.
Author Disclosures:
W. Jaschke: nothing to disclose

EU 8-4 16:45
Implementation of clinical DRLs in practice: ask one centre
S. T. Schindera*; Riehen/CH (sebastian.schindera@ksa.ch)*
Learning objectives:
1. To discuss the main challenges in the implementation of clinical DRLs.
2. To present the major benefits when applying clinical DRLs.
3. To discuss future application of clinical DRLs in CT.
Author Disclosures:
S. T. Schindera: nothing to disclose

EU 8-5 16:55
The European Commission's perspective
G. Simeonov*; Luxembourg/LU (georgi.simeonov@ec.europa.eu)*
Learning objectives:
1. To understand the role of DRLs in the European system for radiation protection in medicine.
2. To understand the European Commission's reasoning behind supporting the EUCLID project.
3. To obtain insights into the position of the European Commission with respect to EUCLID project results.
4. To discuss needs for further European work on DRLs, including the wider context of quality and safety in radiology.
Author Disclosures:
G. Simeonov: nothing to disclose

17:10
Panel discussion: How can clinical DRLs be introduced into daily clinical routine?

16:00 - 17:30 **Room O**

Children in Focus

IF 8
Medicolegal dilemmas in paediatric medicine

IF 8-1 16:00
Chairperson's introduction
A. C. Offiah*; Sheffield/UK (amaka.offiah@nhs.net)*
Author Disclosures:
A. C. Offiah: Advisory Board at Alexion, Advisory Board at BioMarin, Speaker at InfoMed, Grant Recipient at Alexion, Other at Expert witness for cases of suspected child abuse

IF 8-2 16:06
Child abuse, creation of a non-disease? The Swedish report versus IPR/ESPR white paper: is anything really ever black and white?
A. Choudhary*; Little Rock, AR/US (achoudhary@uams.edu)*
Learning objectives:
1. To learn how effective the radiologist is at diagnosing abusive head trauma.
2. To appreciate the difficulties of creating high-level scientific evidence for radiological signs of child abuse.
3. To discuss the dilemmas when selecting studies for meta-analysis of medical signs of child abuse.
Author Disclosures:
A. Choudhary: Shareholder at GE, Speaker at Honorarium for lectures at meetings, Other at Expert witness for medicolegal cases

IF 8-3 16:22
Medical evidence from a legal perspective
W. Duijst*; Maastricht/NL (ackenniscentrum.nl@gmail.com)*
Learning objectives:
1. To understand the true impact of legal evidence and the role of medical expert witnesses.
2. To appreciate the differences between legal and medical evidence.
3. To discuss legal dilemmas when medical scientific evidence is sparse. How does the court evaluate the reliability and credibility of the expert witnesses?
Author Disclosures:
W. Duijst: nothing to disclose

IF 8-4 16:38
The EU perspective: is child abuse a homogenous 'disease' across Europe? Cultural aspects
M. Raissaki*; Iraklion/GR (mraissaki@yahoo.gr)*
Learning objectives:
1. To present examples of cultural differences in what is perceived as 'abuse'.
2. To understand the difficulties in appreciation of demographics of child abuse across Europe.
3. To discuss how potential cultural differences can create medical and legal dilemmas in defining child abuse.
4. To discuss the importance of prevention.
Author Disclosures:
M. Raissaki: nothing to disclose

IF 8-5 16:54
Child sexual abuse in India among children from marginalised backgrounds
R. M. George; *Vienna/AT (reena.mary.george@univie.ac.at)*
Learning objectives:
1. To learn about health services available to survivors of child sexual abuse and awareness programmes currently available to deal with this issue.
2. To appreciate the paradox in law relating to child sexual abuse in India.
3. To discuss positive and negative examples of services provided to children after reporting their abuse, and examples of the impact of child sexual abuse in some cases.
Author Disclosures:
R. M. George: nothing to disclose

17:10
Panel discussion: How can we secure credible evidence regarding child abuse in order to protect both children and their carers?

16:00 - 17:30 **Studio 2020**

Special Focus Session

SF 8a

How to diagnose and manage abdominal, retroperitoneal and pelvic incidentalomas

SF 8a-1 16:00
Chairperson's introduction
A. Rockall; *London/UK (a.rockall@imperial.ac.uk)*
Session objectives:
1. To illustrate the frequency of incidentalomas on imaging studies.
2. To discuss the pros and cons of incidental detection of abnormalities during imaging studies.
3. To highlight the economic aspects of management of incidentally diagnosed lesions.
Author Disclosures:
A. Rockall: Speaker at Guerbet

SF 8a-2 16:05
Liver, pancreatic and splenic incidentalomas
A. Cieszanowski; *Warsaw/PL (andrzej.cieszanowski@wum.edu.pl)*
Learning objectives:
1. To explain the frequency of incidental findings in the liver, pancreas, and spleen according to age and applied imaging modality.
2. To highlight the role of current imaging techniques in the differentiation of abdominal incidentalomas.
3. To describe the present guidelines and recommendations for the follow-up of incidental findings in the abdomen.
Author Disclosures:
A. Cieszanowski: Speaker at Siemens, Speaker at GE, Speaker at Philips, Speaker at Bayer, Speaker at Bracco

SF 8a-3 16:30
Adrenal and renal incidentalomas
M. Hellström; *Gothenburg/SE (mikael.hellstrom@xray.gu.se)*
Learning objectives:
1. To discuss the frequency and significance of cystic and solid renal incidentalomas.
2. To highlight the prevalence of incidental adrenal findings.
3. To describe the role of different diagnostic methods in the characterisation of renal and adrenal incidentalomas, including renal biopsy.
4. To underline the recommendations for the workup of adrenal lesions as well as for cystic and solid renal incidentalomas.
Author Disclosures:
M. Hellström: nothing to disclose

SF 8a-4 16:55
Pelvic incidentalomas
D. Akata; *Ankara/TR (akataden@gmail.com)*
Learning objectives:
1. To outline the prevalence of pelvic incidentalomas in male and female populations in different age groups.
2. To highlight the role of US, CT, and MRI in differentiation of pelvic incidentalomas.
3. To explain how to follow-up and manage incidentally detected pelvic masses.
Author Disclosures:
D. Akata: nothing to disclose

17:20
Panel discussion: The management of incidentalomas: when to dismiss, follow-up or treat them?

16:00 - 17:00 **Coffee & Talk 2**

Coffee & Talk (open forum) Session

Organised by the ESR Subcommittee on Audit and Standards

C 14

Clinical audit and the European-Basic Safety Standards (EU-BSS): where are we now?

C 14-1 16:00
Chairperson's introduction
D. Howlett; *Eastbourne/UK (david.howlett@nhs.net)*
Session objectives:
1. To reinforce the importance of a clinical audit for radiology departments.
2. To update on Esperanto: distribution and feedback.
3. To consider the future direction for the European clinical audit.
Author Disclosures:
D. Howlett: nothing to disclose

C 14-2 16:05
Clinical audit: EU-BSS uptake, the ESR perspective
A. Brady; *Cork/IE (adrianbrady@me.com)*
Learning objectives:
1. To review the requirements of the EU-BSS.
2. To present updated survey findings of EU-BSS uptake amongst European radiology departments.
3. To consider the challenges around EU-BSS uptake and transposition.
Author Disclosures:
A. Brady: nothing to disclose

C 14-3 16:20
Clinical audit: EU-BSS uptake, the regulator perspective
A. Karoussou-Schreiner; *Louxembourg/LU*
Learning objectives:
1. To update on EU-BSS transposition across Europe.
2. To update on the Heads of the European Radiological Protection Competent Authorities (HERCA) position.
3. To discuss the process and requirements of inspection.
Author Disclosures:
A. Karoussou-Schreiner: disclosure/affirmation information not submitted

C 14-4 16:30
Case example: clinical audit template
T. Ø. Holter; *Oslo/NO (uxtaho@ous-hf.no)*
Learning objectives:
1. To review a clinical audit performed at a local level.
2. To appreciate the challenges and hurdles encountered.
3. To discuss the benefits of a clinical audit at the departmental level.
Author Disclosures:
T. Ø. Holter: nothing to disclose

16:45
Open forum discussion: To discuss the potential for future pan European projects

16:00 - 17:30 **Room F1**

ESR meets Israel

Meets 8a

Radiology in Israel: technology and professionalism

Presiding:
B. Brkljačić; Zagreb/HR
J. Sosna; Jerusalem/IL

Meets 8a-1 16:00
Welcome from the ESR President
B. Brkljačić*; Zagreb/HR (boris@brkljacic.com)*
Author Disclosures:
B. Brkljačić: nothing to disclose

Meets 8a-2 16:02
Introduction
J. Sosna*; Jerusalem/IL (jacobs@hadassah.org.il)*
Learning objectives:
1. To present the fundamentals of radiology in Israel.
2. To present and discuss the role of artificial intelligence (AI) and technology in radiology in Israel.
3. To discuss the humanistic aspects of radiology.
Author Disclosures:
J. Sosna: Consultant at Xact, Grant Recipient at Philips

Meets 8a-3 16:12
Will artificial intelligence (AI) replace the radiologist?
E. Konen*; Ramat Gan/IL (eli.konen@sheba.health.gov.il)*
Learning objectives:
1. To describe AI principles.
2. To present current AI applications.
3. To discuss the role of the future radiologist (AI, human, both).
Author Disclosures:
E. Konen: Consultant at AIDOC, Shareholder at Voxallence

16:32
Interlude 1: Israel: a rich history and bright future

Meets 8a-5 16:37
Doctor-patient communication in radiology
D. Shaham*; Jerusalem/IL (dshaham@hadassah.org.il)*
Learning objectives:
1. To present the human aspects of radiology work.
2. To describe the interpersonal interactions of the radiologist.
3. To present cultural differences in the perception of radiologists.
Author Disclosures:
D. Shaham: nothing to disclose

16:57
Interlude 2: Musical piece

Meets 8a-7 17:02
Imaging technology development: the Israeli experience
J. Sosna*; Jerusalem/IL (jacobs@hadassah.org.il)*
Learning objectives:
1. To present Israel as a start-up nation.
2. To describe technological developments that originated from Israel.
3. To present imaging technology innovations in development and in clinical practice.
Author Disclosures:
J. Sosna: Consultant at Xact, Grant Recipient at Philips

17:22
Panel discussion: The future of radiology: technology- or human-centred?

16:00 - 17:30 **Room F2**

Head and Neck

RC 808

Differential diagnoses you don't want to miss

Moderator:
E. B. Arkink; Reykjavík/IS

RC 808-1 16:00
A. Differential diagnoses of bone lesions in the head and neck: excluding dental cysts
V. Lenoir*; Geneva/CH*
Learning objectives:
1. To understand how to classify bone lesions in the head and neck.
2. To recognise which bone lesions you should be concerned about.
3. To become familiar with the most appropriate imaging modalities and protocols to use.
Author Disclosures:
V. Lenoir: nothing to disclose

RC 808-2 16:30
B. Differential diagnoses of cystic lesions in the head and neck: including dental cysts
S. Robinson*; Vienna/AT (s.robinson@dzu.at)*
Learning objectives:
1. To become familiar with the common cystic lesions in the neck.
2. To understand the pitfalls when assessing cystic lesions.
3. To learn about the most appropriate imaging techniques to use.
Author Disclosures:
S. Robinson: nothing to disclose

RC 808-3 17:00
C. Differential diagnoses of soft tissue masses of the face and neck in adults
D. Farina*; Brescia/IT (davide.farina@unibs.it)*
Learning objectives:
1. To become familiar with the anatomy.
2. To learn which imaging technique to use.
3. To understand the typical imaging appearance of soft tissue masses.
Author Disclosures:
D. Farina: Speaker at BAYER 2019, Other at BRACCO 2019

16:00 - 17:00 **Coffee & Talk 3**

Coffee & Talk (open forum) Session

C 25

Publishing in the radiography journal

C 25-1 16:00
Chairperson's introduction
J. M. Nightingale*; Sheffield/UK (J.Nightingale@shu.ac.uk)*
Session objectives:
1. To discuss all elements of scientific peer review.
2. To understand what to consider when submitting a manuscript.
3. To learn how to respond to referees' comments.
4. To interact with the radiography journal editorial team
Author Disclosures:
J. M. Nightingale: nothing to disclose

C 25-2 16:02
A tool to help establish the evidence base for the profession
H. Precht*; Middelfart/DK (hepr@ucl.dk)*
Learning objectives:
1. To consider why publishing is important for the development of the radiographer profession.
2. To explore the importance of publishing for individual researchers and practitioners.
3. To explore the importance of publishing for clinical and academic departments

Author Disclosures:
H. Precht: Board Member at University College Lillebelt

C 25-3 16:07
Review articles: how to get your work published
F. Zarb*; Msida/MT (francis.zarb@um.edu.mt)*
Learning objectives:
1. To explore what constitutes a strong review article and appropriate review methodologies.
2. To consider the use of reporting guidelines such as PRISMA and STARD
Author Disclosures:
F. Zarb: nothing to disclose

C 25-4 16:12
The reviewer's perspective and how to respond
A. England*; Manchester/UK (A.England@salford.ac.uk)*
Learning objectives:
1. To identify the purpose of peer review and to explain the steps within the peer review process.
2. To understand the qualities of a good review.
3. To learn how best to respond to reviewers' comments
Author Disclosures:
A. England: nothing to disclose

C 25-5 16:17
Editor-in-chief's top ten tips for publishing success
J. M. Nightingale*; Sheffield/UK (J.Nightingale@shu.ac.uk)*
Learning objectives:
1. To discuss reasons why a manuscript may be rejected.
2. To emphasise how common manuscript errors can be avoided.
3. To highlight the author's responsibilities in promoting their article.
Author Disclosures:
J. M. Nightingale: nothing to disclose

16:25
Open forum discussion

16:00 - 17:30 **da Vinci (Room D1)**

Special Focus Session

SF 8b
Quantitative MRI: from MR-physics to tissue microstructure

SF 8b-1 16:00
Chairperson's introduction
L. Mascaro*; Brescia/IT (lmascaro@libero.it)*
Session objectives:
1. To understand the principles and methods of quantitative MRI modalities that are used to measure tissue microstructure.
2. To highlight the pros and cons of quantitative imaging as compared to weighted imaging.
3. To show the potentials and limitations of the mapping technique for providing sub-voxel metrics for tissue characterisation.
4. To give updates on the role of quantitative MRI in research and routine clinical applications.
Author Disclosures:
L. Mascaro: nothing to disclose

SF 8b-2 16:05
T1, T2, and PD: direct mapping or not?
M. J. B. Warntjes*; Linköping/SE (marcel.warntjes@cmiv.liu.se)*
Learning objectives:
1. To present current methods for T1, T2, and PD mapping.
2. To understand how mathematical multicompartment analysis of relaxation times can describe complex biophysical models of tissue microstructure.
3. To underline how relaxation and PD mapping give novel information related to tissue microstructure at the subvoxel level.
Author Disclosures:
M. J. B. Warntjes: Consultant at SyntheticMR, Linköping, Sweden, Shareholder at SyntheticMR, Linköping, Sweden

SF 8b-3 16:28
Bringing quantitative magnetic susceptibility mapping into the clinic
C. Langkammer*; Graz/AT*
Learning objectives:
1. To present current methods for quantitative susceptibility mapping (QSM).
2. To understand which biophysical tissue properties can affects magnetic susceptibility, and to identify which tissues benefit from a QSM analysis.
3. To highlight the potentials of QSM to assess tissue function and disease, and to describe the actual limits of the technique as a standard tool for clinical diagnostic imaging.
Author Disclosures:
C. Langkammer: nothing to disclose

SF 8b-4 16:51
Promises and pitfalls of magnetisation transfer and diffusion
M. Cercignani*; Brighton/UK (m.cercignani@bsms.ac.uk)*
Learning objectives:
1. To present basic and advanced methods for magnetisation transfer (MT) and diffusion quantification.
2. To define the tissue microstructure and structural connectivity features that affect diffusion, and to give updates on novel quantitative diffusion metrics, their potential, and limits for clinical applications.
3. To understand MT modelling and feature extraction, and to describe the state of the art of MT quantification in clinical and pre-clinical studies.
Author Disclosures:
M. Cercignani: nothing to disclose

16:19
Panel discussion: From direct mapping to extrapolating MR-properties

16:00 - 17:30 **Darwin (Room D2)**

ISRRT meets Canada

Meets 8b
Radiography profession performance and future challenges in Canada

Presiding:
E. Agadakos; Athens/GR
D. Katsifarakis; Athens/GR

Meets 8b-1/Meets 8b-2 16:00
Chairpersons' introduction
E. Agadakos*; Athens/GR (eagadakos@gmail.com)*
D. Katsifarakis*; Athens/GR (dikatsifarakis@gmail.com)*
Session objectives:
1. To recognise the demographics and patient accessibility to health care services in the country.
2. To understand the infrastructure of the imaging health services and their contribution to the primary and hospital health services to sustain the population and individual health.
3. To inform on the role of the professional society in influencing the future educational programme of radiographers in the country.
4. To become aware of the strategies employed by the professional society to support and promote the radiographers' role in the community and the health care system.
5. To gain information on radiography career structure and opportunities for professional development of radiographers in Canada.
6. To appreciate the radiographers' post-graduation professional requirements and relevant opportunities, and to keep up to date with evidence-based practice in imaging services.
7. To communicate the society's position on artificial intelligence and preliminary actions undertaken to prepare radiographers in embracing the changes.
Author Disclosures:
E. Agadakos: Board Member at ISRRT , D. Katsifarakis: nothing to disclose

Meets 8b-3 16:05
The regulatory situation in Canada for radiographers and radiological technologists
A. Cromp*; St-Léonard, QC/CA (acromp@ac-consultant.ca)*

Learning objectives:
1. To learn how the profession of radiographers is regulated in Canada.
2. To understand how the regulation differs from one province to another, and the challenges of mobility for radiographers.
3. To become familiar with the continuing professional development obligations imposed by regulators.
4. To understand the difference between regulators, the National Alliance of Regulators, and the Canadian Association of Medical Radiation Technologists (CAMRT).
Author Disclosures:
A. Cromp: nothing to disclose

Meets 8b-4 16:23
The current and evolving state of medical radiation technology (MRT) education in Canada
C. Bru*; Ottawa, ON/CA (cbru@camrt.ca)*
Learning objectives:
1. To examine the different models of entry-level MRT education in Canada.
2. To identify trends impacting entry-level MRT education.
3. To discuss Canada's transition to a role-based competency framework.
4. To describe the advanced practice landscape in Canada.
Author Disclosures:
C. Bru: nothing to disclose

Meets 8b-5 16:41
Artificial intelligence (AI) and the medical radiation profession: how our advocacy must inform future practice
A. Murphy*; Vancouver/CA (aandrewfmurphy@gmail.com)*
Learning objectives:
1. To learn about the overall applications of AI in medical imaging.
2. To understand the methods in which these applications are being researched, tested, and sold to health care professionals, and the steps radiology groups are taking to educate their members.
3. To appreciate the value that both radiographers and radiographer societies around the world can provide by ensuring safe, accountable rollouts of AI tools.
4. To become familiar with AI as a clinical tool rather than an overcomplicated, inaccessible entity.
Author Disclosures:
A. Murphy: nothing to disclose

Meets 8b-6 16:59
Quality, safety and peer review: a Canadian experience
S. DeColle*; Edmonton, AB/CA (Steve.DeColle@albertahealthservices.ca)*
Learning objectives:
1. To learn about technologist peer learning.
2. To appreciate the value of peer learning to the patient experience.
3. To understand the implications peer learning has on quality and safety.
Author Disclosures:
S. Decolle: nothing to disclose

17:17
Panel discussion

16:00 - 17:30 **Descartes (Room D3)**

Professional Challenges Session

PC 8

Patient engagement, visible radiology and eHealth

PC 8-1/PC 8-2 16:00
Chairpersons' introduction
N. Bedlington*; Vienna/AT*
E. Kotter*; Freiburg/DE (elmar.kotter@uniklinik-freiburg.de)*
Session objectives:
1. To learn about the challenges of eHealth today and tomorrow.
2. To appreciate the communication and cooperation of patients using eHealth.
3. To understand the relevance of visible and communicating radiologists.
Author Disclosures:
N. Bedlington: disclosure/affirmation information not submitted, E. Kotter: nothing to disclose

PC 8-3 16:06
Clinical services, communication with patients: which kind of report/language is expected
J. M. L. Bosmans*; Ghent/BE (janbosmans@telenet.be)*
Learning objectives:
1. To learn about the pros and cons of radiologists' communication of imaging results to patients.
2. To appreciate the opportunities for direct communication with patients.
3. To understand the potential of structured reporting providing patient-tailored reports.
Author Disclosures:
J. M. L. Bosmans: nothing to disclose

PC 8-4 16:22
Patient engagement in research: donation of data, risk-sharing in oncology, incentives for screening
E. Briers*; Brussels/BE (erikbriers@telenet.be)*
Learning objectives:
1. To learn about the need for clinical data for research and artificial intelligence developments.
2. To appreciate that patients with serious, life-threatening diseases perform a benefit/risk assessment in making decisions.
3. To understand the value of imaging in screening, and ways to improve acceptance.
Author Disclosures:
E. Briers: nothing to disclose

PC 8-5 16:38
Patient access to reports and images: solutions and experiences
W. Gibbs*; Scottsdale/US (wendeNgibbs@gmail.com)*
Learning objectives:
1. To appreciate the risks of misinterpretation of radiology reports by clinicians.
2. To recognise the importance of clear radiology reporting for patients.
3. To understand the necessity of standardised language and structured reporting.
Author Disclosures:
W. Gibbs: nothing to disclose

PC 8-6 16:54
Education and training
L. Oleaga Zufiria*; Barcelona/ES (lauraoleaga@gmail.com)*
Learning objectives:
1. To learn about the need for education in non-imaging competences.
2. To appreciate inter-professional training in communication techniques.
3. To understand patients' expectations.
Author Disclosures:
L. Oleaga Zufiria: Consultant at TMC Academy

17:10
Panel discussion: Should radiology be more active in direct communication with patients?

16:00 - 17:30 **Room G**

Special Focus Session

SF 8c

Fibrotic lung diseases: what radiologists should know or learn

SF 8c-1 16:00
Chairperson's introduction
S. R. Desai*; London/UK*
Session objectives:
1. To review the common and distinctive imaging features of lung fibrosis.
2. To clarify the differences between idiopathic and secondary manifestations of lung fibrosis.
3. To learn about novel diagnostic and quantification imaging methods.
Author Disclosures:
S. R. Desai: disclosure/affirmation information not submitted

SF 8c-2 16:05
Fleischner updated criteria for the diagnosis of idiopathic pulmonary fibrosis (IPF)
N. Sverzellati; *Parma/IT (nicola.sverzellati@unipr.it)*
Learning objectives:
1. To become familiar with the patterns of definite or probable usual interstitial pneumonia (UIP).
2. To understand the implications of the new criteria for patient care.
3. To learn about the remaining indications of lung biopsy for confirmation of diagnosis.
Author Disclosures:
N. Sverzellati: nothing to disclose

SF 8c-3 16:30
Drug and radiation-induced lung fibrosis
C. M. M. Schaefer-Prokop; *Amersfoort/NL (cornelia.schaeferprokop@gmail.com)*
Learning objectives:
1. To learn about current medications potentially causing lung fibrosis.
2. To review the imaging patterns of drug-induced fibrosis.
3. To learn about the longitudinal evolution of post-radiation fibrosis.
Author Disclosures:
C. M. M. Schaefer-Prokop: nothing to disclose

SF 8c-4 16:55
Connective tissue disease-related lung fibrosis
G. Chassagnon; *Paris/FR*
Learning objectives:
1. To review the CT features of non-specific interstitial pneumonia (NSIP).
2. To learn about new detection and follow-up techniques based on elastic registration.
3. To learn about deep learning-based quantification of connective tissue disease-related lung fibrosis.
Author Disclosures:
G. Chassagnon: disclosure/affirmation information not submitted

17:20
Panel discussion: The pivotal role of radiologists for lung fibrosis management

16:00 - 17:30 **Room K**

Emergency Imaging

RC 817
Why do I miss fractures in emergency?

RC 817-1 16:00
Chairperson's introduction
S. Wirth; *Munich/DE (wirth.online@googlemail.com)*
Session objectives:
1. To learn the typical constellations and findings of missed fractures.
2. To understand the potential complications resulting from missing fractures.
3. To appreciate direct and indirect fracture signs with different imaging modalities.
Author Disclosures:
S. Wirth: nothing to disclose

RC 817-2 16:05
A. Missed fractures in children
K. Johnson; *Birmingham/UK (karl.johnson2@nhs.net)*
Learning objectives:
1. To become familiar with commonly missed fractures in children.
2. To understand the choice of the most suited imaging modality.
3. To learn about atypical imaging findings in different clinical scenarios.
Author Disclosures:
K. Johnson: nothing to disclose

RC 817-3 16:30
B. Missed fractures in adults
S. Döring; *Brussels/BE (seema.doering@gmx.net)*
Learning objectives:
1. To become familiar with the most commonly missed fractures in adult patients.
2. To understand which additional information will influence the choice of imaging modality.
3. To learn about atypical imaging findings in adult patients after trauma.
Author Disclosures:
S. Döring: nothing to disclose

RC 817-4 16:55
C. Missed musculoskeletal injuries in whole-body trauma
A. Platon; *Geneva/CH (Alexandra.Platon@hcuge.ch)*
Learning objectives:
1. To become familiar with the most commonly missed musculoskeletal injuries in patients after polytrauma.
2. To understand the clinical impact of missed subtle injuries on clinical outcome of trauma victims.
3. To be familiar with less typical imaging findings in musculoskeletal injuries.
Author Disclosures:
A. Platon: nothing to disclose

17:20
Panel discussion: How to reduce the rate of missed fractures most effectively and efficiently

16:00 - 17:30 **Room M 1**

Hybrid Imaging

RC 806
Advancing clinical hybrid imaging

RC 806-1 16:00
Chairperson's introduction
T. H. Helbich; *Vienna/AT (Thomas.Helbich@meduniwien.ac.at)*
Session objectives:
1. To understand the basic concepts of hybrid imaging.
2. To appreciate the clinical role of hybrid imaging.
3. To learn how hybrid imaging can be used more effectively in routine practice.
Author Disclosures:
T. H. Helbich: nothing to disclose

RC 806-2 16:06
A. Cost-effectiveness of hybrid imaging
B. M. Fischer; *London/UK (Malene.fischer@kcl.ac.uk)*
Learning objectives:
1. To discuss why clinicians often consider hybrid imaging as the expensive choice, and whether the notion of PET/CT as an expensive technology is fair.
2. To obtain knowledge of basic concepts of health economy.
3. To present and discuss examples of cost-effectiveness studies on the use of PET/CT in oncology.
4. To evaluate how hybrid imaging may be incorporated as a cost-effective tool into routine clinical practice.
Author Disclosures:
B. M. Fischer: Speaker at Takeda, Research/Grant Support at Siemens Heathineers

RC 806-3 16:29
B. PET/MRI in clinical routine
V. Goh; *London/UK (vicky.goh@kcl.ac.uk)*
Learning objectives:
1. To learn about the basic concepts underlying PET/MRI.
2. To understand the potential clinical advantages of combining PET and MRI.
3. To discuss how PET/MRI may find a role as a routine clinical test in the future.
Author Disclosures:
V. Goh: Research/Grant Support at Siemens, Speaker at Siemens

RC 806-4 16:52
C. How PET/MRI enables accurate fusion of radiation treatment?
U. van der Heide; *Amsterdam/NL (u.vd.heide@nki.nl)*

Learning objectives:
1. To learn about the role of MRI and PET/MRI in radiation oncology.
2. To understand how MRI and/or PET/MRI can be used to monitor radiotherapy response.
3. To appreciate the role of hybrid imaging in targeting and modulating radiation therapy.
Author Disclosures:
U. van der Heide: Grant Recipient at Philips Healthcare, Grant Recipient at Elekta AB

17:15
Panel discussion: Clinical hybrid imaging in the real world

16:00 - 17:30 **Room M 2**

E³ - Advanced Course: Hot Topics in Emergency Radiology

E³ 818

Occlusive vascular diseases: no time to lose!

E³ 818-1 16:00
Chairperson's introduction
R. Basilico; *Chieti/IT*
Session objectives:
1. To understand common pathways for acute infarction throughout the body.
2. To identify early signs of ischaemia.
3. To appreciate how early diagnosis can affect outcome favourably.
Author Disclosures:
R. Basilico: nothing to disclose

E³ 818-2 16:06
A. Acute stroke: CT and MRI findings
K. Katulska; *Poznań/PL (katarzyna_katulska@op.pl)*
Learning objectives:
1. To understand the role of CT and MRI in acute stroke.
2. To recognise the imaging findings on CT and MRI in acute stroke.
3. To become familiar with the findings that influence patient management.
Author Disclosures:
K. Katulska: nothing to disclose

E³ 818-3 16:27
B. Acute chest pain
H. Alkadhi; *Zurich/CH*
Learning objectives:
1. To learn about the imaging assessment of acute chest pain.
2. To become familiar with cardiac CT findings in the emergency setting.
3. To understand the importance to establish gated CT protocols covering more than the heart alone.
Author Disclosures:
H. Alkadhi: nothing to disclose

E³ 818-4 16:48
C. Acute mesenteric ischaemia
M. Zins; *Paris/FR (mzins@hpsj.fr)*
Learning objectives:
1. To learn about the imaging protocols for the detection of mesenteric ischaemia.
2. To become familiar with the detection of the crucial findings of mesenteric ischaemia.
3. To become familiar with the role of diagnostic and interventional radiologists in the assessment of mesenteric ischaemia.
Author Disclosures:
M. Zins: nothing to disclose

E³ 818-5 17:09
D. Interventional radiology in acute mesenteric ischaemia
A. Krajina; *Hradec Králové/CZ (antonin.krajina@fnhk.cz)*
Learning objectives:
1. To learn about the indications and contraindications for endovascular treatment.
2. To learn about the available techniques for urgent revascularisation.
3. To learn about the outcomes following endovascular revascularisation, including the complications.
Author Disclosures:
A. Krajina: nothing to disclose

16:00 - 17:30 **Room on demand**
Room C or Room M 3

Oncologic Imaging

RC 816

Role of imaging in cancer of unknown primary (CUP)

Moderator:
N. I. Traikova; Plovdiv/BG

RC 816-1 16:00
A. CT: the useful report
S. Gourtsoyianni; *Athens/GR (sgty76@gmail.com)*
Learning objectives:
1. To become familiar with the potential of CT and its limitations.
2. To discuss the value of morphological imaging for assessment of unknown primaries.
3. To learn about the pitfalls of CT.
Author Disclosures:
S. Gourtsoyianni: nothing to disclose

RC 816-2 16:22
B. MRI with diffusion weighted imaging (DWI) and dynamic contrast-enhancement (DCE)
A. R. R. Padhani; *London/UK (anwar.padhani@stricklandscanner.org.uk)*
Learning objectives:
1. To understand the benefit of MRI in contrast to other modalities.
2. To learn about functional MRI techniques.
3. To discuss the limitations of DWI and DCE for CUP diagnostics.
Author Disclosures:
A. R. R. Padhani: nothing to disclose

RC 816-3 16:45
C. Nuclear medicine: (PET/CT, PET/MRI, novel tracers)
T. Bäuerle; *Erlangen/DE (tobias.baeuerle@uk-erlangen.de)*
Learning objectives:
1. To learn about the benefits and limitations of hybrid imaging for assessment of CUP.
2. To understand novel concepts in tracer development.
3. To discuss the future role of nuclear medicine and radiology for CUP.
Author Disclosures:
T. Bäuerle: nothing to disclose

RC 816-4 17:07
D. Unknown primary: emerging challenges for imaging and the importance of integrated diagnostics
H. Hricak; *New York/US*
Learning objectives:
1. To gain familiarity with the tests and procedures used to evaluate CUP.
2. To understand the pitfalls and benefits of different imaging modalities.
3. To grasp essentials in integrating imaging, molecular genetics, tumour markers, and therapy.
Author Disclosures:
H. Hricak: Speaker at Memorial Sloan Kettering Cancer Center, Board Member at IBA

16:00 - 17:30 **Room M 4**

E³ - Advanced Course: Interactive Teaching Session for Young (and not so Young) Radiologists

E³ 821

Imaging of the brain

E³ 821-1 16:00
A. Stroke mimics
M. M. Thurnher; *Vienna/AT (majda.thurnher@meduniwien.ac.at)*
Learning objectives:
1. To become familiar with the different entities that can mimic a stroke.
2. To know the usefulness of perfusion studies in the differential diagnosis.
Author Disclosures:
M. M. Thurnher: Speaker at Biogen, Speaker at Guerbet, Speaker at Bracco

E³ 821-2 16:45
B. Acquired toxic-metabolic encephalopathies
M. Spero; *Zagreb/HR (martina.spero@gmail.com)*
Learning objectives:
1. To review the most common causes.
2. To learn the MRI and CT appearances of these lesions.
Author Disclosures:
M. Spero: nothing to disclose

16:00 - 17:30 **Room M 5**

E³ - Advanced Course: Artificial Intelligence

E³ 820

Making visible the invisible: pushing the boundaries in multimodality radiomic quantification

Moderator:
N. deSouza; Surrey/UK

E³ 820-1 16:00
Chairperson's introduction
L. Fournier; *Paris/FR*
Session objectives:
1. To introduce the subject of radiomic analyses across imaging modalities.
2. To highlight the potentials and limitations to be discussed by speakers.
3. To introduce the speakers.
Author Disclosures:
L. Fournier: Grant Recipient at Invectys, Speaker at General Electric, Speaker at Bayer, Speaker at Pfizer, Speaker at Novartis, Speaker at Janssen, Speaker at Sanofi, Research/Grant Support at Philips, Research/Grant Support at Ariana Pharma, Research/Grant Support at Evolucare

E³ 820-2 16:05
A. Unravelling the mysteries of the black box: does radiomics enhance or complement biomarker data?
A. Jimenez-Pastor; *Valencia/ES (anajimenez@quibim.com)*
Learning objectives:
1. To learn what radiomic analyses add to current biomarker evaluation.
2. To appreciate the limitations and pitfalls of such analyses.
3. To understand the most robust statistical methods for carrying out the analyses.
Author Disclosures:
A. Jimenez-Pastor: nothing to disclose

E³ 820-3 16:28
B. Working across modalities: how do we progress from redundant to relevant data?
H. C. Woodruff; *Maastricht/NL (h.woodruff@maastrichtuniversity.nl)*
Learning objectives:
1. To learn how radiomic outputs differ across modalities.
2. To appreciate the variability of the method and how to ensure data is robust.
3. To understand the relevance of the findings.
Author Disclosures:
H. C. Woodruff: Shareholder at OncoRadiomics

E³ 820-4 16:51
C. Using radiomics in the clinic: a decision support tool?
M. E. Mayerhöfer; *Vienna/AT (marius.mayerhoefer@meduniwien.ac.at)*
Learning objectives:
1. To learn the clinical scenarios where radiomic analyses may be helpful.
2. To appreciate the place of these analyses in the context of other quantifiable biomarkers.
3. To understand the implications of using these analyses in the clinic.
Author Disclosures:
M. E. Mayerhöfer: Speaker at Siemens, Research/Grant Support at Siemens, Speaker at Bristol-Myers Squibb

17:14
Panel discussion: How do we make sure radiomic analyses are ready for prime time use?

16:00 - 17:30 **Tech Gate Auditorium**

E³ - ECR Master Class (Vascular)

E³ 826

Cone-beam, 4D and more: new diagnostic tools for vascular diseases

Moderator:
T. Jakobs; Munich/DE

E³ 826-1 16:00
A. The role of intraprocedural perfusion assessment in peripheral arterial disease
J. A. Reekers; *Amsterdam/NL*
Learning objectives:
1. To understand the technique of intraprocedural perfusion assessment.
2. To learn how to target peripheral revascularisation therapy based on perfusion assessment.
3. To discuss the value of using intraprocedural perfusion assessment on the outcome of endovascular therapy for peripheral artery disease.
Author Disclosures:
J. A. Reekers: disclosure/affirmation information not submitted

E³ 826-2 16:30
B. CT 4D imaging after thoracic endovascular aortic repair (TEVAR)
R. Schernthaner; *Vienna/AT (ruediger.schernthaner@meduniwien.ac.at)*
Learning objectives:
1. To understand the challenges of imaging follow-up after TEVAR.
2. To become familiar with the technique of 4D CT.
3. To learn how to establish treatment recommendations based on 4D CT results after TEVAR.
Author Disclosures:
R. Schernthaner: Research/Grant Support at Siemens Healthineers

E³ 826-3 17:00
C. How cone-beam CT can change your practice in interventional radiology
R. Uberoi; *Oxford/UK (raman.uberoi@ouh.nhs.uk)*
Learning objectives:
1. To understand the technique of cone-beam CT.
2. To learn about the role and applications of the cone-beam in the angio suite.
3. To discuss the influence on daily clinical practice in interventional radiology.
Author Disclosures:
R. Uberoi: Grant Recipient at Gore, Grant Recipient at Terumo

Friday, March 13

08:30 - 10:00 **Room B**

E³ - Rising Stars Programme: Basic Session

BS 9a

Radiologic anatomy: head and neck

Moderator:
M. Becker; Geneva/CH

BS 9a-1 08:30
Neck spaces
N. I. Traikova; *Plovdiv/BG (nikoletatraikova@gmail.com)*
Learning objectives:
1. To learn the anatomy of the neck spaces.
2. To discuss current imaging techniques for their evaluation.
3. To describe the imaging appearance of most common pathological findings.
Author Disclosures:
N. I. Traikova: nothing to disclose

BS 9a-2 09:00
Temporal bone
J. W. Casselman; *Bruges/BE*
Learning objectives:
1. To know which technique is best suited to visualise specific anatomical structures of the temporal bone.
2. To recognise the clinically most important anatomical structures of the middle and inner ear.
3. To learn how the anatomical structures of the temporal bone appear in the transverse, coronal, and double oblique plane.
Author Disclosures:
J. W. Casselman: Speaker at Cefla S.A. (Newtom), Speaker at Philips Healthcare

BS 9a-3 09:30
Larynx
R. Maroldi; *Brescia/IT (roberto.maroldi@unibs.it)*
Learning objectives:
1. To understand the anatomy and signals of the cartilage framework of the larynx.
2. To learn the surgical subdivision of the paraglottic space of the larynx into its key compartments.
3. To learn the anatomy and signals of the muscles within the larynx.
Author Disclosures:
R. Maroldi: nothing to disclose

08:30 - 10:00 **Room X**

Special Focus Session

SF 9a

Hybrid imaging: beyond FDG PET/CT

SF 9a-1 08:30
Chairperson's introduction
T. Beyer; *Vienna/AT*
Session objectives:
1. To provide an overview of non-FDG PET/CT imaging.
2. To learn about the range of PET tracers that are in widespread use.
3. To consider the potential clinical advantages of these tracers.
Author Disclosures:
T. Beyer: Founder at cmi-experts GmbH, Founder at Dedicaid GmbH, Research/Grant Support at Siemens Healthineers

SF 9a-2 08:36
Prostate specific membrane antigen (PSMA) hybrid imaging in guiding prostate cancer therapy
C. C. Cyran; *Munich/DE (clemens.cyran@med.uni-muenchen.de)*
Learning objectives:
1. To understand the biology of PSMA.
2. To consider different approaches to imaging PSMA and its use in therapy.
3. To learn about current clinical applications for guiding prostate therapy.
Author Disclosures:
C. C. Cyran: Speaker at Goetz Partners Ltd, Consultant at Sandoz

SF 9a-3 08:54
Somatostatin receptor imaging and therapy
L. Aloj; *Cambridge/UK*
Learning objectives:
1. To understand the biology underlying somatostatin-based agents.
2. To consider different approaches to imaging and therapy through the use of the somatostatin receptor.
3. To learn about the current clinical applications guiding neuroendocrine tumour therapy.
Author Disclosures:
L. Aloj: nothing to disclose

SF 9a-4 09:12
Hybrid PET and SPECT for cardiovascular imaging
A. Flotats; *Barcelona/ES*
Learning objectives:
1. To learn the clinical need for hybrid imaging in cardiovascular diseases.
2. To consider the role for both PET and SPECT imaging.
3. To learn the range of cardiovascular tracers that are used clinically and their role.
Author Disclosures:
A. Flotats: nothing to disclose

SF 9a-5 09:30
Imaging to guide immuno-oncology
U. Mahmood; *Oak Brook/US (umahmood@mgh.harvard.edu)*
Learning objectives:
1. To understand the challenges of imaging response to immunomodulatory therapy.
2. To understand current standard of care imaging for immuno-oncology.
3. To understand some of the novel PET imaging approaches in clinical trials and development.
Author Disclosures:
U. Mahmood: Founder at CytoSite Biopharma, Shareholder at CytoSite Bippharma, Research/Grant Support at CytoSite Bippharma

09:48
Panel discussion: New trends in hybrid imaging

09:00 - 10:00 **Coffee & Talk 1**

Coffee & Talk (open forum) Session

Organised by ESOR

C 5

What would the next generation of radiologists look like?

Moderator:
C. Catalano; Rome/IT

C 5-1 09:00
A clinical radiologist
R. Mansour; *Oxford/UK*
Learning objective:
1. To learn about the challenges and opportunities for the next generation clinical radiologists.
Author Disclosures:
R. Mansour: nothing to disclose

C 5-2 09:08
An interventional radiologist
A. Napoli; *Rome/IT (alessandro.napoli@uniroma1.it)*

Learning objectives:
1. To learn new trends in interventional radiology.
2. To understand the evolving role of interventional radiology.
3. To appreciate new technology advances within the interventional radiology domain.
4. To become familiar with future assets of interventional radiology culture for residents and professionals.
Author Disclosures:
A. Napoli: nothing to disclose

C 5-3 09:16
An "artificial intelligent" radiologist
L. Marti-Bonmati; *Valencia/ES (Luis.Marti@uv.es)*
Learning objectives:
1. To learn about the use of artificial intelligence and deep learning (AI/DL) tools during each step of the radiology value chain.
2. To understand how AI/DL solutions can improve radiological reporting.
3. To appreciate the AI/DL approaches towards automatic segmentation and properties extraction in medical imaging.
4. To become familiar with the main limitations of AI/DL tools in the radiological environment.
Author Disclosures:
L. Marti-Bonmati: Advisory Board at QUIBIM SME

C 5-4 09:24
A researcher
O. Clement; *Paris/FR (olivier.clement@aphp.fr)*
Learning objectives:
1. To learn about the opportunities to do research in radiology.
2. To understand the funding programmes and the role of EIBIR.
3. To become familiar with the different aspect of an academic career.
Author Disclosures:
O. Clement: Speaker at Bracco, Speaker at Bayer, Speaker at Guerbet

09:32
Open forum discussion

08:30 - 10:00 **Room O**

Paediatric

RC 912
Foetal imaging and postnatal correlation

RC 912-1 08:30
Chairperson's introduction
D. Prayer; *Vienna/AT (daniela.prayer@meduniwien.ac.at)*
Author Disclosures:
D. Prayer: nothing to disclose

RC 912-2 08:35
A. Foetal MRI advanced techniques
G. Kasprian; *Vienna/AT (gregor.kasprian@meduniwien.ac.at)*
Learning objectives:
1. To learn about the principles of advanced techniques in foetal MRI.
2. To understand the potential for their use.
3. To discuss the limitations and disadvantages of these techniques.
Author Disclosures:
G. Kasprian: nothing to disclose

RC 912-3 08:53
B. Corpus callosum anomalies: pre- and postnatal correlation
E. Vazquez Mendez; *Barcelona/ES (evazquez@vhebron.net)*
Learning objectives:
1. To evaluate the diagnostic accuracy of foetal MRI for diagnosis.
2. To compare pre- and postnatal MRI data.
3. To ascertain the outcome in cases of isolated complete or partial agenesis.
Author Disclosures:
E. Vazquez Mendez: nothing to disclose

RC 912-4 09:11
C. Foetal MRI of acquired brain pathology
L. Guibaud; *Bron/FR*
Learning objectives:
1. To learn about the various types of acquired brain pathology in the foetus.
2. To understand the limitations in the comprehension of the underlying cause.
3. To discuss the best estimates of the prevalence of acquired brain pathology.
Author Disclosures:
L. Guibaud: disclosure/affirmation information not submitted

RC 912-5 09:29
D. Pre- and postnatal congenital cystic renal diseases
F. E. Avni; *Lille/FR (favni@skynet.be)*
Learning objectives:
1. To learn about differential diagnosis of hyperechoic kidneys in foetuses and children.
2. To become familiar with the latest classification of inherited renal cystic diseases.
3. To discuss the limitations of the imaging methods for diagnosis.
Author Disclosures:
F. E. Avni: nothing to disclose

09:47
Panel discussion: How to overcome the challenges in foetal MRI in routine practice and research

08:30 - 10:00 **Studio 2020**

Special Focus Session

SF 9b
Imaging of migrant and refugee children

SF 9b-1 08:30
Chairperson's introduction
M. Soudack; *Ramat Gan/IL (michalle.soudack@health.sheba.gov.il)*
Session objectives:
1. To learn about challenges in providing healthcare to migrant and refugee children in Europe.
2. To be aware of emerging diseases in migrant and refugee children.
3. To discuss the scientific and medicolegal dilemmas when using radiological methods for age determination in unaccompanied refugee minors.
Author Disclosures:
M. Soudack: nothing to disclose

SF 9b-2 08:35
Challenge of promoting health of refugee and migrant children in Europe
A. Hjern; *Stockholm/SE (anders.hjern@su.se)*
Learning objectives:
1. The epidemiology of infectious and chronic diseases in this population compared to domestic children: the clinician's perspective.
2. To learn about the challenges of promoting health of refugee and migrant children in Europe.
3. To discuss how to improve the management of migrant and refugee children and carers, with a special focus on imaging and intervention.
Author Disclosures:
A. Hjern: nothing to disclose

SF 9b-3 08:59
Imaging of emerging diseases in refugee and migrant children
B. Oğuz; *Ankara/TR (oguzberna@yahoo.com)*
Learning objectives:
1. The epidemiology of infectious and chronic diseases in this population compared to domestic children: the radiologist's perspective.
2. To learn about the spectrum of findings on imaging in migrant and refugee children.
3. To discuss new diagnostic and practical challenges for radiologists.
Author Disclosures:
B. Oğuz: nothing to disclose

SF 9b-4 09:23
Age determination for legal purpose
L.-S. O. Müller; *Oslo/NO (lilmul@ous-hf.no)*

Learning objectives:
1. To learn about the principles and limitations of radiological age determination.
2. To define the role of the paediatric radiologist in age determination for legal purposes.
3. To discuss ethical considerations in medical age determination.
Author Disclosures:
L.-S. O. Müller: nothing to disclose

09:47
Panel discussion: The role of the radiologist in the management of refugee and migrant children

08:30 - 09:30 **Coffee & Talk 2**

Coffee & Talk (open forum) Session
Organised by EuroSafe Imaging

C 15
ESR and EuroSafe Imaging initiatives: improving justification

C 15-1 08:30
Chairperson's introduction
G. Frija*; Paris/FR (guy.frija@aphp.fr)*
Session objectives:
1. To describe the importance of justification as a principle of radiation protection and medicine.
2. To describe four key implications for the justification process resulting from European legislation.
3. To provide a brief historical perspective of deficiencies in justification.
Author Disclosures:
G. Frija: nothing to disclose

C 15-2 08:35
Audit and Standards Subcommittee's published surveys
D. Howlett*; Eastbourne/UK (david.howlett@nhs.net)*
Learning objectives:
1. To consider the requirements of the European basic safety standards directive (EU-BSS) with an emphasis on clinical audit.
2. To present the results of EU-BSS uptake surveys amongst European radiology departments.
3. To discuss the implications of survey findings and mechanisms to enhance departmental clinical audit processes.
Author Disclosures:
D. Howlett: nothing to disclose

C 15-3 08:45
Overview of justification processes following previous HERCA initiatives and potential new ones
A. Karoussou-Schreiner*; Louxembourg/LU*
Learning objectives:
1. To outline the actions conducted by regulatory authorities in Europe within HERCA on justification.
2. To discuss the findings following the inspection action conducted on justification in radiology in 2016.
3. To present the campaign "Getting the right image for my patient" that promotes the appropriate use of medical imaging.
Author Disclosures:
A. Karoussou-Schreiner: disclosure/affirmation information not submitted

C 15-4 08:55
Giving a practical, on the ground view of how justification is handled on a day-to-day basis
A. Palkó*; Szeged/HU (palkoand@gmail.com)*
Learning objectives:
1. To demonstrate how dose monitoring is built into the daily workflow of a tertiary diagnostic radiology centre.
2. To understand the effect of required justification, in cases of dose exceeding DRL, on the attitude and practice of physicians and technicians.
Author Disclosures:
A. Palkó: nothing to disclose

C 15-5 09:05
Activities undertaken during 2019/20 to assess and improve matters
G. Frija*; Paris/FR (guy.frija@aphp.fr)*
Learning objectives:
1. To discuss the roles of professionals in the justification process.
2. To outline the key aspects of a draft EuroSafe discussion paper on improving justification.
3. To describe initial feedback on the paper from EuroSafe Imaging Star centres.
Author Disclosures:
G. Frija: nothing to disclose

09:15
Open forum discussion

08:30 - 10:00 **Room E**

Special Focus Session

SF 9c
My top three tips for breast imaging

SF 9c-1 08:30
Chairperson's introduction
M. Fuchsjäger*; Graz/AT (michael.fuchsjaeger@medunigraz.at)*
Session objectives:
1. To appreciate the fundamental tips and tricks of the most renowned European breast radiologists for clinical practice.
2. To acknowledge the single most important aspects for successfully performing breast examinations.
3. To learn how to avoid common pitfalls in breast radiology.
Author Disclosures:
M. Fuchsjäger: nothing to disclose

SF 9c-2 08:35
Screening with tomosynthesis
S. Zackrisson*; Malmö/SE (sophia.zackrisson@med.lu.se)*
Learning objectives:
1. To understand why tomosynthesis is better than mammography for breast cancer screening.
2. To appreciate the current scientific evidence of tomosynthesis in screening.
3. To acknowledge what further steps are needed before implementation in screening.
Author Disclosures:
S. Zackrisson: Speaker at Siemens Healthcare AG, Consultant at Collective Minds Radiology, Founder at Z Imagination AB

SF 9c-3 08:41
Automated breast ultrasound
A. Vourtsis*; Athens/GR (athinavourtsi@yahoo.gr)*
Learning objectives:
1. To recognise artefacts specific to automated breast ultrasound (ABUS).
2. To appreciate the value of multiplanar reconstruction and the coronal spiculation pattern.
3. To gain insight into possible indications for ABUS.
Author Disclosures:
A. Vourtsis: Consultant at General Electric Company Educator, ABUS, Advisory Board at Noncorporate Member of Medical Advisory Board of Volpara Solutions

SF 9c-4 08:47
Complex cystic and solid lesions
P. Kapetas*; Vienna/AT (panagiotis.kapetas@meduniwien.ac.at)*
Learning objectives:
1. To understand the difference between complex cystic and solid lesions from other cystic lesions of the breast.
2. To become familiar with complementary sonographic techniques for the accurate characterisation of cystic breast lesions.
3. To be able to properly manage complex cystic and solid lesions of the breast.
Author Disclosures:
P. Kapetas: nothing to disclose

Questions and discussion

SF 9c-6 08:59
Imaging the axilla
A. O. Oktay Alfatli*; Izmir/TR (aysenur.oktay@ege.edu.tr)*
Learning objectives:
1. To understand the clinical role of axillary staging.
2. To learn the imaging features of abnormal lymph nodes and the criteria for biopsy.
3. To understand the importance of discriminating minimal vs advanced nodal disease.
Author Disclosures:
A. O. Oktay Alfatli: nothing to disclose

SF 9c-7 09:05
Contrast-enhanced spectral mammography
C. S. Balleyguier*; Villejuif/FR*
Learning objectives:
1. To understand the technical principles of contrast-enhanced spectral mammography.
2. To understand the added value of information provided by contrast-enhanced spectral mammography.
3. To become familiar with the information provided by contrast-enhanced spectral mammography and breast MRI regarding lesion morphology and enhancement.
Author Disclosures:
C. S. Balleyguier: disclosure/affirmation information not submitted

SF 9c-8 09:11
Stereotactic-guided biopsy
D. Djilas*; Sremska Kamenica/RS*
Learning objectives:
1. To understand the indications for stereotactic-guided breast biopsy.
2. To learn about the technical aspects of stereotactic biopsy.
3. To understand the importance of marker clip placement post-biopsy.
Author Disclosures:
D. Djilas: disclosure/affirmation information not submitted

Questions and discussion

SF 9c-10 09:23
US-guided biopsy
G. Ivanac*; Zagreb/HR (gordana.augustan@gmail.com)*
Learning objectives:
1. To understand current indications, contraindications, and possible complications of US-guided biopsy.
2. To be familiar with different available biopsy systems and to know which one to choose according to the clinical setting.
3. To learn the most important technical tips for performing a US-guided biopsy successfully.
Author Disclosures:
G. Ivanac: nothing to disclose

SF 9c-11 09:29
MRI-guided biopsy
R. M. Mann*; Nijmegen/NL (r.mann@rad.umcn.nl)*
Learning objectives:
1. To understand the importance of pre-biopsy preparation including patient information.
2. To be familiar with how to relate lesion and needle positions.
3. To appreciate tricks for targeting lesions in complicated locations (superficial, deep, retroareolar).
Author Disclosures:
R. M. Mann: Grant Recipient at Siemens Healthineers, Bayer Healthcare, Screenpoint medical, Seno medical, Medtronic, Bard/BD, Advisory Board at Transonic Imaging

SF 9c-12 09:35
Treatment response and therapy monitoring
E. M. Fallenberg*; Munich/DE*
Learning objectives:
1. To learn what is important in the reporting of the treatment response.
2. To understand the accuracy of mammography, ultrasound, and magnetic resonance in the monitoring of therapy.
Author Disclosures:
E. M. Fallenberg: Advisory Board at Transsonic, Speaker at Guerbet, Speaker at Bayer, Speaker at GE, Board Member at EUSOBI, Board Member at DRG AG Mamma

SF 9c-13 09:41
Post-therapy evaluation
J. Camps Herrero*; Valencia/ES (juliacamps@gmail.com)*
Learning objectives:
1. To understand and learn the different phases of fat necrosis and its imaging correlates in all modalities.
2. To know what to report in patients with breast implants and oncoplastic reconstructions.
3. To learn the different appearances of breast cancer recurrence.
Author Disclosures:
J. Camps Herrero: nothing to disclose

09:47
Questions and discussion

08:30 - 10:00 **Room F1**

ESR meets Croatia, Slovakia and Slovenia

Meets 9

Interventional neuroradiology, cardiac MRI and EVAR: our experience

Presiding:
B. Brkljačić; Zagreb/HR
D. Miletic; Rijeka/HR
V. Lehotska*;* Bratislava/SK
M. Marolt Music; Ljubljana/SI

Meets 9-1 08:30
Welcome from the ESR President
B. Brkljačić*; Zagreb/HR (boris@brkljacic.com)*
Author Disclosures:
B. Brkljačić: nothing to disclose

Meets 9-2/Meets 9-3/Meets 9-4 08:32
Introduction
D. Miletic*; Rijeka/HR (damir.miletic@medri.hr)*
V. Lehotska*; Bratislava/SK (viera.lehotska@ousa.sk)*
M. Marolt Music*; Ljubljana/SI (mmusic@onko-i.si)*
Session objectives:
1. To learn about the interventional neuroradiology (INR) techniques and indications for aneurysm and stroke treatment, and to acknowledge the impact of mechanical thrombectomy.
2. To demonstrate various applications of cardiac MRI including alternative methods in cardiac imaging.
3. To learn about indications, technical aspects and clinical outcomes of endovascular aortic repair.
Author Disclosures:
D. Miletic: nothing to disclose, V. Lehotska: nothing to disclose,
M. Marolt Music: nothing to disclose

Meets 9-5 08:37
Interventional neuroradiology: from coil to clot
D. Ozretic*; Zagreb/HR (david.ozretic@ck.t-com.hr)*
Learning objectives:
1. To present developments of INR in Croatia and its current place in clinical practice.
2. To learn about the INR techniques and indications for aneurysm and stroke treatment.
3. To acknowledge the impact of mechanical thrombectomy on the patients, and on the referring and performing physicians.
Author Disclosures:
D. Ozretic: nothing to disclose

08:57
Interlude: Promotional video about Croatia

Meets 9-7 09:02
Cardiac MRI and beyond
Z. Berecova*; Bratislava/SK (hapka78@hotmail.com)*
Learning objectives:
1. To illustrate organisation and implementation of cardiac imaging, particularly cardiac MRI, in Slovakia.
2. To demonstrate various applications of cardiac MRI.
3. To learn more about the value of alternative methods in cardiac imaging.
Author Disclosures:
Z. Berecova: nothing to disclose

09:22
Interlude: Promotional video about Slovakia

Meets 9-9 09:27
EVAR: two decades of experience in Slovenia
V. Salapura*; Ljubljana/SI (salapura@siol.net)*
Learning objectives:
1. To present developments of endovascular aortic interventions (EVAR) in Slovenia.
2. To learn about indications, technical aspects and clinical outcomes of endovascular aortic repair.
3. To emphasise the importance of continuous progress of minimally invasive endovascular aortic interventions.
Author Disclosures:
V. Salapura: nothing to disclose

09:47
Interlude: Promotional video about Slovenia

09:52
Panel discussion: What is the impact of cardiac MRI, neurovascular and aortic interventions on turf battles in Croatia, Slovakia and Slovenia?

08:30 - 10:00 **Room F2**

Neuro

RC 911
Neuromuscular imaging

RC 911-1 08:30
Chairperson's introduction
L. Ten Dam*; Amsterdam/NL (l.tendam@amc.uva.nl)*
Session objectives:
1. To provide an imaging strategy for neuromuscular diseases.
2. To become familiar with congenital and acquired neuromuscular diseases.
3. To demonstrate the role of imaging in muscular atrophy.
Author Disclosures:
L. Ten Dam: nothing to disclose

RC 911-2 08:35
A. How to image patients with neuromuscular disease
M.-A. Weber*; Rostock/DE (marc-andre.weber@med.uni-rostock.de)*
Learning objectives:
1. To be aware of the recent developments in muscle imaging.
2. To understand the role of imaging in muscle atrophy.
3. To become familiar with the expectations from the neurologist.
Author Disclosures:
M.-A. Weber: nothing to disclose

RC 911-3 08:58
B. How to report congenital myopathies
A. Pichiecchio*; Pavia/IT (anna.pichiecchio@mondino.it)*
Learning objectives:
1. To appreciate muscle MRI findings in neuromuscular disorders.
2. To learn about structured reporting in neuromuscular diseases.
3. To understand the role of various imaging modalities in the workup of congenital myopathies.
Author Disclosures:
A. Pichiecchio: Advisory Board at G-enzyme, Consultant at Prex srl

RC 911-4 09:21
C. How to recognise adult neuromuscular disease?
S. Shah*; London/UK*
Learning objectives:
1. To apply the optimal imaging protocol.
2. To appreciate the role of quantitative imaging in genetic and acquired myopathies.
3. To illustrate the role of brain imaging in neuromuscular disorders.
Author Disclosures:
S. Shah: disclosure/affirmation information not submitted

09:44
Panel discussion: Recent developments in muscle imaging

09:00 - 10:00 **Coffee & Talk 3**

Coffee & Talk (open forum) Session

C 26
Embolisation techniques: tips and tricks

C 26-1 09:00
Chairperson's introduction
T. J. Kroencke*; Augsburg/DE*
Session objectives:
1. To become familiar with the varied indications for embolisation.
2. To understand the basic embolisations techniques.
3. To be familiar with the different types of embolic agents.
Author Disclosures:
T. J. Kroencke: nothing to disclose

C 26-2 09:04
Embolisation in trauma
S. Anthony*; Oxford/UK*
Learning objectives:
1. To understand the indications for embolisation in trauma.
2. To understand the selection of embolisation materials for small and large vessels.
3. To appreciate the outcomes of embolisation in trauma.
Author Disclosures:
S. Anthony: disclosure/affirmation information not submitted

C 26-3 09:10
Embolisation for endoleaks post endovascular aneurysm repair (EVAR)
F. Fanelli*; Florence/IT (fabrizio.fanelli@unifi.it)*
Learning objectives:
1. To appreciate the types of endoleaks post EVAR.
2. To become familiar with the techniques for embolisation for endoleaks.
3. To appreciate the outcomes following embolisation.
Author Disclosures:
F. Fanelli: Advisory Board at Philips, Advisory Board at Medtronic, Consultant at Philips, Consultant at Medtronic, Speaker at Cook, Speaker at Medtronic, Speaker at Philips, Speaker at Volcano Philips, Speaker at WL Gore & Associates, Research/Grant Support at Surmodics, Advisory Board at Bayer, Speaker at Penumbra

C 26-4 09:16
Gonadal vein embolisation
A. Basile*; Catania/IT (antodoc@yahoo.com)*
Learning objectives:
1. To understand the indications for gonadal vein embolisation.
2. To appreciate the techniques for embolisation.
3. To become familiar with the outcomes of gonadal vein embolisation.
Author Disclosures:
A. Basile: disclosure/affirmation information not submitted

C 26-5 09:22
Oncology embolisation of liver tumours
P. Reimer*; Karlsruhe/DE*
Learning objectives:
1. To appreciate the indications for embolisation in liver tumours.
2. To understand the principles and techniques of embolisation in liver tumours.
3. To become familiar with the outcomes of embolisation for common lesions in liver tumours.
Author Disclosures:
P. Reimer: nothing to disclose

09:28
Open forum discussion

08:30 - 10:00 **da Vinci (Room D1)**

Physics in Medical Imaging

RC 913

Radiation dose monitoring systems (RDMS): from commissioning to effective use

RC 913-1 08:30
Chairperson's introduction: RDMS: big data and tons of information
V. Tsapaki*; Nea Ionia/GR (virginia@otenet.gr)*
Session objectives:
1. To learn about the basic elements to consider when purchasing and commissioning an RDMS.
2. To be able to increase the effectiveness of using your RDMS.
3. To understand how to manage the situation of patients with recurrent exams.
Author Disclosures:
V. Tsapaki: nothing to disclose

RC 913-2 08:35
A. Supply and commissioning of an RDMS to meet all your needs
N. Fitousi*; Leuven/BE (niki.fitousi@qaelum.com)*
Learning objectives:
1. To understand how to select the right system for each hospital.
2. To learn how data should be validated after being collected.
3. To understand how derived quantities are calculated.
Author Disclosures:
N. Fitousi: Employee at Qaelum NV

RC 913-3 08:58
B. How to manage the data and extract the relevant information
O. Rampado*; Turin/IT (orampado@cittadellasalute.to.it)*
Learning objectives:
1. To learn about methods of data extraction.
2. To be able to query the database with different filters.
3. To understand how to use this data to guide optimisation actions.
Author Disclosures:
O. Rampado: nothing to disclose

RC 913-4 09:21
C. Monitoring and analysis of patients with high cumulative risks
J. Vassileva*; Vienna/AT*
Learning objectives:
1. To learn the strategies to define attention levels and possible intervention thresholds.
2. To understand how to correlate cumulative dose indices with cumulative risks.
3. To evaluate which procedures and clinical pathways involve high cumulative risks.
Author Disclosures:
J. Vassileva: nothing to disclose

09:44
Panel discussion: Are RDMS useful to share data between the main players in the optimisation process?

08:30 - 10:00 **Darwin (Room D2)**

Special Focus Session

SF 9d

Cardiac imaging to drive clinical decision making

SF 9d-1 08:30
Chairperson's introduction
L. Natale*; Rome/IT (luigi.natale@unicatt.it)*
Session objectives:
1. To become familiar with the inevitable role of advanced cardiac imaging for clinical decision making in ischaemic and structural heart disease.
2. To learn about the importance of outcome prediction for appropriate treatment decision making.
3. To understand the essential role of cardiac radiology in the management of cardiac patients.
Author Disclosures:
L. Natale: nothing to disclose

SF 9d-2 08:35
Cardiac imaging as decision maker in coronary artery disease
M. Hrabak Paar*; Zagreb/HR (majahrabak@gmail.com)*
Learning objectives:
1. To understand the importance of myocardial assessment for treatment decision making in coronary artery disease.
2. To become familiar with imaging techniques to assess ischaemic myocardial disease.
3. To learn about imaging derived biomarkers to predict the outcome of coronary revascularisation and to assess prognosis of patients with coronary artery disease.
Author Disclosures:
M. Hrabak Paar: nothing to disclose

SF 9d-3 08:59
Cardiac imaging as inevitable prerequisite to indicate minimal-invasive valvular repair
G. Feuchtner*; Innsbruck/AT (Gudrun.Feuchtner@i-med.ac.at)*
Learning objectives:
1. To become familiar with minimal-invasive treatment options for valvular heart disease.
2. To learn about the information required to indicate and plan minimal-invasive valvular repair.
3. To understand the importance of cardiac imaging to identify the best time and the best technique for valvular repair.
Author Disclosures:
G. Feuchtner: nothing to disclose

SF 9d-4 09:23
Cardiac MRI to explore the grey zones of the athletes' hearts
A. Kallifatidis*; Thessaloniki/GR (alexandros.kallifatidis@yahoo.gr)*
Learning objectives:
1. To understand the important difference between well-trained and hypertrophic myocardium.
2. To learn about the imaging techniques to differentiate between athlete's heart and hypertrophic cardiomyopathy.
3. To become familiar with imaging derived biomarkers to predict prognosis and to indicate treatment of patients with myocardial hypertrophy
Author Disclosures:
A. Kallifatidis: nothing to disclose

09:47
Panel discussion: Not without radiology! Could there be any treatment of ischemic or structural heart disease without advanced cardiac imaging anymore? And what does this mean for radiology service?

08:30 - 10:00 **Descartes (Room D3)**

Professional Challenges Session

PC 9

Postgraduate and speciality training for radiographers

PC 9-1/PC 9-2 08:30
Chairpersons' introduction
D. Akata; *Ankara/TR (akataden@gmail.com)*
B. Kraus; *Vienna/AT*
Session objectives:
1. To consider the importance of further education and training beyond Bachelor level (EQF Level 6).
2. To discuss the importance of tailoring education and training for specialist areas.
Author Disclosures:
D. Akata: nothing to disclose, B. Kraus: nothing to disclose

PC 9-3 08:35
Postgraduate radiographer training across Europe
L. A. Rainford; *Dublin/IE (louise.rainford@ucd.ie)*
Learning objectives:
1. To discuss the current landscape of postgraduate training opportunities for radiographers across Europe.
2. To review the range of approaches to the purpose, design, and delivery of programmes.
3. To explore future opportunities to progress postgraduate radiography education.
Author Disclosures:
L. A. Rainford: nothing to disclose

PC 9-4 08:53
Ultrasound training requirements
R. A. M. Santos; *Coimbra/PT (rutemartinssantos@gmail.com)*
Learning objectives:
1. To describe the range of approaches to postgraduate ultrasound education for radiographers.
2. To explore the key considerations for postgraduate ultrasound education.
3. To discuss the potential impact of high-quality ultrasound training programmes on service delivery.
Author Disclosures:
R. A. M. Santos: nothing to disclose

PC 9-5 09:11
In-house cardiovascular interventional training
H. Faltot; *Colmar/FR (herve.faltot@cardio-paramed.com)*
Learning objectives:
1. To discuss the specific requirements and considerations for radiographers training in vascular interventional radiology and interventional cardiology.
2. To review the structure and impact of an in-house training programme.
3. To consider future opportunities to link with a formal postgraduate training programme.
Author Disclosures:
H. Faltot: nothing to disclose

PC 9-6 09:29
Paediatric radiography training in specialised and non-specialised centres
J. L. Portelli; *Msida/MT (jonathan.portelli@um.edu.mt)*
Learning objectives:
1. To review potential deficits in the education and training of radiographers in paediatrics.
2. To discuss the need for paediatric radiography to be considered as a specialty in radiography.
3. To consider potential solutions to improve the knowledge, skills, and competence of radiographers in paediatric imaging.
Author Disclosures:
J. L. Portelli: nothing to disclose

09:47
Panel discussion: Overcoming the challenges in postgraduate radiography education

08:30 - 10:00 **Room G**

Abdominal Viscera

RC 901

CT protocol selection for imaging of abdominal viscera

Moderator:
D. J. M. Tolan; Leeds/UK

RC 901-1 08:30
A. CT protocol of the liver
F. Caseiro Alves; *Coimbra/PT (caseiroalves@gmail.com)*
Learning objectives:
1. To learn about the indication of different CT protocols of the liver.
2. To understand the value of correct contrast media timing.
3. To recognise how to avoid the most common mistakes in a clinical setting.
Author Disclosures:
F. Caseiro Alves: nothing to disclose

RC 901-2 09:00
B. CT protocol of the pancreas
W. Schima; *Vienna/AT (wolfgang.schima@khgh.at)*
Learning objectives:
1. To be able to understand differences between standard and dedicated pancreas CT protocols.
2. To discuss the value of intravenous and oral contrast media for pancreas imaging.
3. To be aware of potential pitfalls in diagnosing pancreatic tumours or inflammatory lesions.
Author Disclosures:
W. Schima: nothing to disclose

RC 901-3 09:30
C. CT protocol in trauma patients
A. G. Schreyer; *Brandenburg a.d.H./DE (andreas.schreyer@mac.com)*
Learning objectives:
1. To understand the particularities of CT protocols in trauma patients.
2. To be aware of the most common differential diagnoses in a trauma setting.
3. To learn to avoid mistakes and to deal with pitfalls in trauma patients.
Author Disclosures:
A. G. Schreyer: nothing to disclose

08:30 - 10:00 **Room K**

Joint Session of the ESR and EFOMP

ESR/EFOMP

Photon counting detectors: system design and clinical applications of an emerging technology

Moderators:
V. Gershan; Skopje/MK
T. Sella; Jerusalem/IL

ESR/EFOMP-1 08:30
Photon counting CT: detector, prototypes and scan modes
M. Kachelrieß; *Heidelberg/DE (marc.kachelriess@dkfz.de)*
Learning objectives:
1. To learn which kind of detectors are currently available for performing photon counting.
2. To become familiar with the existing prototypes of photon counting CT and with their scan modes.
3. To understand the advantages of photon counting CT.

Author Disclosures:
M. Kachelrieß: nothing to disclose

ESR/EFOMP-2 08:50
Pre-clinical and clinical applications of spectral photon-counting CT (SPCCT)
P. C. Douek*; Lyons/FR (philippe.douek@chu-lyon.fr)*
Learning objectives:
1. To learn the potentials of pre-clinical and clinical application of SPCC.
2. To appreciate the potential value of SPCCT in terms of spatial resolution, low-dose, and ultra-low-dose imaging.
3. To understand the potential of K-edge icontrast agent imaging.
Author Disclosures:
P. C. Douek: Grant Recipient at H2020

ESR/EFOMP-3 09:10
Physics evaluation and initial clinical results with the first full-field photon counting CT system based on silicon
M. Danielsson*; Stockholm/SE (md@mi.physics.kth.se)*
Learning objectives:
1. To learn about the recent advancements of photon-counting technology using silicon sensors.
2. To understand the differences between conventional sensors and alternative materials.
3. To appreciate the possibility offered by photon counting technology to perform quantitative material decomposition.
Author Disclosures:
M. Danielsson: Shareholder at Prismatic Sensors AB

ESR/EFOMP-4 09:30
Digital mammography screening with photon counting technique: high diagnostic performance at low mean glandular dose
M. F. J. Ryan*; Cork/IE (maxf.ryan@gmail.com)*
Learning objectives:
1. To learn of the recent advancements of photon counting technology in digital mammography screening.
2. To appreciate the possibility offered by photon counting technology to perform digital mammography screening.
3. To understand the differences of conventional tomosynthesis using energy-integrating flat-panel detectors
Author Disclosures:
M. F. J. Ryan: nothing to disclose

09:50
Panel discussion: Which clinical applications are foreseeable for the photon counting technology?

08:30 - 10:00 **Room M 1**

E³ - Rising Stars Programme: Basic Session

BS 9b
Bone health and osteoporosis imaging

Moderator:
J.-P. Dillenseger; Strasbourg/FR

BS 9b-1 08:30
Osteoporosis: epidemiology, risk factors, and screening
K. Knapp*; Exeter/UK (K.M.Knapp@exeter.ac.uk)*
Learning objectives:
1. To become familiar with epidemiological considerations and risk factors.
2. To be aware of screening and imaging in osteoporosis patient follow-up.
Author Disclosures:
K. Knapp: Author at Carver's Medical Imaging, Research/Grant Support at Wellcome, Stryker

BS 9b-2 08:55
Dual-energy x-ray absorptiometry and other modalities
R. M. Lopes*; Vila Nova de Gaia/PT (rogeriolopes87@gmail.com)*
Learning objectives:
1. To become familiar with the evolution of dual-energy x-ray absorptiometry (DXA) systems.
2. To understand the important role of the radiographer in DXA examinations: optimisation, reproducibility, and quality assurance.
3. To become aware of the importance of understanding the scan generated report information.
Author Disclosures:
R. M. Lopes: nothing to disclose

BS 9b-3 09:20
Opportunities for radiographers in bone health
E. McDermott*; Dublin/IE (eilish.mcdermott@ucd.ie)*
Learning objectives:
1. To explore potential opportunities for radiographers to increase their contribution in this field.
2. To be aware of the limitations with current osteoporosis imaging structures and roles.
3. To discuss the importance of education, training, and continuous professional development for radiographers specialising in this field.
Author Disclosures:
E. McDermott: nothing to disclose

09:45
Panel discussion: How can we further develop the radiographers' role in osteoporosis imaging?

08:30 - 10:00 **Room M 2**

E³ - Advanced Course: How to Improve Your Expertise in Cardiothoracic Imaging

E³ 919
Low-dose thoracic CT: only screening for lung cancer?

E³ 919-1 08:30
Chairperson's introduction
N. Howarth*; Chêne-Bougeries/CH (nigel.howarth@grangettes.ch)*
Session objectives:
1. To learn how to optimise CT protocols in the context of screening.
2. To be aware of the false positive risk.
3. To learn about the key features to report during screening.
Author Disclosures:
N. Howarth: nothing to disclose

E³ 919-2 08:36
A. Overview of lung cancer screening activities in European countries
S. Diederich*; Düsseldorf/DE (Stefan.Diederich@vkkd-kliniken.de)*
Learning objectives:
1. To be aware of the latest results of lung cancer screening trials.
2. To learn about the best technical standards for lung cancer screening.
3. To learn about the performance of artificial intelligence algorithms for lung cancer prediction.
Author Disclosures:
S. Diederich: nothing to disclose

E³ 919-3 09:04
B. Lung nodule management
A. R. Larici*; Rome/IT (annarita.larici@unicatt.it)*
Learning objectives:
1. To be aware of the common causes of solitary pulmonary nodules.
2. To learn about key radiological features suggesting a benign cause.
3. To learn about the methods allowing identifying malignant nodules.
Author Disclosures:
A. R. Larici: Advisory Board at Boehringer-Ingelheim, Speaker at Boehringer-Ingelheim, MSD, Roche, GE

E³ 919-4 09:32
C. Coronary artery disease assessment as part of a lung cancer screening programme: how to do it?
R. Vliegenthart*; Groningen/NL (r.vliegenthart@umcg.nl)*

Learning objectives:
1. To become familiar with the importance and predictive power of coronary calcium assessment.
2. To discuss the possibilities of combining coronary calcium assessment and lung cancer screening.
3. To learn about the practical implementation of coronary calcium assessment in the routine chest.
Author Disclosures:
R. Vliegenthart: nothing to disclose

08:30 - 10:00 **Room M 4**

Musculoskeletal

RC 910

The old spine: challenges of imaging and treatment

Moderator:
M. Adriaensen; Heerlen/NL

RC 910-1 08:30
A. Degeneration of the old spine: relevance of findings and differential diagnosis
V. Cassar-Pullicino*; Oswestry/UK (Victor.Pullicino@nhs.net)*
Learning objectives:
1. To explain the pathophysiology of degenerative changes in the spine.
2. To describe the imaging findings of degenerative diseases of the spine.
Author Disclosures:
V. Cassar-Pullicino: nothing to disclose

RC 910-2 09:00
B. Fractures: bone fragility in the elderly, assessing osteoporosis and bone quality, and differential diagnosis
G. Guglielmi*; Andria/IT*
Learning objectives:
1. To explain the pathophysiology of osteoporosis in the spine.
2. To describe the imaging findings of spinal osteoporosis and its consequences.
Author Disclosures:
G. Guglielmi: Speaker at University of Foggia

RC 910-3 09:30
C. Interventional radiology: is there still a place for vertebroplasty and kypho-/stentoplasty
C. A. Binkert*; Winterthur/CH (christoph.binkert@ksw.ch)*
Learning objectives:
1. To explain the procedures of vertebroplasty and kyphoplasty.
2. To discuss the current role of vertebroplasty and kyphoplasty in spinal fractures.
Author Disclosures:
C. A. Binkert: Advisory Board at CTI vascular, Merit Medical, Research/Grant Support at Abbott, Philips

08:30 - 10:00 **Room M 5**

E³ - Advanced Course: Hot Topics in GU Cancer

E³ 922

Whole-body imaging in metastatic urinary tract and prostate cancer

E³ 922-1 08:30
Chairperson's introduction
A. R. R. Padhani*; London/UK (anwar.padhani@stricklandscanner.org.uk)*
Author Disclosures:
A. R. R. Padhani: Research/Grant Support at Siemens Healthineers, Advisory Board at Siemens Healthineers, Other at Siemens Healthineers, Janssen, Sanofi, Mint

E³ 922-2 08:45
A. Whole-body MRI: technique and reporting system Met Rads P
F. Lecouvet*; Brussels/BE (frederic.lecouvet@uclouvain.be)*
Learning objectives:
1. To review patient selection for whole-body MRI in prostate cancer.
2. To learn state-of-the-art technical tips.
3. To learn a systematic reporting system.
Author Disclosures:
F. Lecouvet: nothing to disclose

E³ 922-3 09:10
B. Whole-body MRI and response assessment
N. Tunariu*; Sutton, London/UK (nina.tunariu@icr.ac.uk)*
Learning objectives:
1. To recognise active disease.
2. To learn pitfalls of interpretation.
3. To recognise the appearance of treatment response.
Author Disclosures:
N. Tunariu: Speaker at Janssen, Advisory Board at Janssen, Advisory Board at Bayer

E³ 922-4 09:35
C. PET and PET/MRI in prostate cancer
I. A. Burger*; Zurich/CH*
Learning objectives:
1. To learn about the role of PET in prostate cancer.
2. To understand the advantages and limitations of PET and PET/MRI.
3. To become familiar with potential pitfalls through case review.
Author Disclosures:
I. A. Burger: nothing to disclose

08:30 - 10:00 **Tech Gate Auditorium**

State of the Art Symposium

SA 9

Immunotherapy: what the radiologist needs to know

SA 9-1 08:30
Chairperson's introduction
J. Sosna*; Jerusalem/IL (jacobs@hadassah.org.il)*
Session objectives:
1. To describe the basics of immunotherapy in oncology.
2. To demonstrate the scope of clinical uses and the clinical impact.
3. To familiarise radiologists with the evaluation criteria.
Author Disclosures:
J. Sosna: Consultant at Xact, Grant Recipient at Philips

SA 9-2 08:35
Immunotherapy: the basics for radiologists
T. Ng*; London/UK (tony.ng@kcl.ac.uk)*
Learning objectives:
1. To describe the basic changes in the immune system in oncology patients.
2. To describe the means by which immunotherapy can be used.
3. To present different immune modulation therapies in various neoplastic diseases.
Author Disclosures:
T. Ng: Grant Recipient at Daiichi Sankyo Inc.

SA 9-3 09:00
Assessment of tumour response
C. Suzuki*; Stockholm/SE (chikako.suzuki@ki.se)*
Learning objectives:
1. To describe the current practice of oncology evaluation in cross sectional imaging.
2. To present the difficulties of the common techniques.
3. To provide an overview of novel assessment techniques and their applicability.
Author Disclosures:
C. Suzuki: nothing to disclose

SA 9-4 09:25
The immune response in interventional oncology: challenges and opportunities
N. Goldberg; *Jerusalem/IL (sgoldber@bidmc.harvard.edu)*
Learning objectives:
1. To describe the current practice of interventional oncology (IO).
2. To present applications in which the immune system can be modulated by IO.
3. To discuss challenges and opportunities of immune system modulation in IO.
Author Disclosures:
N. Goldberg: Advisory Board at Xact Robotics, Consultant at Angiodynamics, Consultant at Cosman Company

09:50
Panel discussion: Role of radiologists in immunotherapy

10:30 - 11:00 **Forum (Room A)**

Plenary Lecture

PL 2

Presiding:
B. Brkljačić; Zagreb/HR

PL 2-1 10:30
Digitalisation: the journey to a more human healthcare
B. Montag; *Erlangen/DE*
Author Disclosures:
B. Montag: disclosure/affirmation information not submitted

12:45 - 13:45 **Room B**

E³ - The Beauty of Basic Knowledge: Breast

E³ 24C

Basics of breast MRI

Moderators:
J. Camps Herrero; Valencia/ES
K. Kinkel; Chêne-Bougeries/CH

E³ 24C-1 12:45
When is breast MRI indicated and what protocol to use?
R. M. Mann; *Nijmegen/NL (r.mann@rad.umcn.nl)*
Learning objectives:
1. To know the guidelines for accepted indications of breast MRI.
2. To learn the basic protocol for screening and diagnostic breast MRI.
Author Disclosures:
R. M. Mann: Grant Recipient at Siemens Healthineers, Bayer Healthcare, Screenpoint medical, Seno medical, Medtronic, BD/BARD, Advisory Board at Transonic imaging

E³ 24C-2 13:15
How to read breast MRI
F. Pediconi; *Rome/IT (federica.pediconi@uniroma1.it)*
Learning objectives:
1. To understand morphological and kinetic findings.
2. To know the value of diffusion-weighted imaging.
3. To learn about reporting by using the breast imaging reporting and data system (BIRADS).
Author Disclosures:
F. Pediconi: Speaker at Bayer, Speaker at Bracco imaging

12:45 - 13:45 **Room C**

E³ - The Beauty of Basic Knowledge: Pancreas

E³ 25C

Cystic neoplasms

Moderator:
T. Lauenstein; Düsseldorf/DE

E³ 25C-1 12:45
Intraductal papillary neoplasms
S. Skehan; *Dublin/IE*
Learning objectives:
1. To learn about the classification of cystic pancreatic neoplasms.
2. To appreciate the classification of intraductal papillary mucinous neoplasms (IPMNs).
3. To understand the diagnostic imaging findings of IPMNs.
Author Disclosures:
S. Skehan: nothing to disclose

E³ 25C-2 13:15
Other cystic pancreatic neoplasms
R. M. Pozzi-Mucelli; *Stockholm/SE (raffaella.pozzi-mucelli@sll.se)*
Learning objectives:
1. To understand diagnostic imaging findings of other cystic neoplasms.
2. To appreciate differential diagnosis of pancreatic cystic lesions.
3. To understand the follow-up of cystic pancreatic neoplasms.
Author Disclosures:
R. M. Pozzi-Mucelli: nothing to disclose

12:45 - 13:45 **Coffee & Talk 2**

Coffee & Talk (open forum) Session

Organised by EuroSafe Imaging

C 16

Dose management (DM): requirements, promises and reality

C 16-1 12:45
Chairperson's introduction
R. W. Loose; *Nuremberg, DE/DE (r.loose@mail.de)*
Session objectives:
1. To stress the impact of DM on quality assurance and optimisation.
2. To demonstrate how DM can help to implement the requirements of the European basic safety standards directive (EU-BSS).
3. To discuss different complexity levels of DM.
Author Disclosures:
R. W. Loose: nothing to disclose

C 16-2 12:50
DICOM image and radiation dose structured report (RDSR) dose parameters: what do we have, what do we need?
E. Vaño; *Madrid/ES (eliseov@med.ucm.es)*
Learning objectives:
1. To appreciate the relevance of the dosimetric information available during and at the end of interventional procedures to help in optimisation.
2. To learn that additional details on technical parameters are available in the DICOM RDSR, helping to audit individual procedures.
3. To understand how the information contained in the RDSR for radiation events may be helpful in optimising some individual procedures.
Author Disclosures:
E. Vaño: nothing to disclose

C 16-3 13:00
Workflow of dose management in the context of PACS, RIS, HIS, IHE
P. Mildenberger; *Mainz/DE (mildenbe@uni-mainz.de)*

Learning objectives:
1. To demonstrate the available tools for DM in hospital information systems/radiology information systems/picture archiving and communication systems (HIS-RIS-PACS).
2. To explain the health care enterprise (IHE) concept for DM.
3. To discuss the potential of new developments for DM.
Author Disclosures:
P. Mildenberger: nothing to disclose

C 16-4 13:10
Requirements on dose management system in terms of dose storage, processing, reporting, tracking, quality assurance and the directive EU-BSS 2013/59
S. T. Schindera*; Riehen/CH (sebastian.schindera@ksa.ch)*
Learning objectives:
1. To demonstrate examples of how to use dose management software for quality improvement.
2. To demonstrate the pitfalls of using dose management software.
3. To discuss future applications for dose management systems.
Author Disclosures:
S. T. Schindera: nothing to disclose

C 16-5 13:20
Experiences in practice between vendor promises and clinical reality
V. Tsapaki*; Nea Ionia/GR (virginia@otenet.gr)*
Learning objectives:
1. To demonstrate the real practice of DM procurement to installation.
2. To show the possible challenges during the procedure of DM purchase and installation.
3. To discuss necessary implementation steps.
Author Disclosures:
V. Tsapaki: nothing to disclose

13:30
Open forum discussion

12:45 - 13:45 **Coffee & Talk 3**

Coffee & Talk (open forum) Session
Organised by EIBIR

C 27
Artificial intelligence (AI) and the future of imaging: European funding prospects

C 27-1 12:45
Chairperson's introduction
G. P. Krestin*; Rotterdam/NL*
Session objectives:
1. To learn about the mission of the European Institute for Biomedical Imaging Research (EIBIR).
2. To become familiar with the European research landscape and EIBIR support.
3. To learn about the need for AI in imaging research.
Author Disclosures:
G. P. Krestin: Consultant at Bracco Imaging, Board Member at Quantib BV, Research/Grant Support at GEHC, Research/Grant Support at Bayer AG, Research/Grant Support at Siemens Healthineers

C 27-2 12:55
The importance of artificial intelligence in imaging research
W. J. Niessen*; Rotterdam/NL (w.niessen@erasmusmc.nl)*
Learning objectives:
1. To learn about AI and its role in imaging research.
2. To appreciate the importance of AI in imaging research.
3. To learn about EIBIR initiatives on AI.
Author Disclosures:
W. J. Niessen: Founder at Quantib BV, Shareholder at Quantib BV, Consultant at Quantib BV

C 27-3 13:05
Deep learning in imaging and cancer care
G. Langs*; Vienna/AT*
Learning objectives:
1. To learn about applications of deep learning.
2. To understand how deep learning is used in imaging and cancer care.
Author Disclosures:
G. Langs: Founder at contextflow GmbH, Grant Recipient at Novartis, Grant Recipient at Siemens Healthineers, Grant Recipient at NVIDIA

C 27-4 13:15
Applying artificial intelligence for biomarker discovery
A. Alberich-Bayarri*; Valencia/ES (angel@quibim.com)*
Learning objectives:
1. To learn about applications of AI.
2. To understand how AI can be used for biomarker discovery.
Author Disclosures:
A. Alberich-Bayarri: CEO at QUIBIM SL, Founder at QUIBIM SL, Board Member at QUIBIM SL

C 27-5 13:25
European funding and support services for AI and imaging research
P. Zolda*; Vienna/AT*
Learning objectives:
1. To learn about the types of funding available for AI and biomedical imaging research.
2. To learn about the support EIBIR offers imaging researchers.
3. To appreciate EIBIR's effectiveness in helping researchers secure funding.
Author Disclosures:
P. Zolda: nothing to disclose

13:35
Open forum discussion

12:45 - 13:45 **Room M 5**

EDiR Session

EDiR 3
The Essential Guide by Springer and other new tools to prepare the examination

Moderator:
L. Oleaga Zufiria; Barcelona/ES

EDiR 3-1 12:45
The Essential Guide publication by Springer
L. Oleaga Zufiria*; Barcelona/ES (lauraoleaga@gmail.com)*
Learning objectives:
1. To present the new e-book for EDiR preparation.
2. To present a guide on how to use the book.
3. To present the setup of the chapters of the book.
Author Disclosures:
L. Oleaga Zufiria: Consultant at TMC Academy

EDiR 3-2 12:57
EDiR App: self-assessment
W. van Lankeren*; Rotterdam/NL (w.vanlankeren@erasmusmc.nl)*
Learning objectives:
1. To present the self-assessment cases available in the app.
2. To show the utility of self-assessment for EDiR preparation.
3. To demonstrate the importance of using new learning approaches.
Author Disclosures:
W. van Lankeren: nothing to disclose

EDiR 3-3 13:09
EDiR App: structured reporting
F. M. Saez Garmendia*; Bilbao/ES (fersaez@yahoo.com)*
Learning objectives:
1. To become familiar with the new CORE cases with structured reports available in the EDiR app.
2. To help candidates facing the CORE exam to use structured reports.
3. To show the advantages of using structured reports when preparing for the CORE examination.
Author Disclosures:
F. M. Saez Garmendia: nothing to disclose

EDiR 3-4 13:21
EDiR blog
W. van Lankeren; *Rotterdam/NL*
Learning objectives:
1. To present the recent blogs incorporated in the app.
2. To show the process of blog preparation.
3. To show examples of flash and long cases.
Author Disclosures:
W. van Lankeren: nothing to disclose

13:33
Discussion

14:00 - 15:30 **Room N**

Breast

RC 1102

State of the art and recent developments in breast ultrasound

Moderator:
A. Athanasiou; Athens/GR

RC 1102-1 14:00
A. Breast ultrasound: tell me the value of coloured images
C. S. Balleyguier; *Villejuif/FR*
Learning objectives:
1. To learn the correct setting and interpretation of Doppler and elastography.
2. To realise the added value in lesion assessment.
3. To know the roll in follow-up and therapy monitoring.
Author Disclosures:
C. S. Balleyguier: disclosure/affirmation information not submitted

RC 1102-2 14:30
B. Automated breast ultrasound (ABUS): the right add-on in screening dense breast
A. Vourtsis; *Athens/GR (athinavourtsi@yahoo.gr)*
Learning objectives:
1. To learn how to perform, assess image quality, interpret, and recognise artefacts.
2. To review the current literature of ABUS in women with dense breasts.
3. To understand the value of 3D multiplanar images and ABUS workflow implementation compared to handheld US (HHUS).
Author Disclosures:
A. Vourtsis: Advisory Board at Noncorporate Member of Medical Advisory Board of Volpara Solutions, Consultant at Consultant, General Electric Company Educator, ABUS

RC 1102-3 15:00
C. Can artificial intelligence (AI) be helpful in the US-screening setting?
P. Kapetas; *Vienna/AT (panagiotis.kapetas@meduniwien.ac.at)*
Learning objectives:
1. To understand the current status of the use of AI in breasts US.
2. To realise the limitations in the implementation of US in screening and of AI in US examinations.
3. To explore potential future applications.
Author Disclosures:
P. Kapetas: nothing to disclose

14:00 - 15:30 **Room O**

Children in Focus

IF 11

Against all odds: bringing health care to children in low-resource areas

IF 11-1 14:00
Chairperson's introduction
K. Rosendahl; *Bergen/NO (karen.rosendahl@unn.no)*
Author Disclosures:
K. Rosendahl: nothing to disclose

IF 11-2 14:06
Child health in the Sustainable Development Goals (SDG) era
A. Banerjee; *Geneva/CH (banerjeea@who.int)*
Learning objectives:
1. To recognise the changes in mortality and morbidity patterns.
2. To understand the new directions in child health.
3. To discuss the life course approach to child health.
Author Disclosures:
A. Banerjee: Employee at World Health Organization, Speaker at World Health Organization

IF 11-3 14:26
The challenges of health care delivery to refugee and migrant children
G. Bernini; *Milan/IT (gaela.bernini@bracco.com)*
Learning objectives:
1. To learn the current status of health care delivery in this vulnerable population.
2. To appreciate the acute impact on the child.
3. To understand the late effects to these children and impact on their future lives.
Author Disclosures:
G. Bernini: Employee at Bracco Foundation

IF 11-4 14:46
ESPR Outreach task force: what is our best way to help?
J. Kasznia-Brown; *Bristol/UK (joanna.brown@tst.nhs.uk)*
Learning objectives:
1. To learn about the aims of the ESPR outreach task force.
2. To illustrate with details of ongoing projects.
3. To discuss the best way for paediatric radiologists to influence health care for children in low-resource areas.
Author Disclosures:
J. Kasznia-Brown: nothing to disclose

15:06
Panel discussion: How can we efficiently reach out to children in low resource areas to develop self-sustainable aid-programs?

14:00 - 15:30 **Studio 2020**

Joint Session of the EFRS and ISRRT

EFRS/ISRRT

Artificial intelligence and the radiographer profession

EFRS/ISRRT-1/EFRS/ISRRT-2 14:00
Chairpersons' introduction
J. McNulty; *Dublin/IE (jonathan.mcnulty@ucd.ie)*
D. E. Newman; *Fargo, ND/US (donnaenewman@gmail.com)*
Session objectives:
1. To discuss artificial intelligence in the context of the radiographer profession.
2. To explore the key considerations for the profession related to artificial intelligence.
Author Disclosures:
J. McNulty: nothing to disclose, D. E. Newman: nothing to disclose

EFRS/ISRRT-3 14:06
Exploring the current landscape and evidence-base relating to artificial intelligence (AI) and the radiographer profession
N. H. Woznitza; *London/UK (nicholas.woznitza@nhs.net)*
Learning objectives:
1. To summarise the existing evidence of the impact of AI on radiographers.
2. To recognise the risks and benefits when introducing AI into clinical practice.
3. To explore the opportunities that AI could present in radiographer role development.
Author Disclosures:
N. H. Woznitza: Consultant at InHealth

EFRS/ISRRT-4 14:24
Ethical considerations in AI
A. Brady; *Cork/IE (adrianbrady@me.com)*
Learning objectives:
1. To learn the ethical controversies that AI is introducing in medical imaging.
2. To provide an overview of the professional and legal implications.
3. To explore/elaborate on the need for a code of conduct.
Author Disclosures:
A. Brady: nothing to disclose

EFRS/ISRRT-5 14:42
Considering AI in our education and training programmes
M. Hardy; *Bradford/UK (M.L.Hardy1@bradford.ac.uk)*
Learning objectives:
1. To consider what our students need to know about AI.
2. To discuss opportunities to use AI to supplement radiographer education.
3. To identify future concepts that radiographers will require to work with integrated AI.
Author Disclosures:
M. Hardy: nothing to disclose

EFRS/ISRRT-6 15:00
Horizon scanning: the future of AI and the radiographer profession
M. Jackowski; *Angier, NC/US (mjackowski@asrt.org)*
Learning objectives:
1. To discuss how radiographers can contribute to the development of AI in medical imaging.
2. To summaries barriers to the implementation of AI in clinical practice.
3. To illustrate the potential contribution of AI to patient safety.
Author Disclosures:
M. Jackowski: Board Member at American Society of Radiologic Technologists, Employee at Siemens Healthineers

15:18
Panel discussion: What steps can be taken to better prepare radiographers for AI?

14:00 - 15:30 **Darwin (Room D2)**

Emergency Imaging

RC 1117
Complications of endovascular interventions

Moderator:
M. C. Firetto; Milan/IT

RC 1117-1 14:00
A. Complications in thoracic and abdominal endovascular aneurysm procedures
R. A. Morgan; *London/UK (robert.morgan@stgeorges.nhs.uk)*
Learning objectives:
1. To become familiar with the most common endovascular thoracic and abdominal procedures.
2. To understand the mechanism of the possible risks during endovascular procedures.
3. To recognise these acute complications in different imaging modalities.
Author Disclosures:
R. A. Morgan: Speaker at Cook, Speaker at Bard

RC 1117-2 14:30
B. Imaging and management of complication of peripheral arterial revascularisation
M. J. Lee; *Dublin/IE (mlee@rcsi.ie)*
Learning objectives:
1. To become familiar with the possible complication of endovascular treatments.
2. To recognise findings of complications in different imaging modalities.
3. To learn about the management of common complications.
Author Disclosures:
M. J. Lee: nothing to disclose

RC 1117-3 15:00
C. Imaging appearance of typical complications after liver embolisation: what is normal and what needs to be reported
T. J. Kroencke; *Augsburg/DE*
Learning objectives:
1. To become familiar with the possible endovascular typical complications and normal findings.
2. To become familiar with the interventional radiologist's needs imaging to plan treatment after complications.
3. To recognise when to call surgical colleagues.
Author Disclosures:
T. J. Kroencke: nothing to disclose

14:00 - 15:30 **Descartes (Room D3)**

EFOMP Workshop

EF 11
CT protocol management and optimisation: management (part A)

Moderator:
M. Brambilla; Novara/IT

EF 12-1 14:00
Chairperson's introduction
K. N. Bolstad; *Bergen/NO*
Session objectives:
1. To become familiar with the concept of CT protocol management systems (CT-PMS).
2. To discuss the opportunities provided by the standardisation of CT protocols in the optimisation process.
3. To understand how dose tracking systems can be used in quality assurance of CT-PMS.
Author Disclosures:
K. N. Bolstad: nothing to disclose

EF 11-2 14:05
Developing a CT protocol management system (CT-PMS)
J. Sjöberg; *Stockholm/SE (johan.a.sjoberg@sll.se)*
Learning objectives:
1. To learn how to set up a review committee and the role of each member (radiologist, medical physicist, radiographer).
2. To understand why implementing a CT-PMS is a prerequisite for optimisation.
3. To become familiar with existing CT-PMS systems.
Author Disclosures:
J. Sjöberg: nothing to disclose

EF 11-3 14:35
A general framework for monitoring CT acquisition workflow
T. Szczykutowicz; *Madison, WI, WI/US (tszczykutowicz@uwhealth.org)*
Learning objectives:
1. To learn how to maintain consistency in CT acquisition protocols throughout a large radiology department.
2. To understand how technologist quality can be monitored using informatics tools.
3. To discuss the current state of informatics solutions to facilitate protocols management in radiology.
Author Disclosures:
T. Szczykutowicz: Advisory Board at imalogix LLC, Consultant at GE Healthcare, Consultant at Takeda Pharmecuitcals , Owner at protocolshare.org LLC, Grant Recipient at GE Healthcare

EF 11-4 15:05
Dose tracking systems as a tool for CT-PMS
F. Zanca; *Leuven/BE (federica.zanca@palindromo.consulting)*
Learning objectives:
1. To understand how dose management systems can be used in quality assurance of CT-PMS.
2. To become familiar with applications of this method through worked examples.
3. To discuss the application in multicentre studies.
Author Disclosures:
F. Zanca: Owner at Palindromo Consulting

14:00 - 15:30 **Room G**

E³ - ECR Master Class (Head and Neck)

E³ 1126

Improving staging and treatment outcomes in head and neck cancer

E³ 1126-1 14:00
Chairperson's introduction
M. Horta; *Lisbon/PT (mariana_horta@hotmail.com)*
Session objectives:
1. To learn about new developments in MRI for early tumour detection.
2. To understand the changing role of imaging with human papillomavirus (HPV) related disease.
3. To learn how to improve detection of recurrence and prediction of outcome.
Author Disclosures:
M. Horta: nothing to disclose

E³ 1126-2 14:05
A. Nasopharynx: early tumour detection and imaging markers for treatment response
A. D. King; *Hong Kong/CN*
Learning objectives:
1. To learn how best to detect early nasopharyngeal carcinoma (NPC).
2. To understand how to assess tumour response.
3. To highlight how imaging response may alter the treatment pathway.
Author Disclosures:
A. D. King: nothing to disclose

E³ 1126-3 14:28
B. Early glottic carcinoma: new insights relevant for tumour staging and patient management
D. Farina; *Brescia/IT (davide.farina@unibs.it)*
Learning objectives:
1. To become acquainted with treatment options for early glottic cancer.
2. To understand the best imaging techniques for assessing early glottic cancer.
3. To learn which imaging features affect patient management.
Author Disclosures:
D. Farina: Speaker at BAYER 2019, Other at BRACCO 2019

E³ 1126-4 14:51
C. Oropharynx: risk stratification related to HPV association
A. Trojanowska; *Lublin/PL*
Learning objectives:
1. To understand the role of HPV in treatment and outcome of oropharyngeal cancer.
2. To learn about the impact of HPV on tumour staging.
3. To reflect on imaging features differentiating HPV+ from HPV-.
Author Disclosures:
A. Trojanowska: disclosure/affirmation information not submitted

15:14
Panel discussion: Will new developments in imaging alter staging and treatment in head and neck oncology?

14:00 - 15:30 **Room M 2**

E³ - Advanced Course: Hot Topics in Emergency Radiology

E³ 1118

Dual-energy and subtraction CT in emergency radiology

E³ 1118-1 14:00
Chairperson's introduction
S. Wirth; *Munich/DE (wirth.online@googlemail.com)*
Session objectives:
1. To become familiar with dual-energy CT techniques and reconstruction possibilities.
2. To understand the clinical applications and added value of dual-energy CT in emergency pathologies.
3. To learn about the anatomical and functional information of different organ systems provided by dual-energy CT.
4. To become familiar with the impact of dual-energy CT on radiation dose and required iodine volume.
5. To become familiar with the possible future applications of dual-energy CT in combination with deep learning techniques.
Author Disclosures:
S. Wirth: nothing to disclose

E³ 1118-2 14:06
A. Blood and bleeding
M. Brink; *Nijmegen/NL (Mobrink@hotmail.com)*
Learning objectives:
1. To understand the advantages of dual-energy CT in neuro, aortic, and PE diagnoses.
2. To understand how virtual non-contrast images might replace the precontrast phase.
3. To highlight the superiority of dual-energy CT in the demonstration of enhancement.
Author Disclosures:
M. Brink: Grant Recipient at Canon Medical Systems, Speaker at Canon Medical Systems

E³ 1118-3 14:34
B. The usual suspects: urogenital and musculoskeletal
R. Guggenberger; *Zurich/CH (roman.guggenberger@usz.ch)*
Learning objectives:
1. To learn about the differentiation of stones.
2. To understand the advantages of duel-energy CT in recognising subtle/occult fractures.
3. To highlight the role of dual-energy CT in reducing metal-related artefacts in musculoskeletal imaging.
Author Disclosures:
R. Guggenberger: nothing to disclose

E³ 1118-4 15:02
C. Dual-energy CT in acute emergency conditions in the abdomen and pelvis
J. Sosna; *Jerusalem/IL (jacobs@hadassah.org.il)*
Learning objectives:
1. To describe dual-energy CT techniques.
2. To provide an overview of dual-energy tools used in the evaluation of ED patients.
3. To present the role of dual-energy CT in emergency situations.
Author Disclosures:
J. Sosna: nothing to disclose

16:00 - 17:30 **Room C**

Breast

RC 1202

Evidence-based breast MRI: when, how and why

RC 1202-1 16:00
Chairperson's introduction
F. Sardanelli; *Milan/IT*
Session objectives:
1. To understand the contribution of MRI to preoperative staging and the context within which it should be recommended.
2. To understand the importance of the multiparametric protocol and robust image quality.
3. To recognise the steps required to move to abbreviated MRI for high-risk screening.
Author Disclosures:
F. Sardanelli: Advisory Board at Bracco, Speaker at Bayer, Bracco, General Electric, Research/Grant Support at Bayer, Bracco, General Electric

RC 1202-2 16:05
A. Preoperative staging with MRI: fresh data on an old mantra
R. M. Trimboli*; San Donato Milanese/IT (trimboli.rm@gmail.com)*
Learning objectives:
1. To learn about the evidence for and against the use of MRI in preoperative staging.
2. To understand the background, design, and early results of the MIPA trial and recent literature.
3. To be able to explain the role of preoperative MRI during multidisciplinary tumour board meetings.
Author Disclosures:
R. M. Trimboli: nothing to disclose

RC 1202-3 16:30
B. Abbreviated protocols: are we ready?
C. K. Kuhl*; Aachen/DE (ckuhl@ukaachen.de)*
Learning objectives:
1. To learn about the evidence for abbreviated MRI and the comparison with standard protocols.
2. To understand the different protocols for abbreviated MRI and the merits of each sequence used.
3. To appreciate the advantages and limitations for abbreviated MRI.
Author Disclosures:
C. K. Kuhl: nothing to disclose

RC 1202-4 16:55
C. How can we make use of MRI biomarkers in clinical practice?
L. Martincich*; Candiolo/IT*
Learning objectives:
1. To learn about the different biomarkers that are available and the evidence for using them in patients with breast cancer.
2. To understand in which clinical settings biomarkers might be of value now and in the future.
3. To recognise the limits for a widespread application.
Author Disclosures:
L. Martincich: disclosure/affirmation information not submitted

17:20
Panel discussion: Why is the adoption of MRI in clinical practice still so difficult?

16:00 - 17:00 **Coffee & Talk 1**

Coffee & Talk (open forum) Session
Organised by ESOR

C 6
The European Diploma in Radiology (EDiR) as an instrument to develop a professional career

C 6-1 16:00
Chairperson's introduction
L. Oleaga Zufiria*; Barcelona/ES (lauraoleaga@gmail.com)*
Session objectives:
1. To present EDiR: the essential guide.
2. To describe the new EDiR innovative tools to prepare the exam.
3. To describe the advantages of being an EDiR holder.
4. To present quiz examination cases (MRQs, short cases, CORE cases).
Author Disclosures:
L. Oleaga Zufiria: Consultant at TMC Academy

C 6-2 16:05
How to succeed in the EDiR examination: presentation of "EDiR: the essential guide" and new innovative tools to prepare for the EDiR examination
L. Oleaga Zufiria*; Barcelona/ES (lauraoleaga@gmail.com)*
Learning objectives:
1. To present the script for reading the e-book.
2. To present the setup of the chapters following the scheme of the three sections in which EDiR is organised.
3. To demonstrate the links to ESR online educational content.
4. To show the self-assessment cases available in the app.
5. To show the new CORE cases with structured report.
6. To present the recent blogs incorporated in the app.
Author Disclosures:
L. Oleaga Zufiria: Consultant at TMC Academy

C 6-3 16:20
Why EDiR certification matters
A. Soler Perromat*; Barcelona/ES (alexandresolerp@gmail.com)*
Learning objectives:
1. To describe the experience of taking the exam.
2. To explain the reasons why it is worth taking the exam.
3. To understand the benefits of having the European Diploma in Radiology.
Author Disclosures:
A. Soler Perromat: nothing to disclose

C 6-4 16:30
Interactive quiz
W. van Lankeren*; Rotterdam/NL (w.vanlankeren@erasmusmc.nl)*
Learning objectives:
1. To familiarise the EDiR candidate with the way of testing.
2. To more effectively prepare for the EDiR exam after interactive participation in the quiz.
3. To practice the skills of how to tackle and address the questions in the exam.
Author Disclosures:
W. van Lankeren: nothing to disclose

16:50
Open forum discussion

16:00 - 17:30 **Room N**

EuroSafe Imaging Session

EU 12
Dose reduction in quantitative single- and multi-energy computed tomography

EU 12-1/EU 12-2 16:00
Chairpersons' introduction
S. T. Schindera*; Riehen/CH (sebastian.schindera@ksa.ch)*
W. Stiller*; Heidelberg/DE*
Session objectives:
1. To raise awareness of available technology and methods for quantitative computed tomography imaging.
2. To become familiar with clinical applications of single- and multi-energy CT for the acquisition of quantitative imaging biomarkers.
3. To learn about the potential for dose reduction in the field of quantitative CT and its effects on analyses results.
Author Disclosures:
S. T. Schindera: nothing to disclose, W. Stiller: Advisory Board at Philips Medical Systems Nederland B.V., Veenpluis 4-6, 5684 Best, The Netherlands

EU 12-3 16:05
Dual- and multi-energy CT: physical background and concepts
P. B. Noel*; Philadelphia, PA/US (peter.noel@uphs.upenn.edu)*
Learning objectives:
1. To introduce the basic concept of spectral imaging.
2. To illustrate the technical implementations of dual- and multi-energy CT.
3. To demonstrate dose reduction potentials in spectral CT.
Author Disclosures:
P. B. Noel: Advisory Board at Philips Healthcare, Research/Grant Support at Philips Healthcare, Speaker at Philips Healthcare, Consultant at Stryker , Shareholder at MITOS GmbH

EU 12-4 16:20
Spectral photon-counting CT: technical concepts for quantitative multi-energy imaging and dose reduction
L. Boussel*; Lyons/FR*
Learning objectives:
1. To become familiar with photon-counting CT technology and its differences to conventional CT detectors.
2. To understand the technical concepts of photon counting for quantitative multi-energy imaging.
3. To learn about the potential of photon-counting technology for enabling future dose reduction in CT.
Author Disclosures:
L. Boussel: nothing to disclose

EU 12-5 16:35
Single dual-energy iodine maps with organ-specific acquisition timing as a quantitative imaging biomarker replacing abdominal CT perfusion
S. Skornitzke*; Heidelberg/DE (Stephan.Skornitzke@med.uni-heidelberg.de)*
Learning objectives:
1. To learn about the potential of dual-energy CT for iodine quantification in the abdomen as a quantitative imaging biomarker
2. To understand the link between conventional dynamic CT perfusion and quantitative dual-energy iodine maps.
3. To raise awareness of dual-energy iodine maps with organ-specific acquisition times as a dose-reduced alternative to abdominal CT perfusion.
Author Disclosures:
S. Skornitzke: Shareholder at Investment funds containing shares of healthcare companies

EU 12-6 16:50
Effects of dose reduction on quantitative analyses of chest CT
J. M. Goo*; Seoul/KR (jmgoo@plaza.snu.ac.kr)*
Learning objectives:
1. To understand the dose reduction approaches in chest CT.
2. To review the quantitative analyses used in chest CT.
3. To learn about the impact of dose reduction approaches on quantitative analyses.
Author Disclosures:
J. M. Goo: Research/Grant Support at Infinitt Healthcare

EU 12-7 17:05
Perfusion CT as quantitative imaging biomarker in acute ischaemic stroke and brain trauma: what about the dose?
I. Shelef*; Beer-Sheva/IL (shelef@bgu.ac.il)*
Learning objectives:
1. To become familiar with perfusion CT as a quantitative imaging biomarker in acute ischemic stroke and brain trauma.
2. To learn about the potential for, and limitations of, dose reduction in neurologic perfusion CT imaging.
3. To understand the use and limitations of perfusion CT for the assessment of acute ischemic stroke and brain trauma.
Author Disclosures:
I. Shelef: nothing to disclose

17:20
Panel discussion: Which role does quantitative single- and multi-energy computed tomography play in daily practice, and is it compatible with dose reduction?

16:00 - 17:30 **Room O**

Children in Focus

IF 12

The child as an individual: whose life is it anyway?

IF 12-1 16:00
Chairperson's introduction
B. Said*; London/UK (Bella.Said@gosh.nhs.uk)*
Author Disclosures:
B. Said: nothing to disclose

IF 12-2 16:05
Use of restraints in children: what is acceptable, when and why?
J. Dahlberg*; Oslo/NO (jorged@medisin.uio.no)*
Learning objectives:
1. To learn about the legal aspects/laws/UN/European children's convention.
2. To describe ethical and judicial dilemmas regarding restraint.
3. To discuss who defines what is to the "benefit to the child".
Author Disclosures:
J. Dahlberg: nothing to disclose

IF 12-3 16:25
Parental and cultural autonomy: can carers make any decisions on behalf of their child?
E. Verhagen*; Gronigen/NL (a.a.e.verhagen@umcg.nl)*
Learning objectives:
1. To discuss who owns the child's data and the ethical dilemmas of sharing children's medical stories in magazines, TV programmes, social media etc.
2. To learn about the value of childrens' data for medical research.
3. To what extent can parents decide what is best for their child? Using examples including vaccination, alternative therapies, and circumcision/genital mutilation etc.
Author Disclosures:
E. Verhagen: nothing to disclose

IF 12-4 16:45
Paediatric radiology: is there really any point?
Ø. E. E. Olsen*; London/UK (oystein.e.olsen@googlemail.com)*
Learning objectives:
1. To appreciate the evidence available for how a child-friendly/age-adjusted environment increases the diagnostic quality of radiological examinations.
2. To learn the importance of not treating children as small adults (results from adult research not applicable for children, normal variants, different diseases, age-adjusted care).
3. To discuss variations in the practice and availability of specialised paediatric radiology practice across Europe.
Author Disclosures:
Ø. E. E. Olsen: nothing to disclose

17:05
Panel discussion: Who defines what is best for the child?

IF 12-6/IF 12-7 17:25
Closing remarks
L.-S. O. Müller*; Oslo/NO (lilmul@ous-hf.no)*
C. Owens*; London/UK (owens.catherine.5@gmail.com)*
Author Disclosures:
L.-S. O. Müller: nothing to disclose, C. Owens: nothing to disclose

16:00 - 17:30 **Studio 2020**

E³ - ECR Master Class (Oncologic Imaging)

E³ 1226

Whole-body MRI (and PET/MRI)

Moderator:
D. Prezzi; London/UK

E³ 1226-1 16:00
A. Metastatic bone prostate cancer
F. Lecouvet*; Brussels/BE (frederic.lecouvet@uclouvain.be)*
Learning objectives:
1. To define imaging strategies in newly diagnosed, recurrent, and advanced disease.
2. To become able to use MET-RADS-P guidelines for whole-body MRI acquisition, reading, and response assessment.
3. To illustrate recent therapeutic advances: i.e. oligometastatic disease and precision medicine approaches.
Author Disclosures:
F. Lecouvet: nothing to disclose

E³ 1226-2 16:30
B. Multiple myeloma
L. A. Moulopoulos*; Athens/GR (lmoulop@med.uoa.gr)*

Learning objectives:
1. To become aware of the value of whole-body MRI in myeloma.
2. To understand current imaging protocols.
3. To learn about its roles: detect, monitor, and provide prognostic information.
Author Disclosures:
L. A. Moulopoulos: nothing to disclose

E³ 1226-3 17:00
C. Lymphoma
M. E. Mayerhöfer*; Vienna/AT (marius.mayerhoefer@meduniwien.ac.at)*
Learning objectives:
1. To introduce the role of whole-body MRI and PET/MRI for imaging lymphoma subtypes.
2. To know its value for detection, assessment of response, and prognosis.
3. To understand the current advantages and limitations of whole-body MRI and PET/MRI.
Author Disclosures:
M. E. Mayerhöfer: Speaker at Siemens, Research/Grant Support at Siemens, Speaker at Bristol-Myers Squibb

16:00 - 17:30 **Room E**

E³ - Advanced Course: Interactive Teaching Session for Young (and not so Young) Radiologists

E³ 1221a

Genitourinary radiology for the general radiologist

E³ 1221a-1 16:00
A. Cystic pelvic masses: differential diagnosis and management
O. Nikolic*; Novi Sad/RS (nikolic.olivera@gmail.com)*
Learning objectives:
1. To learn the imaging characteristics of the different entities.
2. To become familiar with the practical workflow in everyday clinical practice
Author Disclosures:
O. Nikolic: nothing to disclose

E³ 1221a-2 16:45
B. Gynaecological emergencies
M. Weston*; Leeds/UK (michael.weston2@nhs.net)*
Learning objectives:
1. To become familiar with the differential diagnosis.
2. To identify the key imaging findings.
Author Disclosures:
M. Weston: nothing to disclose

16:00 - 17:30 **Room F1**

E³ - Advanced Course: Interactive Teaching Session for Young (and not so Young) Radiologists

E³ 1221b

Gastrointestinal radiology

E³ 1221b-1 16:00
A. Inflammatory bowel disease
J. Rimola*; Barcelona/ES (jrimola@clinic.cat)*
Learning objectives:
1. To review the spectrum of imaging findings in inflammatory bowel disease, mainly in Crohn's disease.
2. To learn about the management options.
Author Disclosures:
J. Rimola: Advisory Board at Takeda, Advisory Board at Gilead, Advisory Board at Robarts Clinical Reserach, Research/Grant Support at Abbvie, Research/Grant Support at Genentech

E³ 1221b-2 16:45
B. Rectal cancer staging: key findings
I. Blazic*; Belgrade/RS (ivanablazic@yahoo.com)*
Learning objectives:
1. To understand the imaging technique.
2. To identify the key imaging findings.
Author Disclosures:
I. Blazic: nothing to disclose

16:00 - 17:30 **Room F2**

E³ - Rising Stars Programme: Basic Session

BS 12

Vascular: US and vascular disease

Moderator:
J. Bremerich; Basel/CH

BS 12-1 16:00
Abdominal aorta
D.-A. A. Clevert*; Munich/DE (Dirk.Clevert@med.uni-muenchen.de)*
Learning objectives:
1. To learn how to perform the examination and its role in diagnostic assessment.
2. To learn about US findings in abdominal aortic aneurysm (AAA) treatment planning and post-treatment evaluation.
3. To appreciate the role of contrast enhanced ultrasound (CEUS) and technological innovations in routine practice.
Author Disclosures:
D.-A. A. Clevert: Speaker at Bracco, Samsung, Philips, Siemens, Advisory Board at Philips, Samsung

BS 12-2 16:30
Upper and lower limb: arterial
E. Divjak*; Zagreb/HR*
Learning objectives:
1. To understand how to perform the examination and its role in diagnostic assessment.
2. To understand US findings for diagnostic and follow-up.
3. To underline tips and tricks to start your activity.
Author Disclosures:
E. Divjak: nothing to disclose

BS 12-3 17:00
Lower limb: venous
S. M. Dudea*; Cluj/RO (sdudea1@gmail.com)*
Learning objectives:
1. To understand how to perform the examination and its role in diagnostic assessment.
2. To understand US findings for diagnostic and follow-up.
3. To underline tips and tricks to start your activity.
Author Disclosures:
S. M. Dudea: nothing to disclose

16:00 - 17:00 **Coffee & Talk 3**

Coffee & Talk (open forum) Session

Organised by the ESR Subcommittee on Value-Based Radiology

C 28

Value in radiology: in the eye of the beholder

C 28-1 16:00
Chairperson's introduction
M. Fuchsjäger*; Graz/AT (michael.fuchsjaeger@medunigraz.at)*

Session objectives:
1. To understand the concept of value in radiology.
2. To learn about the challenges of developing a concept of value-based radiology.
3. To learn about experiences with value-based approaches in practice.
Author Disclosures:
M. Fuchsjäger: nothing to disclose

C 28-2 16:10
Artificial intelligence and value-based health care
P. Algra*; Heiloo/NL*
Learning objectives:
1. To learn about the Value-based Healthcare Centre's implementation of value-based health care (VBHC).
2. To understand the practical challenges of organising health care delivery based on value.
3. To understand the administrative, managerial, and financial processes of VBHC in practice.
Author Disclosures:
P. Algra: disclosure/affirmation information not submitted

C 28-3 16:15
What do patients value?
C. Justich*; Vienna/AT (cjustich@me.com)*
Learning objectives:
1. To learn about how to mutually interact with one another in a way that is optimised for both sides.
2. To understand what matters most to patients.
3. To appreciate the need to get prepared for further steps.
Author Disclosures:
C. Justich: Speaker at ESR PAG

C 28-4 16:20
Results of the ESR patient survey on value-based radiology (VBR)
M. Fuchsjäger*; Graz/AT (michael.fuchsjaeger@medunigraz.at)*
Learning objectives:
1. To learn about the results of the ESR value-based radiology patient survey.
2. To appreciate how value is perceived by radiology patients.
3. To understand which factors determine quality and value for patients in radiology.
Author Disclosures:
M. Fuchsjäger: nothing to disclose

C 28-5 16:25
Value-based pay models for radiology
V. M. Rao*; Philadelphia/US*
Learning objectives:
1. To learn about the status quo of value-based pay and reimbursement models.
2. To understand the challenges in monetising "value".
3. To learn about the differences between value-based and volume-based pay models.
Author Disclosures:
V. M. Rao: disclosure/affirmation information not submitted

C 28-6 16:30
Value of radiology: the Canadian perspective
E. Lee*; Vancouver/CA (ejlee888@gmail.com)*
Learning objectives:
1. To become familiar with the challenges facing health care delivery in Canada.
2. To understand the value of radiology from a quantitative perspective within the Canadian health care system.
3. To become familiar with the key stakeholders and target audiences that can influence radiology practice and improved patient care.
Author Disclosures:
E. Lee: nothing to disclose

C 28-7 16:35
VBR concepts around the globe: similarities and contrasts
J. A. Brink*; Boston, MA/US*
Learning objectives:
1. To understand the different approaches to VBR internationally.
2. To learn about the differences in practical implementations of VBR concepts.
3. To understand the importance of professional societies in promoting best (value-based) practices.
Author Disclosures:
J. A. Brink: Board Member at Accumen, Inc.

C 28-8 16:40
Joint paper on value-based radiology
A. Brady*; Cork/IE (adrianbrady@me.com)*
Learning objectives:
1. To explain the origin and purpose of the multi-society paper on value-based radiology.
2. To highlight the commonalities and differences between countries relating to value in medicine.
3. To understand how the value contributed to health care by radiology can be objectified and quantified.
Author Disclosures:
A. Brady: nothing to disclose

16:45
Open forum discussion: International perspectives on value in radiology

16:00 - 17:30 **da Vinci (Room D1)**

Chest

RC 1204

Pulmonary neuroendocrine proliferations and neoplasms

Moderator:
M. Silva; Parma/IT

RC 1204-1 16:00
A. Diffuse idiopathic pulmonary neuroendocrine cell hyperplasia (DIPNECH)
G. Chassagnon*; Paris/FR (gchassagnon@gmail.com)*
Learning objectives:
1. To learn about the diagnostic criteria of this syndrome.
2. To understand the correspondence between imaging and pathology.
3. To know when to suggest this diagnosis on CT.
Author Disclosures:
G. Chassagnon: nothing to disclose

RC 1204-2 16:30
B. Carcinoid tumours
H. Prosch*; Vienna/AT (helmut.prosch@meduniwien.ac.at)*
Learning objectives:
1. To learn about the radiological features of central and peripheral carcinoids.
2. To know when to suspect a carcinoid tumour in a case of bronchial obstruction.
3. To learn about the role of FDG and DOTATOC PET/CT in the evaluation of carcinoid tumours.
Author Disclosures:
H. Prosch: nothing to disclose

RC 1204-3 17:00
C. Small cell lung cancer (SCLC)
M. Das*; Duisburg/DE (Marco.Das@helios-gesundheit.de)*
Learning objectives:
1. To learn about the common radiological manifestations of small cell lung cancer.
2. To learn how to distinguish between limited or extensive forms.
3. To learn how the TNM staging system should be integrated into the classification of SCLC.
Author Disclosures:
M. Das: nothing to disclose

16:00 - 17:30 **Darwin (Room D2)**

EFRS meets Slovenia

Meets 12

A guided tour of Slovenia through the modalities

Presiding:
J. McNulty; Dublin/IE
U. Gačnik; Ljubljana/SI

Meets 12-1 16:00
Session introduction
J. McNulty; *Dublin/IE (jonathan.mcnulty@ucd.ie)*
Author Disclosures:
J. McNulty: nothing to disclose

Meets 12-2 16:05
Introduction: Radiographers in Slovenia
U. Gačnik; *Ljubljana/SI (uros.gacnik@gmail.com)*
Session objectives:
1. To introduce the radiography profession in Slovenia and the priorities of the National Society.
2. To introduce Slovenia as a country, Slovenian life, and culture.
Author Disclosures:
U. Gačnik: Speaker at SLOVENIAN SOCIETY OF RADIOGRAPHERS

Meets 12-3 16:10
The radiographers' role in hybrid imaging
S. Rep; *Ljubljana, SLO/SI*
Learning objectives:
1. To understand the advantages and disadvantages of hybrid imaging.
2. To understand the importance of protocol optimisation and the important role of the radiographer.
3. To become familiar with the impact of quality control processes on image and data quality.
Author Disclosures:
S. Rep: nothing to disclose

Meets 12-4 16:26
The effective use of negative contrast agents in magnetic resonance cholangiopancreatography (MRCP)
A. Breznik; *Celje/SI (abreznik@gmail.com)*
Learning objectives:
1. To become familiar with different types of negative contrast agents in MRCP imaging.
2. To acknowledge the impact of using different negative contrast agents.
3. To learn about the possibilities of protocol optimisation in MRCP imaging.
Author Disclosures:
A. Breznik: nothing to disclose

16:42
Interlude: I feel Slovenia

Meets 12-6 16:47
Protocol designing and optimisation in cardiac CT
J. Mišič; *Ljubljana/SI (jure.misic@gmail.com)*
Learning objectives:
1. To become familiar with different cardiac CT scan modes.
2. To learn about the possibilities of protocol optimisation.
3. To understand the challenges in cardiac CT examination.
Author Disclosures:
J. Mišič: Employee at University medical centre Ljubljana

Meets 12-7 17:03
Quality assurance in mammography: evaluation of radiographs
E. Alukić; *Ljubljana/SI*
Learning objectives:
1. To present evaluation criteria for mammographic images from the Slovenian screening programme.
2. To review the most common positioning errors from across the Slovenian screening programme.
3. To address the challenges of the manual assessment of mammograms.
Author Disclosures:
E. Alukić: Speaker at UL, Faculty of Health Sciences

17:19
Panel discussion

16:00 - 17:30 **Descartes (Room D3)**

EFOMP Workshop

EF 12

CT protocol management and optimisation: optimisation (part B)

Moderator:
A. Trianni; Udine/IT

EF 12-2 16:00
Chairperson's introduction
M. Kortesniemi; *Hus/FI (mika.kortesniemi@hus.fi)*
Session objectives:
1. To understand why standardisation of acquisition and reconstruction protocols is needed in quantitative radiology.
2. To provide an overview of CT acquisition and reconstruction protocols based on clinical indications (low-dose and high-dose protocols as examples).
3. To understand the need for benchmarking optimised protocols in everyday clinical practice.
Author Disclosures:
M. Kortesniemi: nothing to disclose

EF 12-2 16:05
Optimised acquisition and reconstruction protocols: chest CT
E. Castellano; *London/UK (elly.castellano@rmh.nhs.uk)*
Learning objectives:
1. To give an overview of optimised protocols.
2. To understand issues related to the technical implementation of these protocols.
3. To discuss specific issues related to different scanners.
Author Disclosures:
E. Castellano: nothing to disclose

EF 12-3 16:30
Optimised acquisition and reconstruction protocols: cardiac CT
M. Kalra; *Boston, MA/US (MKALRA@mgh.harvard.edu)*
Learning objectives:
1. To give an overview of optimised protocols.
2. To understand issues related to the technical implementation of these protocols.
3. To discuss specific issues related to different scanners.
Author Disclosures:
M. Kalra: Research/Grant Support at Siemens Healthineers, Research/Grant Support at Riverain Inc.

EF 12-4 17:00
Optimised acquisition and reconstruction protocols: abdomen and CT angiography
N. Buls; *Brussels/BE (nico.buls@uzbrussel.be)*
Learning objectives:
1. To give an overview of optimised protocols.
2. To understand issues related to the technical implementation of these protocols.
3. To understand issues related to the role of iodine volume, concentration, and flow rate.
Author Disclosures:
N. Buls: Grant Recipient at GE Healthcare, Advisory Board at GE Healthcare

16:00 - 17:30 **Room G**

Multidisciplinary Session

MS 12a

Revisiting screening for developmental dysplasia of the hip (DDH)

MS 12a-1 16:00
Chairperson's introduction
K. Rosendahl*; Bergen/NO (karen.rosendahl@unn.no)*
Session objectives:
1. To explain the rationale behind US screening for developmental dysplasia of the hip.
2. To explain how a nation-wide screening programme could be established for developmental dysplasia of the hip.
3. To describe the current challenges and opportunities in the screening for developmental dysplasia of the hip.
Author Disclosures:
K. Rosendahl: nothing to disclose

MS 12a-2 16:15
The need for a standardised approach to US screening for DDH
K. G. Chlapoutakis*; Iraklion/GR (kgchlapoutakis@outlook.com)*
Learning objectives:
1. To explain the rationale behind US screening for developmental dysplasia of the hip.
2. To describe the method for US screening for developmental dysplasia of the hip.
Author Disclosures:
K. G. Chlapoutakis: nothing to disclose

MS 12a-3 16:35
A paediatrician's perspective on screening DDH: Swiss-Mongolian Paediatric Project
T. Baumann*; Solothurn/CH (tombaum@gawnet.ch)*
Learning objectives:
1. To explain how a nation-wide screening programme could be established for developmental dysplasia of the hip.
2. To describe the challenges and opportunities posed by a nation-wide screening for developmental dysplasia of the hip.
Author Disclosures:
T. Baumann: Investigator at Swiss international pediatric project

MS 12a-4 16:55
A paediatric orthopaedist's perspective: who, when and how to screen for DDH
C. Maizen*; London/UK (maizen.claudia@gmail.com)*
Learning objectives:
1. To explain the paediatric orthopaedic perspective on who, when and how to screen for developmental dysplasia of the hip.
2. To describe the challenges and opportunities in the screening for developmental dysplasia of the hip.
Author Disclosures:
C. Maizen: nothing to disclose

17:15
Panel discussion: How can we improve early detection of developmental dysplasia of the hip?

16:00 - 17:30 **Room K**

Multidisciplinary Session

MS 12b

Multidisciplinary team for epilepsy

MS 12b-1 16:00
Chairperson's introduction
P. Demaerel*; Leuven/BE*
Session objectives:
1. To understand the clinical aspects and treatment dilemmas of epileptic disease.
2. To review the role of imaging in the diagnosis and treatment planning of epilepsy.
3. To learn about image-guided resective epilepsy surgery and the postoperative outcome.
Author Disclosures:
P. Demaerel: nothing to disclose

MS 12b-2 16:05
Clinical presentation and treatment options in epileptic disease
A. Schulze-Bonhage*; Freiburg/DE (andreas.schulze-bonhage@uniklinik-freiburg.de)*
Learning objectives:
1. To review the clinical presentation of epilepsy.
2. To describe localising information in seizure semiology and EEG.
3. To discuss medical and surgical treatment options.
Author Disclosures:
A. Schulze-Bonhage: Grant Recipient at BIAL, Investigator at UCB, Precisis, Speaker at BIAL, EISAI, UCB, Advisory Board at GW, Lundbek, Synergia

MS 12b-3 16:20
Radiological workup in epilepsy: (functional) MRI
H. Urbach*; Freiburg/DE (horst.urbach@uniklinik-freiburg.de)*
Learning objectives:
1. To describe options for the detection of epileptogenic foci.
2. To explore the value of functional imaging techniques in epilepsy.
3. To show how to perform a pre-surgical imaging workup.
Author Disclosures:
H. Urbach: Shareholder at Veobrain GmbH

MS 12b-4 16:35
Stereotactic techniques
V. Coenen*; Freiburg/DE (Volker.coenen@uniklinik-freiburg.de)*
Learning objectives:
1. To describe general options of stereotactic techniques in epilepsy.
2. To discuss stereotactic lesioning techniques in different indications.
3. To show state-of-the-art SEEG technique.
Author Disclosures:
V. Coenen: Advisory Board at CorTec, Advisory Board at Cortics, Other at Medtronic, Other at Boston Scientific

MS 12b-5 16:50
Image-guided epilepsy surgery
J. Beck*; Freiburg/DE*
Learning objectives:
1. To describe non-invasive and invasive pre-surgical diagnostic modalities.
2. To review surgical treatment options and the postoperative outcome.
3. To discuss how to deal with MRI-negative epilepsy.
Author Disclosures:
J. Beck: disclosure/affirmation information not submitted

17:05
Multidisciplinary case presentation and discussion

16:00 - 17:30 **Room M 1**

ESHI^{MT} Session

ESHI(MT)

The importance of identifying technical errors in hybrid imaging: pitfalls and artefacts in PET/CT and PET/MRI

Moderators:
M. D'Anastasi; Msida/MT
J. Rübenthaler; Munich/DE

ESHI(MT)-1 16:00
Artefacts on PET/CT and PET/MRI
I. Rausch*; Vienna/AT*
Learning objectives:
1. To understand image distortions, artefacts, and bias from methodological pitfalls in PET/CT and PET/MR imaging.
2. To learn about possible solutions to frequent image distortions.
3. To understand the methodological limitations of PET/CT and PET/MRI.
Author Disclosures:
I. Rausch: nothing to disclose

ESHI(MT)-2 16:23
Pitfalls in FDG-PET/CT
J. L. Vercher Conejero*; Barcelona/ES (jlvercher@hotmail.com)*
Learning objectives:
1. To become familiar with the different types of pitfalls in FDG-PET/CT imaging and how to minimise them.
2. To understand the strengths and limitations of FDG-PET/CT as a hybrid imaging modality.
3. To learn about the correct patient preparation, relevant patient history, and data and study acquisition.
Author Disclosures:
J. L. Vercher Conejero: Advisory Board at AAA

ESHI(MT)-3 16:46
Beyond FDG: pitfalls and artefacts
C. C. Cyran*; Munich/DE (clemens.cyran@med.uni-muenchen.de)*
Learning objectives:
1. To learn about the most frequent pitfalls and artefacts of PET tracers beyond FDG.
2. To appreciate the most important risks of misinterpretation with PET tracers beyond FDG.
3. To understand the physiological background of pitfalls and artefacts when imaging with PET tracers beyond FDG.
Author Disclosures:
C. C. Cyran: Consultant at Sandoz, Speaker at Goetz Partners Ltd

17:09
Panel discussion: Clinical relevance of misinterpreting pitfalls and artefacts in hybrid imaging. How can we augment diagnostic confidence in hybrid imaging?

16:00 - 17:30 **Room M 2**

E^3 - Advanced Course: How to Improve Your Expertise in Cardiothoracic Imaging

E^3 1219

Infections of the chest

E^3 1219-1 16:00
Chairperson's introduction
R. Cesar*; Golnik/SI (rok.cesar@klinika-golnik.si)*
Session objectives:
1. To review the role of imaging in infectious lung diseases.
2. To learn about cardiac complications of infections.
Author Disclosures:
R. Cesar: nothing to disclose

E^3 1219-2 16:06
A. Pulmonary infections
J. Neuwirth*; Prague 10/CZ (neuwirthj@gmail.com)*
Learning objectives:
1. To review the role and limitations of chest-x ray for diagnosing community-acquired pneumonia.
2. To learn about pulmonary infections in immunocompromised hosts.
3. To become familiar with CT signs suggesting fungal infection.
Author Disclosures:
J. Neuwirth: Speaker at IPVZ, Chair of radiology, Prague

E^3 1219-3 16:34
B. Tuberculosis (TB)
I. E. Tyurin*; Moscow/RU (igortyurin@gmail.com)*
Learning objectives:
1. To evaluate the imaging patterns of thoracic tuberculosis.
2. To review the different imaging features of the disease in immune compromised patients.
3. To discuss the current role of imaging in nontuberculous mycobacterial disease.
Author Disclosures:
I. E. Tyurin: nothing to disclose

E^3 1219-4 17:02
C. Infectious endocarditis
H. Alkadhi*; Zurich/CH*
Learning objectives:
1. To review the valvular consequences of untreated infections.
2. To become familiar with the CT signs of endocarditis in native valves.
3. To learn about the typical appearance of infectious complications after valvular surgery.
Author Disclosures:
H. Alkadhi: nothing to disclose

16:00 - 17:30 **Room M 3**

RTF - Radiology Trainees Forum

TF

Highlighted Lectures

Moderators:
M. Marolt Music; Ljubljana/SI
N. I. Traikova; Plovdiv/BG

TF-1 16:00
Imaging of knee in sports injuries
Ž. Snoj*; Ljubljana/SI (ziga.snoj@gmail.com)*
Learning objectives:
1. To understand the most common sports-related injury patterns in the knee.
2. To learn what to include in the MRI report.
3. To be familiar with diagnostic features after post-treatment procedures in the knee.
Author Disclosures:
Ž. Snoj: nothing to disclose

TF-2 16:30
Benign lesions in head and neck: what is really benign?
R. Maroldi*; Brescia/IT*
Learning objectives:
1. To be familiar with the most common benign findings in head and neck imaging.
2. To understand what benign lesions could cause potential complications and where is the need to be extremely cautious.
3. To know what to include in the MRI report.
Author Disclosures:
R. Maroldi: nothing to disclose

TF-3 17:00
Bone lesions: an integrated approach
V. Cassar-Pullicino*; Oswestry/UK (Victor.Pullicino@nhs.net)*

Learning objectives:
1. To describe typical features of normal bone marrow.
2. To understand normal bone marrow transformation over maturation.
3. To get familiar with MRI pattern of malignant bone marrow lesions.
4. To get familiar with MRI pattern of benign bone marrow lesions.
5. To get familiar with bone marrow MRI pattern as a consequence of iatrogenic (radiotherapy etc.) or metabolic (bone marrow transformation etc.).
Author Disclosures:
V. Cassar-Pullicino: nothing to disclose

16:00 - 17:30 **Room M 4**

Transatlantic Course of ESR and RSNA (Radiological Society of North America): Stroke Imaging and Endovascular Treatment: Now and the Future

TC 1228

Current status of stroke workup and treatment

Moderators:
R. Uberoi; Oxford/UK
A. Vagal; Cincinnati, OH/US

TC 1228-1 16:00
A. Current status of endovascular management of acute ischaemic stroke: evidence and guidelines
R. Uberoi*; Oxford/UK (raman.uberoi@ouh.nhs.uk)*
Learning objectives:
1. To learn about current evidence of endovascular treatment in acute ischaemic stroke.
2. To become familiar with evidence-based guidelines (AHA/ASA and ESO/ESMINT) in stroke treatment.
Author Disclosures:
R. Uberoi: Grant Recipient at Gore, Grant Recipient at Terumo

TC 1228-2 16:25
B. CT-based evaluation of acute stroke: advantages and challenges
A. Vagal*; Cincinnati, OH/US (vagala@ucmail.uc.edu)*
Learning objectives:
1. To learn about the advantages and challenges of CT-based stroke imaging workup.
2. To become familiar with the pitfalls of CT perfusion imaging.
Author Disclosures:
A. Vagal: Research/Grant Support at NIH/NINDS, Cerovenus

TC 1228-3 16:50
C. MRI-based evaluation of acute stroke: advantages and challenges
M. Wintermark*; Stanford, CA/US*
Learning objectives:
1. To learn about the advantages of MRI-based stroke imaging workup.
2. To become familiar with the challenges of MRI-based stroke imaging workup.
Author Disclosures:
M. Wintermark: Advisory Board at Icometrix, Advisory Board at MoreHealth, Advisory Board at Magnetic Insight, Advisory Board at Nines, Advisory Board at Subtle

17:15
Panel discussion: Strategy for acute stroke imaging and intervention

16:00 - 17:30 **Room M 5**

E^3 - Advanced Course: Hot Topics in GU Cancer

E^3 1222

Whole-body imaging in gynaecological malignancy

E^3 1222-1 16:00
Chairperson's introduction
P. Rousset*; Pierre-Bénite/FR (roussetpascal@gmail.com)*
Author Disclosures:
P. Rousset: nothing to disclose

E^3 1222-2 16:15
A. Whole-body MRI for staging and treatment planning in ovarian cancer
V. Vandecaveye*; Leuven/BE (vincent.vandecaveye@uz.kuleuven.ac.be)*
Learning objectives:
1. To learn the MRI technique for imaging the peritoneum in advanced ovarian cancer.
2. To learn the appearances of whole-body MRI in metastatic ovarian cancer.
3. To be aware of the pitfalls to interpretation.
Author Disclosures:
V. Vandecaveye: nothing to disclose

E^3 1222-3 16:40
B. PET/CT and PET/MRI in cervix and endometrial cancer: current status
L. Umutlu*; Essen/DE (Lale.Umutlu@uk-essen.de)*
Learning objectives:
1. To learn the indications for use of hybrid imaging in cervix and endometrial cancer.
2. To know the strengths and weaknesses of the technique.
3. To be familiar with the role of hybrid imaging in patient prognosis.
Author Disclosures:
L. Umutlu: Speaker at Siemens Healthineers, Speaker at Bayer Healthcare, Grant Recipient at Siemens Healthineers

E^3 1222-4 17:05
C. Advanced imaging techniques in metastatic gynaecological cancer
E. Sala*; Cambridge/UK (es220@medschl.cam.ac.uk)*
Learning objectives:
1. To learn about the concept and technique of texture analysis.
2. To be familiar with the key associations between biology and texture features.
3. To be familiar with the potential added value of texture analysis in image interpretation.
Author Disclosures:
E. Sala: nothing to disclose

16:00 - 17:30 **Tech Gate Auditorium**

Special Focus Session

SF 12

Update in head and neck cancer imaging

SF 12-1 16:00
Chairperson's introduction
M. Ravanelli*; Brescia/IT*
Session objectives:
1. To learn about the role of functional imaging in the diagnosis, treatment planning, and evaluation of head and neck cancer.
2. To become acquainted with the technique, current status, and future directions of quantitative imaging analysis in head and neck oncology.
Author Disclosures:
M. Ravanelli: disclosure/affirmation information not submitted

SF 12-2 16:05
Functional imaging for characterisation of primary tumours
M. de Win*; Amsterdam/NL (m.m.dewin@amsterdamumc.nl)*
Learning objectives:
1. To review functional imaging techniques applied in head and neck oncology.
2. To gain an understanding of the underlying biologic phenomena represented by the different techniques.
3. To appreciate their usefulness for histopathologic differentiation of a primary head and neck tumour.
Author Disclosures:
M. de Win: nothing to disclose

SF 12-3 16:30
Functional imaging for treatment prediction and treatment monitoring
M. Becker*; Geneva/CH*
Learning objectives:
1. To understand the role of functional imaging in treatment planning of head and neck cancers.
2. To become familiar with the role of functional imaging in the evaluation of therapeutic response.
3. To recognise the challenges of the execution and interpretation of hybrid imaging, and to learn about solutions.
Author Disclosures:
M. Becker: Grant Recipient at Swiss National Science Foundation

SF 12-4 16:55
Texture analysis and radiogenomics in head and neck carcinoma
A. D. King*; Hong Kong/CN*
Learning objectives:
1. To learn about the rationale and technique of texture analysis and radiogenomics.
2. To acquire knowledge of the current results of these techniques in head and neck oncology.
3. To get an insight into the challenges of these techniques and future directions.
Author Disclosures:
A. D. King: nothing to disclose

17:20
Panel discussion: New tools in head and neck oncology: fancy follies or must haves?

Saturday, March 14

08:30 - 10:00 **Room C**

Abdominal Viscera

RC 1301

Common benign and malignant liver lesions: unusual radiological appearance

Moderator:
S. M. Ertürk; Istanbul/TR

RC 1301-1 08:30
A. Features of benign liver lesions
M. M. França*; Maia/PT (mariamanuela.franca@gmail.com)*
Learning objectives:
1. To know the most common benign liver lesions.
2. To learn about unusual appearances of benign liver tumours.
3. To develop an algorithm in order to find the correct differential diagnosis.
Author Disclosures:
M. M. França: nothing to disclose

RC 1301-2 09:00
B. Features of primary malignant liver lesions
V. Vilgrain*; Clichy/FR (valerie.vilgrain@aphp.fr)*
Learning objectives:
1. To understand the typical features and prevalence of hepatocellular carcinomas (HCCs) and cholangiocellular carcinomas (CCCs).
2. To learn about the reasons why HCCs and CCCs do not always show typical imaging features.
3. To establish a strategy as to how to differentiate atypical HCCs and CCCs from other liver tumours.
Author Disclosures:
V. Vilgrain: Speaker at Hospital Beaujon

RC 1301-3 09:30
C. Features of liver metastases
Y. Menu*; Paris/FR (yves.menu@aphp.fr)*
Learning objectives:
1. To learn about the primary tumours often leading to liver metastases.
2. To understand why liver metastases can have different imaging characteristics.
3. To know the imaging features of liver metastases after systemic chemotherapy or loco-regional therapy.
Author Disclosures:
Y. Menu: nothing to disclose

08:30 - 10:00 **Room X**

Joint Session of the ESR and ESMRMB

ESR/ESMRMB

Ultrahigh-field (UHF) MRI goes clinical and beyond

Moderators:
R. Kreis; Bern/CH
A. Rockall; London/UK

ESR/ESMRMB-1 08:30
Challenges and solutions
A. G. Webb*; Leiden/NL (a.webb@lumc.nl)*
Learning objectives:
1. To learn about the challenges due to theoretical differences between MRI at very high and low field.
2. To understand the physical basis for improved imaging at very high fields.
3. To appreciate the technical solutions and the promise of ultrahigh-field MRI.
Author Disclosures:
A. G. Webb: nothing to disclose

ESR/ESMRMB-2 08:55
The clinical use today
T. Sinnecker*; Basel/CH (tim.sinnecker@miac.ch)*
Learning objectives:
1. To learn about currently available imaging methods available at UHF.
2. To appreciate the clinical benefits of UHF MRI in neurologic and non-neurologic diseases.
3. To recognise the potential of UHF MRI in MS.
Author Disclosures:
T. Sinnecker: Employee at Medical Image Analysis Center (MIAC), Other at Travel support from Roche and Actelion outside of this work

ESR/ESMRMB-3 09:20
New horizons
J. Wijnen*; Utrecht/NL (jwijnen@umcutrecht.nl)*
Learning objectives:
1. To learn about non-standard contrasts becoming available thanks to UHF.
2. To appreciate the clinical potential of proton and heteronuclear spectroscopy at UHF.
3. To catch a glimpse of heteronuclear MRI at 7T and beyond.
Author Disclosures:
J. Wijnen: nothing to disclose

09:45
Panel discussion: Does UHF MRI add more than cost?

09:00 - 10:00 **Coffee & Talk 1**

Coffee & Talk (open forum) Session

Organised by ESOR

C 7

Why are research fellowships important for young radiologists?

C 7-1 09:00
Chairperson's introduction
L. Marti-Bonmati*; Valencia/ES (Luis.Marti@uv.es)*
Session objectives:
1. To interact with young and senior radiologists to foster research.
2. To discuss all elements of researchers' involvement.
3. To understand enhanced critical-thinking and problem-solving skills.
4. To provide data for discussions in competencies and in healthcare innovation.
Author Disclosures:
L. Marti-Bonmati: nothing to disclose

C 7-2 09:10
My experience as a young research fellowship recipient
J. Amorim*; Porto/PT (joaopinheiroamorim@gmail.com)*
Learning objectives:
1. To comment on the lessons learned and opportunities for young researchers.
2. To understand how research and clinical practice can be related.
3. To become familiar with main radiological research methodologies.
4. To learn how a research relationship can be built and followed-up.
Author Disclosures:
J. Amorim: Grant Recipient at Bracco Fellowship from the European School of Radiology (ESOR)

C 7-3 09:20
Multidisciplinary collaboration to improve research in radiology
A. Alberich-Bayarri*; Valencia/ES (angel@quibim.com)*
Learning objectives:
1. To comment on the relevance of multidisciplinary collaboration in all steps of research.
2. To become familiar with the creation of, and problems related to, collaborative research.
3. To learn how knowledge, innovation, improvements, and visibility are distributed in healthcare.
Author Disclosures:
A. Alberich-Bayarri: CEO at QUIBIM SL, Board Member at QUIBIM SL, Founder at QUIBIM SL

C 7-4 09:30
How to mentor research fellowship programmes
R. Manfredi*; Rome/IT*
Learning objectives:
1. To understand how to develop or set up a research institutional programme.
2. To learn how to attract the best residents, fellows, and staff radiologists.
3. To be able to manage levels of involvement, tasks, and times (chronograms).
Author Disclosures:
R. Manfredi: Speaker at Bracco

09:40
Open forum discussion

08:30 - 10:00 **Room N**

EuroSafe Imaging Session

EU 13
Paediatric CT doses and risks (MEDIRAD)

Moderator:
I. Thierry-Chef; Barcelona/ES

EU 13-1 08:30
Chairperson's introduction
J. Damilakis*; Iraklion/GR (John.Damilakis@med.uoc.gr)*
Author Disclosures:
J. Damilakis: Research/Grant Support at European Commission H2020

EU 13-2 08:35
The use of CT in paediatrics: examination frequencies and common practices
M. Kaijser*; Danderyd/SE*
Learning objectives:
1. To provide information on the role of CT in the paediatric population.
2. To describe historical and current trends of CT usage in the paediatric population.
3. To discuss what can be expected of paediatric imaging in the future.
Author Disclosures:
M. Kaijser: disclosure/affirmation information not submitted

EU 13-3 08:50
CT dosimetry in children: patient-specific dosimetry and dose reduction tools
J. Damilakis*; Iraklion/GR (John.Damilakis@med.uoc.gr)*
Learning objectives:
1. To learn the strengths and limitations of patient-specific CT dosimetry.
2. To become familiar with dose reduction tools in paediatric CT.
3. To be updated about radiation doses in paediatric CT.
Author Disclosures:
J. Damilakis: Research/Grant Support at European Commission H2020

EU 13-4 09:05
Radiation exposure from CT in childhood and subsequent risk of haematological malignancies, brain and other cancers
I. Thierry-Chef*; Barcelona/ES*
Learning objectives:
1. To present the results of the EPI-CT European study concerning haematological malignancies.
2. To present the results of the EPI-CT European study concerning brain cancers and other solid tumours.
3. To discuss extension of follow-up and the need for a more detailed nested case-control study.
4. To share the lessons learned for optimisation of paediatric imaging protocols.
Author Disclosures:
I. Thierry-Chef: Employee at ISGlobal

EU 13-5 09:20
Risk communication and risk optimisation
C. Granata*; Genoa/IT*
Learning objectives:
1. To learn how to establish an effective dialogue in a clinical setting with parents and carers.
2. To understand how the principles of justification and optimisation, and their implementation, are the basis of risk optimisation in radiologic imaging.
Author Disclosures:
C. Granata: Speaker at Guerbet

09:35
Panel discussion: Radiation safety in paediatric CT: what are the challenges?

08:30 - 10:00 **Room O**

E³ - ECR Master Class (Breast)

E³ 1326a
Artificial intelligence (AI) in breast imaging: potential perspectives and (unjustified) fears

Moderator:
T. H. Helbich; Vienna/AT

E³ 1326a-1 08:30
A. What a breast radiologist should know about artificial intelligence
E. Giannotti*; Nottingham/UK (ytteb84@hotmail.com)*
Learning objectives:
1. To define all terms used in artificial intelligence topics.
2. To know the main domains of applications in breast imaging.
3. To understand the principles of deep learning algorithm.
Author Disclosures:
E. Giannotti: nothing to disclose

E³ 1326a-2 09:00
B. Deep learning algorithm applications in breast imaging
I. Thomassin-Naggara*; Paris/FR (isabellethomassin@gmail.com)*
Learning objectives:
1. To understand when we need to train, validate, and apply an AI in clinical routine.
2. To appreciate the real value for diagnosis of the different existing algorithms.
3. To learn how we could use it for personalised screening.
Author Disclosures:
I. Thomassin-Naggara: Advisory Board at siemens, Research/Grant Support at GE, Research/Grant Support at Canon, Speaker at GE, Speaker at Canon, Speaker at Guerbet, Speaker at Hologic

E³ 1326a-3 09:30
C. Radiomics and breast imaging
K. Pinker-Domenig*; New York, NY/US (pinkerdk@mskcc.org)*
Learning objectives:
1. To learn how a radiomic model may be built.
2. To know the main applications of radiomics in breast imaging.
3. To understand potential clinical implications of this domain.
Author Disclosures:
K. Pinker-Domenig: Research/Grant Support at Katja Pinker is funded in part through the NIH/NCI Cancer Center Support Grant P30 CA008748., Speaker at Katja Pinker received payment for activities not related to the present article including lectures, service on speakers bureaus and for travel/accommodations/meeting expenses from the European Society of Breast Imaging (MRI educational course, annual scie, Research/Grant Support at Digital Hybrid Breast PET/MRI for Enhanced Diagnosis of Breast Cancer (HYPMED) H2020 - Research and Innovation Framework Programme PHC-11-2015 # 667211-2, Research/Grant Support at A Body Scan for Cancer Detection using Quantum Technology (CANCERSCAN) H2020-FETOPEN-2018-2019-2020-01 # 828978, Research/Grant Support at ultiparametric 18F-Fluoroestradiol PET/MRI coupled with Radiomics Analysis and Machine Learning for Prediction and Assessment of Response to Neoadjuvant Endocrine Therapy in Patients with Hormone Receptor+/HER2− Invasive Breast Cancer 02.09.2019 / 31.08.2

08:30 - 10:00 **Studio 2020**

Special Focus Session

SF 13

The abused child: the key role of imaging

SF 13-1 08:30
Chairperson's introduction
S. M. Aukland; *Bergen/NO (stein.magnus.aukland@helse-bergen.no)*
Session objectives:
1. To learn about existing imaging guidelines in suspected physical child abuse.
2. To learn about the typical radiological findings in physical child abuse and how to differentiate inflicted from accidental injury.
3. To discuss the radiological evidence and the medico-legal role of the radiologist in physical child abuse.
Author Disclosures:
S. M. Aukland: nothing to disclose

SF 13-2 08:34
Skeletal injury: should we use radiography or CT?
R. R. van Rijn; *Amsterdam/NL (r.r.vanrijn@amsterdamumc.nl)*
Learning objectives:
1. To learn about usual aspects of skeletal injury in non-accidental trauma.
2. To learn about appropriate workup and existing guidelines.
3. To discuss respective indications for radiography and CT.
Author Disclosures:
R. R. van Rijn: nothing to disclose

SF 13-3 08:52
Head injury CT and/or MRI?
A. Choudhary; *Little Rock, AR, AR/US (achoudhary@uams.edu)*
Learning objectives:
1. To learn about usual aspects of abusive head injury.
2. To learn about appropriate workup and existing guidelines.
3. To discuss respective indications for CT and MRI.
Author Disclosures:
A. Choudhary: Shareholder at GE, Speaker at Honorarium for lectures for child abuse courses, Other at expert witness for child abuse cases

SF 13-4 09:10
Inflicted abdominal injury
M. Raissaki; *Iraklion/GR (mraissaki@yahoo.gr)*
Learning objectives:
1. To learn about typical imaging findings in abdominal trauma.
2. To learn about appropriate radiology workup in suspected inflicted abdominal injuries.
3. To discuss indications for imaging.
Author Disclosures:
M. Raissaki: nothing to disclose

SF 13-5 09:28
Testimony in court
A. C. Offiah; *Sheffield/UK (amaka.offiah@nhs.net)*
Learning objectives:
1. To learn about the paediatric radiologist as a medico-legal expert.
2. To describe the role of the paediatric radiologist as part of the multidisciplinary team in suspected child abuse.
3. To learn about the role and the challenges for the paediatric radiologist during testimony in court.
Author Disclosures:
A. C. Offiah: Advisory Board at Alexion, Board Member at BioMarin, Grant Recipient at Alexion, Speaker at InfoMed, Other at Expert witness in cases of suspected child abuse

09:46
Panel discussion: Imaging in non-accidental injury: the role of the paediatric radiologist

08:30 - 09:30 **Coffee & Talk 2**

Coffee & Talk (open forum) Session

Organised by EuroSafe Imaging

C 17

International Society of Radiology (ISR) call for action on quality and safety

Moderators:
D. P. Frush; Durham/US
G. Frija; Paris/FR

C 17-1 08:30
Introduction to the concept of the International Atomic Energy Agency (IAEA) Bonn Call for Action
O. Holmberg; *Vienna/AT (O.Holmberg@iaea.org)*
Learning objectives:
1. To learn what the Bonn Call for Action is, and how it helps strengthen radiation protection in medicine.
2. To understand the involvement of international organisations, radiation protection campaigns, and other interested parties in the implementation of the Bonn Call for Action.
3. To gain knowledge on different radiation protection initiatives and activities that link to the Bonn Call for Action.
Author Disclosures:
O. Holmberg: nothing to disclose

C 17-2 08:40
The World Health Organisation (WHO) vision
M. D. R. D. R. Perez; *Geneva/CH (perezm@who.int)*
Learning objectives:
1. To present the WHO views and actions to promote quality and safety in health care.
2. To identify the challenges and opportunities for enhancing radiation safety culture in health care.
3. To discuss strategies for integrating radiation safety into the concept of patient safety and quality of care, enhancing stakeholders' engagement, and strengthening global cooperation.
Author Disclosures:
M. D. R. D. R. Perez: nothing to disclose

C 17-3 08:50
The Middle East vision
S. Hagi; *Jeddah/SA (sarahhagi@gmail.com)*
Learning objectives:
1. To present the current status of quality and safety issues in the Middle East region.
2. To address expectations and challenges for ArabSafe.
3. To identify opportunities of increased cross-fertilization between ArabSafe and ISRQSA.
Author Disclosures:
S. Hagi: nothing to disclose

C 17-4 09:00
The African vision
T. El-Diasty; *Mansoura/EG (teldiasty@hotmail.com)*
Learning objectives:
1. To highlight the interest of the ISR and EuroSafe Imaging in promoting quality and safety issues in Africa.
2. To address challenges regarding quality/safety awareness in Africa.
3. To present the situation in Africa and the expectations of the African Society of Radiology (ASR) and AFROSAFE.
Author Disclosures:
T. El-Diasty: nothing to disclose

C 17-5 09:10
The Chinese vision
Z. Y. Jin; *Beijing/CN*

Learning objectives:
1. To highlight the current status of quality and safety in the Chinese radiology field.
2. To address challenges to quality and safety control of clinical radiology practice in China.
3. To present EuroSafe's potential in promoting quality and safety issues in China.
Author Disclosures:
Z. Y. Jin: disclosure/affirmation information not submitted

09:20
Open forum discussion

08:30 - 10:00 **Room E**

E³ - Advanced Course: Interactive Teaching Session for Young (and not so Young) Radiologists

E³ 1321

Musculoskeletal radiology: arthropathies

E³ 1321-1 08:30
A. Extremities
Ü. Aydingöz; *Ankara/TR (ustunaydingoz@yahoo.com)*
Learning objectives:
1. To explain the key points in the differential diagnosis of common arthropathies in the extremities.
2. To describe the imaging findings of common arthropathies in the extremities as they relate to pathophysiology.
Author Disclosures:
Ü. Aydingöz: nothing to disclose

E³ 1321-2 09:15
B. The axial skeleton
A. H. Karantanas; *Iraklion/GR (akarantanas@gmail.com)*
Learning objectives:
1. To explain the key points in the differential diagnosis of arthropathies in the axial skeleton.
2. To describe the imaging findings of arthropathies in the axial skeleton as they relate to pathophysiology.
Author Disclosures:
A. H. Karantanas: nothing to disclose

08:30 - 10:00 **Room F1**

E³ - ECR Master Class (Chest)

E³ 1326b

Autoimmune thoracic diseases

Moderator:
P. A. Grenier; Paris/FR

E³ 1326b-1 08:30
A. Relapsing polychondritis
A.-L. Brun; *Suresnes/FR (annelaure.brun@gmail.com)*
Learning objectives:
1. To learn about the pathophysiology and clinical manifestations of this disease.
2. To learn when to suggest this diagnosis on CT.
3. To review the other causes of tracheobronchial wall thickening.
Author Disclosures:
A.-L. Brun: nothing to disclose

E³ 1326b-2 09:00
B. Alveolar proteinosis
A. Oikonomou; *Toronto, ON/CA (anastasia.oikonomou@sunnybrook.ca)*
Learning objectives:
1. To learn about the CT manifestations of alveolar proteinosis.
2. To review the other causes of crazy paving on CT.
3. To be aware of infectious complications, especially superinfection by Nocardia.
Author Disclosures:
A. Oikonomou: nothing to disclose

E³ 1326b-3 09:30
C. Goodpasture syndrome and differentials
A. Devaraj; *London/UK*
Learning objectives:
1. To learn about the pathophysiology and the clinical manifestations of this disease.
2. To learn about CT signs of intra-alveolar haemorrhage.
3. To review the other causes of intra-alveolar haemorrhage.
Author Disclosures:
A. Devaraj: Advisory Board at Boehringer Ingelheim

09:00 - 10:00 **Coffee & Talk 3**

Coffee & Talk (open forum) Session -

Organised by the ESR Subcommittee on Undergraduate Education

C 29

Developing the next generation radiologist by targeting undergraduates

C 29-1 09:00
Welcome and introduction: It's never too early to develop the next generation radiologist
V. Goh; *London/UK (vicky.goh@kcl.ac.uk)*
Session objectives:
1. To understand why it is important to target medical students.
2. To highlight the current undergraduate engagement programmes.
3. To identify further strategies for ESR to improve undergraduate engagement.
Author Disclosures:
V. Goh: Research/Grant Support at Siemens, Speaker at Siemens

C 29-2 09:05
Why I chose radiology as a future career
A. Sharkey; *London/UK (AmyRose.Sharkey@gstt.nhs.uk)*
Learning objectives:
1. To appreciate the factors influencing career decision-making at the undergraduate level.
2. To highlight the challenges in making radiology an attractive career.
3. To learn of successful practices in promoting radiology to undergraduates.
Author Disclosures:
A. Sharkey: nothing to disclose

C 29-3 09:13
Engaging undergraduates: lessons learnt from a young teacher's perspective
A. Svare; *Riga/LV (atis.svare@gmail.com)*
Learning objectives:
1. To understand the challenges of engaging undergraduates from a teacher's perspective.
2. To highlight current best practice in teaching radiology.
3. To learn potential ways to improve radiology engagement in undergraduate education.
Author Disclosures:
A. Svare: nothing to disclose

C 29-4 09:21
Interactivity: using software teaching platforms to inspire undergraduates
T. Vincent; *Brighton/UK (T.R.Vincent@bsms.ac.uk)*

Learning objectives:
1. To understand the key educational design principles that help make digital learning resources effective for learners.
2. To explore how digital learning resources can help attract undergraduates to radiology.
3. To discuss how ESR could improve undergraduate engagement with teaching and learning platforms.
Author Disclosures:
T. Vincent: nothing to disclose

C 29-5 09:29
How could the ESR develop the next generation radiologists? Delivering the undergraduate curriculum
C. Catalano; *Rome/IT (carlo.catalano@uniroma1.it)*
Learning objectives:
1. To highlight how the ESR undergraduate curriculum was conceived and developed.
2. To highlight how ESR is delivering the curriculum.
3. To highlight how ESR is developing undergraduate engagement.
Author Disclosures:
C. Catalano: nothing to disclose

C 29-6 09:37
Open forum discussion: The next generation radiologist: next steps in producing a white paper
V. Goh; *London/UK,* A. Sharkey; *London/UK,* A. Svare; *Riga/LV,* T. Vincent; *Brighton/UK,* C. Catalano; *Rome/IT,* L. Oleaga Zufiria; *Barcelona/ES (lauraoleaga@gmail.com)*
Author Disclosure:
L. Oleaga Zufiria: Consultant at TMC Academy

08:30 - 10:00 **da Vinci (Room D1)**

Emergency Imaging

RC 1317
Imaging of 'foreign bodies'

RC 1317-1 08:30
Chairperson's introduction
J. B. Dormagen; *Oslo/NO (jobador@gmail.com)*
Session objectives:
1. To become familiar with commonly used surgical and orthopaedic devices and materials.
2. To learn their proper positioning, and the early signs of postoperative complications.
3. To understand the imaging pathway in management of ingested foreign bodies.
Author Disclosures:
J. B. Dormagen: nothing to disclose

RC 1317-2 08:35
A. Surgical and orthopaedic devices: are they really properly positioned?
E. A. Dick; *London/UK (elizabethdick2010@gmail.com)*
Learning objectives:
1. To become familiar with different types of commonly used surgical, neurosurgical, and orthopaedic devices in clinical practice.
2. To understand how to evaluate their proper positioning.
3. To be familiar with imaging signs of incorrect implementation of neurosurgical and orthopaedic devices.
Author Disclosures:
E. A. Dick: Board Member at ESER

RC 1317-3 09:00
B. Did I swallow that? US and CT of sharp foreign bodies penetrating stomach and bowel
J. B. C. M. Puylaert; *The Hague/NL (dr.jbcmpuylaert@wxs.nl)*
Learning objectives:
1. To be familiar with characteristics of commonly ingested foreign bodies.
2. To understand which imaging modalities are best suited for detection of foreign bodies in different clinical scenarios.
3. To recognise the first signs of early complications resulting from ingested foreign bodies.
Author Disclosures:
J. B. C. M. Puylaert: nothing to disclose

RC 1317-4 09:25
C. The role of interventional radiology in the management of foreign bodies and following complications
H. Leonhardt; *Gothenburg/SE (henrik.leonhardt@vgregion.se)*
Learning objectives:
1. To recognise the role of interventional radiology in the treatment of complications resulting from the presence of foreign bodies.
2. To learn when to call the interventional radiologist.
3. To learn about techniques of the removal of foreign bodies with an endovascular approach.
Author Disclosures:
H. Leonhardt: nothing to disclose

09:50
Panel discussion: Common language with clinicians: how to report 'foreign bodies' presence and indicate the optimal management

08:30 - 10:00 **Darwin (Room D2)**

EFRS meets the Netherlands

Meets 13
Safety in the Netherlands

Presiding:
J. McNulty; Dublin/IE
S. Geers van Gemeren; Utrecht/NL

Meets 13-1 08:30
Session introduction
J. McNulty; *Dublin/IE (jonathan.mcnulty@ucd.ie)*
Author Disclosures:
J. McNulty: nothing to disclose

Meets 13-2 08:35
Introduction: Radiographers in the Netherlands
S. Geers van Gemeren; *Utrecht/NL (s.geers@nvmbr.nl)*
Session objectives:
1. To introduce the radiography profession in the Netherlands and the priorities of the National Society.
2. To introduce the Dutch country and culture.
3. To introduce the important role of radiographers in safety.
Author Disclosures:
S. Geers van Gemeren: nothing to disclose

Meets 13-3 08:40
Hybrid imaging: the merge between radiology and nuclear medicine
P. Liedorp; *Raamsdonkveer/NL (peter@pi-medical.nl)*
Learning objectives:
1. To understand the advantages and disadvantages of merging radiology and nuclear medicine departments.
2. To understand the history of hybrid imaging.
3. To become familiar with the safety issues in hybrid imaging and the change in education of radiographers.
Author Disclosures:
P. Liedorp: nothing to disclose

Meets 13-4 08:56
Gonad shielding guidelines for radiographers
A. Vegter; *Stadskanaal/NL (a.vegter@treant.nl)*
Learning objectives:
1. To learn about the Dutch gonad shielding guidelines for radiographers.
2. To acknowledge the impact of using guidelines and standards for the profession.
3. To learn about the import role of clinical reasoning for radiation protection.
Author Disclosures:
A. Vegter: nothing to disclose

09:12
Interlude: Feel the Netherlands

Meets 13-6 09:17
REVIVE: Radiology during pregnancy: translating risk factor publications and international guidelines into practice when communicating with pregnant patients
C. Vroonland*; Haarlem/NL (colinda.vroonland@inholland.nl)*
Learning objectives:
1. To become familiar with the multidisciplinary project REVIVE.
2. To learn about the Dutch guidelines.
3. To understand the challenges in implementing guidelines and standards.
Author Disclosures:
C. Vroonland: Research/Grant Support at SIA

Meets 13-7 09:33
Electromagnetic field risk assessment and evaluation in MRI
J. Meedendorp*; Utrecht/NL*
Learning objectives:
1. To learn about the EU directive 2013/15 on electromagnetic fields.
2. To learn about the Dutch guidelines on electromagnetic field risk assessment and evaluation.
3. To learn about the challenges and import role for radiographers.
Author Disclosures:
J. Meedendorp: disclosure/affirmation information not submitted

09:49
Panel discussion

08:30 - 10:00 **Descartes (Room D3)**

Professional Challenges Session

PC 13
Equipment purchasing decisions: a team approach

PC 13-1 08:30
Chairperson's introduction
A. Trianni*; Udine/IT (annalisa.trianni@asuiud.sanita.fvg.it)*
Session objectives:
1. To become familiar with the general procurement process.
2. To address the general challenges of the process regarding multiple modalities.
3. To introduce the different roles of the team professionals.
Author Disclosures:
A. Trianni: nothing to disclose

PC 13-2 08:35
Preliminary evaluation of the need and utilisation
E. Kotter*; Freiburg/DE (elmar.kotter@uniklinik-freiburg.de)*
Learning objectives:
1. To learn about utilisation/need aspects and related values for further planning of specifications.
2. To discuss the differences between smaller and larger organisations' needs for evaluation.
3. To present the preliminary evaluation process with an example case(s).
Author Disclosures:
E. Kotter: nothing to disclose

PC 13-3 08:49
Technical specification as the prerequisite for clinical use
A. T. Rogers*; Nottingham/UK (andy.rogers@nuh.nhs.uk)*
Learning objectives:
1. To become familiar with the different types of technical specification to satisfy the utilisation criteria.
2. To address the pitfalls of specifications related to neutrality, independence, and relativity aspects.
3. To learn to grade tenders against specifications with an example case(s).
Author Disclosures:
A. T. Rogers: Speaker at Nottingham University Hospitals

PC 13-4 09:03
Site planning and project management
M. N. N. Özmen*; Ankara/TR (mozmen@hacettepe.edu.tr)*
Learning objectives:
1. To address issues related to site construction requirements.
2. To discuss potential collaboration in purchasing between engineering, physics, and imaging experts.
3. To highlight approaches for success in imaging equipment installation.
Author Disclosures:
M. N. N. Özmen: nothing to disclose

PC 13-5 09:17
Legal and financial aspects of procurement
A. Giovagnoni*; Ancona/IT (a.giovagnoni@univpm.it)*
Learning objectives:
1. To describe tender requirements in different countries.
2. To discuss financial options in equipment purchasing.
3. To describe ways for planning departmental equipment upgrades and maintenance.
Author Disclosures:
A. Giovagnoni: nothing to disclose

PC 13-6 09:31
Economic issues
E. Schouman-Claeys*; Paris/FR*
Learning objectives:
1. To discuss negotiation strategies.
2. To discuss short and long term financial plans for imaging equipment purchasing.
3. To describe the means for planning return on investment for expensive imaging scanners.
Author Disclosures:
E. Schouman-Claeys: disclosure/affirmation information not submitted

09:45
Panel discussion: How to choose the right machine?

08:30 - 10:00 **Room G**

New Horizons Session

NH 13
Alzheimer's disease and neurodegeneration: visualising the invisible

NH 13-1 08:30
Chairperson's introduction
S. Haller*; Geneva/CH (sven.haller@me.com)*
Session objectives:
1. To appreciate that dementia is more than Alzheimer's.
2. To understand that neurodegenerative diseases are overlapping and may co-exist.
3. To acknowledge the need for early and specific detection of cognitive decline for future, hopefully successful, clinical trials.
Author Disclosures:
S. Haller: Consultant at Spineart, Advisory Board at EPAD, Board Member at Neuroradiology, Speaker at GE

NH 13-2 08:35
Visualising the human glymphatic system
G. A. Ringstad*; Oslo/NO (geirringstad@yahoo.no)*
Learning objectives:
1. To become familiar with the glymphatic system.
2. To appreciate the role of the glymphatic system in the clearance of amyloid-β and tau.
3. To highlight experiences with MRI of the glymphatic system in normal pressure hydrocephalus dementia.
4. To understand how reduced glymphatic and lymphatic clearance function may be associated with neurodegenerative disease.
Author Disclosures:
G. A. Ringstad: Shareholder at Brainwidesolutions AS, Speaker at Bayer AG

NH 13-3 08:53
PET as part of the biomarker toolbox for early clinical diagnosis of Alzheimer's disease
J. Arbizu; *Pamplona/ES (jarbizu@unav.es)*
Learning objectives:
1. To learn about the different radiotracers available to evaluate the specific processes involved in the neurodegenerative conditions found in dementia.
2. To understand the benefit of PET molecular imaging in the diagnostic workup of Alzheimer's disease.
3. To appreciate the role of different PET and SPECT techniques in the differential diagnosis of neurodegenerative disorders.
4. To become familiar with the methodology to perform and read PET molecular imaging in dementia.
Author Disclosures:
J. Arbizu: Research/Grant Support at Lilli-Avid, Research/Grant Support at General Electric, Research/Grant Support at Piramal , Advisory Board at Advanced Accelerator Applications, Advisory Board at Bayer, Advisory Board at Araclon-Biotech, Speaker at Advanced Accelerator Applications, Speaker at Isoder, Advisory Board at Biogen, Speaker at Eisai, Speaker at Genzyme

NH 13-4 09:11
Imaging beyond beta-amyloid and tau: insights from high-field MRI
L. van der Weerd; *Leiden/NL*
Learning objectives:
1. To appreciate the technical advantages and disadvantages in the use of ultra-high field MRI.
2. To learn about the mechanisms of MRI contrasts at ultra-high field.
3. To learn about underlying pathophysiological sources of MRI contrast and the disease specificity of different MRI biomarkers.
4. To list promising applications of ultra-high field MRI in Alzheimer's disease and other neurodegenerative diseases.
Author Disclosures:
L. van der Weerd: nothing to disclose

NH 13-5 09:29
Integrating population imaging with clinical imaging for the memory clinic: the Oxford Brain Health Centre
C. Mackay; *Oxford/UK (clare.mackay@psych.ox.ac.uk)*
Learning objectives:
1. To overview current practice for memory clinic imaging in the UK and beyond and appreciate the limitations for research.
2. To describe the recent major initiatives in population imaging and understand some of the technical and logistical challenges these studies face.
3. To describe the opportunities and challenges associated with integrating high quality individual imaging with large population datasets such as the UK Biobank for the clinic.
Author Disclosures:
C. Mackay: nothing to disclose

09:47
Panel discussion: Over 100 years of hype and hope in dementia and Alzheimer's research: what lessons have we learned, and what are the future directions?

08:30 - 10:00 **Room K**

E³ - European Diploma Prep Session

E³ 1323
Urogenital

E³ 1323-1 08:30
Chairperson's introduction
V. Løgager; *Herlev/DK (Vibeke.Loegager@regionh.dk)*
Session objectives:
1. To become familiar with the imaging presentation of common neoplastic and infectious disorders of the kidneys.
2. To describe the typical imaging features of obstructive uropathy and neoplastic disorders of the ureter and bladder.
3. To understand the imaging presentation of benign and malignant disorders of the prostate.
Author Disclosures:
V. Løgager: nothing to disclose

E³ 1323-2 08:36
A. Renal and adrenal imaging
N. Grenier; *Bordeaux/FR (nicolas.grenier@chu-bordeaux.fr)*
Learning objectives:
1. To describe the normal imaging anatomy and variants of the kidney and the adrenal glands.
2. To understand the imaging features of benign and malignant tumours of the kidneys.
3. To describe imaging features of benign and malignant tumours of the adrenal glands.
4. To explain the imaging features of infectious disorders of the kidneys.
Author Disclosures:
N. Grenier: Advisory Board at Supersonic Imagine

E³ 1323-3 09:04
B. Imaging of the ureter and bladder
M. Seçil; *Izmir/TR (mustafa.secil@deu.edu.tr)*
Learning objectives:
1. To explain the imaging anatomy and variants of the ureter and bladder.
2. To understand the diagnostic evaluation and imaging features of obstructive uropathy.
3. To describe the imaging features of benign and malignant tumours of the ureter and bladder.
Author Disclosures:
M. Seçil: nothing to disclose

E³ 1323-4 09:32
C. Prostate imaging
H. C. Thoeny; *Fribourg/CH (Harriet.thoeny@h-fr.ch)*
Learning objectives:
1. To explain the prostate imaging reporting and data system (PIRADS) in prostate imaging.
2. To describe the imaging features of benign prostatic hypertrophy.
3. To understand the imaging features of prostate cancer.
4. To describe the imaging features of inflammatory changes of the prostate.
Author Disclosures:
H. C. Thoeny: Advisory Board at Guerbet

08:30 - 10:00 **Room M 2**

E³ - Advanced Course: How to Improve Your Expertise in Cardiothoracic Imaging

E³ 1319
Cardiovascular imaging in pregnancy

E³ 1319-1 08:30
Chairperson's introduction
J.-N. Dacher; *Rouen/FR (jean-nicolas.dacher@chu-rouen.fr)*
Session objectives:
1. To learn about risk factors, incidence, and outcomes of acute cardiovascular events during pregnancy.
2. To learn how to adapt CT acquisition protocol during pregnancy.
3. To become familiar with alternative imaging techniques.
Author Disclosures:
J.-N. Dacher: nothing to disclose

E³ 1319-2 08:36
A. Pulmonary embolism: optimising patient's selection and radiation protection
C. Loewe; *Vienna/AT (christian.loewe@meduniwien.ac.at)*
Learning objectives:
1. To learn how to adapt CT acquisition protocol during pregnancy.
2. To become familiar with alternative imaging techniques.
3. To become familiar with alternative diagnoses.
Author Disclosures:
C. Loewe: Speaker at Siemens Healthineers , Speaker at BRACCO, Speaker at GE Healthcare

E³ 1319-3 09:04
B. Acute aortic disease in pregnancy
R. P. J. Budde; *Rotterdam/NL (r.budde@erasmusmc.nl)*

Learning objectives:
1. To learn about risk factors and prevalence of acute aortic syndromes during pregnancy.
2. To learn how to adapt CT acquisition protocol during pregnancy.
3. To become familiar with alternative imaging techniques.
Author Disclosures:
R. P. J. Budde: nothing to disclose

E³ 1319-4 09:32
C. Imaging peripartum cardiomyopathy and other cardiac complications
A. Jacquier*; Marseille/FR (alexis.jacquier@ap-hm.fr)*
Learning objectives:
1. To learn about prevalence and clinical presentation of cardiomyopathy during pregnancy.
2. To learn an appropriate diagnostic algorithm.
3. To become familiar with prognosis and outcome.
Author Disclosures:
A. Jacquier: nothing to disclose

08:30 - 10:00 **Room M 3**

Cardiac

RC 1303

New techniques in cardiac CT: game changers or money makers?

RC 1303-1 08:30
Chairperson's introduction: Will the new techniques overcome the clinical underuse of cardiac CT?
K. Nikolaou*; Tübingen/DE (Konstantin.Nikolaou@med.uni-tuebingen.de)*
Session objectives:
1. To understand the importance of combining morphological and functional information in ischemic heart disease.
2. To understand the reasons for persisting underuse.
3. To get an overview about new techniques able to change this underuse.
Author Disclosures:
K. Nikolaou: Research/Grant Support at Siemens, GE, Bracco, Bayer

RC 1303-2 08:35
A. Morphology matters: cardiac CT can improve the outcome
G. Muscogiuri*; Milan/IT (g.muscogiuri@gmail.com)*
Learning objectives:
1. To underline the high predictive value of cardiac CT.
2. To emphasise the impact of cardiac CT on the outcome.
3. To discuss the role of cardiac CT in the clinical management of coronary artery disease patients.
Author Disclosures:
G. Muscogiuri: nothing to disclose

RC 1303-3 09:00
B. CT perfusion: integration of function will change the game
R. Vliegenthart*; Groningen/NL (r.vliegenthart@umcg.nl)*
Learning objectives:
1. To learn about the technical challenges of performing CT perfusion.
2. To understand the opportunities of combining functional and morphological information by adding perfusion to cardiac CT.
3. To become familiar with the interpretation of CT perfusion results.
Author Disclosures:
R. Vliegenthart: nothing to disclose

RC 1303-4 09:25
C. CT-derived fractional flow reserve (FFR) is the future!
U. J. Schoepf*; Charleston, SC/US (schoepf@musc.edu)*
Learning objectives:
1. To understand the principle of CT derived fractional flow reserve (CT FFR).
2. To learn about the possible added value of CT derived FFR to cardiac CT.
3. To discuss the influence of availability of CT derived FFR in the clinical management of CAD patients.
Author Disclosures:
U. J. Schoepf: Research/Grant Support at Astellas; Bayer; Bracco; Elucid Bioimaging; GE; Heartflow; Siemens

09:50
Panel discussion: Artificial intelligence to overcome clinical underuse of these techniques

08:30 - 10:00 **Room M 4**

Transatlantic Course of ESR and RSNA (Radiological Society of North America): Stroke Imaging and Endovascular Treatment: Now and the Future

TC 1328

Practical stroke imaging and mimics

Moderators:
J.-P. Pruvo; Lille/FR
A. Vagal; Cincinnati, OH/US

TC 1328-1 08:30
A. Stroke mimics and "chameleons": how to recognise them
D. Leys*; Lille/FR (didier.leys@univ-lille.fr)*
Learning objectives:
1. To learn about the definitions of stroke mimics and chameleons.
2. To understand the clinical challenges of stroke mimics.
3. To become familiar with the imaging signs and differential diagnosis of stroke mimics.
Author Disclosures:
D. Leys: Advisory Board at Pfizer 2017, 2018, Advisory Board at Bayer 2017, Investigator at Boehringer Ingelheim, Research/Grant Support at University of Heidelberg

TC 1328-2 09:00
B. Practical review of stroke imaging and triage: within six hours and beyond including wake-up strokes
L. Hacein-Bey*; Carmichael, CA/US (lhaceinbey@yahoo.com)*
Learning objectives:
1. To learn about optimal patient triage in acute ischaemic stroke in early and delayed time windows.
2. To understand stroke imaging in wake-up strokes and unknown onset time.
3. To appreciate the importance of efficient workup and time metrics.
Author Disclosures:
L. Hacein-Bey: nothing to disclose

TC 1328-3/TC 1328-4 09:30
C. Interactive case discussion
L. Hacein-Bey*; Carmichael, CA/US (lhaceinbey@yahoo.com)*
D. Leys*; Lille/FR (didier.leys@univ-lille.fr)*
Learning objectives:
1. To learn how imaging can help in decision making in acute stroke.
2. To consolidate the knowledge gained from the session with interactive cases.
Author Disclosures:
L. Hacein-Bey: nothing to disclose, D. Leys: Advisory Board at Pfizer 2017, 2018, Advisory Board at Bayer 2017, Investigator at Boehringer Ingelheim, Grant Recipient at University of Heidelberg

08:30 - 10:00 **Room M 5**

E³ - Advanced Course: Hot Topics in GU Cancer

E³ 1322

Tumour relapse in gynaecological cancer

E³ 1322-1 08:30
Chairperson's introduction
S. Nougaret*; Montpellier/FR*
Author Disclosures:
S. Nougaret: nothing to disclose

E³ 1322-2 08:45
A. Differentiating relapse from post-treatment appearances
R. Forstner*; Salzburg/AT (r.forstner@salk.at)*
Learning objectives:
1. To learn post radiotherapy appearances in cervix cancer.
2. To recognise the appearances of disease relapse.
3. To be familiar with the complications of treatment seen on imaging.
Author Disclosures:
R. Forstner: nothing to disclose

E³ 1322-3 09:10
B. Planning exenterative surgery
H. A. H. Vargas*; New York, NY/US*
Learning objectives:
1. To learn the important criteria for patient selection.
2. To learn the critical anatomy for surgical planning.
3. To be familiar with the post-surgical appearances and follow-up plan.
Author Disclosures:
H. A. H. Vargas: nothing to disclose

E³ 1322-4 09:35
C. Salvage treatment with image directed therapy: high-intensity focused US (HIFU) and stereotactic radiotherapy
N. deSouza*; Surrey/UK*
Learning objectives:
1. To be familiar with the imaging considerations for stereotactic radiotherapy in relapsed disease.
2. To be familiar with the concepts of imaging in directing a radiotherapy treatment plan.
3. To be familiar with the use of HIFU for treatment of pelvic relapse.
Author Disclosures:
N. deSouza: nothing to disclose

08:30 - 10:00 **Tech Gate Auditorium**

Joint Session of the ESR and EFSUMB

ESR/EFSUMB
Bosniak cyst classification

ESR/EFSUMB-1/ESR/EFSUMB-2 08:30
Chairpersons' introduction
D.-A. A. Clevert*; Munich/DE (Dirk.Clevert@med.uni-muenchen.de)*
P. S. Sidhu*; London/UK (paulsidhu@nhs.net)*
Session objectives:
1. To review the classification of complex renal cysts and the relationship to malignancy.
2. To appreciate the need for a contrast-enhanced ultrasound (CEUS) classification of these complex cysts.
3. To review and understand the nature of the enhancement of complex cysts with CEUS.
Author Disclosures:
D.-A. A. Clevert: Speaker at Bracco, Speaker at Siemens, Speaker at Samsung, Speaker at Philips, Advisory Board at Philips, Advisory Board at Samsung; P. S. Sidhu: Advisory Board at Samsung Inc, Seoul Korea, Consultant at Itreas Inc, Amsterdam, Speaker at Bracco, SpA Milan, Speaker at Philips, Netherlands, Speaker at Siemens Healthineers, Speaker at GE healthcare

ESR/EFSUMB-3 08:35
Contrast-enhanced ultrasound (CEUS) in the classification of Bosniak cysts: is it better?
V. Cantisani*; Rome/IT (vito.cantisani@uniroma1.it)*
Learning objectives:
1. To provide CEUS features for characterising cystic lesions.
2. To discuss literature evidence on the reliability of CEUS.
3. To compare CEUS properties with CT and MRI for better kidney cystic characterisation.
Author Disclosures:
V. Cantisani: Speaker at Samsung, Speaker at Bracco, Speaker at Canon

ESR/EFSUMB-4 08:53
Role of CT and MRI
T. Fischer*; Berlin/DE (thom.fischer@charite.de)*
Learning objectives:
1. To review the pros and cons of each approach, including safety of CT.
2. To become familiar with the Bosniak cyst classification for MRI and CT.
3. To discuss the evidence for the use of these methods in routine clinical practice.
Author Disclosures:
T. Fischer: Advisory Board at Canon, Siemens, Bracco, Speaker at Canon, Siemens, Bracco

ESR/EFSUMB-5 09:11
Key recommendations of the EFSUMB clinical position paper on US-based Bosniak cyst classification
M. Bertolotto*; Trieste/IT (bertolot@units.it)*
Learning objectives:
1. To review the differences between CEUS and contrast-CT/MRI in cystic renal lesion characterisation.
2. To describe the key features of CEUS that enables estimation of the risk of malignancy and assigns a Bosniak score.
3. To illustrate the EFSUMB key recommendations for renal cyst classification at CEUS.
Author Disclosures:
M. Bertolotto: nothing to disclose

ESR/EFSUMB-6/ESR/EFSUMB-7 09:29
Interactive cases presentation with renal cysts
J. Webb*; Liverpool/UK (JOLANTA.WEBB@liverpoolft.nhs.uk)*
M. Ragel*; Liverpool/UK (mragel@blueyonder.co.uk)*
Learning objectives:
1. To understand which features of a renal cyst to assess during CEUS in order to assign a Bosniak classification, especially to distinguish between benign and malignant lesion.
2. To know the pitfalls of CEUS renal cyst characterisation and how to counteract them.
3. To understand the place of CEUS in renal cyst characterisation and the follow-up.
Author Disclosures:
J. Webb: nothing to disclose, M. Ragel: nothing to disclose

09:47
Panel discussion: How would you classify this complex renal cyst?

10:30 - 11:00 **Forum (Room A)**

Plenary Lecture

PL 3
Building the human brain: molecular logic of neural circuit formation

Presiding:
B. Brkljačić; Zagreb/HR

PL 3-1 10:30
Building the human brain: molecular logic of neural circuit formation
N. Šestan*; New Haven, CT/US*
Author Disclosures:
N. Šestan: disclosure/affirmation information not submitted

12:45 - 13:45 **Room B**

E³ - The Beauty of Basic Knowledge: Breast

E³ 24D
Basics of interventional breast imaging

Moderators:
F. J. Gilbert; Cambridge/UK
K. Kinkel; Chêne-Bougeries/CH

E³ 24D-1 12:45
Ultrasound-guided interventional imaging: when and how?
M. Mahoney; *Cincinnati, OH/US (mary.mahoney@uc.edu)*
Learning objectives:
1. To learn about cyst aspiration and biopsy techniques.
2. To understand contraindication and complications.
3. To understand the correlation between imaging and pathology.
Author Disclosures:
M. Mahoney: Board Member at RSNA, Board Member at ACR, Author at Elsevier

E³ 24D-2 13:05
When and how to biopsy under mammographic guidance?
D. Djilas; *Sremska Kamenica/RS*
Learning objectives:
1. To learn about the techniques and limitations.
2. To become familiar with the quality control of stereotactic or tomosynthesis guided breast biopsy.
Author Disclosures:
D. Djilas: disclosure/affirmation information not submitted

E³ 24D-3 13:25
When and how to biopsy under MRI guidance?
P. A. T. Baltzer; *Vienna/AT (patbaltzer@gmail.com)*
Learning objectives:
1. To learn about the techniques and limitations.
2. To become familiar with the quality control of MRI guided breast biopsy.
Author Disclosures:
P. A. T. Baltzer: nothing to disclose

12:45 - 13:45 **Room C**

E³ - The Beauty of Basic Knowledge: Pancreas

E³ 25D
Solid pancreatic neoplasms

Moderator:
B. I. Choi; Seoul/KR

E³ 25D-1 12:45
Diagnosis
M. Zins; *Paris/FR (mzins@hpsj.fr)*
Learning objectives:
1. To learn about diagnostic imaging findings of solid pancreatic neoplasms.
2. To understand treatment planning.
3. To appreciate differential diagnosis of solid pancreatic neoplasms.
Author Disclosures:
M. Zins: nothing to disclose

E³ 25D-2 13:15
Staging
N. Kartalis; *Stockholm/SE (nikolaos.kartalis@me.com)*
Learning objectives:
1. To learn how to stage pancreatic adenocarcinoma.
2. To understand resectability criteria.
3. To appreciate the role of imaging in treatment planning.
Author Disclosures:
N. Kartalis: nothing to disclose

12:45 - 13:45 **Coffee & Talk 3**

Coffee & Talk (open forum) Session
Organised by the ESR Patient Advisory Group (ESR-PAG)

C 30
Innovative tools to improve the communication between radiologists and patients

C 30-1 12:45
Chairperson's introduction
N. Bedlington; *Vienna/AT*
Session objectives:
1. To understand why patient-centred communication is key for achieving better outcomes in the radiology department.
2. To identify room for improvement in patient communication based on experience reports by patient representatives.
3. To learn how radiologists can implement efficient communication strategies to better divide time between patient consultations and clinical practice.
Author Disclosures:
N. Bedlington: disclosure/affirmation information not submitted

C 30-2 12:50
Sharing best practices in engaging with radiologists
C. Cruwys; *Haute Vienne/FR (CCruwys@dense-info.org)*
Learning objectives:
1. To appreciate practical tools that help to streamline the flow of information between patients and radiologists.
2. To learn about programs that help patients to better engage with professionals in the radiology department.
3. To understand how patients can participate in decision-making regarding the care pathway.
Author Disclosures:
C. Cruwys: nothing to disclose

C 30-3 12:58
The radiologist's perspective: effectively dividing time for communication with patients
D.-G. Carrie; *Balma/FR (dominiquecarrie@wanadoo.fr)*
Learning objectives:
1. To learn how to better organise direct contact with the patient in the radiology department.
2. To demonstrate how language can be adapted to meet expectations for understandable and clear communication.
3. To understand what practical tools are available in the radiology department to communicate more effectively with patients.
Author Disclosures:
D.-G. Carrie: nothing to disclose

C 30-4 13:06
Patient experiences on optimising communication in the radiology department
B. Bauer; *Abensberg/DE*
Learning objectives:
1. To demonstrate how digital tools can contribute to improving the communication between patients and radiologists.
2. To learn about practical solutions in hospital departments in order to explain clinical results.
3. To outline how patients can more adequately educate themselves to better understand radiology procedures.
Author Disclosures:
B. Bauer: nothing to disclose

C 30-5 13:14
Achieving better patient outcomes through effective communication and empowerment
C. Justich; *Vienna/AT (cjustich@me.com)*

Learning objectives:
1. To outline which initiatives could be introduced in the hospital department to involve patients in seeking effective communication tools.
2. To learn practical solutions in hospital departments to meet patients' demands for involvement in decision-making regarding the care pathway.
3. To understand why patient empowerment and engagement will result in more effective communication in the hospital department.
Author Disclosures:
C. Justich: Speaker at ESR PAG

13:22
Open forum discussion: How to implement a system of effective patient-professional communication

14:00 - 15:30 **Room B**

Head and Neck

RC 1508
Skull base

RC 1508-1 14:00
Chairperson's introduction
B. Schuknecht*; Zurich/CH (bschuknecht@mri-roentgen.ch)*
Session objectives:
1. To become familiar with normal skull base anatomy and variants.
2. To understand how to review skull base pathology.
3. To know how to differentiate infection/inflammation from a tumour.
Author Disclosures:
B. Schuknecht: nothing to disclose

RC 1508-2 14:05
A. Skull base anatomy
E. Loney*; Halifax/UK (elizabeth.loney@cht.nhs.uk)*
Learning objectives:
1. To understand how to classify skull base anatomy.
2. To become acquainted with clinically relevant anatomical variants.
3. To review the important anatomical subsites.
Author Disclosures:
E. Loney: nothing to disclose

RC 1508-3 14:28
B. Infectious and inflammatory diseases of the skull base
J. Goh*; Singapore/SG (Julian_Goh@ttsh.com.sg)*
Learning objectives:
1. To understand how to recognise infectious and inflammatory skull base pathology.
2. To become familiar with the imaging modalities used to diagnose and assess treatment response.
3. To recognise the important review areas and complications.
Author Disclosures:
J. Goh: nothing to disclose

RC 1508-4 14:51
C. Benign and malignant tumours of the skull base
A. Borges*; Lisbon/PT (borgalexandra@gmail.com)*
Learning objectives:
1. To learn how to make an accurate differential diagnosis.
2. To become familiar with important review areas and the staging of malignant tumours.
3. To recognise tumour mimics.
Author Disclosures:
A. Borges: nothing to disclose

15:14
Panel discussion: What are the challenges in assessing the skull base?

14:00 - 15:30 **Room C**

Musculoskeletal

RC 1510
Imaging of forgotten small joints

Moderator:
P. N. M. Tyrrell; Oswestry/UK

RC 1510-1 14:00
A. Sterno-clavicular joints: from trauma to inflammation
A.-G. Jurik*; Aarhus/DK (jurik@dadlnet.dk)*
Learning objectives:
1. To explain the pathological conditions that involve the sterno-clavicular joints.
2. To describe the imaging findings of abnormalities that involve the sterno-clavicular joints.
Author Disclosures:
A.-G. Jurik: nothing to disclose

RC 1510-2 14:30
B. Symphysis pubis and its surroundings
A. Kassarjian*; Pozuelo de Alarcón/ES (akassarjian@gmail.com)*
Learning objectives:
1. To explain the pathological conditions that involve the symphysis pubis and its surroundings.
2. To describe the imaging findings of abnormalities that involve the symphysis pubis and its surroundings.
Author Disclosures:
A. Kassarjian: nothing to disclose

RC 1510-3 15:00
C. Proximal tibio-fibular joint: a cause for lateral knee pain
A. Cotten*; Lille/FR (anne.cotten@chru-lille.fr)*
Learning objectives:
1. To explain the pathological conditions that involve the proximal tibio-fibular joint.
2. To describe the imaging findings of abnormalities that involve the proximal tibio-fibular joint.
Author Disclosures:
A. Cotten: Author at CHU de Lille

14:00 - 15:30 **Room X**

ESR Patient Advisory Group (ESR-PAG)

PA
Artificial intelligence (AI) in radiology: meeting expectations and benefiting outcomes

PA-1/**PA-2** 14:00
Chairpersons' introduction
B. Bauer*; Abensberg/DE*
N. I. Traikova*; Plovdiv/BG (nikoletatraikova@gmail.com)*
Session objectives:
1. To understand how patients can benefit from the application of AI in radiology.
2. To learn which management changes the introduction of AI in radiology triggers for professionals in clinical practice.
3. To learn how the use of AI in radiology raises ethical questions that need to be answered in view of a patient-centred approach.
Author Disclosures:
B. Bauer: nothing to disclose, N. I. Traikova: nothing to disclose

PA-3 14:05
The untapped potential of AI in radiology
J. A. Brink*; Boston, MA/US*

Learning objectives:
1. To learn how AI is currently used in radiology to generate more effective outcomes.
2. To understand how AI will transform clinical practice for radiologists in the next few decades.
3. To identify best practices for bridging the gap between radiologist and patient due to technological developments.
Author Disclosures:
J. A. Brink: Board Member at Accumen, Inc.

PA-4 14:20
Managing expectations for a patient-centred application of AI in radiology
E. Briers; *Brussels/BE (erikbriers@telenet.be)*
Learning objectives:
1. To understand what benefits patients expect from introducing AI in radiology.
2. To demonstrate how patients can contribute to better outcomes through shared-decision making and active involvement in utilising AI.
3. To learn how patients can be encouraged to co-develop AI in radiology that is patient-centred and adapted to patient expectations.
Author Disclosures:
E. Briers: nothing to disclose

PA-5 14:35
A patient perspective on data privacy in AI
C. Isaacs; *Woking/UK (chrisisaacs83@googlemail.com)*
Learning objectives:
1. To learn which measures need to be introduced from a patient's point of view to uphold the highest data privacy standards.
2. To provide examples of how patient involvement in data collection and analysis contributes to an accelerated diagnosis and treatment.
3. To understand how patient education and communication in the field of AI is crucial in order to maintain the patient's trust in clinical practice and research.
Author Disclosures:
C. Isaacs: nothing to disclose

PA-6 14:50
Putting ethics fist: key questions concerning AI in radiology
A. Brady; *Cork/IE (adrianbrady@me.com)*
Learning objectives:
1. To understand which ethical implications accompany the introduction of AI in radiology.
2. To learn about practical solutions to uphold the highest ethical standards in radiology.
3. To share best practices of collaboration between patients and radiologists in developing guidelines and ethical standards.
Author Disclosures:
A. Brady: nothing to disclose

PA-7 15:05
Data sets for training and validation of AI-tools
L. Marti-Bonmati; *Valencia/ES (Luis.Marti@uv.es)*
Learning objectives:
1. To learn about the relevance of training for AI development.
2. To appreciate the opportunities of collaborative developments of data sets for training.
3. To understand the need for validation of AI tools.
Author Disclosures:
L. Marti-Bonmati: nothing to disclose

15:20
Panel discussion: How to embed AI in radiology to the benefit of a patient-centred approach

14:00 - 15:00 **Coffee & Talk 1**

Coffee & Talk (open forum) Session
Organised by ESOR

C 8
ESOR one-year fellowship

C 8-1 14:00
Chairperson's introduction
R. G. H. Beets-Tan; *Amsterdam/NL (r.beetstan@nki.nl)*
Session objectives:
1. To understand the goal of a one year ESOR research fellowship and to learn about the expectations.
2. To know how this fellowship could help you boost your career.
Author Disclosures:
R. G. H. Beets-Tan: nothing to disclose

C 8-2/**C 8-3** 14:05
Why should you apply for a one-year fellowship?
T. D. L. Nguyen-Kim; *Zurich/CH (thidanlinh.nguyen@usz.ch)*
E. K. Hong; *Seoul/KR (amyh0803@gmail.com)*
Learning objectives:
1. To learn from their experiences during their visit to the centre.
2. To know how it improved their scientific skills.
3. To learn how their fellowship had an impact on their academic career.
Author Disclosures:
T. D. L. Nguyen-Kim: nothing to disclose, E. K. Hong: nothing to disclose

14:35
Open forum discussion

14:00 - 15:30 **Room N**

Breast

RC 1502
Interventional breast imaging: the increasing role of the radiologist

Moderator:
C. Kurtz; Lucerne/CH

RC 1502-1 14:00
A. Fine needle aspiration cytology (FNAC), core needle or vacuum assisted biopsy (VAB): what, when and how?
A. Evans; *Dundee/UK (a.z.evans@dundee.ac.uk)*
Learning objectives:
1. To get to know the different needle systems.
2. To become familiar with potential pitfalls.
3. To be able to choose the right needle for the right indication.
Author Disclosures:
A. Evans: nothing to disclose

RC 1502-2 14:30
B. Breast lesion localisation: going beyond wires
M. Marolt Music; *Ljubljana/SI (mmusic@onko-i.si)*
Learning objectives:
1. To appreciate the importance of image-guided preoperative wire localisation for non-palpable lesions.
2. To get to know alternative localisation techniques.
3. To become familiar with the limitations of different techniques.
Author Disclosures:
M. Marolt Music: nothing to disclose

RC 1502-3 15:00
C. Percutaneous ablation of breast cancer: a step forward
G. Mauri; *Milan/IT (vanni.mauri@gmail.com)*

Learning objectives:
1. To become familiar with the different techniques for tumour ablation.
2. To acknowledge the value of each technique for the treatment of breast lesions.
3. To identify factors that affect success.
Author Disclosures:
G. Mauri: Consultant at Elesta SrL

14:00 - 15:30 **Room O**

ESTI Session: Lung Cancer Screening Certification Programme

ESTI

Lung nodule management: case-based session

Moderator:
M. Silva; Parma/IT

ESTI-1 14:00
Solid nodule morphological evaluation: how to recognise obviously benign/malignant nodules, intrapulmonary lymph nodes, and pitfalls
A. Devaraj; *London/UK*
Learning objectives:
1. To learn how to recognise obviously benign/malignant nodules.
2. To become familiar with intrapulmonary lymph nodes characteristics.
3. To be aware of the common pitfalls.
Author Disclosures:
A. Devaraj: nothing to disclose

ESTI-2 14:30
Solid nodule measurement, follow-up and criteria of positive screens
H. Prosch; *Vienna/AT (helmut.prosch@meduniwien.ac.at)*
Learning objectives:
1. To understand the limitations of diameter measurement.
2. To appreciate the role of computed assisted diagnosis (CAD) tools for volume measurement and doubling time estimation.
3. To learn about the criteria of positive screens.
Author Disclosures:
H. Prosch: Research/Grant Support at Siemens

ESTI-3 15:00
Subsolid nodules evaluation, follow-up and criteria of positive screens
M.-P. Revel; *Paris/FR (marie-pierre.revel@aphp.fr)*
Learning objectives:
1. To learn how to categorise nodules as solid, part-solid, or non solid.
2. To learn how to define subsolid nodule evolutivity during follow-up.
3. To learn about the criteria of positive screens.
Author Disclosures:
M.-P. Revel: Other at GUERBET

14:00 - 15:00 **Coffee & Talk 2**

Coffee & Talk (open forum) Session

Organised by EuroSafe Imaging

C 18

EuroSafe meets ArabSafe

C 18-1/**C 18-2** 14:00
Chairpersons' introduction
G. Frija; *Paris/FR (guy.frija@aphp.fr)*
B. Mansouri; *Algiers/DZ (boudjema.mansouri@gmail.com)*
Session objectives:
1. To highlight the EuroSafe Imaging strategy.
2. To discuss optimisation and justification.
3. To share common experiences.
Author Disclosures:
G. Frija: nothing to disclose, B. Mansouri: nothing to disclose

C 18-3 14:10
EuroSafe Imaging campaign: is the EuroSafe Imaging Call for Action relevant for ArabSafe?
G. Frija; *Paris/FR (guy.frija@aphp.fr)*
Learning objectives:
1. To highlight the EuroSafe Imaging Call for Action.
2. To detail how optimisation is handled.
3. To provide an update on the EuroSafe Imaging Stars concept.
Author Disclosures:
G. Frija: nothing to disclose

C 18-4 14:20
ArabSafe campaign: which are the most important challenges in implementing radiation protection?
B. Mansouri; *Algiers/DZ (boudjema.mansouri@gmail.com)*
Learning objectives:
1. To update and highlight the implementation of the ArabSafe campaign, including the results and constraints.
2. To highlight the implementation of the Bonn Call for Action into Arabic countries though the ArabSafe campaign, taking into consideration the peculiarities or similarities at a regional level (north Africa or the Middle East).
3. To expand on issues relating to radiation safety and, in particular, how to tackle the challenges of encouraging adherence to standards, policies strategies, and activities.
Author Disclosures:
B. Mansouri: nothing to disclose

C 18-5 14:30
Use case in Saudi Arabia. Presentation of the first Saudi National DRLs for CT in adults and children: implementation plan and the effect of the implementation of dose monitoring in mammography screening practice in Saudi Arabia
S. Hagi; *Jeddah/SA (sarahhagi@gmail.com)*
Learning objectives:
1. To present the results of the Saudi Food & Drug Authority (SFDA) National DRLs for CT practice.
2. To highlight the modification to paediatric practices.
3. To present the features of mammography practice in Saudi Arabia and its limitations.
4. To introduce the Saudi FDA national project for establishing mammography DRLs.
5. To discuss the effect of using dose monitoring software on mean glandular dose in a teaching hospital.
Author Disclosures:
S. Hagi: nothing to disclose

C 18-6 14:40
Use case in Egypt
D. Husseiny Salama; *Cairo/EG (drdinahusseiny@yahoo.com)*
Learning objectives:
1. To present Egypt's key use cases in radiation safety technology.
2. To highlight the interaction between the available tools and the needs of the end users.
3. To introduce the radiation safety model in Egypt and how the technology functions through it.
Author Disclosures:
D. Husseiny Salama: nothing to disclose

14:50
Open forum discussion

14:00 - 15:30 **Room E**

Special Focus Session

SF 15

My top three tips for imaging musculoskeletal injury

SF 15-1 14:00
Chairperson's introduction
Ü. Aydingöz; *Ankara/TR (ustunaydingoz@yahoo.com)*

Session objectives:
1. To describe clinically useful imaging tips to diagnose and manage musculoskeletal injuries.
2. To explain the relevance and diagnostic accuracy of the presented imaging findings.
3. To list pitfalls and the differential diagnosis of imaging findings.
Author Disclosures:
Ü. Aydingöz: nothing to disclose

SF 15-2 14:05
Wrist
J.-L. Drape*; Paris/FR (jean-luc.drape@cch.aphp.fr)*
Learning objectives:
1. To describe clinically useful imaging tips to diagnose and manage wrist injuries.
2. To explain the relevance and diagnostic accuracy of the presented imaging findings.
3. To list the pitfalls and the differential diagnosis of imaging findings.
Author Disclosures:
J.-L. Drape: nothing to disclose

SF 15-3 14:20
Shoulder
K. Wörtler*; Munich/DE (klaus.woertler@tum.de)*
Learning objectives:
1. To describe clinically useful imaging tips to diagnose and manage shoulder injuries.
2. To explain the relevance and diagnostic accuracy of the presented imaging findings.
3. To list the pitfalls and the differential diagnosis of imaging findings.
Author Disclosures:
K. Wörtler: nothing to disclose

SF 15-4 14:35
Hip
V. V. Mascarenhas*; Lisbon/PT (vmascarenhas@me.com)*
Learning objectives:
1. To describe clinically useful imaging tips to diagnose and manage hip injuries.
2. To explain the relevance and diagnostic accuracy of the presented imaging findings.
3. To list the pitfalls and the differential diagnosis of imaging findings.
Author Disclosures:
V. V. Mascarenhas: nothing to disclose

SF 15-5 14:50
Knee
C. W. A. Pfirrmann*; Forch/CH*
Learning objectives:
1. To describe clinically useful imaging tips to diagnose and manage knee injuries.
2. To explain the relevance and diagnostic accuracy of the presented imaging findings.
3. To list the pitfalls and the differential diagnosis of imaging findings.
Author Disclosures:
C. W. A. Pfirrmann: nothing to disclose

SF 15-6 15:05
Ankle
B. Forster*; Vancouver/CA (bruce.forster@vch.ca)*
Learning objectives:
1. To describe clinically useful imaging tips to diagnose and manage ankle and foot injuries.
2. To explain the relevance and diagnostic accuracy of the presented imaging findings.
3. To list the pitfalls and the differential diagnosis of imaging findings.
Author Disclosures:
B. Forster: Shareholder at Canada Diagnostic Centres, Grant Recipient at SECTRA AB; Remuneration of travel expenses for educational conference

15:20
Panel discussion: My single best tip in improving diagnostic accuracy in musculoskeletal injury

14:00 - 15:30 **Room F1**

ESR meets Canada

Meets 15
Tales from the Canadian Frontier

Presiding:
B. Brkljačić; Zagreb/HR
M. Barry; Ottawa, ON/CA

Meets 15-1 14:00
Welcome from the ESR President
B. Brkljačić*; Zagreb/HR (boris@brkljacic.com)*
Author Disclosures:
B. Brkljačić: nothing to disclose

Meets 15-2 14:02
Introduction: Fun facts about Canada
M. Barry*; Ottawa, ON/CA (mbarry@car.ca)*
Session objectives:
1. To learn about cultural anecdotes associated with Canada.
2. To appreciate the vastness in diversity and landscape of the country.
3. To become familiar with the economic disposition of the national healthcare system in Canada.
Author Disclosures:
M. Barry: nothing to disclose

Meets 15-3 14:04
Overview of radiology in Canada
M. Barry*; Ottawa, ON/CA (mbarry@car.ca)*
Learning objectives:
1. To have a better understanding of the Canadian healthcare landscape and radiology practice in a single-payer system.
2. To learn about advocacy strategies that have been successful in raising awareness for radiology and garnering support from key decision makers.
3. To appreciate the challenges that exist in medical imaging in Canada and explore solutions/best practices for navigating through these difficulties.
Author Disclosures:
M. Barry: nothing to disclose

Meets 15-4 14:19
Artificial intelligence: a global phenomenon changing the way radiologists practice
J. J. R. Chong*; Montreal, QC/CA (jaronchong@gmail.com)*
Learning objectives:
1. To become familiar with the status of artificial intelligence in Canada.
2. To learn about how deep learning and algorithms can impact the way data is interpreted in relation to medical imaging.
3. To understand how artificial intelligence will change the way radiologists practice within Canada.
Author Disclosures:
J. J. R. Chong: nothing to disclose

Meets 15-5 14:34
Hot topic - Physician burnout: a Canadian perspective
M. N. Patlas*; Hamilton, ON/CA (patlas69@yahoo.com)*
Learning objectives:
1. To understand burnout in the Canadian context and the contributing factors to stress.
2. To learn strategies in mitigating burnout in a clinical environment.
Author Disclosures:
M. N. Patlas: Author at Springer

Meets 15-6 14:49
Canadian interlude with embassy

Meets 15-7 14:54
Transcontinental thematic analysis of gender role in medical schools leadership: a message to academic radiology and hospital administration
W. Abdellatif*; Vancouver, BC/CA*
Author Disclosures:
disclosure/affirmation information not submitted

Meets 15-8 14:59
Can CTA differentiate free-floating thrombus in the internal carotid artery from atherosclerotic plaque in patients evaluated for stroke or transient ischemic attack? A Canadian multi-centre study
P. Puac Polanco; *Ottawa, ON/CA*
Author Disclosures:
disclosure/affirmation information not submitted

Meets 15-9 15:04
Traumatic bowel injuries increased detectability with dual-energy CT virtual monoenergetic with color-coded iodine overlay imaging
F. Macri; *Vancouver, BC/CA*
Author Disclosures:
disclosure/affirmation information not submitted

Meets 15-10 15:09
The history of Medicare in Canada
E. Lee*; Vancouver/CA (ejlee888@gmail.com)*
Learning objectives:
1. To describe the Canadian medical system.
2. To recognise the journey and evolution to a publicly funded health system.
3. To identify the advantages and challenges within the Canadian medical system.
Author Disclosures:
E. Lee: nothing to disclose

15:24
Questions

14:00 - 15:30 **Room F2**

E³ - Rising Stars Programme: Basic Session

BS 15a
Hybrid imaging

Moderator:
U. Mahmood; Oak Brook/US

BS 15a-1 14:00
Clinical applications of hybrid imaging
K. Riklund*; Umeå/SE (katrine.riklund@umu.se)*
Learning objectives:
1. To understand the indications and limitations of hybrid imaging in common diseases.
2. To discuss the added value of hybrid imaging.
Author Disclosures:
K. Riklund: Board Member at CMRAD AB, Board Member at Dicom Port AB

BS 15a-2 14:30
Hybrid imaging: thorax
D. Neriman*; London, LONDON/UK (deena.neriman@nhs.net)*
Learning objectives:
1. To learn about the indications for thoracic pathologies.
2. To discuss limitations and pitfalls in thoracic pathologies.
3. To demonstrate the most important findings.
Author Disclosures:
D. Neriman: nothing to disclose

BS 15a-3 15:00
Hybrid imaging: abdomen and pelvis
S. Gatidis*; Tübingen/DE (sergios.gatidis@med.uni-tuebingen.de)*
Learning objectives:
1. To learn about the indications for abdominal and pelvic pathologies.
2. To discuss limitations and pitfalls in abdominal and pelvic pathologies.
3. To demonstrate the most important findings.
Author Disclosures:
S. Gatidis: nothing to disclose

14:30 - 15:30 **Coffee & Talk 3**

Coffee & Talk (open forum) Session

C 31
Addressing shortages in the medical imaging workforce

Moderators:
B. Verbist; Leiden/NL
D. Katsifarakis; Athens/GR

C 31-1 14:30
Overview from the WHO on the health care worker shortages and contributing factors
M. D. R. D. R. Perez*; Geneva/CH (perezm@who.int)*
Learning objectives:
1. To summarise the existing shortages, the WHO's High-Level Commission on Health Employment and Economic Growth, and the ILO-WHO-OECD Working for Health Five Year Action Plan.
2. To discuss the adopted World Health Assembly resolution on the Global Strategy on Human Resources for Health: Workforce 2030.
3. To explain the Call for Action Campaign that has been established to address the global health care worker shortfall.
Author Disclosures:
M. D. R. D. R. Perez: nothing to disclose

C 31-2 14:35
The view of the International Society of Radiology
L. Donoso*; Barcelona/ES (ldonoso@clinic.cat)*
Learning objectives:
1. To provide an overview of global radiologist shortfalls.
2. To discuss the ISR's contributions and strategies to counter the global radiologist workforce shortage.
Author Disclosures:
L. Donoso: Advisory Board at Context Flow, Advisory Board at Methinks, Advisory Board at iVascular, Author at Affidea, Shareholder at Vivo Diagnostico

C 31-3 14:40
The view of the European Society of Radiology
L. E. Derchi*; Genoa/IT (derchi@unige.it)*
Learning objectives:
1. To provide an overview of current, and future, radiologist shortfalls in Europe.
2. To discuss opportunities and efforts to counter the radiologist workforce shortages in Europe.
Author Disclosures:
L. E. Derchi: nothing to disclose

C 31-4 14:45
The view of the International Society of Radiographers and Radiologic Technologists
D. E. Newman*; Fargo, ND/US (donnaenewman@gmail.com)*
Learning objectives:
1. To provide an overview of global radiographer/radiologic technologist shortages.
2. To discuss ISRRT's collaborative efforts and strategies, submitted to WHO, to counter these shortages.
3. To discuss the ISRRT partnership with the EFRS to disseminate strategies within Europe to help counter these shortages.
Author Disclosures:
D. E. Newman: nothing to disclose

C 31-5 14:50
The views of the European Federation of Radiographer Societies
J. McNulty*; Dublin/IE (jonathan.mcnulty@ucd.ie)*
Learning objectives:
1. To provide an overview of the current status of the radiographer workforce across Europe.
2. To discuss opportunities and efforts to counter shortages across Europe through collaborative efforts.
Author Disclosures:
J. McNulty: nothing to disclose

14:55
Open forum discussion

14:00 - 15:30 **da Vinci (Room D1)**

Physics in Medical Imaging

RC 1513
Striking the balance: image quality assessment in radiological optimisation

RC 1513-1 14:00
Chairperson's introduction: The big picture: can we be objective about image quality?
M. Kortesniemi*; Hus/FI (mika.kortesniemi@hus.fi)*
Session objectives:
1. To appreciate the reasons why image quality is important in radiological optimisation.
2. To understand the main methods of image quality assessment and optimisation.
3. To learn how image quality assessment is applied in clinical practice.
Author Disclosures:
M. Kortesniemi: nothing to disclose

RC 1513-2 14:05
A. From signal to image: the basics of image quality assessment
A. Mackenzie*; Guildford/UK (alistairmackenzie@nhs.net)*
Learning objectives:
1. To learn the basics of signal formation and image quality assessment.
2. To understand how they are applied in radiological imaging.
3. To identify limitations.
Author Disclosures:
A. Mackenzie: nothing to disclose

RC 1513-3 14:28
B. Between a ROC(k) and a hard place: methods of determining clinical image quality
O. J. O Connor*; Cork/IE (oj.oconnor@ucc.ie)*
Learning objectives:
1. To learn about traditional and practical methods of determining image quality.
2. To understand how the methods are applied to projection radiography, interventional radiology, and CT.
3. To identify limitations of current techniques.
Author Disclosures:
O. J. O Connor: nothing to disclose

RC 1513-4 14:51
C. Bridging the gap between physical and clinical image quality
C. Hoeschen*; Magdeburg/DE*
Learning objectives:
1. To learn about physics-based methods of determining image quality.
2. To understand how they are applied to projection radiography, interventional radiology, and CT.
3. To identify how to bridge the gap between the physics methods and the clinical image quality assessment.
Author Disclosures:
C. Hoeschen: disclosure/affirmation information not submitted

14:14
Panel discussion: Can we balance image quality and dose needs in an objective manner?

14:00 - 15:30 **Darwin (Room D2)**

E³ - ECR Master Class (Abdominal Viscera)

E³ 1526
Update of diffusion-weighted MRI

Moderator:
S. R. Rafaelsen; Vejle/DK

E³ 1526-1 14:00
A. Technical advances of diffusion-weighted imaging (DWI)
N. Papanikolaou*; Lisbon/PT*
(nickolas.papanikolaou@research.fchampalimaud.org)
Learning objectives:
1. To learn about the strengths and shortcomings of different DWI techniques.
2. To understand how to integrate and optimise DWI in MRI protocols.
3. To be able to avoid pitfalls in DWI.
Author Disclosures:
N. Papanikolaou: Advisory Board at Advantis Medical Imaging, Shareholder at MRIcons LTD

E³ 1526-2 14:30
B. DWI of abdominal organs
D. Caruso*; Rome, LT/IT (dcaruso85@gmail.com)*
Learning objectives:
1. To learn how to integrate DWI in your abdominal MRI protocol.
2. To understand the clinical value of DWI for the depiction of abdominal pathologies.
3. To be able to deal with technical difficulties of DWI in the upper abdomen and subphrenic space.
Author Disclosures:
D. Caruso: nothing to disclose

E³ 1526-3 15:00
C. DWI of pelvic organs
E. Sala*; Cambridge/UK (es220@medschl.cam.ac.uk)*
Learning objectives:
1. To understand the correct implementation of DWI for pelvic imaging.
2. To learn how to avoid imaging artefacts in pelvic DWI.
3. To become familiar with typical findings and pitfalls of pelvic DWI.
Author Disclosures:
E. Sala: nothing to disclose

14:00 - 15:30 **Descartes (Room D3)**

Vascular

RC 1515
No time to lose: aortic disease, revisited

Moderator:
T. Jargiello; Lublin/PL

RC 1515-1 14:00
A. Diagnosis and treatment of abdominal aortic aneurysms
F. Wolf*; Vienna/AT (florian.wolf@meduniwien.ac.at)*
Learning objectives:
1. To learn about the definition and classification of abdominal aortic aneurysms.
2. To understand the relevant information and measurements to plan an endovascular aortic repair.
3. To become familiar with the different possibilities of endovascular treatment including anchors, snorkels, branches, and chimneys.
Author Disclosures:
F. Wolf: nothing to disclose

RC 1515-2 14:30
B. Acute diagnosis and imaging in aortic dissection
R. Iezzi*; Rome/IT (roberto.iezzi@policlinicogemelli.it)*

Learning objectives:
1. To learn about definition and classification of aortic dissections and subtypes.
2. To understand the importance of accurate diagnosis for appropriate treatment planning.
3. To appreciate the need for acute diagnosis and treatment indication.
Author Disclosures:
R. Iezzi: Advisory Board at Terumo, Guerbet, Speaker at Terumo, Pharmacept, Bracco

RC 1515-3 15:00
C. Endovascular treatment in aortic dissection
P. J. Schaefer*; Kiel/DE (jp.schaefer@rad.uni-kiel.de)*
Learning objectives:
1. To learn about endovascular treatment possibilities for aortic dissections.
2. To understand the role of radiology in modern treatment of aortic dissections.
3. To appreciate the need to combine radiological information with the clinical situation.
Author Disclosures:
P. J. Schaefer: nothing to disclose

14:00 - 15:30 **Room G**

Neuro

RC 1511
Update on cerebrospinal fluid (CSF) diseases

Moderator:
Z. Merhemic; Sarajevo/BA

RC 1511-1 14:00
A. Imaging strategies for hydrocephalus
J. Bladowska*; Wroclaw/PL (asia.bladowska@gmail.com)*
Learning objectives:
1. To describe the different types of hydrocephalus and how to distinguish them in imaging.
2. To understand the pathophysiology of CSF circulation.
3. To apply MRI techniques for diagnosing abnormalities of the CSF flow.
Author Disclosures:
J. Bladowska: nothing to disclose

RC 1511-2 14:22
B. Diagnosis and treatment of intracranial hypotension
E. Papadaki*; Iraklion/GR (fpapada@otenet.gr)*
Learning objectives:
1. To understand the underlying pathophysiology of spontaneous intracranial hypotension (SIH).
2. To understand imaging strategies for this condition.
3. To clarify myths and misperceptions of intracranial hypotension.
Author Disclosures:
E. Papadaki: nothing to disclose

RC 1511-3 14:45
C. Reversible cerebral vasoconstriction syndrome (RCVS), posterior reversible encephalopathy syndrome (PRES), and others
J. Linn*; Munich/DE (Jennifer.Linn@uniklinikum-dresden.de)*
Learning objectives:
1. To understand the current controversial mechanism of posterior reversible encephalopathy syndrome (PRES).
2. To understand therapeutic and prognostic implications of PRES and reversible cerebral vasoconstriction syndrome (RCVS) diagnosis.
3. To appreciate imaging features of PRES, RCVS, and their differentials.
Author Disclosures:
J. Linn: Speaker at Bayer Healthcare, Advisory Board at mediaire GmbH

RC 1511-4 15:07
D. Hypertension-associated brain changes
A. Krainik*; Grenoble/FR (akrainik.esr@gmail.com)*
Learning objectives:
1. To understand the causes of intracranial hypertension.
2. To understand the threats of intracranial hypertension on the central nervous system and arterial integrity.
3. To recognise intracranial hypertension and its complications on CT and MRI.
Author Disclosures:
A. Krainik: nothing to disclose

14:00 - 15:30 **Room K**

E³ - European Diploma Prep Session

E³ 1523
Cardiac and vascular

E³ 1523-1 14:00
Chairperson's introduction
K.-F. Kreitner*; Mainz/DE (karl-friedrich.kreitner@unimedizin-mainz.de)*
Session objectives:
1. To understand the basic principles and techniques of cardiovascular imaging, including CT and MRI of the heart and great vessels.
2. To become familiar with the imaging presentations of disorders of the endocardium, the pericardium, and the cardiac valves.
3. To understand the MRI presentation of disorders of the myocardium.
Author Disclosures:
K.-F. Kreitner: nothing to disclose

E³ 1523-2 14:06
A. Cardiovascular imaging: the basics
R. Marano*; Rome/IT (riccardo.marano@unicatt.it)*
Learning objectives:
1. To understand the anatomy, normal variants, and abnormalities of the heart and great vessels.
2. To describe the technical aspects and methodology of cardiac and vascular CT.
3. To describe the technical aspects and methodology of cardiac and vascular MRI.
Author Disclosures:
R. Marano: nothing to disclose

E³ 1523-3 14:34
B. Cardiovascular imaging: valves, endocardium and aorta
C. Loewe*; Vienna/AT (christian.loewe@meduniwien.ac.at)*
Learning objectives:
1. To recognise the imaging presentation of the different forms of valvular disease.
2. To understand the causes and imaging presentations of endocarditis.
3. To describe the diagnostic evaluation and imaging presentation of common diseases of the great vessels, including aortic dissection and aneurysms.
Author Disclosures:
C. Loewe: Speaker at Siemens Healthineers, Speaker at BRACCO, Speaker at GE Healthcare

E³ 1523-4 15:02
C. Cardiovascular imaging: myocardium and pericardium
J. Bogaert*; Leuven/BE (Jan.Bogaert@uzleuven.be)*
Learning objectives:
1. To describe the diagnostic evaluation and imaging presentation of ischaemic heart disease.
2. To understand the diagnostic evaluation and imaging presentation of myocarditis.
3. To become familiar with the causes and imaging presentations of pericardial effusion.
Author Disclosures:
J. Bogaert: nothing to disclose

14:00 - 15:30 **Room M 1**

E³ - Rising Stars Programme: Basic Session

BS 15b

Radiographer research: tips to get you started

Moderator:
G. Unterhumer; Vienna/AT

BS 15b-1 14:00
Undertaking a systematic review
L. J. O. C. Lanca*; Singapore/SG (Luis.Lanca@singaporetech.edu.sg)*
Learning objectives:
1. To become familiar with the aims of systematic reviews.
2. To understand the systematic reviews process and explore methodologies.
3. To be aware of the importance of identifying the appropriate keywords, databases, and search strategies to promote a robust systematic review.
Author Disclosures:
L. J. O. C. Lanca: nothing to disclose

BS 15b-2 14:25
Planning and undertaking interviews
M. D. Davis*; Dublin/IE (michaela.davis@ucd.ie)*
Learning objectives:
1. To become familiar with interview-focused methodologies.
2. To understand the importance of a well-designed and thorough interview process.
3. To learn how to present interview findings.
Author Disclosures:
M. D. Davis: nothing to disclose

BS 15b-3 14:50
Conducting survey-based research
A. M. Bolejko*; Malmö/SE (anetta.bolejko@med.lu.se)*
Learning objectives:
1. To be aware of appropriate methodologies for performing surveys and questionnaires (paper-based and online).
2. To become familiar with survey validation methods.
3. Tips to promote effective survey dissemination and higher response rates.
Author Disclosures:
A. M. Bolejko: Speaker at Lund university, Author at Lund university

15:15
Panel discussion: Research mentorship: getting help from the experts

14:00 - 15:30 **Room M 2**

E³ - Advanced Course: How to Improve Your Expertise in Cardiothoracic Imaging

E³ 1519

Mediastinal and cardiac tumours in adults

E³ 1519-1 14:00
Chairperson's introduction
E. Coche*; Brussels/BE (emmanuel.coche@uclouvain.be)*
Session objectives:
1. To review the main causes of mediastinal and cardiac tumours.
2. To become familiar with the new classification of mediastinal compartments.
3. To appreciate the need for defining a standardised management.
Author Disclosures:
E. Coche: Speaker at Cliniques Universitaires St-Luc

E³ 1519-2 14:06
A. Prevascular compartment of the mediastinum
J. Vilar*; Valencia/ES (vilarsamper@gmail.com)*
Learning objectives:
1. To become familiar with the main causes of prevascular tumours.
2. To review the CT features of thymic malignancies.
3. To learn when to suspect lymphoma and when to suggest percutaneous biopsy.
Author Disclosures:
J. Vilar: nothing to disclose

E³ 1519-3 14:34
B. Paravertebral space
M. Occhipinti*; Florence/IT (mariaelena.occhipinti@gmail.com)*
Learning objectives:
1. To become familiar with the posterior mediastinal pathology.
2. To review the typical and atypical features of neurogenic tumours.
3. To learn about less frequent causes of paravertebral space masses.
Author Disclosures:
M. Occhipinti: Research/Grant Support at Fondazione Menarini

E³ 1519-4 15:02
C. Cardiac masses: a survival guide
V. E. Sinitsyn*; Moscow/RU (vsini@mail.ru)*
Learning objectives:
1. To learn how to differentiate thrombi from tumours of the cardiac cavities.
2. To review the main differential diagnosis of cardiac tumours.
3. To learn about the role of US, CT, and MRI for diagnosis and characterisation.
Author Disclosures:
V. E. Sinitsyn: nothing to disclose

14:00 - 15:30 **Room M 4**

Transatlantic Course of ESR and RSNA (Radiological Society of North America): Stroke Imaging and Endovascular Treatment: Now and the Future

TC 1528

Endovascular treatment

Moderators:
J.-P. Pruvo; Lille/FR
R. Uberoi; Oxford/UK

TC 1528-1 14:00
A. Endovascular treatment of acute ischaemic stroke: practical pearls
A. Berlis*; Augsburg/DE*
Learning objectives:
1. To learn about endovascular treatment in ischaemic stroke.
2. To understand the different approaches of endovascular treatment.
3. To appreciate the importance of efficient workup and time metrics in angiosuite.
Author Disclosures:
A. Berlis: disclosure/affirmation information not submitted

TC 1528-2 14:30
B. Where to perform and how to organise thrombectomy
J. Heit*; Stanford/US (jheit@stanford.edu)*
Learning objectives:
1. To learn about the number of persons and regulatory recommendations.
2. To understand the optimal organisation in angiosuite and workflow.
3. To appreciate the implications and management for continuity of care.
Author Disclosures:
J. Heit: Consultant at Medtronic, Consultant at MicroVention, Advisory Board at iSchemaView

TC 1528-3/TC 1528-4/TC 1528-5 15:00
C. Interactive discussion with illustrative cases of endovascular thrombectomy
A. Berlis*; Augsburg/DE*
J. Heit*; Stanford/US (jheit@stanford.edu)*
G. Boulouis*; Paris/FR (gregoireboulouis@gmail.com)*

Learning objectives:
1. To learn about tricks and tips of endovascular treatment using illustrative cases.
2. To appreciate the optimal time metrics in angiosuite.
3. To become familiar with the different approaches (stent retriever, ADAPT) and challenging cases (tandem occlusions, distal occlusions).
Author Disclosures:
A. Berlis: disclosure/affirmation information not submitted;
J. Heit: Consultant at Medtronic, Consultant at MicroVention, Advisory Board at iSchemaView
G. Boulouis: nothing to disclose

14:00 - 15:30 **Room M 5**

E³ - Advanced Course: Hot Topics in GU Cancer

E³ 1522

Tumour relapse in urological cancer

E³ 1522-1 14:00
Chairperson's introduction
V. Løgager*; Herlev/DK (Vibeke.Loegager@regionh.dk)*
Author Disclosures:
V. Løgager: nothing to disclose

E³ 1522-2 14:15
A. Prostate cancer relapse
V. Panebianco*; Rome/IT (valeria.panebianco@uniroma1.it)*
Learning objectives:
1. To learn the follow-up strategy post radical prostatectomy.
2. To recognise relapse and know the patterns of spread.
3. To learn about the use of imaging in planning salvage therapy.
Author Disclosures:
V. Panebianco: nothing to disclose

E³ 1522-3 14:40
B. Non-prostate urological cancer relapse
H. A. H. Vargas*; New York, NY/US*
Learning objectives:
1. To recognise the expected post treatment appearances.
2. To know follow-up strategies for detection of relapse.
3. To learn to recognise pitfalls by case review.
Author Disclosures:
H. A. H. Vargas: nothing to disclose

E³ 1522-4 15:05
C. Theranostics in urological cancer
M. Hartenbach*; Vienna/AT (markus.hartenbach@me.com)*
Learning objectives:
1. To learn about theranostic options in urological cancers.
2. To understand the advantages and limitations of theranostic approaches.
3. To become familiar with the new indications and outcomes of theranostic approaches.
Author Disclosures:
M. Hartenbach: CEO at MINUTEmedical Inc.

14:00 - 15:30 **Tech Gate Auditorium**

ESR Ultrasound Subcommittee Session

US 15

Common applications of dermatologic ultrasound

Moderators:
O. Catalano; Naples/IT
D. E. Gaitini; Haifa/IL

US 15-1 14:00
Chairperson's introduction
X. Wortsman*; Santiago/CL (xworts@yahoo.com)*
Session objectives:
1. To review the normal anatomy of the skin, nails, and hair, and to review the guidelines and technical considerations for performing dermatologic ultrasound examinations.
2. To provide an overview of the frequent applications of ultrasound in benign dermatologic conditions.
3. To learn the ultrasonographic features of the most common types of skin cancer.
Author Disclosures:
X. Wortsman: nothing to disclose

US 15-2 14:05
Dermatologic ultrasound: essential anatomy, guidelines, and technical considerations
D. E. Gaitini*; Haifa/IL (d_gaitini@rambam.health.gov.il)*
Learning objectives:
1. To learn the requisites for practising dermatologic ultrasound examinations.
2. To become familiar with the normal ultrasound anatomy of skin, nail, and hair.
3. To review and understand the current guidelines for dermatologic ultrasound examinations.
Author Disclosures:
D. E. Gaitini: nothing to disclose

US 15-3 14:25
Top ten applications of ultrasound in benign dermatologic conditions
X. Wortsman*; Santiago/CL (xworts@yahoo.com)*
Learning objectives:
1. To learn the most common benign dermatologic conditions that can benefit from an ultrasound examination.
2. To appreciate the clinical and ultrasonographic correlations of these dermatologic entities.
3. To understand the ultrasound appearance of these conditions.
Author Disclosures:
X. Wortsman: nothing to disclose

US 15-4 14:45
Ultrasonographic signs and locoregional staging of skin cancer
O. Catalano*; Naples/IT*
Learning objectives:
1. To learn the most common types of skin cancer.
2. To appreciate the ultrasonographic appearance of the most common types of skin cancer.
3. To understand and review the protocol for an ultrasonographic locoregional staging of skin cancer.
Author Disclosures:
O. Catalano: nothing to disclose

15:05
Panel discussion: Questions and answers

16:00 - 17:30 **Room B**

Emergency Imaging

RC 1617

Blunt polytrauma: CT protocols, CT interpretation and interventional radiology options

RC 1617-1 16:00
Chairperson's introduction
K. H. Nieboer*; Brussels/BE (k.hans.nieboer@gmail.com)*
Session objectives:
1. To understand the different CT and contrast protocols that can be performed in blunt polytrauma patients and when to apply them.
2. To be able to quickly identify and classify solid organ injuries.
3. To recognise injuries that can be treated with interventional radiology.
Author Disclosures:
K. H. Nieboer: Speaker at GE Healthcare

RC 1617-2 16:05
A. CT protocols in blunt polytrauma
E. Kashef*; London/UK (elikadoc@icloud.com)*
Learning objectives:
1. To understand the advantages and disadvantages of different CT protocols adopted in blunt polytrauma patients.
2. To learn the goal of use of single and dual phase contrast injection protocols in trauma.
3. To be able to incorporate the most suitable CT protocol in defined clinical scenarios.
Author Disclosures:
E. Kashef: Speaker at Guerbet , Consultant at Rocket medical

RC 1617-3 16:30
B. Solid organs injuries: a tailored approach
M. N. Patlas*; Hamilton, ON/CA (patlas69@yahoo.com)*
Learning objectives:
1. To learn about the main traumatic injuries that can be detected in solid organs.
2. To understand which crucial findings will change patient management.
3. To understand what surgical and intensive care teams need to know about detected injuries.
Author Disclosures:
M. N. Patlas: Other at Springer

RC 1617-4 16:55
C. Interventional radiology in trauma: diagnosis and management
T. Jargiello*; Lublin/PL (tojarg@interia.pl)*
Learning objectives:
1. To learn which vascular injuries in solid organs can be treated with interventional radiology.
2. To become familiar with the imaging findings of great vessel injuries.
3. To understand how vascular injuries can be treated.
Author Disclosures:
T. Jargiello: nothing to disclose

17:20
Panel discussion: What is the best CT protocol in the evaluation of blunt trauma patients?

16:00 - 17:30 **Room N**

EuroSafe Imaging Session

EU 16
Technology developments which impact dose delivery

EU 16-1/**EU 16-2** 16:00
Chairpersons' introduction: Setting the scene of modern technology for exposure efficient medical imaging
C. Hoeschen*; Magdeburg/DE*
G. Frija*; Paris/FR (guy.frija@aphp.fr)*
Session objectives:
1. To introduce why optimisation of dose is important in certain imaging tasks.
2. To highlight the importance of efficient technology use.
3. To introduce speakers and their topics in terms of potential of imaging technology.
Author Disclosures:
C. Hoeschen: disclosure/affirmation information not submitted;
G. Frija: nothing to disclose

EU 16-3 16:05
Overarching technological developments for producing x-rays in medical imaging for reducing dose
C. Hoeschen*; Magdeburg/DE*
Learning objectives:
1. To learn about the possibilities for dose efficient imaging using scanning imaging geometries and/or monoenergetic x-rays.
2. To understand new concepts for source developments that could be used in medical surroundings to offer advantages in reducing dose.
3. To discuss the chances and limits of such approaches, especially with respect to three-dimensional and interventional imaging.
Author Disclosures:
C. Hoeschen: disclosure/affirmation information not submitted

EU 16-4 16:23
Applying algorithmic approaches for efficient imaging technologies
M. Rafecas*; Lübeck/DE (rafecas@imt.uni-luebeck.de)*
Learning objectives:
1. To learn about the different reconstruction and noise reduction methods.
2. To understand potentials and limitations of such technologies.
3. To see examples from various imaging modalities.
Author Disclosures:
M. Rafecas: nothing to disclose

EU 16-5 16:41
Optimising radiation efficiency in interventional imaging
M. Pech*; Magdeburg/DE*
Learning objectives:
1. To learn about the possibilities to improve image quality and dose management in CT fluoroscopy.
2. To understand the concept of iterative 3D image reconstruction.
3. To learn how to estimate the radiation dose to the hand during interventions correctly.
Author Disclosures:
M. Pech: Speaker at Universitätsklinikum Magdeburg A.ö.R.

EU 16-6 16:59
New concepts for dose determination for staff and patients, and ist importance for optimisation
L. Struelens*; Mol/BE (lstruele@sckcen.be)*
Learning objectives:
1. To learn about the possibilities of changing the way personal dosimetry of staff is performed by using computational methods.
2. To learn about new developments to improve the monitoring of patient doses by using computational methods.
Author Disclosures:
L. Struelens: nothing to disclose

17:17
Panel discussion: Future chances for radiation protection by efficient use of technological developments

16:00 - 17:30 **Room O**

New Horizons Session

NH 16
Lung cancer screening implementation in Europe: is it inevitable?

NH 16-1 16:00
Chairperson's introduction
M. M. Prokop*; Nijmegen/NL (mathias.prokop@radboudumc.nl)*
Session objectives:
1. To summarise the current status of CT lung cancer screening from a national and international perspective.
2. To analyse common hurdles to recruitment, retention, and access.
3. To determine future directions into which CT lung cancer screening should evolve.
Author Disclosures:
M. M. Prokop: Research/Grant Support at Canon Medical Systems, Research/Grant Support at Siemens Healthineers, Speaker at Siemens Healthineers, Speaker at Bracco, Speaker at Bayer, Speaker at Canon Medical Systems

NH 16-2 16:05
NELSON trial latest results
H. J. de Koning*; Rotterdam/NL (h.dekoning@erasmusmc.nl)*
Learning objectives:
1. To review the NELSON trial design and settings.
2. To learn about the final mortality reduction results.
3. To learn about causes of death unrelated to lung cancer.
Author Disclosures:
H. J. de Koning: Research/Grant Support at HORIZON2020 4-in-the-lung run, Speaker at Univ Zurich/Astra Zeneca, Research/Grant Support at NIH/NCI CISNET

NH 16-3 16:23
Lung cancer screening in Europe
M. Silva; *Parma/IT (mariosilvamed@gmail.com)*
Learning objectives:
1. To review the European guidelines for screening.
2. To learn about the Lung Cancer Screening (LCS) certification project.
3. To describe the currently active nationwide screening programmes.
Author Disclosures:
M. Silva: nothing to disclose

NH 16-4 16:41
Challenges to implementing lung cancer screening: US experience
A. Bankier; *Boston, MA/US (alexander.bankier@umassmemorial.org)*
Learning objectives:
1. To learn about ways to promote lung cancer screening.
2. To review the strategies for a high adherence and retention rate.
3. To learn how to optimise lung cancer screening implementation in clinical practice.
Author Disclosures:
A. Bankier: Consultant at Daiichi Pharmaceutical, Consultant at Spiration (Olympus)

NH 16-5 16:59
Lung cancer screening: will humans still be needed?
B. van Ginneken; *Nijmegen/NL (bramvanginneken@gmail.com)*
Learning objectives:
1. To learn about computer-aided detection (CAD) tools for lung nodule detection and characterisation.
2. To review automated screening opportunities beyond lung nodule detection.
3. To learn about the current and projected future artificial intelligence performance in lung cancer detection.
Author Disclosures:
B. van Ginneken: Founder at Thirona, Grant Recipient at MeVis Medical Solutions, Shareholder at Thirona, Grant Recipient at Delft Imaging Systems, Grant Recipient at Thirona

NH 16-6 17:17
Panel discussion: Lung cancer screening, from trial to practice
M. M. Prokop; *Nijmegen/NL,* H. J. de Koning; *Rotterdam/NL,* M. Silva; *Parma/IT,* A. Bankier; *Boston, MA/US,* B. van Ginneken; *Nijmegen/NL,* S. Vallone; *Turin/IT*

16:00 - 17:30 **Studio 2020**

E³ - ECR Master Class (Musculoskeletal)

E³ 1626a
State-of-the-art imaging of postoperative joints

Moderator:
F. Kainberger; Vienna/AT

E³ 1626a-1 16:00
A. Postoperative shoulder
C. W. A. Pfirrmann; *Forch/CH*
Learning objectives:
1. To explain the most frequently used surgical techniques for glenohumeral instability, subacromial decompression, rotator cuff repair and arthroplasty, and their imaging appearance.
2. To describe potential postoperative complications and their imaging apprearance.
Author Disclosures:
C. W. A. Pfirrmann: nothing to disclose

E³ 1626a-2 16:30
B. Postoperative knee
E. Oei; *Rotterdam/NL (e.oei@erasmusmc.nl)*
Learning objectives:
1. To explain the most frequently used surgical techniques for meniscal repair, ligament reconstruction and cartilage repair, and their imaging appearance.
2. To describe potential postoperative complications and their imaging appearance.
Author Disclosures:
E. Oei: Research/Grant Support at GE Healthcare

E³ 1626a-3 17:00
C. Postoperative hip
P. D. Afonso; *Lisbon/PT (p.diana.a@gmail.com)*
Learning objectives:
1. To explain the most frequently used surgical techniques for femoroacetabular impingement and degenerative hip joint disease, and their imaging appearance.
2. To describe potential postoperative complications and their imaging appearance.
Author Disclosures:
P. D. Afonso: nothing to disclose

16:00 - 17:30 **Room on demand Room E or Room F2**

Abdominal Viscera

RC 1601
Imaging of pancreatitis

Moderator:
K. I. Ringe; Hannover/DE

RC 1601-1 16:00
A. Focal pancreatitis vs adenocarcinoma
T. L. Bollen; *Nieuwegein/NL (tlbollen@hotmail.com)*
Learning objectives:
1. To learn about the prevalence and clinical markers of focal pancreatitis and adenocarcinoma.
2. To understand the difficulties in differentiating these entities and to develop imaging-based problem solving tools.
3. To become familiar with follow-up strategies in non-conclusive cases or when the biopsy is negative.
Author Disclosures:
T. L. Bollen: nothing to disclose

RC 1601-2 16:22
B. IgG4 autoimmune pancreatitis
A. Arora; *Liverpool/UK*
Learning objectives:
1. To know the imaging characteristics of autoimmune pancreatitis compared to other forms of pancreatitis.
2. To learn about the value of different imaging tool including US, CT, and MRI for the diagnosis of autoimmune pancreatitis.
3. To be aware of imaging markers indicating therapeutic success in patients with autoimmune pancreatitis.
Author Disclosures:
A. Arora: disclosure/affirmation information not submitted

RC 1601-3 16:45
C. Imaging of chronic pancreatitis
N. Kartalis; *Stockholm/SE (nikolaos.kartalis@me.com)*
Learning objectives:
1. To understand the strengths and weaknesses of different imaging tools for the diagnosis of chronic pancreatitis.
2. To be aware of typical and atypical imaging findings in patients with chronic pancreatitis.
3. To learn about the pitfalls and how to avoid diagnostic mistakes in patients with chronic pancreatitis.
Author Disclosures:
N. Kartalis: nothing to disclose

RC 1601-4 17:07
D. Interventions in acute pancreatitis
M. Maher; *Dublin/IE (m.maher@ucc.ie)*
Learning objectives:
1. To recognise the techniques of interventions in acute pancreatitis.
2. To understand the indications of transgastral vs percutaneous drainage.
3. To learn how to avoid complications following pancreatic interventions.
Author Disclosures:
M. Maher: nothing to disclose

16:00 - 17:30 **Room F1**

State of the Art Symposium

SA 16

Hepatocellular carcinoma (HCC): the role of radiology

SA 16-1 16:00
Chairperson's introduction
F. Caseiro Alves*; Coimbra/PT (caseiroalves@gmail.com)*
Session objectives:
1. To discuss the role of radiologists in the management of patients with HCC.
2. To learn the imaging findings of HCC and the differentials.
3. To become familiar with treatment options.
Author Disclosures:
F. Caseiro Alves: nothing to disclose

SA 16-2 16:05
A clinician's perspective on the role of radiology in HCC: any room for improvement?
M.-A. Woerns*; Mainz/DE (marcus-alexander.woerns@unimedizin-mainz.de)*
Learning objectives:
1. To review how the clinician benefits from imaging in the management of patients with HCC.
2. To become familiar with the clinician's questions and the answers radiology may provide.
3. To learn from a clinician's perspective how radiologists can improve in their role in the management of patients with HCC.
Author Disclosures:
M.-A. Woerns: Advisory Board at Abbvie, Bayer, Bristol-Myers Squibb, Eisai, Ipsen, Roche Pharma, Speaker at Abbvie, Bayer, Bristol-Myers Squibb, Celgene, Gilead Science, Incyte, Ipsen, Janssen-Cilag, MSD Sharp & Dohme, Research/Grant Support at Abbvie, Ipsen

SA 16-3 16:20
Guidelines and beyond: the non-invasive diagnosis of HCC
C. B. Sirlin*; San Diego/US (csirlin@ucsd.edu)*
Learning objectives:
1. To understand similarities and differences in the current guidelines for the diagnosis of HCC worldwide.
2. To understand the algorithmic approach to imaging diagnosis: liver imaging reporting and data system (LI-RADS).
3. To review the pros and cons of the different systems.
Author Disclosures:
C. B. Sirlin: Consultant at Consultancy as representative of UC Regents: GE Healthcare, Bayer, AMRA, Fulcrum Therapeutics, IBM/Watson Health, Advisory Board at Advisory Board as representative of UC Regents: AMRA, Guerbet, Bristol Myers Squibb, Grant Recipient at Gilead, GE Healthcare, Siemens, GE MRI, Bayer, GE Digital, GE US, ACR Innovation, Philips, Celgene, Speaker at Speaking services, money deposited to UC Regents: GE Healthcare, Bayer , Other at Development of educational presentations or articles, money paid to UC Regents: Medscape, Resoundant, Research/Grant Support at Lab Service Agreements: Enanta, ICON Medical Imaging, Gilead, Shire, Virtualscopics, Intercept, Synageva, Takeda, Genzyme, Janssen, NuSirt, Celgene-Parexel, Organovo, Consultant at Independent Consulting: Epigenomics, Blade Therapeutics , Author at Royalty from educational article, paid to UC Regents: Wolters Kluwer Health (UpToDate Publishing): , Other at Development of educational presentations or articles, money paid to Claude Sirlin: Medscape, Board Member at SAR Board of Directors, no fees received, travel expenses reimbursed

SA 16-4 16:40
How to approach a small lesion in cirrhosis
G. Brancatelli*; Palermo/IT (gbranca@yahoo.com)*
Learning objectives:
1. To review typical and atypical forms of small HCC in the cirrhotic liver.
2. To describe the most common lesions and pseudolesions occurring in the cirrhotic liver beyond HCC.
3. To understand strategies to improve diagnosis of small lesions in the cirrhotic liver.
Author Disclosures:
G. Brancatelli: Consultant at Bayer, Speaker at Bayer, Other at General Electric, Other at Bracco

SA 16-5 17:00
How imaging can help choose treatment of HCC and the role of interventional radiology
V. Vilgrain*; Clichy/FR (valerie.vilgrain@aphp.fr)*
Learning objectives:
1. To learn the key factors for the treatment of HCC patients.
2. To understand the role of imaging in choosing treatment.
3. To become familiar with the role of interventional radiology in HCC.
Author Disclosures:
V. Vilgrain: Speaker at Hospital Beaujon

17:20
Panel discussion: How can we improve the diagnosis of HCC?

16:00 - 17:30 **Room on demand**
Room E or Room F2

Musculoskeletal

RC 1610

Musculoskeletal infection

Moderator:
M. Rupreht; Maribor/SI

RC 1610-1 16:00
A. Imaging osteomyelitis: an update
J. Fritz*; Baltimore, MD/US (janfritz777@gmail.com)*
Learning objectives:
1. To describe the role of imaging in diagnosing osteomyelitis.
2. To explain the role of intravenous contrast medium material in diagnosing osteomyelitis.
3. To list the differential diagnostic considerations in imaging osteomyelitis.
Author Disclosures:
J. Fritz: Research/Grant Support at Siemens Healthcare, Advisory Board at Siemens Healthcare, Advisory Board at GE Healthcare, Patent Holder at Siemens Healthcare, Patent Holder at Johns Hopkins University

RC 1610-2 16:30
B. Soft tissue infections
S. Martin*; Palma de Mallorca/ES (silvia.m.martin@gmail.com)*
Learning objectives:
1. To describe the role of imaging in soft tissue infections.
2. To explain the role of intravenous contrast medium material in diagnosing soft tissue infections.
3. To list the differential diagnostic considerations in imaging soft tissue infections.
Author Disclosures:
S. Martin Martin: nothing to disclose

RC 1610-3 17:00
C. Septic arthritis
R. K. Lalam*; Oswestry/UK (radhesh.lalam@nhs.net)*
Learning objectives:
1. To describe the role of imaging in septic arthritis.
2. To explain the role of intravenous contrast medium material in diagnosing septic arthritis.
3. To list the differential diagnostic considerations in imaging septic arthritis.
Author Disclosures:
R. K. Lalam: nothing to disclose

16:00 - 17:00 **Coffee & Talk 3**

Coffee & Talk (open forum) Session

C 32

How to advance the academic ladder

C 32-1 16:00
Chairperson's introduction
J. Sosna*; Jerusalem/IL (jacobs@hadassah.org.il)*
Session objectives:
1. To describe promotion tracks in academic radiology.
2. To present quality metrics in judging publications.
3. To highlight the importance of grants in the production of valuable research.
Author Disclosures:
J. Sosna: Consultant at Xact, Grant Recipient at Philips

C 32-2 16:05
Judging publications for academic promotions
L. Marti-Bonmati*; Valencia/ES (Luis.Marti@uv.es)*
Learning objectives:
1. To present how publications are judged in academic committees.
2. To describe bibliometric measures.
3. To emphasise the value of publications in academic radiology.
Author Disclosures:
L. Marti-Bonmati: nothing to disclose

C 32-3 16:15
Grants: importance for science and academia
G. P. Krestin*; Rotterdam/NL*
Learning objectives:
1. To describe the value of raising grants for performing research.
2. To present possible sources of funding and means for acquiring them.
3. To present how grant-raising is judged in universities.
Author Disclosures:
G. P. Krestin: Consultant at Bracco Imaging, Board Member at Quantib BV, Research/Grant Support at GEHC, Research/Grant Support at Bayer AG, Research/Grant Support at Siemens Healthineers

16:25
Open forum discussion

16:00 - 17:30 **da Vinci (Room D1)**

Vascular

RC 1615

Visceral arteries

RC 1615-1 16:00
Chairperson's introduction
J. A. Reekers*; Amsterdam/NL*
Session objectives:
1. To learn about incidence and aetiology of visceral arteries diseases.
2. To become familiar with clinical symptoms and evaluation in visceral arteries diseases.
3. To indicate the role of radiology in diagnosis and treatment of the visceral arteries.
Author Disclosures:
J. A. Reekers: disclosure/affirmation information not submitted

RC 1615-2 16:05
A. Diagnosis of abdominal vascular compression syndromes
B. E. Çil*; Istanbul/TR (bcil@kuh.ku.edu.tr)*
Learning objectives:
1. To become familiar with abdominal arterial and venous compression syndromes.
2. To learn about functional imaging techniques in assessment of vascular compression syndromes.
3. To become familiar with the typical imaging findings in abdominal compression syndromes and their clinical relevance.
Author Disclosures:
B. E. Çil: nothing to disclose

RC 1615-3 16:28
B. Acute and chronic mesenteric ischaemia
M. Zins*; Paris/FR (mzins@hpsj.fr)*
Learning objectives:
1. To become familiar with occlusive and non-occlusive mesenteric ischaemia.
2. To understand the differences between acute and chronic ischaemia.
3. To learn about the importance of fast and correct diagnosis in acute mesenteric ischaemia.
Author Disclosures:
M. Zins: nothing to disclose

RC 1615-4 16:51
C. Endovascular treatment of mesenteric ischaemia
R. A. Morgan*; London/UK (robert.morgan@stgeorges.nhs.uk)*
Learning objectives:
1. To review indications for endovascular treatment of mesenteric ischaemia.
2. To become familiar with the technical possibilities of endovascular repair of visceral arteries.
3. To learn about risks and complications of endovascular treatment of mesenteric ischaemia.
Author Disclosures:
R. A. Morgan: Speaker at Cook, Speaker at Bard

17:14
Panel discussion: Radiologists as the best case managers in acute and chronic mesenteric ischaemia

16:00 - 17:30 **Darwin (Room D2)**

Breast

RC 1602

Update on lesions with uncertain malignant potential (B3)

Moderator:
C. Van Ongeval; Leuven/BE

RC 1602-1 16:00
A. Wrap-up of the newest literature on the most important B3 lesions
Z. Varga*; Zurich/CH*
Learning objectives:
1. To know about the biological behaviour of the most important B3 lesions.
2. To understand the difference between B3a and B3b lesions.
3. To recognise the most worrisome entities.
Author Disclosures:
Z. Varga: nothing to disclose

RC 1602-2 16:30
B. Imaging lesions of uncertain potential
A. Linda*; Udine/IT (annalinda33@gmail.com)*
Learning objectives:
1. To become familiar with the most common imaging findings in B3 lesions.
2. To identify the most appropriate imaging modality.
3. To identify the factors that limit patient compliance to the management recommendations after a pathologic result of a high-risk breast lesion.
Author Disclosures:
A. Linda: nothing to disclose

RC 1602-3 17:00
C. How to handle them: update on B3 guidelines
N. Sharma*; Leeds/UK (Nisha.sharma2@nhs.net)*
Learning objectives:
1. To learn about the most recent international recommendations on the management of B3 lesions.
2. To differentiate between the results of a core needle and a vacuum assisted biopsy (VAB).
3. To be able to identify cases when VAB excision may pose a valid alternative to a surgical one.
Author Disclosures:
N. Sharma: nothing to disclose

16:00 - 17:30 **Descartes (Room D3)**

Radiographers

RC 1614

Practical computed tomography tips for radiographers

RC 1614-1/RC 1614-2 16:00
Chairpersons' introduction
H. Husejnagic*; Tuzla/BA*
J. Santos*; Coimbra/PT (joanasantos@estescoimbra.pt)*
Session objectives:
1. To understand the impact of CT scanner development on the radiographers' role.
2. To be aware of practical optimisation tips for routine CT examinations based on clinical indications in adults and children.
Author Disclosures:
H. Husejnagic: disclosure/affirmation information not submitted;
J. Santos: Speaker at ESTESC-IPC

RC 1614-3 16:06
A. The practical implications of CT scanner development: where we have come from and where we are now
D. Hribar*; Ljubljana/SI (dejan.hribar@kclj.si)*
Learning objectives:
1. To appreciate the developments in CT technology over time.
2. To understand the implications of technological advancements upon current clinical practice.
3. To be aware of key aspects of technology developments with which radiographers should be fully familiar.
Author Disclosures:
D. Hribar: Other at Siemens Healthineers

RC 1614-4 16:29
B. Practical tips for radiographers in CT scanning of the thorax and abdomen
S. D. Mørup*; Kolding/DK (sdmo@ucl.dk)*
Learning objectives:
1. To review CT examinations of the thorax and abdomen, and subsequent dose implications.
2. To be aware of recent research relevant to the optimisation of CT examination of the thorax and abdomen.
3. To understand key principles of optimisation for specific clinical indications when performing a CT examination of the thorax and abdomen.
Author Disclosures:
S. D. Mørup: nothing to disclose

RC 1614-5 16:52
C. Practical tips for radiographers when scanning paediatric imaging
B. Møller Christensen*; Jönköping/SE (berit.moller-christensen@ju.se)*
Learning objectives:
1. To review examinations that are routinely performed on paediatric patients.
2. To understand key evidence-based principles of optimisation and how these can be applied in routine practice.
3. To be aware of how European and international guidelines and legislation in different geographical jurisdictions should empower active optimisation in paediatric CT.
Author Disclosures:
B. Møller Christensen: nothing to disclose

17:15
Panel discussion: How can we ensure CT radiographers keep up to date with changes in CT technology?

16:00 - 17:30 **Room G**

Paediatric

RC 1612

Imaging in abdominal emergencies: an (evidence-based) update

Moderator:
C. de Lange; Oslo/NO

RC 1612-1 16:00
A. The acute abdomen in neonates
A. Coma*; Barcelona/ES (coma.ana@gmail.com)*
Learning objectives:
1. To learn about typical neonatal abdominal emergencies.
2. To understand the choice of modalities in acute abdomen emergencies in neonates.
3. To appreciate typical findings and 'red flag' features.
Author Disclosures:
A. Coma: nothing to disclose

RC 1612-2 16:30
B. The acute abdomen in young children
A. D. Calder*; London/UK (Alistair.Calder@gosh.nhs.uk)*
Learning objectives:
1. To learn about the causes of acute abdominal pain in children.
2. To understand the choice of imaging techniques and their limitations.
3. To appreciate typical radiological features of abdominal emergencies.
Author Disclosures:
A. D. Calder: nothing to disclose

RC 1612-3 17:00
C. Polytrauma: differences between adult and paediatric protocols
C. J. L. Eriksen*; Oslo/NO (cornelialind@gmail.com)*
Learning objectives:
1. To learn how paediatric trauma differs from adult trauma.
2. To understand how examination techniques and protocols must be tailored accordingly.
3. To appreciate the importance of multidisciplinary team collaboration in planning and conducting radiological investigations in a trauma setting.
Author Disclosures:
C. J. L. Eriksen: nothing to disclose

16:00 - 17:30 **Room K**

Cardiac

RC 1603

Dead or alive: imaging of myocardial viability

RC 1603-1 16:00
Chairperson's introduction
C. Peebles*; Southampton/UK (Charles.Peebles@uhs.nhs.uk)*
Session objectives:
1. To understand the concept of myocardial viability.
2. To understand the current state of the art to image myocardial viability.
3. To outline the role of echocardiography, single-photon emission computed tomography (SPECT), CT, and MRI.
Author Disclosures:
C. Peebles: nothing to disclose

RC 1603-2 16:05
A. MRI: why and when
T. Leiner*; Utrecht/NL (t.leiner@umcutrecht.nl)*
Learning objectives:
1. To learn about how MRI should be performed to assess viability.
2. To understand the strengths and weaknesses of MRI compared to other techniques.
3. To learn how to report MRI for viability assessment.

Author Disclosures:
T. Leiner: Research/Grant Support at Bayer Healthcare, Research/Grant Support at Philips Healthcare, Board Member at International Society for Magnetic Resonance in Medicine (ISMRM)

RC 1603-3 16:28
B. Hybrid imaging
F. Caobelli*; Basel/CH (federico.caobelli@usb.ch)*
Learning objectives:
1. To learn about how hybrid imaging should be performed to assess viability.
2. To understand the strengths and weaknesses of hybrid imaging compared to other techniques.
3. To understand how hybrid imaging could be developed in clinical practice.
Author Disclosures:
F. Caobelli: nothing to disclose

RC 1603-4 16:51
C. CT: how and why
F. Bamberg*; Freiburg/DE (fabian.bamberg@uni-tuebingen.de)*
Learning objectives:
1. To learn about the potential of CT to assess viability.
2. To understand the strengths and weaknesses of CT imaging compared to other techniques.
3. To understand how to report CT for viability assessment.
Author Disclosures:
F. Bamberg: Research/Grant Support at Siemens Healthineers, Research/Grant Support at Bayer Healthcare, Speaker at Siemens Healthineers, Speaker at Siemens Healthineers, Speaker at Bracco

17:14
Panel discussion: What imaging test for which patient?

16:00 - 17:30 **Room M 1**

E³ - ECR Master Class (Genitourinary)

E³ 1626b

Prostate MRI: the accreditation issue

E³ 1626b-1 16:00
Chairperson's introduction
J. Richenberg*; Brighton/UK (jonathan.richenberg@nhs.net)*
Session objectives:
1. To understand the emerging role of the multidisciplinary approach for prostate cancer.
2. To discuss the role of the radiologist in the multidisciplinary approach to prostate cancer.
3. To discuss the accreditation and certification issues for prostate imaging.
Author Disclosures:
J. Richenberg: nothing to disclose

E³ 1626b-2 16:05
A. Prostate MRI: minimum and optimal requirements
J. O. Barentsz*; Nijmegen/NL (Jelle.Barentsz@radboudumc.nl)*
Learning objectives:
1. To understand the minimum requirements for multiparametric MRI of prostate cancer.
2. To understand how to optimise MRI technique at 3T and 1.5T.
3. To review sequence parameters and scan optimisation for prostate imaging.
Author Disclosures:
J. O. Barentsz: Advisory Board at SPL Medical, Advisory Board at Soteria

E³ 1626b-3 16:28
B. Towards a European accreditation of prostate imaging centres
V. Løgager*; Herlev/DK (Vibeke.Loegager@regionh.dk)*
Learning objectives:
1. To learn about the role of the radiologist in the multidisciplinary approach for prostate cancer.
2. To discuss the requirements for a specialist prostate centre, with emphasis to the imaging issue.
3. To understand quality indicators for prostate MRI.
Author Disclosures:
V. Løgager: nothing to disclose

E³ 1626b-4 16:51
C. Towards a certified radiologist
H. C. Thoeny*; Fribourg/CH (Harriet.thoeny@h-fr.ch)*
Learning objectives:
1. To understand the need for a certified radiologist in a prostate unit.
2. To illustrate the level III European Training Curriculum for prostate imaging.
3. To discuss how to certify radiologists for prostate imaging.
Author Disclosures:
H. C. Thoeny: Advisory Board at Guerbet

17:14
Panel discussion: Prostate units: the radiologist must be in the core team

16:00 - 17:30 **Room M 2**

E³ - Advanced Course: How to Improve Your Expertise in Cardiothoracic Imaging

E³ 1619

Pulmonary embolism/pulmonary hypertension

E³ 1619-1 16:00
Chairperson's introduction
G. Aviram*; Tel-Aviv/IL (aviramgalit@hotmail.com)*
Session objectives:
1. To review the current controversies regarding pulmonary embolism diagnosis.
2. To review the role of CT in pulmonary hypertension.
3. To appreciate the need for defining a standardised management.
Author Disclosures:
G. Aviram: Research/Grant Support at Philips Healthcare

E³ 1619-2 16:06
A. Diagnosis of acute pulmonary embolism (PE)
M.-P. Revel*; Paris/FR (marie-pierre.revel@aphp.fr)*
Learning objectives:
1. To review the role of clinical probability scores and D-dimer assessment.
2. To learn about tips and tricks to optimise arterial opacification on CT.
3. To learn about key features to report in acute PE.
Author Disclosures:
M.-P. Revel: Other at GUERBET

E³ 1619-3 16:34
B. Pulmonary hypertension
A. P. Parkar*; Bergen/NO (apparkar@gmail.com)*
Learning objectives:
1. To become familiar with the causes of pulmonary hypertension.
2. To learn about the radiological presentation of pulmonary artery hypertension.
3. To understand how imaging helps patient management.
Author Disclosures:
A. P. Parkar: nothing to disclose

E³ 1619-4 17:02
C. The heart in pulmonary hypertension
K.-F. Kreitner*; Mainz/DE (karl-friedrich.kreitner@unimedizin-mainz.de)*
Learning objectives:
1. To learn about cardiac causes of pulmonary hypertension.
2. To become familiar with cardiac assessment in pulmonary hypertension.
3. To recognise the prognostic importance of right ventricle dysfunction in pulmonary hypertension.
Author Disclosures:
K.-F. Kreitner: nothing to disclose

16:00 - 17:30 **Room M 3**

E³ - Rising Stars Programme: Basic Session

BS 16

The importance of good patient positioning in imaging

Moderator:
A. Ohmstede; Oldenburg/DE

BS 16-1 16:00
Positioning tips and tricks for musculoskeletal radiography
J. Jensen*; Odense/DK*
Learning objectives:
1. To understand how correct positioning is assessed.
2. To understand the impact of incorrect patient positioning on radiation dose and image quality.
3. To highlight appropriate actions to correct poor positioning.
Author Disclosures:
J. Jensen: nothing to disclose

BS 16-2 16:25
Positioning tips and tricks for CT
R. Booij*; Rotterdam/NL (r.booij@erasmusmc.nl)*
Learning objectives:
1. To become familiar with the impact on image quality and radiation exposure due to the isocenter in CT.
2. To be aware of tools to adapt protocols according to clinical indications.
3. To understand the impact of patient positioning in image post-processing.
Author Disclosures:
R. Booij: Research/Grant Support at Siemens Healthineers

BS 16-3 16:50
Positioning tips and tricks for MRI
C. Malamateniou*; London/UK (christina.malamateniou@city.ac.uk)*
Learning objectives:
1. To understand the importance of appropriate coil positioning as part of sequence optimisation.
2. To understand the importance of careful patient positioning in terms of image quality, diagnostic accuracy, and reproducibility.
3. To be aware of further positioning considerations for claustrophobic, paediatric, and other patient groups.
Author Disclosures:
C. Malamateniou: nothing to disclose

17:15
Panel discussion: The importance of patient positioning: do we have to go back to basics?

16:00 - 17:30 **Room M 4**

Transatlantic Course of ESR and RSNA (Radiological Society of North America): Stroke Imaging and Endovascular Treatment: Now and the Future

TC 1628

The future strategy for stroke thrombectomy

Moderators:
J.-P. Pruvo; Lille/FR
R. Uberoi; Oxford/UK
A. Vagal; Cincinnati, OH/US

TC 1628-1 16:00
A. Addressing workforce needs: who and how to train specialists
H. van Overhagen*; Den Haag, ZH/NL (hansvo@xs4all.nl)*
Learning objectives:
1. To learn about the number and type of specialists trained.
2. To understand the global organisation of stroke interventionists and neurologists.
3. To appreciate the future potential number of cases.
Author Disclosures:
H. van Overhagen: nothing to disclose

TC 1628-2 16:30
B. The future for stroke thrombectomy: what is next?
M. V. Jayaraman*; Providence, RI/US (MJayaraman@Lifespan.org)*
Learning objectives:
1. To learn about the subgroups that were not studied in the recent stroke trials.
2. To understand about use of artificial intelligence in stroke.
3. To become familiar with use of artificial intelligence in stroke.
Author Disclosures:
M. V. Jayaraman: nothing to disclose

TC 1628-3 17:00
C. New innovations in stroke thrombectomy techniques and technology
K. A. Hausegger*; Klagenfurt/AT (klaus.hausegger@kabeg.at)*
Learning objectives:
1. To understand the limitations of current devices and techniques.
2. To appreciate the evolution in stroke thrombectomy technology.
3. To understand how the different devices and techniques may improve outcomes.
Author Disclosures:
K. A. Hausegger: nothing to disclose

16:00 - 17:30 **Room M 5**

E³ - Advanced Course: Hot Topics in GU Cancer

E³ 1622

Early detection of ovarian cancer

E³ 1622-1 16:00
Chairperson's introduction
R. Forstner*; Salzburg/AT (r.forstner@salk.at)*
Author Disclosures:
R. Forstner: nothing to disclose

E³ 1622-2/ **E³ 1622-3** 16:15
A. Current guidance on screening and familial ovarian cancer
A. George*; London/UK (angela.george@rmh.nhs.uk)*
A. Rockall*; London/UK (a.rockall@imperial.ac.uk)*
Learning objectives:
1. To be aware of the implications of the results of recent screening trials.
2. To be aware of breast cancer (BRCA) gene testing and treatment implications.
3. To know the guidance on screening high risk groups.
Author Disclosures:
A. George: Advisory Board at Astra Zeneca, Tesaro/GSK, Roche, Speaker at Astra Zeneca, Tesaro/GSK, Roche, Clovis;
A. Rockall: Speaker at Guerbet

E³ 1622-4 16:40
B. Ultrasound in ovarian tumours: the role of pattern recognition, IOTA, and O-RADS
J. Yazbek*; London/UK (joseph.yazbek@nhs.net)*
Learning objectives:
1. To explore various methods used in the ultrasound assessment of adnexal masses.
2. To understand a new lexicon for ovarian/adnexal mass evaluation on ultrasound.
3. To explore the clinical application of the lexicon and the development of a risk stratification and management system.
Author Disclosures:
J. Yazbek: nothing to disclose

E³ 1622-5 17:05
C. O-RADS: MRI
I. Thomassin-Naggara*; Paris/FR (isabellethomassin@gmail.com)*
Learning objectives:
1. To understand a new lexicon for ovarian/adnexal mass evaluation on MRI.
2. To understand the use of the lexicon in the development of a risk stratification and management system.
3. To apply O-RADS-MRI to case management.
Author Disclosures:
I. Thomassin-Naggara: Speaker at General Electric, Advisory Board at Siemens, Speaker at Canon, Research/Grant Support at General Electric, Research/Grant Support at Canon, Speaker at Guerbet, Speaker at Hologic

16:00 - 17:30 **Tech Gate Auditorium**

ESR Ultrasound Subcommittee Session

US 16

Ultrasound-guided interventional procedures: new techniques and applications

Moderator:
D.-A. A. Clevert; Munich/DE

US 16-1 16:00
Liver
E. Leen*; London/UK*
Learning objectives:
1. To learn about the new results and applications of ultrasound in guided interventional procedures: liver malignancy biopsy, primary liver malignancy ablation, secondary liver malignancy ablation.
2. To understand consolidated and new indications of ultrasound-guided interventional procedures: PEI, RFA, MWA, IRE.
3. To appreciate the accuracy of ultrasound-guided interventional procedures from consolidated to new applications: analysis of data from personal experiences and literature series comparison and discussion.
4. To become familiar with the new techniques of ultrasound guidance and the new diagnostic and therapeutic indications for ultrasound-guided interventional procedures: CEUS imaging, fusion imaging, elastosonographic imaging for liver malignancy biopsy and treatment, MWA, IRE, combination treatment.
Author Disclosures:
E. Leen: disclosure/affirmation information not submitted

US 16-2 16:15
Pancreas
M. D'onofrio*; Verona/IT (mirko.donofrio@univr.it)*
Learning objectives:
1. To learn about new results and applications of ultrasound-guided interventional procedures: pancreatic
malignancy FNA and biopsy, primary pancreatic malignancy ablation.
2. To understand consolidated and new indications of ultrasound-guided interventional procedures: FNA and biopsy, RFA.
3. To appreciate the accuracy of ultrasound-guided interventional procedures from consolidated to new applications: analysis of data from personal experiences and literature series comparison and discussion.
4. To become familiar with the new techniques of ultrasound guidance and with the new diagnostic and therapeutic indications for ultrasound-guided interventional procedures: CEUS imaging, fusion imaging, elastosonographic imaging for pancreatic malignancy biopsy and treatment, RFA, MWA, IRE, combination treatment.
Author Disclosures:
M. D'onofrio: Speaker at Siemens, Speaker at Hitachi, Speaker at Bracco, Advisory Board at Siemens, Research/Grant Support at Hitachi

US 16-3 16:30
Kidney
J.-M. Correas*; Paris/FR*
Learning objectives:
1. To learn about new results and applications of ultrasound-guided interventional procedures: renal malignancy FNA and biopsy, primary renal malignancy ablation.
2. To understand consolidated and new indications of ultrasound-guided interventional procedures: FNA and biopsy, RFA.
3. To appreciate the accuracy of ultrasound-guided interventional procedures from consolidated to new applications: analysis of data from personal experiences and literature series comparison and discussion.
4. To become familiar with the new techniques of ultrasound guidance and with the new diagnostic and therapeutic indications for ultrasound-guided interventional procedures: CEUS imaging, fusion imaging, elastosonographic imaging for renal malignancy biopsy and treatment, RFA, cryoablation, MWA, combination treatment.
Author Disclosures:
J.-M. Correas: disclosure/affirmation information not submitted

US 16-4 16:45
Thyroid
G. Mauri*; Milan/IT (vanni.mauri@gmail.com)*
Learning objectives:
1. To learn about new results and applications of ultrasound-guided interventional procedures: thyroid malignancy FNA, thyroid nodule ablation.
2. To understand consolidated and new indications of ultrasound-guided interventional procedures: FNA, RFA.
3. To appreciate the accuracy of ultrasound-guided interventional procedures from consolidated to new applications: analysis of data from personal experiences and literature series comparison and discussion.
4. To become familiar with the new techniques of ultrasound guidance and with the new diagnostic and therapeutic indications for ultrasound-guided interventional procedures: CEUS imaging, fusion imaging, elastosonographic imaging for thyroid malignancy FNA.
Author Disclosures:
G. Mauri: Consultant at Elesta SrL

US 16-5 17:00
Vascular
D.-A. A. Clevert*; Munich/DE (Dirk.Clevert@med.uni-muenchen.de)*
Learning objectives:
1. To learn about new results and application of ultrasound-guided vascular interventional procedures.
2. To understand consolidated and new indications to ultrasound-guided vascular interventional procedures.
3. To become familiar with the new techniques of ultrasound guidance and with the new diagnostic and therapeutic indications for ultrasound vascular interventional procedures: CEUS imaging and fusion imaging.
Author Disclosures:
D.-A. A. Clevert: Speaker at Bracco, Siemens, Philips, Samsung, Advisory Board at Philips, Samsung

17:15
Panel discussion: How to be prepared for ultrasound-guided interventions?

Sunday, March 15

08:30 - 09:30 **Room B**

E³ - The Beauty of Basic Knowledge: Breast

E³ 24E

How to deal with common clinical breast symptoms

Moderators:
G. Forrai; Budapest/HU
K. Kinkel; Chêne-Bougeries/CH

E³ 24E-1 08:30
The acute painful breast
M. Lesaru*; Bucharest/RO (m.lesaru@gmail.com)*
Learning objectives:
1. To learn about the choice of imaging modality.
2. To understand management options and treatment of common breast lesions causing pain, including mastitis.
Author Disclosures:
M. Lesaru: nothing to disclose

E³ 24E-2 09:00
How to manage nipple discharge
I. Thomassin-Naggara*; Paris/FR (isabellethomassin@gmail.com)*
Learning objectives:
1. To identify causes of nipple discharge unrelated to the breast or physiology.
2. To learn about the choice and sequence of imaging modalities to identify breast lesions causing nipple discharge.
3. To understand the spectrum of common benign and malignant breast lesions in relationship to nipple discharge.
Author Disclosures:
I. Thomassin-Naggara: Advisory Board at Siemens, Speaker at GE, Speaker at Canon, Research/Grant Support at GE, Research/Grant Support at Canon, Speaker at Guerbet, Speaker at Hologic

08:30 - 09:30 **Room C**

E³ - The Beauty of Basic Knowledge: Pancreas

E³ 25E

Pancreatic adenocarcinoma mimickers

Moderator:
R. Negrelli; Verona/IT

E³ 25E-1 08:30
Autoimmune pancreatitis
R. Manfredi*; Rome/IT (riccardo.manfredi@unicatt.it)*
Learning objectives:
1. To learn about autoimmune pancreatitis.
2. To understand imaging findings of pancreatic adenocarcinoma mimickers.
3. To appreciate differential diagnosis criteria for pancreatic adenocarcinoma.
Author Disclosures:
R. Manfredi: Speaker at Bracco

E³ 25E-2 09:00
Paraduodenal pancreatitis
G. Morana*; Treviso/IT (giovanni.morana@aulss2.veneto.it)*
Learning objectives:
1. To learn about autoimmune paraduodenal pancreatitis.
2. To understand imaging findings of paraduodenal pancreatitis.
3. To appreciate differential diagnosis criteria for paraduodenal pancreatitis.
Author Disclosures:
G. Morana: Speaker at BRACCO

08:30 - 10:00 **Room N**

Physics in Medical Imaging

RC 1713

Dose management in paediatric radiology

RC 1713-1 08:30
Chairperson's introduction
C. Saidlear*; Dublin/IE (colm.saidlear@cuh.ie)*
Session objectives:
1. To become familiar with modern dose management methods in paediatric radiology.
2. To understand the important aspects of paediatric dose management.
3. To appreciate the current trends and limitations.
Author Disclosures:
C. Saidlear: nothing to disclose

RC 1713-2 08:35
A. The special case of the paediatric patient: risks and justification
C. Owens*; London/UK (owens.catherine.5@gmail.com)*
Learning objectives:
1. To learn about risks and justification techniques in paediatric radiology.
2. To understand how these methods are applied in a clinical setting.
3. To appreciate the benefits of new information and the current limitations.
Author Disclosures:
C. Owens: Consultant at Sidra Medicine

RC 1713-3 08:58
B. Optimisation and technology in neonate and paediatric CT scanning
P. Nowik*; Stockholm/SE (patrik.nowik@ki.se)*
Learning objectives:
1. To review the dose assessment and dose management methods in paediatric CT imaging.
2. To understand the technical possibilities for CT optimisation between different vendors.
3. To learn how to implement optimisation in protocol management and at the multiprofessional team level.
Author Disclosures:
P. Nowik: Consultant at Siemens Healthcare Sweden

RC 1713-4 09:21
C. Optimisation and technology in neonate and paediatric projection radiography (PR) and interventional radiology (IR)
H. Delis*; Patras/GR (hdelis@gmail.com)*
Learning objectives:
1. To understand the dose management and technical optimisation methods in paediatric PR.
2. To understand the dose management and technical optimisation methods in paediatric IR.
3. To learn how to implement optimisation in protocol management and at the multiprofessional team level.
Author Disclosures:
H. Delis: nothing to disclose

09:44
Panel discussion: Paediatric dose management: are we doing enough for the next generation?

08:30 - 10:00 **Studio 2020**

Special Focus Session

SF 17a

Colorectal liver metastasis: treatment planning and management

SF 17a-1 08:30
Chairperson's introduction
O. Akhan*; Ankara/TR (akhano@tr.net)*
Session objectives:
1. To mention the clinical importance of colorectal cancer (CRC) liver metastasis.
2. To describe the best diagnostic methods for both the diagnosis and treatment decision.
3. To make an overview on the treatment options.
4. To discuss the importance of combined therapies.
Author Disclosures:
O. Akhan: nothing to disclose

SF 17a-2 08:34
Surgeon's perspective: what is needed?
J. Conneely*; Dublin/IE*
Learning objectives:
1. To underline what a surgeon would like to know from diagnostic radiologists.
2. To teach which surgical treatment options we have.
3. To discuss the role of surgery for treatment through comparing or combining with the other options.
Author Disclosures:
J. Conneely: disclosure/affirmation information not submitted

SF 17a-3 08:52
Radiologist's perspective: what should be shown?
D. Miletic*; Rijeka/HR (damir.miletic@medri.hr)*
Learning objectives:
1. To describe the best techniques and their indications for diagnosis.
2. To teach important radiological features for diagnosis and treatment decision.
3. To teach how the patients are evaluated after treatment.
Author Disclosures:
D. Miletic: nothing to disclose

SF 17a-4 09:10
Interventional radiology in oncology perspective: which therapies are recommended?
R. Iezzi*; Rome/IT (roberto.iezzi@policlinicogemelli.it)*
Learning objectives:
1. To mention the interventional radiological treatment options and the role of local ablation alternatives.
2. To teach the role of transarterial treatment alternatives and their results.
3. To discuss the importance of combined therapies.
Author Disclosures:
R. Iezzi: Advisory Board at Terumo, Guerbet, Speaker at Terumo, Pharmacept, Bracco

SF 17a-5 09:28
Immunotherapy and the role of the radiologist
J. Podgorska*; Warsaw/PL (jpodgo@gmail.com)*
Learning objectives:
1. To understand the mechanisms of actions of immunotherapy.
2. To recognise different patterns of response to immunotherapy.
3. To be aware of adverse reactions related to novel drugs.
Author Disclosures:
J. Podgorska: Investigator at TG THERAPEUTICS, ICON CLINICAL RESEARCH LIMITED, MSD POLSKA SP. Z O.O., IQVIA RDS EASTERN HOLDINGS GMBH, Speaker at GE MEDICAL SYSTEMS POLSKA, Siemens Healthcare Sp. z o.o.

09:46
Panel discussion: The role of diagnostic and interventional radiology in diagnosis and management of colorectal liver metastasis

08:30 - 10:00 **Room F1**

E^3 - Advanced Course: Interactive Teaching Session for Young (and not so Young) Radiologists

E^3 1721

Neuroradiology: paediatric and adult

E^3 1721-1 08:30
A. Imaging in epilepsy: how to scan and find the suspect
M. Okujava*; Tbilisi/GE (okujava@gmx.net)*
Learning objectives:
1. To describe best imaging protocols when considering the patient's age.
2. To review common epileptogenic lesions and their imaging features.
3. To define contributions from advanced imaging.
Author Disclosures:
M. Okujava: nothing to disclose

E^3 1721-2 09:15
B. Imaging in movement disorders: keeping up with the neurologist
H. K. Karli Oğuz*; Ankara/TR (kaderkarlioguz@gmail.com)*
Learning objectives:
1. To review common movement disorders and basic mechanisms.
2. To define the role of radiologic examinations and review ideal imaging protocols.
3. To review diagnostic radiologic patterns in classified movement disorders
Author Disclosures:
H. K. Karli Oğuz: nothing to disclose

08:30 - 10:00 **Room F2**

Musculoskeletal

RC 1710

Muscle oedema, injury and atrophy

Moderator:
M. F. Reiser; Munich/DE

RC 1710-1 08:30
A. Non-infectious causes of muscle inflammation and muscle injury due to nerve entrapment
N. Mamisch-Saupe*; Zurich/CH (nsaupe@hotmail.com)*
Learning objectives:
1. To explain the non-infectious causes of muscle inflammation and muscle injury due to nerve entrapment.
2. To describe the imaging findings of non-infectious causes of muscle inflammation and muscle injury due to nerve entrapment.
Author Disclosures:
N. Mamisch-Saupe: Speaker at Hirslanden Clinic Zurich

RC 1710-2 09:00
B. Traumatic and overuse injuries of the muscles
F. Kainberger*; Vienna/AT (franz.kainberger@meduniwien.ac.at)*
Learning objectives:
1. To explain the pathophysiology of overuse injuries of the muscles.
2. To describe the imaging findings of overuse injuries of the muscles.
Author Disclosures:
F. Kainberger: nothing to disclose

RC 1710-3 09:30
C. Sarcopenia: more than just atrophy
V. Vasilevska Nikodinovska*; Skopje/MK (v_vasilevska@yahoo.com)*
Learning objectives:
1. To describe the emerging concept of sarcopenia.
2. To explain how imaging modalities are used in the diagnosis and management of sarcopenia.
Author Disclosures:
V. Vasilevska Nikodinovska: nothing to disclose

08:30 - 10:00 **da Vinci (Room D1)**

Professional Challenges Session

PC 17

Challenges facing the radiology workforce

PC 17-1 08:30
Chairperson's introduction
S. Morozov*; Moscow/RU (morozov@npcmr.ru)*
Session objectives:
1. To learn about the challenges of radiology today.
2. To appreciate the value of subspecialisation and its risks to radiology as a general discipline.
3. To understand the need for interdisciplinary and inter-professional cooperation.
Author Disclosures:
S. Morozov: Speaker at Siemens, CEO at Moscow CDT, Advisory Board at Agfa

PC 17-2 08:36
Strategies to overcome radiologists shortage including "turf battles - a friend or a foe?", teleradiology, artificial technology, delegation to radiographers
N. Dugar*; Doncaster/UK (Neelam.Dugar@gmail.com)*
Learning objectives:
1. To learn about the different situations across Europe.
2. To appreciate the potential of supportive solutions.
3. To understand the opportunities and threads of delegation.
Author Disclosures:
N. Dugar: nothing to disclose

PC 17-3 08:54
Education and training challenges
C. Catalano*; Rome/IT (carlo.catalano@uniroma1.it)*
Learning objectives:
1. To learn about the differences in concepts for education and training across Europe.
2. To appreciate the potential of efficient education and training in radiology.
3. To understand the need for appropriate support to implement education and training structures.
Author Disclosures:
C. Catalano: nothing to disclose

PC 17-4 09:12
Challenges and opportunities with subspecialisation in radiology
C. D. Becker*; Geneva/CH*
Learning objectives:
1. To learn about the spectrum of highly subspecialised radiology.
2. To appreciate the potential of subspecialisation.
3. To understand the risks for radiology from turf battles (or not providing specialised services).
Author Disclosures:
C. D. Becker: nothing to disclose

PC 17-5 09:30
Radiologists' workload and risks for burnout
B. Forster*; Vancouver/CA (bruce.forster@vch.ca)*
Learning objectives:
1. To learn about typical administrative tasks and physician/manager balance.
2. To understand the value of analytics and efficiency optimisation.
3. To appreciate the support by business and management experts in radiology departments.
Author Disclosures:
B. Forster: Shareholder at Canada Diagnostic Centres, Grant Recipient at SECTRA AB; Remuneration of travel expenses as educational speaker

09:48
Panel discussion: Is radiology at risk due to shortages, subspecialisation and other challenges?

08:30 - 10:00 **Darwin (Room D2)**

Radiographers

RC 1714

Leadership and management in radiography

RC 1714-1/RC 1714-2 08:30
Chairpersons' introduction
F. Birsasteanu*; Timisoara/RO*
T. Starc*; Brezovica/SI*

Session objectives:
1. To appreciate the key principles for all current and future radiographer leaders.
2. To discuss the impact of quality leadership within profession and within departments.
Author Disclosures:
F. Birsasteanu: disclosure/affirmation information not submitted;
T. Starc: nothing to disclose

RC 1714-3 08:36
A. Effective communication: a key leadership and management tool
J. M. Nightingale*; Sheffield/UK (J.Nightingale@shu.ac.uk)*
Learning objectives:
1. To be aware of the theories underpinning effective communication.
2. To understand the meaning and impact of effective communication within radiography practice.
3. To explore which steps can be taken to improve communication techniques.
Author Disclosures:
J. M. Nightingale: nothing to disclose

RC 1714-4 08:59
B. Leading change: key considerations and tools to motivate radiography teams in quality management
Z. Läänelaid*; Tartu/EE*
Learning objectives:
1. To understand the key principles of change management.
2. To be familiar with motivators relevant to radiography teams.
3. To become aware of practical tips to support radiographers responsible for change within their professional roles.
Author Disclosures:
Z. Läänelaid: disclosure/affirmation information not submitted

RC 1714-5 09:22
C. Inclusive leadership: equality, diversity and inclusion
L. A. Rainford*; Dublin/IE (louise.rainford@ucd.ie)*
Learning objectives:
1. To understand the breadth of which radiographers should reflect on inclusivity in the profession.
2. To be familiar with the changing landscape of inclusivity in academic and clinical environments.
3. To be familiar with specific initiatives, guidelines, and directives driving improvements in inclusivity through inclusive leadership.
Author Disclosures:
L. A. Rainford: nothing to disclose

09:45
Panel discussion: Developing future radiographer leaders: what support do current clinical and academic leaders need?

08:30 - 10:00 **Descartes (Room D3)**

Oncologic Imaging

RC 1716

Tumour response assessment in abdominal imaging

Moderator:
O. V. Kucheruk; Moscow/RU

RC 1716-1 08:30
A. Size-based assessment: metrics and pitfalls
M. D'Anastasi*; Msida/MT (melvin.a.danastasi@gov.mt)*
Learning objectives:
1. To learn about the current size-based assessment concepts.
2. To understand classification strategies, including response evaluation criteria in solid tumours (RECIST).
3. To discuss potential pitfalls of treatment response assessment based on tumour size.
Author Disclosures:
M. D'Anastasi: Advisory Board at Keosys Medical Imaging

RC 1716-2 08:52
B. Diffusion weighted imaging (DWI) and dynamic contrast-enhancement (DCE): opportunities
D.-M. Koh*; London/UK*
Learning objectives:
1. To become familiar with the rationale of DWI and DCE images for tumour response assessment.
2. To learn about the application of functional imaging strategies in abdominal imaging.
3. To consider an integration of DWI and DCE in classification systems.
Author Disclosures:
D.-M. Koh: nothing to disclose

RC 1716-3 09:15
C. Nuclear medicine and molecular approaches
C. C. Cyran*; Munich/DE (clemens.cyran@med.uni-muenchen.de)*
Learning objectives:
1. To appreciate basic concepts of nuclear medicine for response monitoring.
2. To learn about different radiotracers for abdominal tumours.
3. To discuss quantitative assessment strategies from nuclear medicine.
Author Disclosures:
C. C. Cyran: Consultant at Sandoz, Speaker at Goetz Partners Ltd

RC 1716-4 09:37
D. Immunotherapy and imaging
D. Regge*; Candiolo-Torino/IT (daniele.regge@ircc.it)*
Learning objectives:
1. To learn about current aspects of immunotherapy in tumour response assessment.
2. To discuss strategies for quantitative tumour monitoring in abdominal imaging.
3. To become familiar with the pitfalls in imaging the response to immunotherapy.
Author Disclosures:
D. Regge: Speaker at GE Medical Systems

08:30 - 10:00 **Room G**

New Horizons Session

NH 17

MRI of the future

NH 17-1 08:30
Chairperson's introduction
F. A. Gallagher*; Cambridge/UK (fag1000@cam.ac.uk)*
Session objectives:
1. To provide an overview of recent advances in MRI.
2. To discuss potential clinical applications.
3. To explain the challenges in translating these new approaches into patient care.
Author Disclosures:
F. A. Gallagher: Grant Recipient at GSK, Grant Recipient at GE Healthcare

NH 17-2 08:35
Is there a future for gadolinium-based contrast agents?
O. Clement*; Paris/FR (olivier.clement@aphp.fr)*
Learning objectives:
1. To discuss the risks of gadolinium-based contrast agents.
2. To learn about the role of targeted gadolinium agents.
3. To learn about new MRI contrast agents.
Author Disclosures:
O. Clement: Speaker at Bracco, Speaker at Bayer, Grant Recipient at Guerbet

NH 17-3 08:50
High field MRI: is higher better and is there a limit?
S. Trattnig*; Vienna/AT (siegfried.trattnig@meduniwien.ac.at)*
Learning objectives:
1. To discuss the advantages of high field MRI.
2. To learn about the challenges of using high field imaging.
3. To consider potential clinical roles for high field MRI.
Author Disclosures:
S. Trattnig: nothing to disclose

NH 17-4 09:05
Novel MRI contrast methods: CEST, hyperpolarisation
S. Aime*; Turin/IT (silvio.aime@unito.it)*
Learning objectives:
1. To present novel methods to generate MRI contrast.
2. To understand the underlying biology.
3. To consider potential clinical applications in the future.
Author Disclosures:
S. Aime: nothing to disclose

NH 17-5 09:20
Quantitative MRI: fingerprinting and beyond
V. Gulani*; n/a*
Learning objectives:
1. To understand the principles underlying magnetic resonance fingerprinting (MRF).
2. To learn how the method can be applied clinically.
3. To discuss potential roles of MRF in healthcare.
Author Disclosures:
V. Gulani: disclosure/affirmation information not submitted

NH 17-6 09:35
Matrix in vision: non-invasive imaging of the extracellular matrix
B. Hamm*; Berlin/DE*
Learning objectives:
1. To learn about the extracellular matrix as an imaging target.
2. To understand the role of molecular imaging.
3. To understand the role of magnetic resonance elastography.
Author Disclosures:
B. Hamm: disclosure/affirmation information not submitted

09:50
Panel discussion: What are the promising emerging areas in MRI?

08:30 - 10:00 **Room K**

E³ - European Diploma Prep Session

E³ 1723

Gynaecology and obstetrics

E³ 1723-1 08:30
Chairperson's introduction
M. Bekiesinska-Figatowska*; Warsaw/PL (m.figatowska@mp.pl)*
Session objectives:
1. To understand the imaging presentation of the most common benign and malignant disorders of the uterus.
2. To become familiar with inflammatory and neoplastic disorders of the adnexa.
3. To understand the imaging features of acute gynaecological disorders and of acute diseases in pregnancy.
Author Disclosures:
M. Bekiesinska-Figatowska: nothing to disclose

E³ 1723-2 08:36
A. Imaging of the uterus
R. A. Kubik-Huch*; Baden/CH (rahel.kubik@ksb.ch)*
Learning objectives:
1. To comprehend the imaging anatomy of the uterus and its changes throughout life and during pregnancy.
2. To understand typical imaging features and the local imaging-based staging of cervical cancer.
3. To become familiar with the typical imaging features of benign disorders of the uterus, especially uterine leiomyomas, adenomyosis, and endometriosis.
Author Disclosures:
R. A. Kubik-Huch: nothing to disclose

E³ 1723-3 09:04
B. Disorders of the adnexa
R. Forstner*; Salzburg/AT (r.forstner@salk.at)*
Learning objectives:
1. To describe the imaging features of benign tumours of the ovaries.
2. To understand the diagnostic evaluation and imaging features of malignant tumours of the ovaries.
3. To identify imaging features in regard to the stage and extent of adnexal tumours.
4. To become familiar with the imaging features useful for differentiating adnexal masses.
Author Disclosures:
R. Forstner: nothing to disclose

E³ 1723-4 09:32
C. Acute gynaecological and obstetric disorders
G. Masselli*; Rome/IT (gabriele.masselli@uniroma1.it)*
Learning objectives:
1. To become familiar with the typical and atypical imaging features of acute disorders of the uterus.
2. To understand the common emergencies associated with acute gynaecological disorders, including ectopic pregnancy, placenta previa, and emergencies related to abortion.
Author Disclosures:
G. Masselli: nothing to disclose

08:30 - 10:00 **Room M 2**

E³ - ECR Master Class (Emergency Imaging)

E³ 1726

Post-treatment emergencies in oncologic patients

E³ 1726-1 08:30
Chairperson's introduction: The role of imaging in the early detection of complications in oncologically treated patients
N.N.

Session objectives:
1. To learn about different approaches in modern tumour therapy.
2. To understand the radiological appearance of complications following treatment in oncologic patients.
3. To appreciate the role of different imaging modalities in further management of patients.
Author Disclosures: -

E³ 1726-2 08:35
A. Chest
S. Bommart*; Montpellier/FR (s-bommart@chu-montpellier.fr)*
Learning objectives:
1. To become familiar with the modern approach to malignant chest tumour therapy.
2. To learn how to differentiate clinically important complications.
3. To understand how to look for early signs of severe and urgent conditions.
Author Disclosures:
S. Bommart: nothing to disclose

E³ 1726-3 09:00
B. Abdomen
R. Basilico*; Chieti/IT (raffaellabasilico@gmail.com)*
Learning objectives:
1. To learn about different therapies used in abdominal tumours.
2. To become familiar with possible complications.
3. To understand the effectiveness of imaging modalities in the evaluation of emergent complications.
Author Disclosures:
R. Basilico: nothing to disclose

E³ 1726-4 09:25
C. How can interventional radiologists help in the management of oncological treatment complications?
K. K. Pyra*; Lublin/PL (k.pyra@poczta.fm)*
Learning objectives:
1. To be aware of the importance of early detection of treatment associated complications in oncological therapy.
2. To learn which tumour therapy complications can be treated with interventional radiology.
3. To be familiar with interventional techniques used in the treatment of complications of different tumour therapies.
Author Disclosures:
K. K. Pyra: Speaker at Medical University of Lublin

09:50
Panel discussion: What is the impact of complication findings on the continued management of oncologic patients?

08:30 - 10:00 **Room M 3**

E³ - Rising Stars Programme: Basic Session

BS 17

Communication as a safety tool

Moderator:
A. Santos; Coimbra/PT

BS 17-1 08:30
The relevance of patient communication
U. L. Jakobsen*; Odense M/DK (ulja1@ucl.dk)*
Learning objectives:
1. To understand the need for effective communication to guarantee the appropriate examination of the correct patient.
2. To become familiar with various communication techniques to increase patient cooperation.
3. To be aware of the potential of communication to enhance the quality of patient services.
Author Disclosures:
U. L. Jakobsen: nothing to disclose

BS 17-2 08:55
Communication of radiation risk
J. L. Portelli*; Msida/MT (jonathan.portelli@um.edu.mt)*
Learning objectives:
1. To become familiar with practical tips to support effective patient risk communication.
2. To be aware of the risk communication challenges for vulnerable patients.
3. To understand the obligations of communicating risk under EU legislation.
Author Disclosures:
J. L. Portelli: nothing to disclose

BS 17-3 09:20
Radiographers as communication role models
D. Toonen-Bok*; Groningen/NL*
Learning objectives:
1. To become familiar with models of communication.
2. To be aware of radiographers' appropriate attitudes and posture as a means of communication.
3. To be aware of how to develop and promote an optimal communication training setting for students.
Author Disclosures:
D. Toonen-Bok: Speaker at Hanzehogeschool

09:45
Panel discussion: Communication as a tool to improve the patient experience: how can we build an effective communication culture?

08:30 - 10:00 **Room M 4**

Special Focus Session

SF 17b
When stroke happens in children

SF 17b-1 08:30
Chairperson's introduction
M. Argyropoulou*; Ioannina/GR (margyrop@cc.uoi.gr)*
Session objectives:
1. To learn about the aetiology and imaging features of stroke in children.
2. To learn about the imaging protocols for stroke in children.
3. To discuss the optimal diagnostic and treatment pathway when stroke happens in children.
Author Disclosures:
M. Argyropoulou: nothing to disclose

SF 17b-2 08:35
Stroke in neonates
M. H. Lequin*; Rotterdam/NL (m.h.lequin@umcutrecht.nl)*
Learning objectives:
1. To learn about the indications for neonatal stroke imaging.
2. To discuss the role of ultrasonography and MRI in neonatal stroke imaging.
3. To understand the different imaging patterns in neonatal stroke and their prognostic implications.
Author Disclosures:
M. H. Lequin: Speaker at UMCU

SF 17b-3 09:00
Stroke in older children
T. von Kalle*; Stuttgart/DE (t.vonkalle@klinikum-stuttgart.de)*
Learning objectives:
1. To learn about the imaging protocols used in older children presenting with stroke.
2. To discuss the aetiologies of stroke in older children.
3. To understand the stroke imaging patterns and their prognostic implications in older children.
Author Disclosures:
T. von Kalle: nothing to disclose

SF 17b-4 09:25
Interventional radiology in paediatric stroke
O. Naggara*; Paris/FR*
Learning objectives:
1. To discuss the indications for interventions in paediatric stroke.
2. To learn about the techniques used in interventional radiology for paediatric stroke.
3. To understand the limitations and risks of interventions in children with stroke.
Author Disclosures:
O. Naggara: disclosure/affirmation information not submitted

09:50
Panel discussion: How to organise stroke care related to age?

08:30 - 10:00 **Room M 5**

E³ - Advanced Course: Hot Topics in GU Cancer

E³ 1722
Early detection of prostate cancer

E³ 1722-1 08:30
Chairperson's introduction
A. Stanzione*; Naples/IT (arnaldostanzione@yahoo.it)*
Author Disclosures:
A. Stanzione: nothing to disclose

E³ 1722-2/E³ 1722-3 08:45
A. Screening for prostate cancer: where are we now?
S. A. Sohaib*; Sutton/UK*
A. George*; London/UK (angela.george@rmh.nhs.uk)*
Learning objectives:
1. To be aware of important prostate cancer genetics and familial cancer.
2. To learn about the difference in low risk vs high risk genetic groups.
3. To be aware of the use of imaging and other biomarkers.
Author Disclosures:
S. A. Sohaib: nothing to disclose;
A. George: Advisory Board at Astra Zeneca, Tesaro/GSK, Roche, Speaker at Astra Zeneca, Tesaro/GSK, Roche, Clovis

E³ 1722-4 09:10
B. Pre-biopsy detection and new techniques for detection in prostate cancer
S. Punwani*; London/UK*
Learning objectives:
1. To understand the role of multi-parametric magnetic resonance imaging (mpMRI) in tumour detection.
2. To be aware of texture features of prostate cancer.
3. To learn how texture analysis differentiates benign from malignant prostate lesions.
Author Disclosures:
S. Punwani: disclosure/affirmation information not submitted

E³ 1722-5 09:35
C. Active surveillance: best practice
J. J. Futterer*; Nijmegen/NL (jurgenfutterer@gmail.com)*
Learning objectives:
1. To be familiar with case selection for active surveillance.
2. To know the frequency of imaging.
3. To understand when treatment will be commenced.
Author Disclosures:
J. J. Futterer: nothing to disclose

08:30 - 10:00 **Tech Gate Auditorium**

Cardiac

RC 1703

Cardiac imaging in structural heart disease

RC 1703-1 08:30
Chairperson's introduction
L. Natale*; Rome/IT (luigi.natale@unicatt.it)*
Session objectives:
1. To become familiar with the concept of "structural" heart disease in modern cardiovascular medicine.
2. To get an overview about the minimally invasive treatment possibilities in structural heart diseases.
3. To learn about the requirements and possibilities of modern cardiac imaging in structural heart diseases.
Author Disclosures:
L. Natale: nothing to disclose

RC 1703-2 08:35
A. CT-guided planning of minimally invasive procedures
R. Salgado*; Antwerp/BE (r.salgado@outlook.com)*
Learning objectives:
1. To learn about the requirements prior to minimally invasive valvular repair and other diseases.
2. To outline the most appropriate imaging protocols.
3. To gain insights into future developments in devices and minimally invasive treatments.
Author Disclosures:
R. Salgado: nothing to disclose

RC 1703-3 08:58
B. Defining the optimal time to treat valvular heart disease: role of MRI
A. Redheuil*; Paris/FR*
Learning objectives:
1. To outline the clinical problem and approach treatment decision-making in valvular heart disease.
2. To become familiar with the MRI derived imaging biomarkers in valvular heart disease.
3. To discuss the possible future role of MRI in outcome prediction in valvular heart disease.
Author Disclosures:
A. Redheuil: disclosure/affirmation information not submitted

RC 1703-4 09:21
C. Follow-up after minimally invasive valvular repair
H. Alkadhi*; Zurich/CH*
Learning objectives:
1. To become familiar with the appropriate imaging technique after minimally invasive valvular repair.
2. To learn about the different devices currently used in treatment of structural heart disease.
3. To become familiar with the normal outcomes and most common procedural complications.
Author Disclosures:
H. Alkadhi: nothing to disclose

09:44
Panel discussion: How to face the challenges of the increasing demand for imaging evaluation in structural heart disease

10:30 - 12:00 **Room B**

E³ - Rising Stars Programme: Basic Session

BS 18

Cardiothoracic emergencies

Moderator:
A. Santa; Sibiu/RO

BS 18-1 10:30
Acute aortic syndrome
T. Jargiello*; Lublin/PL (tojarg@interia.pl)*
Learning objectives:
1. To become familiar with the most common aetiologies of acute aortic diseases.
2. To present current imaging techniques for evaluation of acute aortic diseases.
3. To demonstrate the most important imaging findings.
Author Disclosures:
T. Jargiello: nothing to disclose

BS 18-2 11:00
Pulmonary embolism
I. Vlahos*; London/UK*
Learning objectives:
1. To review the most common pathologies leading to pulmonary embolism.
2. To present current imaging techniques for evaluation of pulmonary embolism.
3. To become familiar with the typical findings in acute and chronic pulmonary embolism.
Author Disclosures:
I. Vlahos: Consultant at Previously: GE Healthcare (not current), Consultant at Previously: Siemens Healthcare (not current)

BS 18-3 11:30
Acute coronary syndrome
R. M. M. Hinzpeter*; Zurich/CH (Ricarda.Hinzpeter@usz.ch)*
Learning objectives:
1. To become familiar with segmental coronary anatomy.
2. To present different techniques for assessment of acute coronary syndrome.
3. To become familiar with the typical findings of acute coronary syndrome.
Author Disclosures:
R. M. M. Hinzpeter: nothing to disclose

10:30 - 12:00 **Room N**

EuroSafe Imaging Session

EU 18

Artificial intelligence for dose optimisation

Moderator:
M. Kortesniemi; Hus/FI

EU 18-1 10:30
Chairperson's introduction
M. Fachet*; Magdeburg/DE (melanie.fachet@ovgu.de)*
Session objectives:
1. To understand how artificial intelligence (AI) can help in radiation dose optimisation in medical imaging.
2. To learn about practical use cases of AI applications for radiation dose optimisation in medical imaging.
3. To appreciate potential challenges associated with the implementation of AI applications for radiation dose optimisation in medical imaging.
Author Disclosures:
M. Fachet: nothing to disclose

EU 18-2 10:35
Technology using AI for radiation protection
M. Kortesniemi*; Hus/FI (mika.kortesniemi@hus.fi)*

Learning objectives:
1. To understand the revised process of radiation protection and optimisation.
2. To understand the need for more comprehensive imaging quality data extending to the clinical level.
3. To learn how radiomics and AI may help in more clinically adjusted and quantitative optimisation.
Author Disclosures:
M. Kortesniemi: nothing to disclose

EU 18-3 10:55
What is the limit of dose reduction by artificial intelligence methods: 2D and 3D?
C. Hoeschen*; Magdeburg/DE*
Learning objectives:
1. To name a number of very drastic claims of dose reduction using AI in x-ray based imaging.
2. To show that AI methods will, for diagnostic purposes, be limited based on physical information theory aspects, and why some approaches seem to be able to go beyond due to methodological errors.
3. To learn exemplary methods on how to detect methodological errors and construct test cases for ensuring to avoid such errors in your own research.
Author Disclosures:
C. Hoeschen: disclosure/affirmation information not submitted

EU 18-4 11:15
Chances and limitations of AI for nuclear medical imaging
C. Hoeschen*; Magdeburg/DE*
Learning objectives:
1. To understand the nuclear imaging processes and to identify in which steps AI can be of help.
2. To focus on some selected applications, e.g. towards reduction of the administered dose or costs of scanners.
3. To analyse possible drawbacks and bottlenecks.
Author Disclosures:
C. Hoeschen: disclosure/affirmation information not submitted

11:35
Panel discussion: Towards AI for dose optimisation in medical imaging: where are we using it in clinical practice?

10:30 - 12:00 **Room O**

Abdominal Viscera

RC 1801
Imaging of the biliary system

Moderator:
P. K. Prassopoulos; Thessaloniki/GR

RC 1801-1 10:30
A. Magnetic resonance cholangiopancreatography (MRCP): state of the art
C. Matos*; Lisbon/PT*
Learning objectives:
1. To know the different techniques of MRCP including their advantages and disadvantages.
2. To discuss differences of MRCP at 1.5T and 3.0T.
3. To understand how to deal with pitfalls in MRCP.
Author Disclosures:
C. Matos: nothing to disclose

RC 1801-2 11:00
B. Primary sclerosing cholangitis (PSC)
G. Morana*; Treviso/IT (giovanni.morana@aulss2.veneto.it)*
Learning objectives:
1. To be aware of the pathophysiological background of PSC.
2. To learn about typical and atypical imaging features of PSC.
3. To understand follow-up imaging strategies in patients with PSC.
Author Disclosures:
G. Morana: Speaker at BRACCO

RC 1801-3 11:30
C. Biliary drainage and stenting
T. K. Helmberger*; Munich/DE (Thomas.Helmberger@muenchen-klinik.de)*
Learning objectives:
1. To understand the access routes for biliary drainage and stenting.
2. To be aware of pitfalls and complications during and after biliary interventions.
3. To know the strengths and shortcomings of different imaging techniques for therapeutic control and follow-up examinations.
Author Disclosures:
T. K. Helmberger: nothing to disclose

10:30 - 12:00 **Studio 2020**

Neuro

RC 1811
State-of-the-art paediatric neuroradiology

RC 1811-1 10:30
Chairperson's introduction
M. C. Çalli*; Izmir/TR (cem.calli@gmail.com)*
Session objectives:
1. To list the spectrum of applications and indications for imaging in paediatric neuroradiology.
2. To apply the appropriate image acquisition protocols for diseases in the field.
3. To appreciate the clinical relevance of imaging for the diagnostic process of neurological disorders in infants and children.
Author Disclosures:
M. C. Çalli: nothing to disclose

RC 1811-2 10:35
A. Imaging myelin maturation disorders
F. Triulzi*; Milano (MI)/IT (fabio.triulzi@unimi.it)*
Learning objectives:
1. To describe normal and pathological patterns of myelination.
2. To understand the role of imaging with respect to narrowing the differential diagnosis and supporting the clinical diagnosis.
3. To appreciate the importance of pattern recognition for the diagnosis of myelination disorders in children.
Author Disclosures:
F. Triulzi: nothing to disclose

RC 1811-3 10:58
B. Imaging of developmental disorders
B. B. Ertl-Wagner*; Toronto, ON/CA (BirgitBetina.Ertl-Wagner@sickkids.ca)*
Learning objectives:
1. To describe the spectrum of developmental disorders of the brain.
2. To understand the key imaging features that lead to the correct diagnosis.
3. To appreciate the importance of making a correct imaging diagnosis.
Author Disclosures:
B. B. Ertl-Wagner: Spouse/Partner at employee of Siemens Healthineers

RC 1811-4 11:21
C. Imaging in paediatric neuro-oncology
G. Morana*; Genoa/IT (giomorana@yahoo.it)*
Learning objectives:
1. To learn about the spectrum of neuro-oncological diseases in children.
2. To understand the role of imaging beyond the diagnostic process.
3. To appreciate the increasing clinical relevance of advanced imaging techniques in paediatric neuro-oncology.
Author Disclosures:
G. Morana: nothing to disclose

11:44
Panel discussion: Ask the expert: what is relevant for my own daily clinical practice?

10:15 - 12:15 **Room E**

E³ - Rising Stars Programme: Case-Based Diagnosis Training

CB
Case-Based Diagnosis Training

Moderators:
S. Robinson; Vienna/AT
K. M. Friedrich; Vienna/AT

CB-1 10:15
Liver
F. Caseiro Alves; *Coimbra/PT (caseiroalves@gmail.com)*
Author Disclosures:
F. Caseiro Alves: nothing to disclose

CB-2 10:24
Neuro
D. Prayer; *Vienna/AT (daniela.prayer@meduniwien.ac.at)*
Author Disclosures:
D. Prayer: nothing to disclose

CB-3 10:33
Musculoskeletal
F. Kainberger; *Vienna/AT (franz.kainberger@meduniwien.ac.at)*
Author Disclosures:
F. Kainberger: nothing to disclose

CB-4 10:42
Maxillofacial
S. Robinson; *Vienna/AT (s.robinson@dzu.at)*
Author Disclosures:
S. Robinson: nothing to disclose

CB-5 10:51
Genitourinary
M. Toepker; *Vienna/AT (mt@dz10.at)*
Author Disclosures:
M. Toepker: nothing to disclose

CB-6 11:00
Interlude: Air in the wrong place
B. Özgen Mocan; *Chicago, IL/US (burcem@gmail.com)*
Author Disclosures:
B. Özgen Mocan: nothing to disclose

CB-7 11:30
Head and neck
C. Czerny; *Vienna/AT (christian.czerny@meduniwien.ac.at)*
Author Disclosures:
C. Czerny: nothing to disclose

CB-8 11:39
Chest
H. Prosch; *Vienna/AT (helmut.prosch@meduniwien.ac.at)*
Author Disclosures:
H. Prosch: nothing to disclose

CB-9 11:48
Spine
K. M. Friedrich; *Vienna/AT*
Author Disclosures:
K. M. Friedrich: nothing to disclose

CB-10 11:57
Gastrointestinal
W. Schima; *Vienna/AT (wolfgang.schima@khgh.at)*
Author Disclosures:
W. Schima: nothing to disclose

CB-11 12:06
Breast
M. Fuchsjäger; *Graz/AT (michael.fuchsjaeger@medunigraz.at)*
Author Disclosures:
M. Fuchsjäger: nothing to disclose

10:30 - 12:00 **Room F1**

E³ - Advanced Course: Interactive Teaching Session for Young (and not so Young) Radiologists

E³ 1821a
Cardiac imaging: an update

E³ 1821a-1 10:30
A. Coronary artery disease - reporting and data system (CAD-RADS): a new tool for reporting coronary CT angiograms (CTAs)
B. Szilveszter; *Budapest/HU (szilveszter.balint@gmail.com)*
Learning objectives:
1. To be familiar with standardised reporting of coronary CTA findings.
2. To know the impact of CAD-RADS in management and treatment.
Author Disclosures:
B. Szilveszter: nothing to disclose

E³ 1821a-2 11:15
B. Athlete's heart
J. Bogaert; *Leuven/BE (Jan.Bogaert@uzleuven.be)*
Learning objectives:
1. To learn about the different entities that cause left ventricular thickening.
2. To understand the role of the different techniques in the study of this patients.
Author Disclosures:
J. Bogaert: nothing to disclose

10:30 - 11:30 **Coffee & Talk 3**

Coffee & Talk (open forum) Session
Organised by the ESR Subcommittee on PIER

C 33
Guidance for IT in radiology: how radiologist can benefit from DIAM (Digital Imaging Adoption Model)

C 33-1 10:30
Chairperson's introduction
L. Donoso; *Barcelona/ES (ldonoso@clinic.cat)*
Session objectives:
1. To explain the relevance of IT in radiology.
2. To provide an overview of criteria for benchmarking.
3. To discuss the role of audit tools like DIAM.
Author Disclosures:
L. Donoso: Advisory Board at Context Flow, Advisory Board at Methinks, Advisory Board at Affidea, Shareholder at Vivo Diagnostico

C 33-2 10:35
Overview and update on DIAM radiology
P. Mildenberger; *Mainz/DE (mildenbe@uni-mainz.de)*
Learning objectives:
1. To explain the methodology of DIAM radiology.
2. To provide examples of departments' experiences with DIAM radiology.
3. To discuss further opportunities for DIAM radiology.
Author Disclosures:
P. Mildenberger: nothing to disclose

C 33-3 10:45
Overview and international experiences with DIAM enterprise imaging (EI)
J. Studzinski; *Leipzig/DE (jstudzinski@himssanalytics.eu)*
Learning objectives:
1. To explain the methodology of DIAM EI.
2. To provide examples of departments' experiences with DIAM EI.
3. To discuss further opportunities for DIAM EI.
Author Disclosures:
J. Studzinski: nothing to disclose

C 33-4 10:55
The value of DIAM Gap analyses
P. Hoogland; *Utrecht/NL (phoogland@phit.nl)*
Learning objectives:
1. To explain the value of DIAM in consulting radiology departments and national screening programmes.
2. To showcase the benefit of DIAM as a strategic tool for IT development.
3. To discuss the value of DIAM Gap analyses.
Author Disclosures:
P. Hoogland: nothing to disclose

11:05
Open forum discussion: DIAM radiology or DIAM enterprise imaging, which one to go for?

10:30 - 12:00 **da Vinci (Room D1)**

Paediatric

RC 1812

Imaging of frequent queries in children: an evidence-based approach

RC 1812-1 10:30
Chairperson's introduction
S. Franchi-Abella; *Le Kremlin-Bicêtre/FR (stephanie.franchi@aphp.fr)*
Session objectives:
1. To learn about four common queries for radiological investigations in children.
2. To understand the evidence-based indication for imaging and the choice of imaging modalities in these queries.
3. To discuss the importance of good collaboration with the referring clinician when selecting children for imaging and potential further workup in these queries.
Author Disclosures:
S. Franchi-Abella: nothing to disclose

RC 1812-2 10:35
A. Abdominal pain: constipation and beyond
I. Robinson; *Dublin/IE (ihwrobinson@hotmail.com)*
Learning objectives:
1. To learn about the most common causes of chronic abdominal pain in children.
2. To understand indications for imaging and choice of imaging modalities in paediatric abdominal pain.
3. To appreciate typical findings and 'red flag' features.
Author Disclosures:
I. Robinson: nothing to disclose

RC 1812-3 10:53
B. Respiratory tract infections
P. Ciet; *Rotterdam/NL (p.ciet@erasmusmc.nl)*
Learning objectives:
1. To learn about the role of imaging in childhood respiratory tract infections.
2. To understand the indications and limitations for radiography, CT, and ultrasound.
3. To discuss typical radiological findings and their clinical implications in a child with a respiratory tract infection.
Author Disclosures:
P. Ciet: Grant Recipient at Italian Cystic Fibrosis Foundation, Patent Holder at Erasmus MC - MRI diaphragm, Consultant at Vertex Pharmaceutical

RC 1812-4 11:11
C. Large and small heads: when and how to image
U. Y. Ayaz; *Mersin/TR (umityasarayaz@yahoo.com)*
Learning objectives:
1. To learn the indications for imaging in deviating head circumference.
2. To understand examination techniques and imaging algorithms.
3. To appreciate the most common pathologies and their clinical implications.
Author Disclosures:
U. Y. Ayaz: nothing to disclose

RC 1812-5 11:29
D. The limping child
I. Barber Martinez; *Esplugues de Llobregat (Barcelona)/ES (ibarber@sjdhospitalbarcelona.org)*
Learning objectives:
1. To learn about the most important differential diagnosis in a limping child.
2. To understand indications for imaging and choice of imaging modalities in a child with a limp.
3. To appreciate the most important findings and 'red flag' features.
Author Disclosures:
I. Barber Martinez: nothing to disclose

11:47
Panel discussion: The requisites for usual paediatric indications

10:30 - 12:00 **Darwin (Room D2)**

Oncologic Imaging

RC 1816

Functional and molecular imaging techniques in oncology: how to use them in routine practice

RC 1816-1 10:30
Chairperson's introduction: What are the problems of morphologic evaluation
L. Marti-Bonmati; *Valencia/ES (Luis.Marti@uv.es)*
Session objectives:
1. To address the limitations of morphological imaging modalities.
2. To introduce the basic concepts of functional imaging in oncology.
3. To learn the current status of these techniques in routine clinical practice.
Author Disclosures:
L. Marti-Bonmati: nothing to disclose

RC 1816-2 10:35
A. CT perfusion techniques
H. Schoellnast; *Graz/AT*
Learning objectives:
1. To learn about current approaches to CT perfusion.
2. To understand the basic principles behind each technique.
3. To discuss radiation exposure from CT perfusion techniques.
4. To appreciate the clinical usefulness of these techniques in routine clinical practice.
Author Disclosures:
H. Schoellnast: nothing to disclose

RC 1816-3 10:58
B. Functional MRI techniques
V. Goh; *London/UK (vicky.goh@kcl.ac.uk)*
Learning objectives:
1. To learn about different functional MRI techniques, such as diffusion and perfusion.
2. To understand the basic principles behind each technique.
3. To appreciate the clinical usefulness of these techniques in routine clinical practice.
Author Disclosures:
V. Goh: Research/Grant Support at Siemens, Speaker at Siemens

RC 1816-4 11:21
C. Assessment by molecular imaging
J. Grimm; *New York/US (grimmj@mskcc.org)*

Learning objectives:
1. To learn about the basic concepts in molecular imaging.
2. To understand how molecular imaging might be integrated into patient care.
3. To discuss clinical examples of where molecular imaging is already established in clinical practice.
Author Disclosures:
J. Grimm: nothing to disclose

11:44
Panel discussion: Where are we using functional evaluations in clinical practice?

10:30 - 12:00 **Descartes (Room D3)**

Musculoskeletal

RC 1810

Elbow imaging: from detailed anatomy to pathology

Moderator:
A. B. Rosskopf; Zurich/CH

RC 1810-1 10:30
A. The medial and lateral epicondyle
M. C. de Jonge*; Amsterdam/NL (milkodejonge@gmail.com)*
Learning objectives:
1. To explain the anatomical considerations and pathophysiology of abnormalities that involve the medial and lateral epicondyles of the humerus.
2. To describe the imaging findings of abnormalities that involve the medial and lateral epicondyles of the humerus.
Author Disclosures:
M. C. de Jonge: nothing to disclose

RC 1810-2 11:00
B. Biceps and triceps
A. Tagliafico*; Genoa/IT (albertotagliafico@gmail.com)*
Learning objectives:
1. To explain the anatomical considerations and pathophysiology of abnormalities that involve the biceps and triceps brachii.
2. To describe the imaging findings of abnormalities that involves the biceps and triceps brachii.
Author Disclosures:
A. Tagliafico: nothing to disclose

RC 1810-3 11:30
C. Plicae and articular cartilage
A. Alcala-Galiano Rubio*; Madrid/ES (andrearoob@hotmail.com)*
Learning objectives:
1. To explain the anatomical considerations and pathophysiology of abnormalities that involve the elbow plicae and articular cartilage.
2. To describe the imaging findings of abnormalities that involve the elbow plicae and articular cartilage.
Author Disclosures:
A. Alcala-Galiano Rubio: nothing to disclose

10:30 - 12:00 **Room K**

Genitourinary

RC 1807

Contrast media: acute kidney injury and acute adverse reactions

RC 1807-1 10:30
Chairperson's introduction
M.-F. Bellin*; Le Kremlin-Bicêtre/FR*
Session objectives:
1. To learn about emergent issues regarding the safe use of contrast media.
2. To understand the mechanisms underlying acute reactions and renal function deterioration after contrast media injection.
3. To provide evidence-based recommendations for safe use of contrast media and for the management of acute reactions.
Author Disclosures:
M.-F. Bellin: Board Member at IRSN Institut de Radioprotection et Sureté Nucléaire

RC 1807-2 10:35
A. Post-contrast acute kidney injury (PC-AKI)
A. J. van der Molen*; Leiden/NL*
Learning objectives:
1. To understand the definition of PC-AKI.
2. To learn about the possible causes for PC-AKI.
3. To review current evidence regarding PC-AKI.
Author Disclosures:
A. J. van der Molen: Speaker at Bayer Healthcare, Other at Thieme Verlag

RC 1807-3 11:00
B. Iodine-based contrast media in myeloma patients
G. Heinz*; St. Pölten/AT (gertraud.heinz@stpoelten.lknoe.at)*
Learning objectives:
1. To learn about the relationships between iodine-based contrast media and myeloma.
2. To understand the mechanisms of AKI in myeloma patients.

Joint Session of the ESR and EORTC

ESR/EORTC

Advanced imaging for stratifying treatment in oligometastatic prostate cancer

Moderator:
N. deSouza; Surrey/UK

ESR/EORTC-1 10:30
Chairperson's introduction
F. Lecouvet*; Brussels/BE (frederic.lecouvet@uclouvain.be)*
Session objectives:
1. To highlight the role of imaging for detecting oligometastatic prostate cancer.
2. To introduce image-based treatment stratification.
3. To introduce the speakers.
Author Disclosures:
F. Lecouvet: nothing to disclose

ESR/EORTC-2 10:36
Prostate cancer: managing the oligometastatic patient
M. Spahn*; Zurich/CH*

Learning objectives:
1. To learn about the classification of oligometastatic prostate cancer.
2. To appreciate the local and systemic management options for patients with oligometastatic prostate cancer.
3. To understand the impact on the outcome by stratifying patients for treatment.
Author Disclosures:
M. Spahn: nothing to disclose

ESR/EORTC-3 10:59
Whole-body MRI: is it ready for prime time to detect oligometastatic prostate cancer?
F. D. de Keyzer*; Leuven/BE (frederik.de.keyzer@hotmail.be)*
Learning objectives:
1. To learn about whole-body MRI: how to optimise the technique.
2. To appreciate the technical challenges and limitations of the technique in prostate cancer patients.
3. To understand how the output may be quantified and assessed.
Author Disclosures:
F. D. de Keyzer: nothing to disclose

ESR/EORTC-4 11:22
Molecular imaging for directing and delivering therapy in oligometastatic prostate cancer
D. E. Oprea-Lager*; Amsterdam/NL (d_e_oprea@yahoo.com)*
Learning objectives:
1. To learn about targeted imaging and radionuclide therapy in oligometastatic prostate cancer.
2. To appreciate how molecular imaging may be used to stratify therapy.
3. To understand how to devise trials that establish an evidence-based use of modern imaging techniques.
Author Disclosures:

Upgrading to significant disease with monitoring prostate MRI scans and repeat biopsy in men on active surveillance for low-risk prostate cancer: are confirmatory biopsies still necessary?
D. F. Osses, F.-J. Drost, J. F. M. Verbeek, M. J. Roobol, I. G. Schoots; *Rotterdam/NL (i.schoots@erasmusmc.nl)*

Purpose: To investigate whether serial prostate magnetic resonance imaging (MRI) may guide the utility of repeat targeted (TBx) and systematic biopsy (SBx) in monitoring men with low-risk prostate cancer (PCa) at one year in active surveillance (AS).
Methods and materials: We included 111 consecutive men with low-risk (ISUP grade 1) PCa who received protocolled repeat MRIs with or without TBx and repeat SBx at one-year AS. TBx was performed in PI-RADS score ≥3 lesions. Upgrading defined as ISUP grade ≥2 PCa (I), grade ≥2 PCa with cribriform growth/intraductal carcinoma (II), and grade ≥3 PCa (III) was investigated.
Results: Upgrading (I) was 32% (35/111). Upgrading in MRI-positive and MRI-negative men was 48% (30/63) and 10% (5/48) (p<0.001), respectively. In MRI-positive men, upgrading was 23% (7/30) by TBx only and 33% (10/30) by SBx only. Progressive change (PRECISE score 4-5) on positive MRI was observed in 27% (17/63). Upgrading (I) occurred in 41% (7/17) of these men, which was 50% (23/46) in men without progressive change (PRECISE score 1-3) on positive MRI (p=0.534). Upgrading (II) was 15% (17/111). Upgrading in MRI-positive and MRI-negative men was 22% (14/63) and 6% (3/48) (p=0.021), respectively. Upgrading (III) was 5% (5/111). Upgrading in MRI-positive and MRI-negative men was 6% (4/63) and 2% (1/48) (p=0.283), respectively.
Conclusion: In serial MRI-negative men, the added value of repeat SBx at one-year surveillance is limited and should be balanced individually against the harms. In serial MRI-positive men, the added value of repeat SBx is substantial. SBx should be performed together with TBx in all MRI-positive men at one-year surveillance. Biopsy should not be omitted in men without progressive disease on positive MRI.

ECE score: a new MRI scale to evaluate and stratify the risk of extracapsular extension in patients with prostate cancer
S. Varello, M. Gatti, F. Gentile, I. Ruggirello, L. Allois, A. Carisio, C. Dianzani, P. Fonio, R. Faletti; *Turin/IT (sara.varello@gmail.com)*

Purpose: To analyse the performance of different prostate imaging features associated with prostate cancer (PCa) extracapsular extension (ECE) in order to develop an ECE-score.
Methods and materials: A retrospective study on 114 patients who underwent multiparameter prostate MRI (mp-MRI) at 1.5Tesla using a 32 phased-array coil before radical prostatectomy was conducted. mp-MRIs were analysed for the length of contact between PCa and the prostatic capsule, capsule irregularity, bulge, loss of capsule, neurovascular bundle thickening, measurable extra-capsular disease, and DWI signal increase in extra-capsular location, and ADC value and PSA density were calculated. The data was analysed with a parametric test and 5 diagnostic parameters. A threshold of 90% in specificity and positive predictive value was used to distinguish between major and minor criteria. The ECE-score was tested with the ROC curve procedure.
Results: ECE was found at histopathological review in 41 patients (ECE+). Capsule irregularity, bulge, loss of capsule, neurovascular bundle thickening, DWI signal increase in extra-capsular location, and measurable extra-capsular disease had a highly significant difference between ECE+ and others (p<0.0001). Capsule irregularity, bulge, and loss of capsule were included in the minor criteria and neurovascular bundle thickening and DWI signal increase in the extra-capsular location were included in the major criteria. The ECE-score was equal to 1 for the presence of 0 criteria, 2 for 1 minor, 3 for 2 minor, 4 for 3 minor or 1 major, and 5 for 2 major criteria or the presence of measurable extra-capsular disease. The ROC curve procedure established the good ability of the ECE-score to discriminate ECE+ with an AUC of 0.93 (0.87-0.98).
Conclusion: The ECE-score proposed can improve the detection of ECE and allow for more accurate staging, providing important additional information for optimal patient-tailored treatment planning.
Limitations: A monocentric and retrospective study. The absence of interobserver variability.
Ethics committee approval: n/a
Funding: No funding was received for this work.

Influence of the minimum b-value on prostate cancer assessment using conventional DWI and DKI models
N. Adubeiro[1], L. Nogueira[1], R. G. Nunes[2], H. A. Ferreira[2], E. F. C. Ribeiro[1], J. M. La Fuente[1]; *[1]Porto/PT, [2]Lisbon/PT (nca.estsp@gmail.com)*

Purpose: To investigate the influence of the minimum b-value in diffusion parameters estimated for prostate tissues using mono-exponential and kurtosis models.
Methods and materials: 58 patients were prospectively enrolled to perform magnetic resonance imaging of the prostate at 3.0T. A diffusion-weighted sequence using 11 b-values ranging from 0-2,000 s/mm^2 was used.
Mono-exponential and kurtosis models were fitted to the diffusion signal. 6 different b-value combinations were used to estimate the apparent diffusion coefficient (ADC) while varying the minimum b-value (0, 50, 100, 150, 200, and 500 s/mm^2) and b-values up to 1,100 s/mm^2. Diffusion kurtosis imaging (DKI) metrics were computed using b-values ranging from 0-2,000 s/mm^2 and considering the same minimum b-values.
The Mann-Whitney test was used to assess differences in diffusion metrics between prostate cancer (PCa) and normal tissue. Differences in b-value combinations were assessed with the Friedman test. Receiver operating characteristics curves were performed for each metric.
Results: ADC and the mean diffusivity (MD) were significantly lower and the mean kurtosis (MK) was significantly higher (p<0.001) in PCa compared to normal tissue for all b-values combinations.
MK did not change with the minimum b-value for normal tissue or PCa (p>0.05), but ADC and MD differed significantly.
The MK metric achieved the highest AUC (96.0%) and accuracy (93.8%) using all b-values (0-2,000 s/mm^2) but the diagnostic performance was not statistically improved when compared to ADC or MD.
Conclusion: MK values were not influenced by the chosen low b-value, indicating that microperfusion effects do not influence MK, contrarily to ADC and MD.
The diagnostic performances of ADC, MD, and MK were similar.
Limitations: Prostate lesions were confirmed by transrectal ultrasound-guided biopsy.
Ethics committee approval: Approved by the hospital ethics committee [number 251/12 (190-DEFI/195-CES)] and all patients gave written informed consent.

Characterising the appearance of clinically significant prostate cancer on pre-surgical MRI in a radiopathomic study

M. Rusu, C. Kunder, R. Fan, R. West, P. Ghanouni, J. Brooks, G. Sonn; *Stanford/US (mirabela.rusu@stanford.edu)*

Purpose: Magnetic resonance imaging (MRI) has great potential to improve prostate cancer diagnosis. Yet, the subtle differences between low-grade cancers, high-grade cancers, and benign conditions render the interpretation of prostate MRI challenging. We propose to characterise the radiologic appearance of clinically significant (Gleason group >2) prostate cancers on a multi-parametric MRI. We are focusing on patients that underwent radical prostatectomy and had pre-surgical MRIs.
Methods and materials: We aligned the radiology and histopathology images using our RAPSODI platform that registers corresponding histopathology and MRI slices, assuming slice-to-slice correspondences. The labels obtained were used in a radiomic study that relies on the established QIFP platform (http://qifp.stanford.edu) in which 900 textural and morphologic features were computed for each lesion. Our study included 20 patients for which Gleason grades were outlined on 1-2 histopathology slices.
Results: Preliminary results showed statistically significant differences between Gleason groups ≤2 and Gleason groups >2 on the radiomic features of T2-weighted MRI and the apparent diffusion coefficient. The combination of multiple image-derived features resulted in better separation between the two groups.
Conclusion: Differences between clinically significant and insignificant prostate cancers were revealed on pre-surgical multi-parametric MRI via radiomic analysis using labels derived from an alignment of histopathology and MRI images. Future work will focus on using the identified differences to predict high-grade disease on MRI.
Limitations: Our preliminary study included 20 subjects and was focused on assessing MRI differences on account of low-grade and high-grade disease in a radiomic study without the use of an external validation set.
Ethics committee approval: The study was approved by the Institutional Review Board (IRB) of Stanford University. Informed consent was waived for this retrospective study.
Funding: Department of Radiology, Stanford University, NIH-U01CA196387-01.

Multiparamateric MRI characteristics of cribriform growth in prostate cancer in comparison to other Gleason sub-patterns

G. Ghobadi[1], P. J. van Houdt[1], E. Bekers[1], I. G. Schoots[2], H. G. van der Poel[1], F. J. Pos[1], L. Bentzen[3], K. Haustermans[4], U. van der Heide[1]; *[1]Amsterdam/NL, [2]Rotterdam/NL, [3]Aarhus/DK, [4]Leuven/BE (g.ghobadi@nki.nl)*

Purpose: Distinguishing Gleason 4 from Gleason 3 pattern in prostate cancer diagnosis is challenging, owing to overlapping mpMRI characteristics of some Gleason sub-patterns. Cribriform growth is a known prognostic Gleason 4 sub-pattern. The purpose of this study was to identify mpMRI characteristics of cribriform growth and to separate them from non-cribriform Gleason pattern 4 and Gleason pattern 3.
Methods and materials: In a prospective 3-centre study, mpMRI parameters (T2 map, ADC map derived from DWI, and K^{trans} and k_{ep} maps from DCE-MRI) were acquired in 30 patients prior to prostatectomy. Gleason sub-patterns, [Gleason pattern 3 intermediate/dense (based on the density of neoplastic glands) and Gleason pattern 4 with/without cribriform growth] were manually segmented on digital H&E slices. Patient-customised molds enabled the registration of histopathology and MRI. We compared the median mpMRI values for Gleason sub-patterns with a non-parametric Kruskal-Wallis test.
Results: Gleason pattern 4 was determined in 18 patients and cribriform growth was found in 6. Of all cancer volume, 27% was Gleason 4 and 37% of this was cribriform growth. T2 and ADC of cribriform areas were not different from non-cribriform and dense Gleason 3 areas. Only intermediate Gleason 3 areas had higher T2 and ADC values than the other sub-patterns ($p<0.001$). DCE parameters, K^{trans}, and k_{ep} were significantly lower in cribriform versus non-cribriform areas ($p<0.001$). k_{ep} was also lower in areas with cribriform compared to Gleason 3 intermediate ($p<0.001$) and Gleason 3 dense areas ($p<0.001$).
Conclusion: Our results indicate that mp-MRI may help in distinguishing cribriform growth from other sub-patterns based on DCE k_{ep}.
Limitations: The size of the dataset.
Ethics committee approval: Institutional review boards approval and written informed consent obtained.
Funding: This study was part of the DR THERAPAT project (FP7-ICT-2011-9, Project No. 600852).

Automated artificial intelligence-based measurements of biomarkers in ^{18}F-choline PET/CT are associated with disease-specific survival of high-risk prostate cancer patients

E. Polymeri[1], H. Kjölhede[1], O. Enqvist[1], J. Ulén[2], M. H. Poulsen[3], J. A. Simonsen[3], Å. Johnsson[1], P. F. Høilund-Carlsen[3], L. Edenbrandt[1]; *[1]Gothenburg/SE, [2]Malmö/SE, [3]Odense/DK (eirinipol@hotmail.com)*

Purpose: Artificial intelligence (AI) offers new possibilities for obtaining objective quantitative measurements of biomarkers from positron-emission tomography/computed tomography (PET/CT). The aim of this study was to evaluate the prognostic significance of automated quantification of tumour infiltration in the prostate gland in ^{18}F-Choline PET/CT of high-risk prostate cancer patients in respect to age, PSA, and a Gleason score.
Methods and materials: Training of the AI-algorithm was performed on PET/CT scans of 143 patients. Validation of the algorithm was carried out in ^{18}F-choline PET/CT scans of 272 high-risk prostate cancer patients. Automated measurements of the radiotracer uptake in voxels in the region automatically segmented as prostate by the AI-algorithm were performed. Voxels with a standardised uptake value (SUV) above 2.65g/ml were considered abnormal. The following calculations were obtained: lesion VOLUME (volume of abnormal voxels, ml), total lesion uptake (TLU, defined as the product of SUVmean x lesion VOLUME), and lesion FRACTION (the quotient of VOLUME and total prostate volume). Associations between automated measurements, age, prostate-specific antigen (PSA) level (logarithmic), Gleason score, and prostate cancer-specific survival were studied using a univariate Cox-regression model.
Results: 20 patients died of prostate cancer during follow-up. The PET/CT measurements were significantly associated with prostate cancer-specific survival [VOLUME (HR 1.03, p <0.001); TLU (HR 1.9, p<0.001); lesion FRACTION (HR 1.05, p <0.001)], while age, PSA, and Gleason score were not.
Conclusion: ^{18}F-choline uptake, determined by automatically-derived measurements, was significantly associated with disease-specific survival in this patient cohort.
Limitations: The small number of events during the follow-up period in this patient group prevented us from performing multivariate analyses.

Diffusion-weighted imaging in prostate cancer: a descriptor of tumour habitat differentiates high-risk and low-risk lesions

A. Bevilacqua[1], M. Mottola[1], F. Ferroni[2], D. Barone[2], G. Gavelli[2]; [1]*Bologna/IT,* [2]*Meldola/IT (margherita.mottola@unibo.it)*

Purpose: To discriminate between patients with high-risk (HR) and low-risk (LR) prostate cancer (PCa) in order to support radiologists in deciding on the most proper therapy strategy.
Methods and materials: 42 patients with a clinical suspicion of PCa were consecutively selected from the database of our institution. All patients underwent 3T-mpMRI and TRUS biopsy and, based on their Gleason scores (GS), were assigned to the HR (GS≥3+4) or LR class, the latter including, besides patients with GS=3+3, patients with a negative biopsy, whether they have positive or negative mpMRI. 84 radiomic features were extracted on DWI sequences and related ROC curves computed. The feature showing the lowest p-value in discriminating HR from LR was selected.
Results: The mean of the local coefficient of variation (CV_L-m), representing local DWI variance, performed the best ($p \sim 10^{-6}$) and discriminated HR from LR with AUC=0.91 (95% CI, 0.75-0.97), specificity=85%, sensitivity=87% (4 FP and 2 FN), and all FPs were GS=3+3. These results yielded the probability of FDR=24% of the overtreatment for LR patients and the probability of FOR=8% that a HR patient is not treated.
Conclusion: One of our radiomic features derived from DWI sequences was enough to differentiate HR from LR PCa. Since the level of restriction to the motion of water molecules in the extracellular compartment affects tumour behaviour, radiomic features extracted from DWI sequences result in the best candidate to quantify relevant properties of tumour habitats needed to characterise the different tumour heterogeneities.
Limitations: Patients were not enough to reliably include clinical parameters in the PCa risk assessment. Although they could be crucial to help to improve the radiomic model, a higher number of parameters require a number of patients growing exponentially to have a representative sample size.
Ethics committee approval: IRB approval. Written, informed consent was waived.
Funding: No funding was received for this work.

Can PSMA PET CT rule out all relapses of prostate cancer?

M. Garcia Fontes, L. Valuntas, M. Rodríguez Parodi, G. Dos Santos, V. Gigirey, O. Alonso*; Montevideo/UY*

Purpose: To determine if a negative PSMA PET CT can ever rule out tumour recurrences in prostate cancer.
Methods and materials: In a period of 6 months, 246 PET CT PSMAs with biochemical relapse were performed. Those with negative or indeterminate findings were selected to be studied with a multiparametric prostate MRI. 12 patients, 58-75 years old, with a PSA between 0.9 and 22 ng/ml were included. Prostate multiparametric resonance was performed with a Discovery 750W General Electric 3 Tesla. The study protocol included axial T2 panoramic, axial and coronal T2 high resolution of the prostate, diffusion (DWI), and ADC focus and perfusion sequences.
PET CT acquisition was performed 60 minutes after intravenous administration of 2 MBq/Kg of 68Ga-PSMA with 64-slice equipment (General Electric Discovery 690 VCT) from the skull to mid-thigh. The images were corrected for "flight time" (TOF correction).
Results: Of the 12 included patients, 10 presented with local tumour recurrences at the level of the prostate, periprostatic region, or bladder wall. These lesions were not seen with PET PSMA due to the concentration of the radiopharmaceutical in the bladder.
All lesions presented a pathological signal in T2, restriction in DWI, and early enhancement in the perfusion sequence. This last sequence is essential for the detection of tumour recurrences due to the neoangiogenesis of tumoural tissue.
Conclusion: We can conclude that in cases of a negative PSMA PET CT, a multiparametric prostate MRI must be suggested. This study may show relapses in regions not seen with PET PSMA and may change patient management. The main sequence that represents the key of diagnosis is perfussion.
Limitations: Few patients.
Ethics committee approval: Written informed consent obtained.

VERDICT MRI fractional intracellular volume assessment could help avoid unnecessary biopsies in men assessed for prostate cancer with multi-parametric MRI

S. Singh, H. Rogers, E. W. Johnston, B. Kanber, C. M. Moore, D. Atkinson, E. Panagiotaki, S. Punwani*; London/UK*

Purpose: To determine whether the quantitative fractional intracellular volume (FIC) from VERDICT MRI (vascular, extracellular, and restricted diffusion for cytometry in tumours) and/or ADC (apparent diffusion coefficient) can prospectively identify men undergoing prostate mpMRI with significant cancer.
Methods and materials: We previously demonstrated FIC has a higher ROC-AUC (0.93) than ADC (0.85) for differentiating clinically-significant from benign/non-significant prostate cancer. In this study, we derived and prospectively applied FIC and ADC thresholds based on Youden's index (from previous ROC-analysis using men with Likert≥3): FIC:0.41, ADC:1.12×10^{-3} to a cohort of 30 men with Likert≥3 mpMRI lesions who underwent targeted biopsy. The mean lesion FIC, ADC, sensitivity, and specificity of the derived thresholds were calculated.
Results: Biopsies revealed 16 clinically-significant (3+4=2, ≥4+3=4) cancers and 14 benign/non-significant cancers (benign=12, 3+3=2). Clinically-significant lesions had higher FIC (mean: 0.43±0.22) compared to benign/non-significant lesions (mean: 0.26±0.15) p=0.035. ADC was not significantly different between the two groups (significant: $1.06 \pm 0.16 \times 10^{-3}$ vs benign/non-significant: $0.93 \pm 0.33 \times 10^{-3}$, p=0.12).
The FIC threshold correctly classified 86% of men (n=12) with a benign/non-significant biopsy as negative for significant-cancer compared with 36% of men (n=5) for the ADC threshold. 62% of men with significant cancer (n=10) were classified as positive for significant cancer by the FIC threshold, compared with 81% of men (n=13) using the ADC threshold.
Combining Likert≥4 and FIC threshold, 12/14 men with benign/non-significant pathology could have avoided biopsy. However, 1/16 men with significant cancer would not have been biopsied. Combining Likert≥4 and ADC threshold, 4/14 men with benign/non-significant pathology could have avoided a biopsy and all men with significant cancer would have undergone a biopsy.
Conclusion: A combined Likert score and FIC thresholds could help avoid unnecessary biopsies in men being investigated for prostate cancer.
Limitations: n/a

Renal oncocytoma versus chromophobe renal cell carcinoma: radiomics uncovering the secrets in MRI images

N. Gündüz, M. B. Eser, A. Yıldırım, A. Kabaalioğlu*; Istanbul/TR (bilgineser@hotmail.com)*

Purpose: A preoperative distinction between renal oncocytoma (RON) and chromophobe renal cell carcinoma (cRCC) remains challenging based on the visual interpretation of multiparametric magnetic resonance imaging (mp-MRI) including apparent diffusion coefficient (ADC) or dynamic sequences. We aimed to evaluate the ability of radiomics, a recently emerged tool for mathematical tissue characterisation based on tumour heterogeneity, in differentiating both tumours.
Methods and materials: This single-centre retrospective study included 14 patients with histopathologically proven RON (n=6) and cRCC (n=8). All cases were imaged before surgery by mp-MRI. Axial MRI-ADC mapping images were used for the manual segmentation of the masses by two radiologists using open-source PyRadiomics software. The radiomics features were extracted from 3 categories: shape and size, histogram-based first-order texture, and high-order texture. Interobserver reliability was assessed using the intraclass correlation coefficient (ICC). Features with excellent (ICC>0.90) agreement were compared

between RON and cRCC groups. The features with a p<0.05 were analysed by the receiver operating curve for the precision of RON.
Results: 16 radiomics features (2 shape and size, 5 first-order, and 8 high-order texture) provided an ICC>0.90 and p<0.05. Histogram-based first-order features using 3-dimensional whole tumour ADC showed the highest diagnostic performance for predicting RON (median ADC cut-off ≥1.84x10^{-3} mm/s, sensitivity=100%, and specificity 100%, p=0.002). Among high order texture features, 5 grey-level run-length matrixes and 3 grey-level size zone matrixes related features predicted RON with considerably high performance (area under the curve >0.90, sensitivity and specificity >0.80, p<0.05).
Conclusion: Radiomics analysis of MRI-ADC mapping can successfully distinguish between RON and cRCC with a quite high diagnostic precision performance.
Limitations: The small sample size and retrospective design.

The development of postoperative image-guided tissue sampling using 3D-printed tumour moulds enabling multi-omics data integration

S. Ursprung, M. Crispin-Ortuzar, M. Gehrung, A. Priest, F. A. Gallagher, A. Warren, G. Stewart, E. Sala, F. Markowetz*; Cambridge/UK (su263@cam.ac.uk)*

Purpose: Renal cancer is phenotypically and genetically highly heterogeneous. Genetic intratumoral heterogeneity plays a determining role in tumour aggressiveness, metastasis, and treatment resistance. Precise spatial registration of imaging and molecular data is required for multi-omics data integration to leverage the full potential of personalised cancer care. We describe the development of an automated pipeline for producing 3D-printed tumour moulds for image-guided tissue sampling.
Methods and materials: Following preoperative multiparametric, morphologic, and physiological MRI and image registration, the renal tumour, normal kidney, and anatomical structures that needed preserving during tissue sampling were manually segmented. 3D-printed tumour moulds were generated and cutting-guides with 1 cm spacing were introduced. The direction of the cutting-guides can be selected according to pathologists' preferences. The design of the mould was improved in an iterative process involving pathologists, urologists, radiologists, and imaging scientists to ensure accuracy, universal applicability, and minimal disturbance to workflows. The accuracy of the spatial registration was determined by the Dice similarity coefficient between predicted and observed tissue cross-sections.
Results: 6 patients (age 62.7±8.3 years) were included in the iterative mould design process. High morphological correspondence of anatomy between tissue and predicted cross-sections from imaging were seen, as well as a good agreement of predicted and observed tumour cross-sections. In the latest iteration of the mould, Dice similarity coefficients of 0.92 and 0.76 were observed for the tumour and normal kidney, respectively, thanks to the introduction of orientation landmarks.
Conclusion: A highly automated pipeline for the acquisition of tissue samples registered to imaging data was developed in an iterative process. The involvement of urologists and pathologists ensured maximum clinical acceptability of the mould and resulted in a pathway for multi-regional, multi-omics data integration.
Limitations: Recruitement for this study is ongoing.

Radiomic analysis in renal cell carcinoma: the impact of computed tomography vascular phase on parameter quantification

A. Azam[1], A. Jahangeer[1], C. Kelly-Morland[1], M. M. Siddique[1], G. Cook[1], F. Collinson[2], J. Swaine[2], J. Brown[2], V. Goh[1]*; [1]London/UK, [2]Leeds/UK (aishah2018@hotmail.co.uk)*

Purpose: Radiomic analysis and quantification of tumour heterogeneity may capture additional treatment effects beyond current standards and predict clinical outcomes, however, how CT acquisition affects quantifiable parameters should be considered. This prospective study aims to explore the impact of an arterial or portal venous phase acquisition on radiomic features in patients with metastatic renal cell carcinoma.
Methods and materials: 33 adults (31 male; mean age 65.5±9.1) with 61 lesions underwent contrast-enhanced CT. Volumetric regions-of-interest were delineated around the primary±metastatic lesion(s) in both arterial and portal phases. Radiomic features were extracted using validated in-house software. A total of 183 first, second, and high-order statistical parameters were compared using a Wilcoxon signed-rank test, with a Bonferroni correction for multiple comparisons, p<0.005.
Results: Pixel intensity parameters differed between phases e.g. the mean intensity (58.6 vs 68.6, p=0.0015), variance (4,778.9 vs 5,251.3, p=0.0019) (portovenous and arterial, respectively). There was no significant difference in shape, histogram, fractal, second-order grey-level co-occurrence matrix or high-order grey-level run length, grey-level dependence matrix, grey-level run-length size zone matrix, and neighbourhood grey-tone difference matrix parameters.
Conclusion: As expected, histogram parameters differed between phases. However, the stability of radiomics parameters between phases indicates their robustness to acquisition timing and is promising for their use as biomarkers of the treatment response.
Limitations: The small sample size and heterogeneity in CT acquisition parameters.

Patterns of response and comparison of RECIST1.1, irRECIST, and iRECIST criteria in a population of patients treated by nivolumab for a metastatic clear renal cell carcinoma

P. Iorio[1], C. S. Balleyguier[2], N. Lassau[2], M. Tazdait[2], A. Benchimol[2], J. Arfi[2], E. Zareski[3], D. L. Albiges[2], C. Caramella[2]*; [1]Paris/FR, [2]Villejuif/FR, [3]Neuilly/Seine/FR*

Purpose: Immune checkpoint inhibitors (ICIs) now have a place in the treatment of metastatic renal cell carcinomas (mRCC). Atypical responses have been described under ICI in several types of cancer such as pseudoprogression that are not captured by the conventional RECIST 1.1 criteria. Therefore, new criteria have been proposed, irRC, irRECIST, and iRECIST, but little is known about their usefulness in mRCC evaluation.
Methods and materials: This monocentric study included patients treated in a clinical trial with nivolumab for mRCC. We retrospectively analysed the response patterns, their frequency, the discrepancies between the RECIST 1.1, irRECIST, and iRECIST criteria, and overall survival by response type.
Results: Of the 56 patients included, 81% presented a conventional response (objective response or stability 18% and progression 63%) and 19% an atypical response (pseudoprogression 5% and dissociated response 14%). The irRECIST and iRECIST criteria captured the phenomenon of pseudoprogression in all patients, but 3 had no therapeutic impact. Patients with a dissociated response had the lowest overall survival with a significant difference compared to the progression subgroup.
Conclusion: Atypical patterns of response occur in 19% of the patients treated by nivolumab for mRCC. Further studies are needed to confirm our findings of dissociated response patients who seem to have a worse prognosis than classical progressive patients.

Limitations: A monocentric study involving a small number of patients, which does not allow the results to be generalised and significant prognostic factors to be identified. The patients were included in a therapeutic protocol and this could have constituted a selection bias.

The value of venous phase dual-layer spectral CT in the visualisation of laryngeal carcinoma: a preliminary study
G. Hong, Z. Yang, M. Zou*; Guangzhou/CN (trueangel_xun@163.com)*

Purpose: To explore the value of venous phase dual-layer spectral CT (DLSCT) in detecting and staging laryngeal carcinoma.
Methods and materials: 21 patients with a proven diagnosis of laryngeal carcinoma were examined with a DLSCT scanner and retrospectively analysed. Images were acquired in the venous phase. MonoE40 images were reconstructed on a workstation and compared to poly-energetic reconstruction images. Data from the ROIs of the lesion, the adjacent sternocleidomastoid muscle, adipose tissue, the common carotid artery, and the jugular vein were recorded, including iodine content (mg/mL), Z_{eff} values, virtual non-contrast attenuation (HU), and attenuation values at 40, 70, and 100 keV (HU). The steepness of the Hounsfield unit (HU)-increase at the tumour margin was analysed. Means were compared using a Student's t-test. ANOVA was used for multiple comparisons.
Results: MonoE40 images were superior to poly-energetic reconstructions in tumour detection and margin delineation. MonoE40 showed significantly higher attenuation differences between tumour and healthy tissue compared to poly-energetic reconstructions ($p<0.01$). The HU-increase at the boundary of the tumour was significantly steeper in MonoE40 images compared to poly-energetic reconstructions ($p<0.01$). Iodine uptake and Z_{eff} values in the tumour was significantly higher compared to healthy tissue ($p<0.01$). MonoE40 compared to conventional poly-energetic images improved the visualisation of the vessel from the venous phase ($p<0.01$).
Conclusion: Virtual mono-energetic reconstructions of venous phase DLSCT enables improved visualisation of laryngeal carcinoma, quantification of tumour iodine uptake, and Z_{eff} values. Improved contrast of MonoE40 compared to conventional poly-energetic reconstructions enables higher diagnostic confidence concerning tumour margin detection and vessel evaluation.
Limitations: Limitations of the number of cases.
Ethics committee approval: This study was approved by the medical ethics committee of the hospital.
Funding: No funding was received for this work.

Primary tumour and lymph node radiomics assessment in PET-CT in non-metastatic nasopharyngeal carcinoma patients
C. Xie[1], Y. Chen[2], V. Vardhanabhuti[1]; [1]*Hong Kong/HK,* [2]*Beijing/CN*

Purpose: To evaluate the prognostic value of radiomic features extracted from pre-treatment PET-CT images of the primary tumours (PT) and lymph nodes (LNs) in locally advanced nasopharyngeal carcinoma (NPC) patients.
Methods and materials: A total of 145 consecutive patients (median age 48 years, 75.2% male) with newly diagnosed NPC were included. Radiomics analysis was performed on 118 PT and 66 LN images. Conventional PET parameters (SUV_{max}, SUV_{mean}, and TLG), shape-based features, and 6 robust texture features were extracted. This data was used to analyse the correlation with 3-year overall survival (OS) and progression-free survival (PRFS) based on a Kaplan-Meier log-rank test.
Results: One PET radiomics feature (LN sphericity) was significantly predictive of OS ($p=0.024$) and PRFS ($p=0.002$). Independent CT predictive radiomic features were PT GLRM LRE ($p=0.011$), LN sphericity ($p=0.011$), and compactness ($p=0.042$) for OS, and PT GLRM LRE ($p = 0.039$) and LN sphericity ($p = 0.008$) for PRFS.
Conclusion: CT shape-based features and texture features extracted from primary tumours and LNs provide significant predictive value for survival in patients with NPC. LN PET radiomics information was significantly predictive for survival and performed better than primary features. The unity of LN radiomics can be further validated by prospective randomised trials, considering their potential in predicting clinical outcomes of tumour patients.
Limitations: A retrospective study and small sample size.
Ethics committee approval: This study has been approved by IRB.
Funding: No funding was received for this work.

Machine learning re-sampling techniques in imbalanced datasets improve prognostication performance in a multicentre cohort of head and neck cancer patients using a PET-based radiomics model
C. Xie, J. Ho, H. Pang, R. Du, K. Chiu, E. Lee, V. Vardhanabhuti*; Hong Kong/CN*

Purpose: Achieving good performance on real biomedical data that frequently contains imbalance characteristics remains a challenging task. This study aimed to investigate the impact of re-sampling techniques in imbalanced datasets for PET radiomics-based prognostication in head and neck (HNC) cancer patients.
Methods and materials: PET-based radiomics analysis was performed in 166 patients (median age 49.3 years, 77.1% male) diagnosed with nasopharyngeal carcinoma (NPC) in our centre and 182 HNC patients from the TCIA database. Conventional PET and 15 robust texture features were extracted for the correlation analysis of overall survival (OS) and disease progression-free survival (DFS). We investigated cross-combination of 10 re-sampling methods and 4 classifiers for radiomics-based survival prediction.
Results: Re-sampling techniques including oversampling and hybrid sampling achieved significant improvement on the area under the receiver operating characteristic curve (AUC) and prediction of the minority class in terms of precisions, recalls, and F-measures in both cohorts, as compared to no oversampling (Wilcoxon signed rank-sum test, $p < 0.05$). We observed that the combination method ADASYN oversampling+XGboost classifier (AUC of 0.70, accuracy of 0.74, sensitivity of 0.75, and specificity of 0.70) presented the highest performance for DFS prediction. ADASYN+SVM performed best (AUC of 0.80, accuracy of 0.76, sensitivity of 0.74, and specificity of 0.86) for OS prediction in our NPC cohort.
Conclusion: We identified optimal machine learning methods for the prediction of prognostication in NPC, which enhanced the applications of radiomics in precision oncology and clinical practice. Of note, re-sampling techniques showed a significant positive impact on prediction performance in imbalanced datasets.
Limitations: Our study is limited by retrospective datasets in terms of relatively small numbers of instances.

Correlation between histogram-based DCE-MRI parameters and ^{18}F-FDG PET values in oropharyngeal squamous cell carcinoma: evaluation in primary tumours and metastatic nodes

A. Vidiri, E. Gangemi, E. Ruberto, R. Pasqualoni, R. Sciuto, A. Farneti, M. Benevolo, R. Pellini, S. Marzi; *Rome/IT (emma_gan86@yahoo.it)*

Purpose: To investigate the correlation between histogram-based dynamic contrast-enhanced MRI (DCE-MRI) parameters and ^{18}F-FDG-PET values in oropharyngeal squamous cell carcinoma (OPSCC), both in primary tumours (PT) and in metastatic nodes (LNs).
Methods and materials: 52 patients with a new diagnosis of OPSCC were enrolled in the present study. Imaging including DCE-MRI and ^{18}F-FDG PET/CT scans was acquired from all patients. Both PT and the largest LN, if present, were volumetrically contoured.
Quantitative parameters, including the transfer constant K^{trans} and Kep, and the volume of extravascular extracellular space v_e, were calculated from DCE-MRI. The percentiles, P10, P25, P50, P75, P90, and skewness, and kurtosis and entropy were obtained from the histogram-based analysis of each perfusion parameter. Standardised uptake values, SUV_{max}, SUV_{peak}, SUV_{mean}, metabolic tumour volume (MTV), and total lesion glycolysis (TLG) were calculated applying an SUV threshold of 40%.
The correlations between all variables were investigated with the Spearman-rank correlation test. To exclude false-positive results under multiple testing, the Benjamini and Hockberg method was applied.
Results: No significant correlation was found in PT, while significant associations emerged between K^{trans} and ^{18}F-FDG PET parameters in LNs.
Conclusion: Evident relationships emerged between DCE-MRI and ^{18}F-FDG PET parameters in OPSCC LNs, while no association was found in PTs. The complex relationships between perfusion and metabolic biomarkers should be interpreted separately for primary tumours and lymph nodes. A multiparametric approach to analyse PTs and LSs before treatment is advisable in HNSCC.
Limitations: The retrospective nature of this study may have introduced bias and confounding factors.
Ethics committee approval: The study was authorised by the hospital ethics committee
Funding: This study was conducted retrospectively on a patient population included in a larger prospective study funded by the Italian Association for Cancer Research.

A comparison among gamma distribution, intravoxel incoherent motion, and mono-exponential models of orofacial tumours: a preliminary study

W. Panyarak, T. Chikui, K. Tokumori, Y. Yamashita, K. Yoshiura; *Fukuoka/JP (wpanyarak@gmail.com)*

Purpose: We compared the parameters of gamma distribution (GD), intravoxel incoherent motion (IVIM), and mono-exponential (ME) models based on the goodness-of-fit, correlations, and effectiveness in the differential diagnosis among various orofacial lesions.
Methods and materials: 57 patients underwent 3-Tesla MRI examinations including TSE-DWI with 6 b-values (0-1000 s/mm^2). The shape parameter k, scale parameter θ, and fractions of diffusion (f_1, f_2, and f_3, which represent the cell component, parenchyma, and perfusion component, respectively) were obtained by GD model. D, D*, and f were obtained by IVIM model. ADC was obtained by ME model. Akaike information criterion was used to evaluate the goodness-of-fit. Correlations of the three methods were then assessed. All parameters were compared among inflammatory lesions (n=5) and benign (n=14) and malignant tumours (n=38).
Results: There was no significant difference between the GD and IVIM models, but both models showed a better goodness-of-fit than the ME model (p<0.0001). The f_1 showed strong negative correlations with D (ρ=–0.906) while the f_3 showed moderately positive correlations with f (ρ=0.583). The malignant tumours showed significantly lower k, D, and ADC values (p<0.0001), which reflected their higher cellularity (higher f_1 values) of benign tumours. No significant differences were found in any parameters between inflammatory lesions and either type of tumour.
Conclusion: The GD and IVIM models displayed comparable correlations and a better goodness-of-fit than the ME model. The GD model clearly showed that malignant tumours had higher cellularity than did benign tumours, which was attributed to their lower D and ADC values.
Limitations: There was a limited number of benign tumours included.
Ethics committee approval: This study was approved by the institutional ethics committee.

Magnetic resonance imaging (MRI) driven cytology: from a comparison of diagnostic accuracy to a proposal for a new diagnostic algorithm in the preoperative work-up of parotid lesions

G. Guazzarotti, E. Venturini, R. Mellone, A. de Gaspari, D. Di Santo, F. de Cobelli; *Milan/IT*

Purpose: To determine the diagnostic accuracy (AC) of multiparametric MRI (mp-MRI), fine-needle aspiration cytology (FNAC) and their combined use in differential diagnosis of parotid tumours.
Methods and materials: 89 consecutive patients with clinical evaluation and mp-MRI (T2-T1-DWI[b:0-1000]-DCE) for parotid lesion were prospectively enrolled; 80/89 patients underwent FNAC. ADC was measured by ROI avoiding necrosis and, by ROC analysis, 2 ADC thresholds were identified. Time-intensity curves (TIC) were classified as A (time to peak[TTP]≥120s), B (TTP<120s+washout ratio[WR]≥30%), C (TTP<120s+WR<30%), and D (flat). The first 30 patients were retrospectively analysed. Using morphological features, ADC value, TIC, and T2 signal an mp-MRI diagnostic algorithm validated on the remaining patients was constructed. Sensitivity (SE), specificity (SP), positive and negative predictive values (VPP and VPN), and AC were evaluated using histology as a gold standard. AC of FNAC and algorithm was calculated before and after modification of diagnosis referring to anamnestic data and FNAC results.
Results: We evaluated 68 benign (37 pleomorphic adenomas [PA], 23 Warthin tumours, 2 cysts [Cy], and 6 other benign lesions) and 21 malignant lesions (16 carcinomas, 5 lymphomas [L]). 2 ADC thresholds were identified to distinguish PA/Cy (ADC>1.3) and L (ADC<0.6) from other lesions. Adenopathies (p=.003), infiltration of adjacent structures (p<.001), hypointense/heterogeneous T2 signal (p=.002), and type C TIC (p<.001) were significantly related to malignancy and used in the definition of diagnostic algorithm. Applied to the validation group, it showed SE=69.23%, SP=95.24%, PPV=81.81%, NPV=90.90%, and AC=89.09%. Adding anamnestic data, it showed SE=78.57%, SP=95.24%, PPV=84.61%, NPV=93.02, and AC=89.47%.
FNAC demonstrated SE=77.78%, SP=100%, PPV=100%, NPV=96%, and AC=96.49%, with non-diagnostic/indeterminate results in 28.75% of cases.
When FNAC was used to characterise indeterminate lesions after mp-MRI, we obtained SE=80%, SP=95.34%, PPV=85.71%, NPV=93.18%, and AC=91.38%.
Conclusion: Preoperative mp-MRI, associated with FNAC in doubt lesions, reaches a high diagnostic accuracy and should be proposed as a preoperative diagnostic work-up of parotid lesions.
Limitations: A relatively small sample size.
Ethics committee approval: Approved by the Institutional Review Board; each patient signed a specific written informed consent.

Prognostic role of diffusion-weighted and dynamic contrast-enhanced MRI in loco-regionally advanced head and neck cancer treated with concomitant chemoradiotherapy

M. Garbajs[1], S. Bisdas[2], P. Strojan[1], K. Surlan Popovic[1]; [1]*Ljubljana/SI,* [2]*London/UK (manca.garbajs@gmail.com)*

Purpose: In this prospective study, the value of pre-treatment dynamic contrast-enhanced (DCE) and diffusion-weighted (DW) MRI-derived parameters, as well as their changes early during treatment, was evaluated for predicting disease-free survival (DFS) and overall survival (OS) in patients with loco-regionally

advanced head and neck squamous cell carcinoma (HNSCC) treated with concomitant chemo-radiotherapy (cCRT) with cisplatin.
Methods and materials: MRI examinations were performed in 20 consecutive patients with loco-regionally advanced HNSCC at baseline and after 10 Grays (Gy) of cCRT. Tumour apparent diffusion coefficient (ADC) and DCE parameters (volume transfer constant [K_{trans}], extracellular extravascular volume fraction [v_e], and plasma volume fraction [V_p]) were measured. Relative changes in parameters from baseline to 10 Gy were calculated. Univariate and multivariate Cox regression analysis were conducted. Receiver operating characteristic (ROC) curve analysis was employed to identify parameters with the best diagnostic performance.
Results: None of the parameters was identified to predict for DFS. On univariate analysis of OS, lower pre-treatment ADC (p=0.012), higher pre-treatment K_{trans} (p=0.026), and higher reduction in K_{trans} (p=0.014) from baseline to 10 Gy were identified as significant predictors. Multivariate analysis identified only higher pre-treatment K_{trans} (p=0.026; 95% confidence interval (CI): 0.000–0.132) as an independent predictor of OS. At ROC curve analysis, pre-treatment K_{trans} yielded an excellent diagnostic accuracy (area under curve [AUC]=0.95, sensitivity 93.3%, and specificity 80%).
Conclusion: In our group of HNSCC patients treated with cisplatin-based cCRT, pre-treatment K_{trans} was found to be a good predictor of OS.
Limitations: A small sample size and high number of parameters to analyse.
Ethics committee approval: At Ministry of Health, Republic of Slovenia No.22k/03/13.

Correlation between oropharyngeal squamous cell carcinoma and human papilloma virus: MRI volumetric texture analysis

L. Bertana[1], A. Florio[1], N. Landini[1], A. Menegaldo[1], D. Caruso[2], P. Boscolo Rizzo[3], A. C. Frigo[3], A. Laghi[2], G. Morana[1]; [1]*Treviso/IT,* [2]*Rome/IT,* [3]*Padua/IT (lucabertana82@gmail.com)*

Purpose: To predict the presence of human papilloma virus (HPV) in oropharyngeal squamous cell carcinomas (OPSCC) with volumetric MRI texture analysis.
Methods and materials: We retrospectively analysed 47 patients with T1-T4 OPSCC histologically confirmed after a biopsy. HPV was determined as both positive of HPV DeoxyriboNucleic Acid and p16 immunochemistry. All patients underwent MR examinations with the following sequences: pre- and post-contrast T1-w, T2-w, and DWI at 5b-values (0, 50, 100, 500, 750, and 1,000 s/mm²). ADC maps were computed. Texture analysis was performed on a hand-drawn region of interest (ROI) of the entire primary tumour volume on T2-w, DWI at b1000, ADC, and post-contrastography T1-w sequences. Mean value (MV), standard deviation (SD), mean positive pixel (MPP), entropy, skewness, and kurtosis were extracted and compared between HPV+ and HPV- patients with a Student's T-test. Parameters were clustered in three groups (HPV+ smokers, HPV- smokers, and non-smokers). The analysis of variance was computed. False discovery rate was checked with Benjamini-Hochberg correction. Multivariable logistic regression was adopted for an HPV presence predictive model
Results: 18 (38%) patients were HPV+ and 29 (62%) patients were HPV-. HPV+ patients had a significantly lower ADC MV and ADC MPP with respect to HPV- patients (p<0.001). No statistically differences were detected between smokers and non-smokers (p>0.05). The predictive model based on mean ADC resulted in a sensitivity of 89% and specificity of 90% for both parameters
Conclusion: Primary tumour ADC MV and ADC MPP were significantly lower in HPV+ patients than for HPV- patients. Further studies will be necessary to validate these results.
Limitations: Limitation in the number of patients.
Ethics committee approval: Approval from ethic committee for this retrospective study.
Funding: No funding was received for this work.

Histogram analysis parameters derived from DCE-MRI in head and neck squamous cell cancer: associations with microvessel density

H.-J. Meyer[1], G. Hamerla[1], A. K. Höhn[1], L. Leifels[1], A. Surov[2]; [1]*Leipzig/DE,* [2]*Ulm/DE (hans-jonas.meyer@medizin.uni-leipzig.de)*

Purpose: DCE-MRI is a functional imaging modality which is widely acknowledged to be linked to microvessel density in tissues. Therefore, it might be able to predict vessels in tumours. The present study sought to elucidate possible associations between microvessel density and histogram parameters in head and neck squamous cell carcinomas (HNSCC).
Methods and materials: 30 participants with a histologically proven HNSCC were included in the study. DCE-MRI was performed with a 3T MRI and histogram analysis was calculated with a whole lesion measurement. In every case, microvessel density was estimated with CD105 stained specimens.
Results: The median derived from Ktrans correlated with vessel area (ρ=0.39, P=0.034). No other Ktrans or Ve parameters reached statistical significance. Several Kep derived parameters correlated with vessel area as well as with vessel count. MinKep had the highest correlation coefficient with the vessel area (ρ=0.45, P=0.01). ModeKep had the highest coefficient with vessel count (ρ=0.41, P=0.03).
Conclusion: Histogram parameters derived from Kep might be used as surrogate imaging biomarkers for microvessel density parameters in HNSCC. MinKep showed the highest correlation with the vessel area and ModeKep with vessel count.
Limitations: Firstly, the patient sample is rather small, but larger than in two comparable preliminary studies published previously. Secondly, the histopathology analysis was performed on a bioptic specimen, which might not be fully representative of the whole tumour, whereas the MRI analysis was performed as a whole lesion measurement. This might result in some incongruities.

Parallel imaging with and without compressed sensing: utility for head and neck MR imaging in patients with different diseases

H. Ikeda[1], Y. Ohno[1], K. Murayama[1], K. Yamamoto[2], A. Iwase[1], T. Fukuba[1], D. Tabata[1], M. Ikedo[2], H. Toyama[1]; [1]*Toyoake/JP,* [2]*Otawara/JP (ikeda-gif@umin.net)*

Purpose: To determine the utility of compressed sensing (CS) for head and neck MR imaging obtained with parallel imaging (PI) in patients with different diseases.
Methods and materials: 30 consecutive patients with various head and neck diseases underwent T2-weighted imaging by a 3T MR system (Vantage Galan 3T, Canon Medical Systems, Otawara, Japan) by PI with and without CS. On the quantitative assessment of the image quality, signal-to-noise ratio (SNR), percentage of the coefficient of variation (%CV), and contrast-to-noise ratio (CNR) in each patient were determined by ROI measurement. For qualitative assessment, two board-certified radiologists visually evaluated overall image quality, artefacts, and diagnostic performance by a 5-point scoring system. To compare quantitatively assessed image qualities, all indexes were compared between PI with and without CS by t-test. Interobserver agreements on each method were assessed by kappa statistics. To compare qualitative scores, a Wilcoxon's singed-rank test was performed. Finally, mean examination time was compared between PI with and without CS.
Results: SNR, %CV, and CNR of PI with CS were significantly better than those of PI without CS (p<0.0001). Interobserver agreements were assessed as significant and substantial (overall image quality: 0.67<κ<0.71, artefact: 0.65<κ<0.81, diagnostic performance: 0.62<κ<0.73). All qualitative image qualities had no significant differences (p>0.05). Examination time of PI with CS (83s ± 11s) was significantly shorter than without CS (173s ± 54s, p<0.0001).
Conclusion: Compressed sensing combined with parallel imaging is more useful than parallel imaging for head and neck MR examination in patients with different diseases.
Limitations: A limited study population.

Comparison between simultaneous multi-slice and integrated slice-by-slice shimming readout-segmented echo-planar imaging in head and neck tumours
T. Su, Y. Chen, Z. Xu, Z. Zhang, Z. Jin*; Beijing/CN (angelasu.love@163.com)*

Purpose: To compare the simultaneous multi-slice (SMS) and integrated slice-by-slice shimming (iShim) readout-segmented echo-planar imaging (rs-EPI, RESOLVE) for diffusion-weighted imaging (DWI) in head and neck tumours.
Methods and materials: 20 patients with histologically proven head and neck malignant tumours were included in this prospective study. The MR exam included the prototype sequences SMS-RESOLVE and iShim-RESOLVE, acquired at b-values of 0 and 800 s/mm2. Image quality was evaluated quantitatively (distortion rate, signal-to-noise ratio SNR, and ADC values), and compared. The acquisition time was 2:47 for SMS-RESOLVE and 3:09 for iShim-RESOLVE.
Results: 20 primary tumours and 7 metastatic lymph nodes were analysed. The lesion distortion rate of iShim-RESOLVE was significantly lower than that of SMS-RESOLVE. And the SNR of iShim-RESOLVE images were significantly higher than that of SMS-RESOLVE. The primary signal intensities of lesions obtaine by iShim-RESOLVE were significantly higher than that of SMS-RESOLVE images. In addition, there was no significant difference in the ADC values of primary lesions and lymph nodes between iShim-RESOLVE and SMS-RESOLVE sequences.
Conclusion: IShim-RESOLVE can improve image quality in head and neck DWI practice with substantially decreased lesion distortion and increased SNR, and it showed comparable ADC values of tumours and total acquisition time compared to an SMS-RESOLVE sequence.
Limitations: The study population was rather small. The clinical practice values of these protocols should be researched further.
Ethics committee approval: This prospective study was approved by the local ethics committee and written informed consent was obtained from all subjects.
Funding: No funding was received for this work.

Low-tube voltage 80-kVp neck CT with an adaptive statistical iterative reconstruction (ASIR)-V algorithm: preliminary results in the evaluation of the loco-regional extension of head and neck cancer
C. Giannitto[1], G. Vatteroni[1], O. G. Santonocito[2], G. Ferrillo[1], R. Ramberti[3], G. Mercante[1], B. Fiamengo[1], G. Spriano[1], L. Balzarini[1];
[1]*Milan/IT,* [2]*Mascalucia/IT,* [3]*Rozzano/IT*
(caterina.giannitto@gmail.com)

Purpose: To evaluate the diagnostic accuracy of low-tube voltage 80-kV (peak) neck CT acquisition in the loco-regional extension of head and neck cancer, analysing the impact of ASIR-V algorithm on signal, noise, and image quality.
Methods and materials: Two radiologists (with 5 and 10 years experience in head and neck cancer) separately analysed standard 120-kVp neck CTs and anonymised 80-kVp neck CTs of 20 patients with head and neck cancer who underwent CT (Revolution CT; GE Healthcare, Milwaukee, WI). 10 patients (6 oral cancers, 4 laryngeal cancers) who underwent surgery were unrolled. Images were reconstructed using an adaptive statistical iterative reconstruction (ASIR)-V algorithm on image quality. Image noise, the signal-to-noise ratio (SNR), and the contrast-to-noise ratio (CNR) were calculated for the lesions and were compared between the different post-processing ASIR-V % used. Reviewers were blinded to histology results. Sensitivity (SE), specificity (SP), positive predictive value (PPV), and negative predictive value (NPV) were calculated for standard 120-kVp CT and 80-kVp CT evaluations.
Results: Low-tube voltage 80-kVp neck CT acquisition (SE 94%, SP 92.2%, VVP 95.1%, and NPV 90.3 %) is more accurate than 120-kVp CT (SE 85.7%, SP 77.8%, VVP 85.7 %, and NPV 77.8%) in the definition of the loco-regional extension in head and neck cancer. Compared to ASIR-V 0%, image reconstructed with ASIR-V demonstrated a significant reduction of image noise in 80-kVp CT images ($P < 0.05$).
Conclusion: Low-tube voltage 80-kVp neck CT acquisition and reconstruction with ASIR-V could provide a better definition of the loco-regional extension in head and neck cancer.
Limitations: The small cohort and the monocentric experience. Results must be validated in a large cohort.
Ethics committee approval: The study was approved by an ethics committee.

MRI accuracy in the detection of optic nerve invasion in retinoblastomas: a radio-pathologic correlation
R. Costa, J. Albuquerque, V. R. F. Simonini, H. S. D. Souza, M. Decnop, C. Mattosinho*; Rio de Janeiro/BR (rangeldesousa1@gmail.com)*

Purpose: To determine the sensitivity, specificity, and accuracy of MRIs in detecting optic nerve invasion in patients with retinoblastoma.
Methods and materials: A retrospective study with inclusion criteria of patients with a diagnosis of retinoblastoma who attended a reference centre in oncology from 2009-2019 and who had MRIs of orbits and a subsequent enucleation procedure. The criteria for invasion by imaging was a thickening and enhancement of the nerves as well as morphological changes. The results obtained were compared with the histopathological reports, confirming or discarding the optic nerve invasion and determining the sensitivity, specificity, and accuracy.
Results: 50 patients were included, with a predominance of females with a mean age of 4 years and a mean lesion diameter of 1.5 cm. In the analysed group, MRI showed a sensitivity of 21%, specificity of 74%, and negative predictive value of 61%. The estimated accuracy was 54%.
Conclusion: In the studied group, MRI showed low accuracy for the detection of optic nerve invasion, considering that in most retinoblastomas the invasion is microscopic. The false-positive cases are mostly due to the related inflammatory process, which mimics the radiological findings of invasion.
Limitations: A small number of patients (50) and unicentric study.

Physical evaluation of a novel ultra-high-resolution CT scanner

L. J. Oostveen[1], K. Boedeker[2], M. Brink[1], M. M. Prokop[1], F. de Lange[1], I. Sechopoulos[1]; [1]*Nijmegen/NL,* [2]*Otawara/JP (luuk.oostveen@radboudumc.nl)*

Purpose: To evaluate the technical performance of an ultra-high-resolution CT (UHRCT) system.
Methods and materials: Standard procedures and phantoms were used to measure the modulation transfer function (MTF), slice sensitivity profile, uniformity, CT number accuracy, noise power spectrum (NPS), and low-contrast detectability of a UHRCT (Aquilion Precision, Canon Medical Systems) and compare them to a multidetector-row CT (MDCT, Aquilion ONE Genesis). The super-high-resolution (SHR) mode of the UHRCT uses detector elements (dels) with an effective size of 0.25x0.25 mm^2 at the isocentre. The high-resolution (HR) mode bins two dels in the longitudinal direction. The normal-resolution (NR) mode bins 2x2 del, resulting in a del size equivalent to that of the MDCT system.
Results: The UHRCT limiting-resolution MTF (10% MTF: 4.1 lp/mm) is twice as high as that in the NR mode and of the MDCT (10% MTF: 1.7 and 1.9 lp/mm, respectively). The slice sensitivity profile in the SHR mode (FWHM: 0.45 mm) is 40% narrower than that of the MDCT (0.77 mm). Uniformity and CT numbers are within the expected range for all UHRCT modes. Noise in the SHR and HR modes has a higher magnitude and higher frequency components than MDCT. Low-contrast detectability is lower for all UHRCT modes compared to MDCT, but a dose increase of about 14% for NR, and about 23% for HR and SHR, results in matching low contrast performance.
Conclusion: HR and SHR modes of UHRCT result in twice the limiting spatial resolution of MDCT, requiring only a 23% increase in dose to achieve the same low-contrast detectability.
Limitations: The use of linear metrics with non-linear reconstruction algorithms must be performed with care and only for the evaluation of the relative differences between techniques, as done here.

Context-sensitive ultrahigh-resolution bone imaging in whole-body photon-counting CT

L. Klein, E. Wehrse, C. Amato, C. H. Ziener, M. Uhrig, S. Heinze, H.-P. Schlemmer, M. Kachelrieß, S. Sawall; *Heidelberg/DE (laura.klein@dkfz.de)*

Purpose: To improve the diagnostic workflow of bone imaging by providing organ-specific, context-sensitive images in whole-body photon-counting (PC) CT showing osseous structures at ultrahigh resolution (UHR) and soft tissue at standard resolution with reduced noise within a single image.
Methods and materials: Acquisitions of the lumbar spine and pelvis were acquired in 5 patients and 10 forensic specimens using the UHR mode (pixel size 0.25 mm at the isocenter) of a PC CT prototype (SOMATOM CounT, Siemens Healthineers). Acquisitions are performed using 120 kV/300 mAs over a longitudinal scan range of 10 cm ($CTDI_{vol\ 32cm}$=24 mGy, D_{eff}=2.8 mSv). Images are reconstructed using sharp kernels (e.g. U70f) for bones and smoother kernels (e.g. D40f) for diagnostic tasks in soft tissue. Reconstruction of UHR data with low spatial resolution results in reduced noise compared to acquisitions with standard pixels sizes at the same dose [MedPhys 32(5):1321ff, 2005]. Bones, contrast agent, and soft tissue regions are automatically identified by decomposing the intrinsically acquired spectral data of the system. A context-sensitive image [Med. Phys. 45(10): 4541ff, 2018] is computed pixelwise using the sharp reconstruction for osseous structures and smooth reconstruction for soft tissue.
Results: The resulting context-sensitive images simultaneously provide mutually exclusive image properties: low noise and moderate spatial resolution (7.4 lp/cm for D40f) in soft tissue and the highest spatial resolution in osseous structures (16.0 lp/cm for U70f).
Conclusion: Context-sensitive images including UHR data improve clinical workflow by presenting mutually exclusive image properties within a single image and hence increased information content. This also may increase the rate of incidental findings.
Limitations: The proposed method has only been applied to a limited number of patients and forensic specimens.

Kernel considerations for high-resolution photon-counting CT: dose reduction versus spatial resolution

L. Klein, J. Hardt, A. Byl, E. Wehrse, S. Heinze, M. Uhrig, H.-P. Schlemmer, M. Kachelrieß, S. Sawall; *Heidelberg/DE (laura.klein@dkfz.de)*

Purpose: To evaluate the dependency of noise reduction of high-resolution whole-body photon-counting (PC) CT compared to conventional energy-integrating (EI) CT as a function of reconstruction kernel.
Methods and materials: A semi-anthropomorphic liver phantom and forensic human specimens were measured using a prototype CT equipped with an EI and a PC detector (SOMATOM CounT, Siemens Healthineers). Images were acquired using the ultrahigh-resolution mode of the PC detector (PC-UHR, pixel size 0.25 mm at the isocenter) and the EI detector (0.6 mm at the isocenter). Reconstructions were performed using all available reconstruction kernels and resulted in different noise and spatial resolution levels. Theory predicts that PC-UHR images reconstructed to a lower spatial resolution result in reduced noise compared to EI at the same resolution and dose [MedPhys 32(5):1321ff, 2005]. Dose-normalised noise is evaluated and compared between both detector types for different kernels. Phantom results are verified in post mortem lung scans that typically require reconstructions using smooth and sharp kernels.
Results: Low-resolution images (below $MTF_{10\%}$=6.5 lp/cm, B40f kernel) show no significant difference in image noise between both detector types. PC-UHR reconstructed with a higher target MTF ($MTF_{10\%}$=9.3 lp/cm, B80f) achieves a noise reduction of up to 30% at the same dose and resolution as the EI detector. A noise evaluation in bronchioli typically performed at low spatial resolution does not benefit from acquisitions with small detector pixels while the visualisation of fine lung structures using sharp resolution kernels improves significantly using PC-UHR.
Conclusion: Clinical applications requiring medium or high resolution will be improved by the usage of PC-UHR and the consequent noise reduction equivalent to a radiation dose reduction.
Limitations: The effect has only been evaluated in phantoms and forensic specimens.

Dedicated metal artefact reduction for photon-counting CT

A. Byl, L. Klein, J. Hardt, E. Wehrse, H.-P. Schlemmer, S. Heinze, M. Uhrig, S. Sawall, M. Kachelrieß; *Heidelberg/DE (achim.byl@dkfz-heidelberg.de)*

Purpose: To reduce metal artefacts in photon-counting (PC) CT.
Methods and materials: CT systems with PC detectors usually provide multiple energy bins and acquire spectral information by default. In the presence of metal artefacts, the bin images require metal artefact reduction. We linearly combined (LC) the bin images in two ways: a) to produce an image with reduced artefacts and b) to minimise noise. A corrected LC (CLC) image was obtained by applying frequency split (FS) normalised metal artefact reduction (NMAR), the gold standard MAR algorithm, to the LC with minimum noise, inserting the high-frequency components of the LC with reduced artefacts. Then, each bin was corrected with FSNMAR using the CLC as a prior and corresponding FS image. Images of forensic specimens containing metal implants were acquired at the SOMATOM CounT PC prototype CT system (Siemens Healthineers, Germany) at 140 kV with a tube current of 300 mAs and thresholds of 25, 45, 70, and 90 keV, resulting in 4 bin images. To quantify the artefact content standard deviations in 3 ROIs (metal artefact, soft tissue without artefacts, and bone), our new PC-FSNMAR were compared to conventional FSNMAR applied to each bin separately (binwise FSNMAR).
Results: Compared to binwise FSNMAR, PC-FSNMAR shows several advantages: a reduced noise and artefact level of up to 70% close to the metal, fewer metal artefacts even in the low-energy bins due to the usage of an optimal prior image, and preserved spectral information in all bins.
Conclusion: PC-FSNMAR significantly improves image quality compared to conventional binwise FSNMAR, in particular in regions close to the metal and for low-energy bins, which suffer most from metal artefacts.

Development of an articulated anthropomorphic 3D-printed arm phantom for image quality and dosimetry optimisation of CT protocols

O. V. Ivashchenko[1], H. Ruitenbeek[2], M. Boonekamp[1], M. Fusaglia[3], I. Hernandez-Giron[1]; *[1]Leiden/NL, [2]Enschede/NL, [3]Amsterdam/NL (o.ivashchenko@lumc.nl)*

Purpose: To guarantee optimal diagnostic image quality to dose trade-off in CT, acquisition and reconstruction parameters are optimised for standardised patient positions. For indications related to anatomical regions from the lower abdomen up to the head, arms should be placed outside the field-of-view. However, for a large group of patients, including trauma or restricted shoulder mobility cases, one or both arms can be fully immobilised. Then, arm-positioning-specific instructions do not apply, affecting dose and image quality. This could be overcome using trauma-specific CT protocols adapted for non-trivial arm positions. CT-manufacturers allow for complex dose modulation with non-trivial arm-positioning, but implementation and optimisation in clinical practice is rare. One of the reasons is the scarcity of commercially available anthropomorphic phantoms for CT-dosimetry with articulated arms. Our goal was to develop affordable and reproducible production methods of totally articulated arm extensions of the RANDO-phantom, widely used for CT QC in radiology and radiotherapy.
Methods and materials: 3D-modelling, 3D-printing, and moulding techniques were used to manufacture the phantom, using anthropomorphic bones and soft-tissue-like materials. After testing various 3D-printing, silicone, gels, and polyurethane materials, a nylon-aluminium mix aluminide and a custom polyurethane-rubber mix were selected, corresponding to average HUs of human hard bone and fat-muscle mix, respectively. Image quality, attenuation, and dose modulation properties of the phantom, attached to RANDO-phantom, were evaluated for trauma-CT protocols.
Results: Attenuation of the phantom [bone: (562±336) HU, soft tissue: (56±24) HU] closely mimicked values of the human arm [compact-bone: (800±400) HU, fat-to-muscle: (-80:100) HU] and is stable within the 80-140kV range. CTDIvol dose of the thorax trauma-CT varied by 12% (0.3 mGy) for various arm positions (arms-up, down, and mixed).
Conclusion: A reproducible method for the production of totally-articulated arm phantom for CT-imaging was developed to optimise new CT protocols with complex arm positions.
Limitations: The simplified soft tissue anatomy.

The characterisation of the stellar detector and admire iterative reconstruction using a channelised hotelling observer and noise power spectrum metric

C. Ghetti[1], O. Ortenzia[1], A. D'alessio[2], L. Noferini[3]; *[1]Parma/IT, [2]Novara/IT, [3]Arezzo/IT (CGhetti@ao.pr.it)*

Purpose: To investigate the performances of two CT systems produced by the same manufacturer (Siemens Somatom Flash/Edge) with different detector technologies and different generations of iterative reconstruction (IR) algorithms (Safire and Admire).
Methods and materials: A homemade phantom was scanned on Flash CT equipped with ultrafast ceramic (UFC) detector and Edge CT with a stellar detector. Images were reconstructed with filtered back-projection (FBP) and IR algorithms. Image quality was evaluated in terms of low-contrast detectability using a channelised hotelling observer (CHO). The performance on signal detection predicted by the CHO was compared to the outcomes of three expert readers for tuning the model-observer (MO). The noise reduction, image texture, and the effects of IR algorithms were evaluated in terms of the noise power spectrum (NPS).
Results: The analysis with MO showed the best performance of Edge respect to Flash system for both FBP and IR algorithms. The better stellar detector efficiency improved the signal detection of the Edge versus the Flash system of about 20%. The IR algorithms further improved the detectability of the signal on both systems. The evaluated noise reduction due to the stellar detector was 57%. Admire IR preserved a more traditional CT image texture appearance due to lower NPS peak shift.
Conclusion: The stellar detector implemented on Edge CT showed an overall greater improvement in low-contrast detectability performance compared to the CT scanner equipped with a conventional detector. Large differences in NPS were observed between Safire and Admire.
Limitations: A very simple detection task, i.e. detecting a known symmetric object placed on a uniform background which is very far from the clinical condition.

Threshold-dependent dual-energy performance and spectral separation in a clinical whole-body photon-counting CT

S. Sawall, L. Klein, C. Amato, E. Wehrse, J. Maier, H.-P. Schlemmer, C. H. Ziener, S. Heinze, M. Kachelrieß; *Heidelberg/DE (stefan.sawall@dkfz.de)*

Purpose: To evaluate the dual-energy (DE) performance and spectral separation in a clinical, photon counting CT (PCCT) and compare it to dual-source CT (DSCT) DE imaging.
Methods and materials: Semi-anthropomorphic phantoms (abdomen/thorax) extendable with fat rings (S/M/L) equipped with iodine vials (5-30 mg/mL) were measured in a clinical PCCT prototype (SOMATOM CounT, Siemens). The system is comprised of a PC detector with two energy bins, [20 keV, T] and [T, eU] with T=threshold and U=tube voltage. PCCT measurements were performed at all tube voltages (80-140 kV) and threshold settings (50-90 keV). Further measurements were performed using energy integrating DSCT (SOMATOM Flash, Siemens) using 100 kV/Sn 140 kV. Spectral separation was quantified as the relative contrast media ratio (RelCM) between the energy bins and low/high images. Image noise and the dose-normalised contrast-to-noise ratio (CNRD) were evaluated in the resulting virtual non-contrast and iodine images.

Results: RelCM of the PC detector varied between 1.2 and 2.7 and increased with higher thresholds and higher tube voltage, and slightly decreased with larger phantoms. RelCM of the DSCT was found as 2.20 on average over all phantoms. The maximum CNRD in the iodine images was found for T=67/68/70/71 keV for 80/100/120/140 kV. This corresponds to CNRD values of 1.07/1.21/1.32/1.40 $mGy^{-1/2}$ for the small phantom, while the EI DSCT achieves 1.67 $mGy^{-1/2}$ in this case.
Conclusion: Intrinsically acquired PC data are able to provide VNC and iodine images similar to conventional DSCT and allow for a retrospective spectral analysis. Quantitatively, the CNRD is 16% lower with PC than with dual-source dual-energy CT.
Limitations: The presented experiments are limited to phantoms. A forensic study is pending.

Does patient off-centring impact the accuracy of dual-energy CT-based iodine quantification in liver tumours?
C. S. Schmidt, B. Baessler, D. N. Nakhostin, H. Alkadhi, A. Euler*; Zurich/CH*

Purpose: To assess the impact of patient off-centring to the absolute error of dual-energy CT-based iodine quantification (DECT-IQ) in liver tumours.
Methods and materials: A liver phantom with 3 cylindrical liver lesions (diameter 15 mm; iodine concentration of 0, 3, and 5 mgI/mL) was imaged repeatedly at 7 vertical table positions ranging from -6 to + 4 cm from the centred 0-position. Scans were performed in dual-energy mode on a dual-source (DS) DECT at 100/Sn150 kV (Somatom Force, Siemens Healthineers) and a single-source (SS) split-filter DECT at AuSn120 kV (Somatom Edge Plus, Siemens Healthineers). The radiation dose was kept constant at 8 mGy. 10 repeated measurements of each lesion's iodine concentration were averaged to obtain the concentration at each off-centre position. The absolute error of iodine quantification was calculated by comparing the measured to the known iodine concentrations. Absolute errors were compared using robust repeated-measures ANOVAs with robust posthoc comparisons.
Results: Absolute errors varied considerably between the 7 different off-centre positions (DS: range 0-1 mgI/mL, mean error 0.31±0.23 mgI/mL; SS: range 0-2.8 mgI/mL, mean error 1.08±0.66 mgI/mL). Group-wise comparisons yielded statistically different error values for multiple lesions and off-centre positions. However, no consistent trend could be observed for absolute error rates depending on off-centre position. Overall, larger error ranges and variations were observed for SS compared to DS.
Conclusion: Patient off-centring has a considerable, yet non-systematic, impact on iodine quantification in DECT and should be considered as an important confounding factor. However, this impact was smaller for DS DECT than for SS DECT.
Limitations: A phantom study.

A 3D generalisation of a detectability index in computed tomography: a feasible approach?
R. Villa, N. Paruccini, M. Signoriello, E. de Ponti*; Monza/IT*
(raffaele.vill@gmail.com)

Purpose: Computed tomography (CT) devices acquire and reconstruct volumetric data. In this condition, the 2D analysis of the target transfer function (TTF) and noise power spectrum (NPS) may cause an overestimation of the detectability index, in particular, when iterative reconstruction (IR) algorithms are used. 3D detectability index generalisations have been used to evaluate low-contrast CT performance.
Methods and materials: A cylindrical water-filled phantom was equipped with a central cylindrical PMMA insert and then scanned changing CTDIvol, reconstruction algorithm, filter, and slice thickness; 2D TTF was evaluated.
3D TTF was investigated using a central PMMA spherical insert in the same cylindrical water phantom.
2D and 3D NPS were calculated in a homogeneous phantom. Furthermore, FFT and NPS results were combined in non-pre-whitening (NPW) model to obtain the 3D detectability index.
Results: 3D TTFs show a spherical symmetry for low CTDI level. NPS analysis shows that the variation between 2D and 3D NPS is around 10% in terms of variance for FBP and iterative noise-based reconstruction; the difference increases significantly for model-based iterative reconstruction (from 20% to 180%). The 2D NPS and 3D NPS ratio are flat for FBP, while it depends on spatial frequency for model-based IR; it is higher for lower frequencies. A comparison between 3D and 2D detectability indexes shows a reduction of 15 and 35% for FBP and IR, respectively.
Conclusion: The 3D generalisation of the detectability index shows a lower performance for a model-based IR algorithm when compared with the one obtained with standard 2D metrics.
Limitations: A comparison with a human observer has to be performed in order to check absolute performances.

CT imaging texture analysis: evaluation of variability sources in the different steps of radiomic workflow
F. Calderoni[1], C. de Mattia[1], F. Rizzetto[2], P. E. Colombo[1], A. Vanzulli[3], A. Torresin[1]; *[1]Milan/IT, [2]Rho/IT, [3]Segrate/IT (francesca.calderoni@unimi.it)*

Purpose: To analyse the main sources of textural radiomic features (RFs) variability in the different steps of radiomic workflow to quantify the effect on trial results and to evaluate possible recommendations for its reduction.
Methods and materials: Radiomic workflow consists of several steps (imaging acquisition and reconstruction, segmentation, and features extraction) and for each of them, potential sources of variability were analysed.
The analyses were performed on Catphan® acquisitions or patients' images for parameters not significant on the phantom. A wide set of scanner manufacturers and models were considered, involving different centres.
The software used for segmentation and features extraction were IntelliSpace Portal 8, 3DSlicer, and IBEX.
Results: In the imaging acquisition step, repeatability, inter-scanner reproducibility, and tube voltage caused high RFs variability, with a mean relative standard deviation of 30% (range 0%-800%), while the workload was demonstrated to not affect RFs values strongly.
Regarding imaging reconstruction, the most crucial parameters were the algorithm and kernel, with RFs mean variations of 50% and 20%, respectively (maximum 600% and 400%).
The inter-reader variation in contouring was the overall largest source of variability, with a mean value of 60% (maximum 1000%).
In the RFs extraction step, the inter-slice resampling seemed not to be a useful solution and the choice of the feature category parameters was the most critical point to standardising in the radiomic workflow.
Conclusion: A phantom study is preparatory to determine an optimal workflow that maximises RFs predictivity on patients. Once the main variability sources are identified, these can be limited or removed through a reasoned and shared standardisation. Nevertheless, a compromise between RFs stability and predictivity must be evaluated and tailored on each specific trial.
Limitations: The conclusions derive from choices made for the analysis.

Stable and harmonisable radiomics features: a guide to robust radiomics analysis

A. Ibrahim[1], H. C. Woodruff[1], S. Primakov[1], R. Granzier[1], R. Leijenaar[1], J. E. Wildberger[1], F. Mottaghy[2], P. Lambin[1]; [1]Maastricht/NL, [2]Aachen/DE (a.ibrahim@maastrichtuniversity.nl)

Purpose: Radiomics features have been reported to be sensitive to differences in image acquisition and reconstruction, which affects the generalisability of radiomics signatures. We aim to identify radiomics features that are insensitive to these differences and to investigate the potential of ComBat harmonisation in radiomics analysis.
Methods and materials: Publicly available credence cartridge radiomics (CCR) phantom data (13 CT scans of a 10-layer phantom) was used. Features were extracted using 2 toolboxes (RadiomiX and Pyradiomics). An overall concordance correlation coefficient (OCCC) with a cut-off of 0.9 was used to identify stable and "ComBatable" features. ComBat was applied using the scanner directly as the source of feature variation and also in a step-wise manner to remove intra-scanner and inter-scanner batch effects.
Results: 6% and 10% of RadiomiX and Pyradiomics features, respectively, were insensitive to differences in imaging vendors and/or reconstruction settings. After direct ComBat application, 21% and 14% of RadiomiX and Pyradiomics features, respectively, were found to be 'ComBatable'. Following step-wise ComBat application, 40% and 29% RadiomiX and Pyradiomics features, respectively, were "ComBatable".
Conclusion: We identified a subset of radiomics features that can be directly compared when the images being analysed were acquired using different vendors. ComBat harmonisation can significantly increase the number of radiomics features that can be used for analysis across varied cohorts. We propose a new methodology for performing radiomics analysis to produce more generalisable radiomics signatures.
Limitations: Taking reconstruction settings per scan as a source of a batch effect. The lack of scans generated by other commonly used scanners in the clinics. The lack of scans with the same settings acquired using different scanners.

CT imaging texture analysis: evaluation of the effect of reconstruction algorithms and kernels by different vendors

F. Calderoni[1], C. de Mattia[1], P. E. Colombo[1], A. Vanzulli[2], G. Feliciani[3], A. Sarnelli[4], A. Torresin[1]; [1]Milan/IT, [2]Segrate/IT, [3]Meldola/IT, [4]Forli/IT (francesca.calderoni@unimi.it)

Purpose: Iterative reconstruction (IR) techniques allow for radiation dose savings through noise reduction in CT image processing. This effect on imaging texture and on radiomic features (RFs) was analysed.
Methods and materials: The analyses were performed on Catphan® acquisitions on 3 scanners of different vendors (Siemens Healthineers, Philips Healthcare, and GE Healthcare) reconstructed with several combinations of an algorithm (filtered back projection (FBP) or IR), IR blending, and kernel.
RFs were extracted from the same cylindric region using IBEX.
The following variability sources were considered as relative discrepancy (RD) or relative standard deviation (RSD) of RFs values: FBP and IR algorithms with a fixed kernel, different blending, and different kernels with the same algorithm.
Results: The RD between FBP and IR was feature, vendor, and kernel dependent. The Siemens scanner showed the highest variability (up to 2,469%), while the Philips scanner the lowest (up to 73%).
The effect of blending values was strongly vendor dependent with RSDs higher than the variability due to FBP-IR reconstruction.
Considering similar kernels as in clinical situations, the greatest effect can be seen in the Philips scanner (up to 70%).
The RFs trend as a function of the different kernels suggests differences among kernels of the 3 vendors but also highlights the physical meaning that lies under some RFs definitions.
Conclusion: The imaging reconstruction step introduces a not negligible variability in the radiomic workflow.
A second reconstruction, other than the diagnostic one, could be proposed to reduce the variability affecting patient studies, fixing the most similar algorithm and kernel among the different vendors. Nevertheless, a residual difference which affects inter-scanner reproducibility is inevitable and must be taken into account.
Limitations: The use of a uniform target within the phantom.

The evaluation of CT image quality with patient-mimicking phantoms: the development of phantoms with anatomic detail and low-contrast lesions for detectability experiments

G. Ardila Pardo, J. Conzelmann, U. Genske, B. Hamm, M. Scheel, P. Jahnke; Berlin/DE (paul.jahnke@charite.de)

Purpose: Detectability experiments aim to assess the diagnostic performance of CT images and are of particular relevance for studying iterative reconstruction. The purpose was to develop anatomically realistic phantoms with low-contrast lesions for detectability experiments.
Methods and materials: Low-contrast lesions were digitally inserted into a neck CT image of a patient. The original and the manipulated CT images were used to create 5 phantoms: 1 phantom without any lesion and 4 phantoms with lesions of 10, 20, 30, and 40 HU contrast. Radiopaque 3D printing was used with potassium iodide doped ink (600 mg/mL). The phantoms were scanned with different CT settings. The lesion contrast was analysed with HU measurements. A 2-alternative forced-choice experiment was performed with 7 radiologists to study the impact of lesion contrast on detection accuracy (DA) and reader confidence (1=lowest, 5=highest).
Results: The developed phantoms reproduced the patient size, shape, and anatomy. The measured mean±SD contrast values of the low contrast lesions were 9.7±1.2 HU (10 HU contrast lesion), 18.2±2 HU (20 HU contrast), 30.2±2.7 HU (30 HU contrast), and 37.7±3.1 HU (40 HU contrast). Mean±SD detection accuracy and confidence values were not significantly different for 10 and 20 HU lesion contrast (82.1±6.3% vs 83.9±9.4%, p=0.863 and 1.7±0.4 vs 1.8±0.5, p=0.159). They increased to 95±5.7% and 2.6±0.7 for 30 HU lesion contrast and 99.5±0.9% and 3.8±0.7 for 40 HU lesion contrast (p<0.005).
Conclusion: A flexible method was developed to produce anatomically realistic phantoms for detectability experiments. The method creates the groundwork for the assessment of CT image quality in a clinical context.
Limitations: n/a
Ethics committee approval: IRB approval was obtained.

Systematic CT protocol optimisation: how to improve patient safety with available CT techniques
P. Jahnke, J. Conzelmann, U. Genske, M. Nunninger, B. Hamm, M. Scheel, T. Diekhoff; *Berlin/DE (paul.jahnke@charite.de)*

Purpose: CT acquisition protocols frequently use available CT techniques inefficiently, but cannot be systematically optimised in clinical trials. The purpose was to develop a method to test and improve CT protocol settings for safer patient diagnostics with lower dose exposure.
Methods and materials: 7 patient-mimicking phantoms were used to simulate neck CT imaging of patients. 6 phantoms contained low-contrast lesions in different localisations in the parapharyngeal space and 1 phantom did not contain any lesion. The phantoms were scanned twice and different settings for tube voltage (ATPS, 120 kVp), tube current (ATCM SD 14, 10, and 7.5, and 150, 200, and 250 mA), pitch (0.6, 0.8, and 1.4), and image reconstruction (FBP, AIDR-3D) were systematically combined. Lesion detectability was assessed in a reader experiment with 14 radiologists. ROC statistics were performed and the area under the curve (AUC) was determined. The results were compared with a reference protocol (120 kVp, ATCM SD 7.5, pitch 0.8, AIDR-3D).
Results: All acquisitions using ATPS were performed with 100 kVp tube voltage. A tube voltage reduction from 120 to 100 kVp increased AUC values (p=0.002) and reduced the dose (p=0.005). In combination with 100 kVp tube voltage and AIDR-3D (but not with 120 kVp and FBP), an ATCM noise level increase reduced the dose (p<0.005) without decreasing AUC values (p>0.7). A protocol modification to ATPS, ATCM SD 10, pitch 0.8, and AIDR-3D reduced the dose by 71% and non-significantly increased mean±SD AUC values from 0.84±0.09 to 0.88±0.07 (p=0.215).
Conclusion: Patient-mimicking phantoms were used to systematically evaluate CT protocol settings. A 71% dose reduction was possible through the improved use of available CT techniques.
Limitations: n/a

The interplay between radiation dose, convolution kernel, and advanced CT reconstructions
A. Hasegawa[1], T. Pan[2]; *[1]Chapel Hill/US, [2]Houston, TX/US (akira.hasegawa@algomedica.com)*

Purpose: To evaluate how noise reduction and image texture are affected by radiation exposure and convolution kernel in ADMIRE of Siemens and PixelShine of AlgoMedica based on deep learning.
Methods and materials: The homogeneous module of an ACR CT phantom was scanned at radiation exposures between 1.9 and 3.1 mGy (CTDI-16) and reconstructed with Hr40, Hr44, and Hr49 on Force using FBP and ADMIRE. The FBP images were processed by PixelShine.The noise power spectrum (NPS) of each reconstruction was computed. The centroid frequency ratio (CFR) of the NPS centroid frequencies and noise magnitude ratio (NMR) of the areas under the NPS curves of noise reduction and FBP were compared. A smaller CFR means more image blurring and a smaller NMR means more noise reduction. An ideal reconstruction should maintain CFR of close to 1 and NMR of close to 0.
Results: In all radiation exposures, ADMIRE reduced more noise with Hr49 (NMR=0.47) than Hr44 (0.67) or Hr40 (0.78) at the same image blurring (CFR≈0.8). Noise reduction by ADMIRE was not dependent on radiation exposure. The application of PixelShine reduced noise at the same image blurring for all kernels Hr49 (0.92 to 0.45), Hr44 (0.85 to 0.48), and Hr40 (0.87 to 0.56), and was less dependent on the selection of kernel compared to ADMIRE.
Conclusion: Both CFR and NMR were affected by the convolution kernel but not by radiation exposure in both methods. PixelShine (based on deep learning) had less centroid frequency shift for all kernels and was less dependent on kernel selection compared to ADMIRE.
Limitations: We didn't try all available convolution kernels. To change the dose levels, we only changed the tube current.
Ethics committee approval: n/a

Detection of micro-calcifications of breast lesion on ultrasound elastography
S. Sampangi[1], Y. Kumarswamy[1], S. Swamy[1], M. Ashok Kumar[2], A. A. R. Kesari[1], I. Desai[1], N. K. Jain[1], N. Reddy[1]; *[1]Bangalore/IN, [2]Bikaner/IN (dr_sudhakar79@yahoo.com)*

Purpose: To identify and characterise breast lesions with micro-calcifications using ultrasound elastography.
Methods and materials: All patients with breast lesions and micro-calcifications on digital mammogram were subjected for ultrasound and elastography for further characterisation of the lesion. Siemens ACUSON S2000 machine with 14L5 and 9L4 probes were used for the ultrasound scan. Greyscale images of the lesions were described as per ACR BIRADS category. Elastography with VTI images were obtained in and around the lesion. VTI showed the lesion as soft or hard compared to adjacent parenchyma. Elastography/B Mode Ratio was calculated. E/B Ratio of 1 or <1 was considered as benign and > 1 was considered as malignant. Micro-calcifications with hypoechoic lesions were visualised, however in absence of hypoechoic mass, micro-calfications werenot seen in greyscale. VTI images showed micro-calcifications as bright dot like appearence in a hard tumour background along with E/B Ration > 1.
Results: Out of 105 breast lesions with micro-calcifications on a mammogram, the ultrasound scan could identify micro-calcifications in only 20 lesions. However, elastography identified 102 cases. On elastography, the micro-calcifications showed as bright spots in a dark or hard tumour background. Another 3 lesion showed it as a harder area. This gives confidence for radiologists to identify lesions even in the absence of a hypoechoic mass in the breast. Cases of DCIS without mass lesion are generally difficult to identify on the greyscale, but VTI will detect it as a hard area with bright specks of calcifications, like a starry sky appearance. These are also seen along the duct wall and cyst wall in fibro-cystic disease.
Conclusion: Elastography will detect micro-calcifications even in the absence of mass lesions on greyscale.
Limitations: Necrotic changes in breast lesion will be mask micro-calcification on elastography.

Acoustic radiation force impulse elastography as an alternative to diffusion-weighted imaging for the characterisation of breast lesions
P. Kapetas[1], P. Clauser[1], S. Viganò[2], T. H. Helbich[1], P. A. T. Baltzer[1]; *[1]Vienna/AT, [2]Cernusco Sul Naviglio/IT (panagiotis.kapetas@meduniwien.ac.at)*

Purpose: Diffusion-weighted imaging (DWI) and acoustic radiation force impulse (ARFI) elastography are techniques investigating microstructural tissue properties. We hypothesised that the information provided by ultrasound-acquired ARFI and magnetic resonance imaging (MRI)-acquired DWI for breast lesion characterisation is largely redundant, and that ARFI could be applied similarly as DWI, skipping the additional MRI scan.

Methods and materials: 60 patients (18-84 years, mean 51.9), each with one breast lesion, underwent both breast ultrasound including ARFI and MRI including DWI. For each lesion, maximum shear wave velocity (SWV) and mean apparent diffusion coefficient (ADC) were recorded. Histology was the reference standard. Diagnostic performance was assessed with receiver operating characteristics (ROC) curve analysis. Independent predictors of malignancy were evaluated using multivariate logistic regression. Correlation between SWV and ADC was assessed by the Pearson correlation coefficient (r).
Results: Both ARFI and DWI showed high diagnostic performance in differentiating benign (n=15) from malignant (n=45) breast lesions as measured by the area under the ROC curve (0.817 and 0.863 respectively, p=0.535). The corresponding sensitivity and specificity for each modality was 88.9%, 73.3%, 80%, and 86.7%. Correlation analysis demonstrated a significant (p<0.001) moderate (r=-0.492) negative correlation between SWV and ADC. Multivariate logistic regression showed that the combination of ARFI and DWI did not improve the results of the single modalities.
Conclusion: There is significant correlation between ultrasound-acquired SWV and MRI-acquired ADC values of breast lesions. Since both modalities have a similar accuracy for the differentiation of benign from malignant lesions, application of ARFI elastography may obviate the need for an additional MRI examination including DWI for breast lesion characterisation.
Limitations: Limited patient number.

Shear wave elastography stiffness as an independent predictor of axillary lymph node metastases in patients with invasive breast cancer

S. B. Grover[1], A. K. Nag[1], S. Patra[1], H. Grover[2], A. Katyan[1], S. K. Jain[1], A. K. Mandal[1]; [1]*New Delhi/IN,* [3]*New York/US (shabnamgrover@yahoo.com)*

Purpose: To evaluate shear wave elastography tumour stiffness as an independent predictor of axillary lymph node metastases in patients with invasive breast cancer.
Methods and materials: In this institutional review board-approved prospective cross-sectional study, 81 consenting female patients with newly diagnosed, biopsy-proven, single lesion, invasive breast cancer >15 mm diameter were recruited. Patients were examined on Siemens Acuson S-3000 using a 4-9 MHz linear probe. Having assessed SWE quality, the built-in colour overlay was placed, including tumour and surrounding tissue. SWE stiffness was obtained by placing ROI in the region of maximum stiffness on the colour map. At least three E-max values (kPa) were obtained for each tumour. Following surgical resection, tumour type, grade, and axillary lymph node involvement were evaluated at histopathology. Diagnostic performance of mean SWE stiffness for prediction of axillary LN metastases was evaluated using Chi-square test and ROC curve.
Results: Out of 81 interrogated tumours, 40 were axillary node-positive and 41 were negative. SWE stiffness values were higher in lymph node-positive cases (p<0.001). Using E-max cut-off value of >215 kPa for positive axillary LN metastases, sensitivity of 92.3%, false-positive rate of 7.7%, with calculated specificity 92.8%, PPV 92.3%, and NPV 92.8% were obtained.
Conclusion: SWE evaluated tumour stiffness is a reliable independent predictor of axillary lymph node metastasis in invasive breast cancer. Further validation of this technique can lead to its routine application for superior risk stratification and individualised management decisions regarding neoadjuvant chemotherapy and axillary lymph node dissection.
Limitations: Studies with larger cohorts are required for further revalidation of results.
Ethics committee approval: Informed consent obtained from all patients.
Funding: No funding was received for this work.

Combination use of quantitative parameters for shear wave elastography and superb microvascular imaging to evaluate breast masses

E. J. Lee, Y.-W. Chang; *Seoul/KR (demian3923@naver.com)*

Purpose: To evaluate the diagnostic value of adding quantitative parameters of SWE and SMI to breast US in differentiating benign and malignant breast masses.
Methods and materials: 200 pathologically proven breast lesions in 193 patients were retrospectively reviewed using breast US with greyscale, SWE, and SMI. The AUC in the combination of BI-RADS, Emax, Eratio, and SMI_{VI} were compared using calculated cut-off values for two sets of cases. Set 1 included only downgrade C4a. Set 2 included upgrade of C3 and downgrade of C4a. The diagnostic performance was compared between greyscale US and US with the additional combination of quantitative parameters.
Results: There were 115 (57.5 %) benign lesions and 85 (42.5%) malignant lesions. Emax with a cut-off value of 84.45 kPa had the highest AUC value compared to Eratio of 3.35% or SMI_{VI} of 3.57%. In set 1, the combination of BI-RADS with Emax or SMI_{VI} had a significantly higher AUC value compared to BI-RADS alone (p<0.05). BI-RADS with the addition of Emax, Eratio, and SMI_{VI} had the best diagnostic performance compared to BI-RADS alone, with an accuracy of 84.0%. The specificity increased significantly from 46.1% (53 of 115) to 79.1% (91 of 115), and the sensitivity was slightly reduced but not statistically significant.
Conclusion: Combining all quantitative values of SWE and SMI with BI-RADS improved the diagnostic performance in differentiating between benign and malignant breast lesions.
Limitations: This study was a retrospective design and inter- or intraobserver variability was not evaluated. We only investigated the quantitative values of SWE and SMI.
Ethics committee approval: This retrospective study was approved by the institutional review board for ethical issues in clinical research.
Funding: This work received Soonchunhyang University research funding.

What is the most predictive parameter in shear wave elastography to differentiate breast cancer and to predict tumour characteristics and immunohistochemical subtypes?

H. Kim, J. Lee, B. J. Kang, S. H. Kim; *Seoul/KR (kimhj2577@gmail.com)*

Purpose: To identify the most predictive parameter using shear wave elastography (SWE) to differentiate breast cancer and to predict tumour characteristics and immunohistochemical subtypes.
Methods and materials: From November 2018 to February 2019, conventional breast ultrasound (US) and SWE were consecutively performed in women with BI-RADS category of 3 or above breast lesions. A total of 211 breast lesions from 190 patients were enrolled for the study and BI-RADS categories and qualitative and quantitative SWE parameters for each lesion were prospectively obtained. Pathologic results including immunopathologic factors were evaluated. The diagnostic performance of each parameter and its correlation with immunohistochemical subtypes of breast cancer were analysed.
Results: Among the 211 breast lesions, there were 82 malignant and 129 benign lesions, and 69 invasive ductal cancer (IDC) and 142 noninvasive ductal cancer (non-IDC) lesions. Of all the SWE parameters, Emax showed the highest accuracy in differentiating malignancy from benign (AUC=0.891) and IDC from non-IDC (AUC=0.884). Also, Emax was less affected by the lesion depth and size. Poorly differentiated and PR-negative tumours showed higher Emax (p<0.05). Ki-67 positive breast cancer showed more heterogeneous shear wave (high SDmean) and colour distribution (p<0.05). KI-67 and CK5/6 positive breast cancers showed higher Emax/Efat ratio (p<0.05).
Conclusion: Emax is a relatively accurate and stable parameter to differentiate malignancy from benign and IDC from non-IDC. In addition, the Emax/Efat ratio and heterogeneous SWE colour distribution could be a predictive factor in differentiating Ki-67 positive breast cancer.
Limitations: Our research has been conducted using a relatively small sample size and limited within a single centre.

DIMASOS: a German multi-centre trial for density-indicated mammography sonography screening
S. H. Heywang-Köbrunner[1], A. Hacker[1], M. Hertlein[1], C. Mieskes[1], E. Mieskes[1], S. Elsner[2], A. Katalinic[2]; [1]Munich/DE, [2]Lübeck/DE
(sylvia.heywang@referenzzentrum-muenchen.de)

Purpose: Population-based centralised screening programs to date rely on mammography-screening only. However, even with latest digital technology, sensitivity drops strongly in the upper 5-15% density range. Feasibility and outcome of quality-assured density-adapted mammographic-sonographic screening is tested.
Methods and materials: Density is prospectively calculated on approximately 240,000 mammograms to select 30,000 patients with a density exceeding the upper 15% density range. These women are offered participation. Mammographic 1st, 2nd, and consensus readings are followed by independent combined mammographic-sonographic 1st, 2nds and consensus readings.
Results: For women with breast density > upper 15% range, incremental cancer detection, incremental false-positive rate, biopsy rate, and costs will be recorded. Acceptance by patients, feasibility for screeners, and quality assurance will be tested. Incremental detection of at least 60 cancers is expected.
Conclusion: A significant impact on screening effect is expected for women with very high breast densities.
Limitations: Due to wide availability of ultrasound, the ethical requirement of patient information in a randomised controlled trial design is impossible. Two different control groups are possible: either a historical group or a prospective parallel control group (completely anonymised) from women in the same SUs (selected by mammography unit or date).
Effect on interval cancer rate and stage distribution in the follow-up round will be evaluated after completion of the follow-up phase.
Ethics committee approval: Expected 11/2019.
Funding: The study is payed through the National German Innovation Fund.

Sonoelastography in the evaluation of fibrocystic breast disease
N. Jain, R. Rastogi*; Moradabad/IN (neha11aug@gmail.com)*

Purpose: Fibrocystic breast disease or fibroadenosis is a benign disease of the breast characterised clinically by mastalgia, firm palpable regions in the breast, and a suspicious palpable lump. Mastalgia is characteristically premenstrual and is partially or completely relieved with menstrual flow associated with decreased firmness. High-resolution ultrasonography (HRUS) is being utilised for differentiating benign from malignant breast diseases. Recently, sonoelastography, especially acoustic radiation forced impulse (ARFI) imaging, is being evaluated in breast imaging.
Methods and materials: This pilot study aimed to evaluate sonoelastography in fibrocystic breast disease and ARFI in differentiating normal from fibrocystic breast parenchyma.
30 breasts, 15 each with normal and clinically-suspected fibrocystic disease, were evaluated by sonoelastography using a high-resolution, linear-array transducer. Data from virtual touch tissue quantification (VTTQ) was collected from fibroglandular parenchyma in the axillary tail and superolateral quadrant of the breast in both normal and clinical disease groups, as fibrocystic breast disease is more common in the superolateral quadrant. The data obtained from the control group was then compared with that from clinically suspected cases of fibrocystic breast disease. The patients with a diagnosis of fibrocystic breast disease on sonoelastography were followed-up clinically or with tissue diagnosis.
Results: Sonoelastography picked up 10 out of 12 clinically/tissue-proven cases with elasticity values lower than that of the normal breast (usually less than 2m/sec)
Conclusion: Sonoelastography (both VTI and VTTQ) shows highly accurate results allowing for the confident diagnosis of fibrocystic disease, thus obviating the need for tissue diagnosis. Given the high prevalence of benign fibrocystic disease of the breast and high accuracy of sonoelastography, imaging can be used with high confidence in not only reaching the diagnosis but also in monitoring the treatment of disease, thus optimising the cost and duration of treatment.

Does image fusion technique improve the sonographic and histopathologic detection rate of conventional B-mode occult MRI-detected breast lesions?
S. Nakano[1], K. Fujii[2], Y. Mouri[2], J. Kousaka[2], T. Ando[2], M. Goto[2], K. Suzuki[2]; [1]Aichi/JP, [2]Nagakute/JP (snakano1@aichi-med-u.ac.jp)

Purpose: MRI-guided breast biopsy aids in the histopathologic diagnosis of conventional B-mode (cB-mode) occult MRI-detected lesions. Recently, real-time virtual sonography (RVS), a coordinated US and MRI with electromagnetic tracking system, was developed. By using its imaging fusion technique, we can sonographically biopsy for cB-mode occult MRI-detected lesions without special technique. Our aim was to retrospectively evaluate the utility of second-look US using RVS for detection of cB-mode occult MRI-detected lesions.
Methods and materials: Between 2016 and 2018, 27 consecutive patients who underwent second-look US to identify cB-mode occult MRI-detected lesions were enrolled in this study. Second-look US using RVS was performed after an additional supine MRI.
Results: Of the 28 lesions in the 27 patients, all were re-identified in supine MRI and 24 (86%) were detected by second-look US using RVS. MRI morphology types of the 24 lesions were as follows: mass, 10; non-mass enhancement, 14; and focus, 4. US-guided biopsy under RVS or excisional biopsy demonstrated that of the 24 lesions, 8 (33%) were malignant and the remaining 16 (66%) were benign. Of the 8 malignant, 4 were DCIS, 3 were IDC, and one was ILC. All the subtype of invasive carcinomas were ER/PgR positive, HER2 negative, and Ki-67 negative. All 4 remaining US-occult lesions could be followed up under RVS after the enhancing area was marked on the breast surface using RVS.
Conclusion: The findings of our study suggest that second-look US using RVS with additional supine MRI could improve the sonographic and histopathologic detection rate of cB-mode occult MRI-detected lesions.
Limitations: Small number. Retrospective study. Single institute study.
Ethics committee approval: This pilot study was approved by the Institutional Review Board at our hospital. The written informed consent for this evaluation was obtained.
Funding: No funding was received for this work.

Real-time MRI-US imaging fusion technique for breast lesion characterisation
A. Abate[1], R. Giovanazzi[2], C. Di Bella[2], S. de Beni[3], S. D'onofrio[3], M. Cereseto[3], G. Querques[2], V. Besostri[4], R. Corso[2]; [1]Lesmo/IT, [2]Monza/IT, [3]Esaote/IT, [4]Pavia/IT (abate.anna75@gmail.com)

Purpose: Evaluation of novel MRI-US fusion imaging technique based on model-adaptive artificial intelligence (AI) algorithms and focused on improving diagnostic confidence and multimodal-localisation of breast lesions.
Methods and materials: In 6 months, 80 female patients (mean age: 56 ys) underwent breast ultrasound (US), using MyLab9eXP (Esaote, Italy) with fusion-imaging technology (VirtualNavigator and BreastNav), linear probe, and dedicated tracking sensor.
On 22 out of 80 patients, with evident mammographic suspicion and negative US examination, diagnostic completion with MRI was performed in prone and supine position, after locating 9 skin-landmarks (SL) on the patients' breast, to evaluate morphological modifications in prone-supine change.
Results: In 22 MRI examinations, 27 lesions were identified by a target placed on MRI supine image. VirtualNavigator in all cases visualised the target on US through fusion-imaging with supine-MRI. Nevertheless, radiological daily workflow contemplates breast MRI with the prone patient. To manage the relevant deformations due to prone-supine change, a new fusion-imaging AI-modelling algorithm was developed (BreastNav). To assess algorithm accuracy in the two different positions, 5 out of the 22 acquired MRI, with different age and breast morphology, were selected. For each, one SL was identified on prone-MRI. BreastNav automatically determined the new SL position on supine-MRI and the accuracy (in terms of Euclidean error and RMSE) in the 3 dimensions was measured. This assessment enabled the AI-algorithm to be validated, as it responded correctly to the different SL positions with an average error of 1.14 cm.

Conclusion: The AI-modelling algorithm of BreastNav manages important deformations induced by a patient's different positions between US and MRI, in order to optimise lesion identification, visible mainly on MRI, directly on US and to guide subsequent biopsy procedures.

Digital breast tomosynthesis versus MRI in the detection and loco-regional presurgical staging of breast cancer: correlation with breast density and background parenchymal enhancement

S. Messina, A. Orlando, S. Busalacchi, L. Spatafora, G. Milia, F. Midiri, R. Ienzi, M. Midiri, T. V. Bartolotta*; Palermo/IT (silviamessina9106@gmail.com)*

Purpose: To assess the role of digital breast tomosynthesis (DBT) and MRI in detection and loco-regional presurgical staging (LoPreSS) of breast cancer (BC).
Methods and materials: 78 women (age: 32-76), undergone both DBT and breast MRI for biopsied suspicious breast lesions or for equivocal findings at conventional imaging, were divided into two groups on the basis of mammographic density (MD), in non-dense (A-B) and dense (C-D) breasts, and two groups according to the background parenchymal enhancement (BP), 1-2 and 3-4. Sensitivity, specificity, negative and positive predictive values (NPV and PPV), and accuracy in LoPreSS in unifocal, multifocal, multicentric and bilateral BC, were calculated.
Results: 28/78 lesions were benign and 48/78 malignant (17/48 unifocal, 9/48 multifocal, 20/48 multicentric, 2/48 bilateral). MRI showed higher sensitivity (100% vs 87,5%, p=0.0013), specificity (76,7% vs 46,7%, p=0.0001), PPV (87,3% vs 72,4%, p=0.0208), and NPV (100% vs 70%, p<0.0001) than DBT. MRI showed a significantly higher accuracy in LoPreSS than DBT for multicentric (100% vs 45%, p=0.0001), multifocal (100% vs 55%, p=0.0274), and bilateral (100% vs 50%, p=0.3173), but not for unifocal (82,3% vs 64.7%, p=0.2520) BC. 20/48 BC patients showed non-dense and 28/48 dense breasts. DBT showed higher accuracy in LoPreSS in the non-dense group (17/20- 85% -vs 9/28- 32.1%-p=0.0081). With MRI, no differences in LoPreSS between non-dense and dense breast were noted (95% vs 92,8 %, p=0), as well as between BPE 1-2 group and 3-4 group (93,5% and 94,1%, p=0.93) respectively. Among non-dense breasts, MRI and DBT showed no significant differences in preoperative staging accuracy (95% vs 85%; p=0.30).
Conclusion: In BC, LoPreSS breast MRI showed higher accuracy in dense breasts than DBT. No significant differences in non-dense breasts were noted.
Limitations: Single-centre study.

Reduction of pressure sensor artifacts in the simultaneous acquisition of wide-angle breast tomosynthesis and mechanical imaging

P. Bakic[1], M. Dustler[2], A. D. A. Maidment[1], S. Zackrisson[2], A. Tingberg[2]; [1]Philadelphia/US, [2]Malmö/SE (predrag.bakic@pennmedicine.upenn.edu)

Purpose: Mechanical imaging (MI) maps tissue stiffness, which increases in breast tumours. The simultaneous acquisition of digital breast tomosynthesis (DBT) and MI combines the information about the anatomical structure and tissue stiffness of breast findings. This combination has the potential to reduce the number of false-positives and help avoid biopsies by resolving ambiguous DBT findings based upon their MI data. In simultaneous imaging, the MI pressure sensor is present during the DBT acquisition, producing visible artefacts. These artefacts may be reduced by preprocessing DBT projections, modifying the reconstruction algorithm, or designing radiolucent sensors. In this paper, we characterised artefacts seen in wide-angle DBT images with and without preprocessing.
Methods and materials: We have used a clinically available wide-angle DBT system to image a structured physical breast phantom on top of a commercial MI sensor. DBT images were acquired using the standard clinical protocol and automatic exposure control. We preprocessed DBT projections by flat fielding, using sensor images with and without the phantom. Images obtained with and without flat fielding were assessed visually by experienced medical physicists.
Results: Simultaneous DBTMI acquisition shows sensor artefacts in reconstructed images within ~1/3 of the phantom thickness above the detector. These artefacts are less prominent as compared to our previous study of simultaneous DBTMI using a narrow-angle DBT system. Flat-fielded images show substantially reduced appearance of artefacts, with slightly increased noise.
Conclusion: The simultaneous DBTMI imaging removes the requirement for two separate acquisitions. However, it produces noticeable artefacts due to the presence of the MI sensor. These artefacts overlap breast anatomical structures and may compromise diagnosis. Flat fielding of DBT projections substantially eliminates artefacts. Quantitative validation and method optimisation is ongoing.

Impact of digital breast tomosynthesis (DBT) on dose when assessing breast masses

N. Anandan[1], M. A. McMahon[1], B. J. G. Dall[1], I. Haigh[1], Y. Chen[2], N. Sharma[1]; [1]Leeds/UK, [2]Nottingham/UK (nevine.anandan@nhs.net)

Purpose: The impact of DBT on dose when assessing masses.
Methods and materials: All women recalled between 13/11/15 and 29/07/16 following an abnormal screening mammogram had triple assessment and biopsy if required.
A DBT study was read within 6 weeks of assessment clinic. The number of additional mammographic views, doses (mGy), and DBT examination was recorded.
Statistics: Doses analysed in a mixed design, 2x2 ANOVA, looking at dose with and without DBT (within cases).
Results: 1,470 women attended screening assessment and 835 women consented. 810 had complete data on dose and screening outcome.
353 cases recalled for a mass (351 women) and 316 biopsies performed (314 women). 74 cancers identified.
Tomosynthesis/ultrasoud recommended 97 biopsies and 73/74 cancers would have been identified with one case of DCIS missed.
Significant effect of use of DBT, $F(1,339) = 4.80$, $p = .029$, $\omega = .11$ (within cases): mean dose without DBT was higher than with DBT.
When a biopsy was undertaken that tomosynthesis/ultrasound indicated should not have taken place, mean dose was higher without DBT.
When a biopsy was taken that tomosynthesis/ultrasound agreed should have taken place, there was no significant difference in dose without/with DBT.
Reduction in the number of films used, associated with the use of DBT, was analysed in a one way, between cases ANOVA looking at whether cases were biopsied or not. The overall reduction in the number of films used, associated with the use of DBT, was 3.61 (SD = 2.12).
Conclusion: DBT in assessment has the potential to reduce the dose and number of additional mammographic images in diagnostic workup of masses.
Limitations: This was a single-centre study.
Ethics committee approval: IRB approved the prospective study.
Funding: No funding received for this work.

Impact of a pressure-based flexible paddle in digital breast tomosynthesis on the participant and technologist

K. J. Schilling[1], M. van Lier[2], S. Muller[3]; [1]Boca Raton/US, [2]Amsterdam/NL, [3]Buc/FR (monique.van.lier@sigmascreening.com)

Purpose: Mammographic breast compression using compression paddles equipped with a pressure indicator (pressure-based compression) has not yet been reported for flexible paddles in digital breast tomosynthesis (DBT). We aimed to evaluate the effect of a new DBT pressure-based flexible paddle (DBT-PBFP) on the technologist and patient experience. The impact on radiation dose and compression parameters variability was also addressed.
Methods and materials: Women with a DBT appointment, agreeing with study participation, received PBFP-guided breast compression on a GE-Senographe-Pristina. Mean compression pressure (force over contact area) was visualised during compression to the technologist and participant using 8 LED's (2kPa per LED), aiming for an 8-14kPa target range. Compression parameters were retrospectively obtained from the study examinations and priors. The participant and technologist experiences were assessed using a questionnaire.
Results: From 94 participants, four-views conventional prior and study DBT examinations (total: 376 paired-views) and completed questionnaires were available. Technologists indicated that DBT-PBFP use eased explaining breast-compression (100%) and improved their workflow (97%). From all women, 89% would recommend DBT-PBFP-compression to friends. The compression force (mean±standard deviation) did not differ in CC-views (prior:82.3±20.6N, PBFP:86.4±34.2N, p=0.11), but increased in MLO-views (prior:85.2±21.9N, PBFP:103.1±31.5N, p<0.0001). Compression pressure variability decreased with 50% (p<0.0001) for CC-views and 34% (p<0.0001) for MLO-views, along with a decreased breast thickness (CC-view:8%, p<0.0001, MLO-view:10%, p<0.0001). Sub-group analysis (100 paired-views) showed overall average glandular dose reduction (prior:1.65±0.38mGy, PBFP:1.59±0.37mGy), with MLO-views as main contributor.
Conclusion: Using the new DBT-PBFP improved the participant and technologist experience and workflow while significantly reducing compression pressure variability, breast thickness, and average glandular dose.
Limitations: In some patients, a different DBT-system and/or technologist performed the study compared to prior examination, which may impact on the patient-comfort and radiation-dose comparability.
Ethics committee approval: Institutional review-board approved. Written informed-consent.
Funding: No funding was received for this work.

What is the impact of intraoperative specimen tomosynthesis in determination of surgical margin of breast conserving surgery?

I. Başara Akin, G. Tokatli Camkerten, E. Akyol, A. Balci, M. Guray Durak, S. O. Aksoy, P. Balci; Izmir/TR (slbasara@yahoo.com)

Purpose: Breast conserving surgery (BCS) has become a routine procedure in early-stage breast cancer. Because of the risk of local recurrence, the most important aim of BCS is the removal of a malignant mass with no tumour margin. However, it has been shown that surgical margin negativity rates are still low. The sensitivity of specimen mammography (SMG) in terms of surgical margin negativity is low. Specimen tomosynthesis (STS) has increased the diagnostic efficacy lesion detection. The aim of this study was to determine the efficacy of STS added to SMG in the intraoperative process to evaluate the surgical margin in excised tissue.
Methods and materials: SMG and STS findings of BIRADS 4-5 specimens were evaluated retrospectively by two different observers. The observers were unaware of the histopathological outcome during the evaluation process. The SMG and the STS findings were compared in terms of BIRADS classification and histopathology. Inter- and intraobserver correlation analyses were performed. Chi-square test and compatibility Kappa (K) analysis were performed.
Results: 89 patients were included in this study. SMG-STS findings for observer 1 was K 0,80 (excellent) and for observer 2 was K 0,77 (good). Interobserver Ks were 0.48 and 0.43 (moderate), respectively. Sensitivities in SMG were 45% and 23%, the specificities were 90% and 74%, PPVs were 88% and 70%, NPVs were 50% and 42%, respectively. The sensitivities in the STS were 53% and 43%, specificities were 90% and 78%, PPVs were 87% and 48%, and NPVs were 61% and 49%, respectively.
Conclusion: In BCS, using STS in the intraoperative process provides the optimal evaluation of the surgical margin, a shortening of the duration of surgery, and a decrease in re-excision rates.
Limitations: Limited patients number.
Ethics committee approval: n/a
Funding: No funding was received for this work.

Association between patient and physical acquisition parameters and mammography positioning errors

M. Abdolell[1], N. Paquet[1], J. I. Payne[1], K. Tsuruda[2], O. Tong[1], P. Barnes[1], P. Brown[1], J. Caines[1], S. E. Iles[1]; [1]Halifax, NS/CA, [2]Oslo/NO (Sian.Iles@nshealth.ca)

Purpose: To identify which mammographic image positioning errors are associated with patient and physical acquisition parameters in the general screening population.
Methods and materials: Image quality assessments were performed on mammograms of 9259 subjects included in a population-based case-control study. The following mammography positioning errors were assessed (densitas qualityaiTM) on MLO and CC images from each subject's most recent screening exam: exaggeration, skin folds, portion cut-off, patient-related artefacts, posterior tissues missing, improper pectoralis muscle positioning, inadequate IMF, sagging, and proper height on image receptor. Logistic regression was used to model the presence of positioning errors as a function of patient/physical acquisition parameters including age, breast volume, and compression pressure partitioned into deciles. The Mantel-Haenszel test for linear trend was used to assess a dose-response relationship between the risk of errors and patient/physical acquisition parameters.
Results: When examining individual patient/physical acquisition parameters, patient age was found to be linearly associated with 10 of the 13 errors ($p < 0.05$), and breast volume and compression pressure were each found to be associated with 12 of the 13 errors ($p < 0.05$).
Conclusion: This study shows that patient and physical acquisition parameters, such as age, breast volume, and compression pressure, are related to elevated or diminished risk of mammography image positioning errors during a screening exam.
Limitations: This study requires external validation.
Ethics committee approval: REB Approval was received and a waiver of consent was granted.
Funding: There was no funding received for this specific study, but the images used in this study were obtained from a previously funded study.

Sub-regional morphological assessment of normal and degenerative articular cartilage

R. Khandelwal[1], A. Kharat[1], K. Saoji[1], A. Jaju[1], D. Kumar[2]; [1]*Pune/IN,* [2]*Bangalore/IN (rachit.khandelwal@gmail.com)*

Purpose: To assess morphological changes in the sub-regions of knee articular cartilage in the presence of pathologic/degenerative or traumatic disease through automated and quantitative computation method.
Methods and materials: This prospective observational study was designed to assess 35 normal and 20 patients (chondromallacia patellae=8, osteoarthritis=7, and traumatic injuries with degraded cartilage=5). MR scanning was performed on 3T MAGNETOM Vida (Siemens Healthineers, Germany) using an 18-channel knee coil. Regional and sub-regional analysis of the cartilage in terms of morphological changes such as thickness and volume were performed using an MR chondral health (Version 2.1) work-in-progress (WIP) package provided by Siemens Healthineers.
Results: Cartilage was segmented in various zones and regions, which were colour demarcated, and quantitative measurements in terms of thickness and volume were performed. Mean thicknesses of the femur, patella, and tibia of normal subjects were1.63±0.22 mm, 2.11±0.38mm, and 1.51±0.20 mm, respectively, while mean volumes were 10.17±2.39, 3.11±0.79, and 3.74±0.85, respectively. Thicknesses in OA (femur=1.59 mm, tibia=1.45 mm), traumatic (femur-=1.59 mm, tibia=1.50 mm) and chondromallacia patellae (femur=1.57 mm, tibia=1.48 mm) patients were found to be slightly decreased compared to normal, while it was increased for the patella region (OA=2.15 mm, traumatic=1.97 mm, and chondrmallacia patellae=2.15 mm). A similar pattern was observed for volume, in OA (femur=9.52 ml, tibia=3.37 ml), traumatic (femur=9.04 ml, tibia=3.13 ml), and chondromallacia patellae (femur=9.24 mm, tibia=3.32 ml) patients were found to be slightly decreased compared to normal, while it was increased for the patella region (OA=3.18 ml, traumatic=2.7 ml, and chondromallacia patellae=3.20 ml). This evidenced the degenerative changes in the morphology of cartilage.
Conclusion: Automated cartilage segmentation and quantitative measurements in terms of thickness and volume have significantly reduced time and improved diagnostic accuracies quantitatively.
Limitations: A small sample size.
Ethics committee approval: Ethics committee approval obtained.
Funding: WIP loaned by Siemens under Master Research Agreement.

The evaluation of cartilage degeneration using quantitative ultrashort echo time magnetisation transfer (UTE-MT): a feasibility study

J. Yang[1], H. Shao[1], Y. Ma[2], L. Wan[2], J. Du[2], G. Tang[1]; [1]*Shanghai/CN,* [2]*San Diego/US (yangjiaweitj@126.com)*

Purpose: To investigate the feasibility of using a quantitative ultrashort echo time magnetisation transfer (UTE-MT) technique to evaluate cartilage degeneration.
Methods and materials: 20 human anterolateral condyle specimens were obtained from total knee arthroplasty and then underwent MR scans on a clinical 3.0T scanner. 72 regions of interest (ROI) were manually drawn on specimens for UTE-MT measurement and the corresponding cartilage-bone regions were further divided into normal, mild, moderate, and severe degeneration groups based on histological measures of degeneration (Mankin scores) as a reference standard. 20 healthy volunteers and 15 osteoarthritis patients (the anterolateral condyle was involved) underwent MRI scans with UTE-MT and clinical sequences. The cartilage regions were grouped according to MRI Recht grades and UTE-MTR were obtained by drawing the ROI in the corresponding regions. The differences in quantitative results among different grades were compared.
Results: Ex vivo results showed that the UTE magnetisation transfer ratio (UTE-MTR) in the normal group was significantly different from the mild group (P=0.021), moderate group (P<0.001), and severe group (P<0.001). UTE-MTR strongly correlated with histological grades of cartilage degeneration (Mankin scores) (P=-0.678, P<0.001). In vivo results showed that UTE-MTR in the normal group was significantly different from the moderate group (P=0.02).
Conclusion: UTE-MT may provide a promising imaging biomarker with potential application in the diagnosis and monitoring of cartilage degeneration.
Limitations: MTR values are susceptible to many factors, including deviation fre-quencies, radio-frequency angles, and field intensities. We have not been confirmed using the corresponding histological measures of a degeneration in vivo study.
Ethics committee approval: The study was approved by the ethics committee at our research hospital (shsy-iec-ky-3964).
Funding: National Natural Science Foundation of China (81871325,81801656).

Quantitative cartilage mapping using synthetic MR sequences: a comparative study of magnetic resonance image compilation (MAGiC) cartilage mapping and multi-echo T2 cartilage mapping

S. Rajan, V. K. Venugopal, M. Murugavel, V. Mahajan, H. Mahajan; *New Delhi/IN (drsriramrajan@gmail.com)*

Purpose: To compare a cartilage map created using synthetic MRI images using magnetic resonance image compilation (MAGiC) versus a conventional T2 multi-echo cartilage map. A comparison of normal and abnormal values.
Methods and materials: 30 subjects were scanned on a 3.0T scanner, first with multi-echo T2 cartilage map and then with a MAGiC sequence. 20 slices were obtained with the multi-echo and similar synthetic multi-echo images, with the MAGIC technique in a sagittal plane and reconstructed to yield cartilage maps. The T2 relaxation values were calculated by carefully placed ROIs on the weight-bearing segments of the medial (MFC) and lateral femoral cartilage segments (LFC) on both the multi-echo T2 maps and synthetic MR T2 maps. Pearson's correlation coefficient was calculated between these two sets of values.
Results: There was a moderate positive correlation between the T2 relaxation values generated on multi-echo T2W sequences and the synthetic MR generated T2 maps on both the medial and lateral femoral cartilage segments. Pearson's correlation coefficient (R) was 0.5365 and 0.5174 for MFC and LFC, respectively (p<0.05). The exact cartilage thickness was better seen on the synthetic MR images.
Conclusion: We conclude that a cartilage map could be created from virtual multiple echoes synthesised using a single MAGIC acquisition, resulting in both anatomical and cartilage map images.
Limitations: The small sample size.
Ethics committee approval: Approval was obtained from the institutional ethics committee.
Funding: No funding was received for this work.

Regional bone mineral density assessed by statistical parametric mapping in patients with and without reoperation following instrumented lumbar spinal fusion: a case-control study

M. T. Löffler, A. Valentinitsch, C. Zimmer, Y.-M. Ryang, J. S. Kirschke; *Munich/DE (m_loeffler@web.de)*

Purpose: To opportunistically assess regional bone mineral density (BMD) at the lumbar spine using statistical parametric mapping (SPM) of existing CTs in patients with and without reoperation following instrumented lumbar spinal fusion (LSF).

Methods and materials: 17 patients (69.2±9.4 years) who had reoperation after y median 593 days (range 49–2,259) following LSF were matched to 17 patients (70.3±8.4 years) who did not have reoperation (matched by sex, age±5 years, and fused levels). In the hospital's records, patients without reoperation did not present with a sensory-motor deficit or severe pain at the last visit after a median follow-up of 135 days (range 5–1,129). Opportunistic screening of regional BMD was performed using SPM of ≥1 lumbar vertebra in preoperative or immediate postoperative CT. Vertebral bodies were segmented by our in-house algorithm. SPM involves normalisation to a common template and calculation of voxel-wise statistics in relation to a group of 18 young healthy individuals yielding T_{spm}-scores.
Results: Patients with and without reoperation presented normal BMD without significant difference (135.3±50.9 vs 132.1±51.6 mg/cm³). Compared to young healthy individuals, patients with and without reoperation showed equally reduced T_{spm}-scores (inferior vertebral region: -2.52±1.48 vs -2.53±1.40).
Conclusion: Opportunistic osteoporosis screening by SPM at the lumbar spine can be performed in presurgical CT even on a single vertebra, thus informing the surgeon about reduced BMD. In these matched groups undergoing LSF, regional BMD was not associated with the risk of reoperation as it was not in the osteoporotic range.
Limitations: Due to the retrospective design of this case-control study, loss of follow-up is a potential confounding factor.
Ethics committee approval: This retrospective study was approved by the IRB.

The diagnostic accuracy of colour-coded virtual noncalcium dual-energy CT for the depiction of traumatic bone marrow oedema in sacral insufficiency fractures in comparison to MRI

C. Booz, I. Yel, L. Lenga, S. S. Martin, K. Eichler, R. Hammerstingl, T. J. Vogl[1], M. H. Albrecht; *Frankfurt am Main/DE*
(boozchristian@gmail.com)

Purpose: To evaluate the diagnostic accuracy of dual-energy CT virtual non-calcium (VNCa) reconstructions for the depiction of traumatic bone marrow oedema in sacral insufficiency fractures using MRI as a standard of reference.
Methods and materials: Data from 52 consecutive patients who had undergone third-generation dual-source dual-energy CT and 3T MRI within 7 days from January 2017-December 2018 due to low back pain were retrospectively analysed. 5 radiologists, blinded to clinical and MRI information, independently assessed a conventional grey-scale dual-energy CT series for fractures according to the Denis classification. After 8 weeks, readers re-evaluated all cases using colour-coded VNCa reconstructions for sacral bone marrow oedema. Quantitative analysis of CT numbers on VNCa reconstructions was performed by a sixth radiologist. Two additional experienced radiologists, blinded to clinical and CT information, defined the reference standard in consensus MRI reading sessions. Sensitivity, specificity, and the area under the curve (AUC) were primary indices for diagnostic accuracy.
Results: MRI revealed a total of 39 zones with focal traumatic bone marrow oedema in 27 patients. Fracture lines were detected in 12 patients on conventional grey-scale CT. In the qualitative analysis, VNCa showed high overall sensitivity (96%) and specificity (93%) for the depiction of bone marrow oedema. CT numbers obtained from VNCa were significantly different in zones with or without oedema (P<0.001). The overall AUC was 0.965. A cut-off value of -32 Hounsfield units provided a sensitivity of 92% and a specificity of 88% for differentiating bone marrow oedema.
Conclusion: Dual-energy CT VNCa reconstructions yield excellent diagnostic accuracy for colour-coded depictions of traumatic bone marrow oedema in sacral insufficiency fractures compared to MRI.
Limitations: The retrospective single-centre study design.
Ethics committee approval: This study was approved by the local IRB.
Funding: No funding was received for this work.

The effectiveness of methotrexate in the management of localised scleroderma (morphea) according to an ultrasound activity score

C. Vera-Kellet, R. Meza-Romero, C. Moll-Manzur, C. Ramírez-Cornejo, X. Wortsman; *Santiago/CL (xworts@yahoo.com)*

Purpose: Methotrexate (MTX) is a first-line treatment for morphea (cutaneous scleroderma). To date, no studies have evaluated the effectiveness of MTX in morphea considering colour Doppler ultrasonography. We aimed to assess the effectiveness of using MTX in patients with morphea according to ultrasound activity.
Methods and materials: A retrospective cohort study with 22 morphea patients treated with MTX was evaluated clinically and ultrasonographically (July 2014-July 2019). Clinical data, dose, and duration of treatment were correlated with an ultrasound activity score (UAS). The UAS was based on the presence of increased hypodermal hyperechogenicity and dermal-hypodermal hypervascularity, type of vessels, number, and the type of involved corporal segments in consecutive ultrasound examinations per patient. Statistics included Wilcoxon and Fisher exact tests, the odds ratio (OR), and the risk ratio (RR) with their 95% confidence intervals. Significance was set at 0.05.
Results: Between the first and second ultrasound, there was a significant decrease of one point of the UAS (p<0.05) and 7.9 times more chance of lowering the UAS in the group exposed to >15 mg/week of MTX versus the group exposed to ≤15 mg/week of MTX. However, between the first and last ultrasound, there was an increase in a point of the UAS (p<0.05), and only 3.6 times more chance of lowering the activity score in the group exposed to concentrations >15 mg/week of MTX. A non-significant decrease of the activity was detected in the group exposed to ≤15 mg/week of MTX.
Conclusion: A decrease of activity is seen in patients treated with MTX doses ≥15 mg/week, but there is a long-term loss of the effect of MTX.
Limitations: The small size of the sample.
Ethics committee approval: Approved by the ethics committee.
Funding: No funding was received for this work.

Bone marrow oedema in the non-traumatic hip: high accuracy of dual-energy CT with water-hydroxyapatite decomposition imaging

W. Son[1], C. Park[1], H. S. Jeong[1], Y. S. Song[2], I. S. Lee[2]; *[1]Yangsan/KR, [2]Busan/KR (andywson@gmail.com)*

Purpose: To evaluate the diagnostic performance of dual-energy CT with water-hydroxyapatite (HAP) imaging for bone marrow oedema in patients with non-traumatic hip pain.
Methods and materials: 40 patients (mean age, 58 years; 16 male and 24 female) who underwent rapid kVp-switching dual-energy CT and MRI within 1 month from April 2018-February 2019 with hip pain but no trauma were enrolled. Two radiologists retrospectively evaluated 80 hip joints for the presence, extent (femoral head involved, head and neck, and head to intertrochanter), and severity (mild oedema, moderate, and severe) of bone marrow oedema on dual-energy water-HAP images. Water mass density (mg/cm³) on water-HAP images was determined with a region-of-interest-based quantitative analysis. MRI served as the standard of reference.
Results: Sensitivity, specificity, and accuracy of readers 1 and 2 for the identification of bone marrow oedema in water-HAP images were 85% and 85%, 93% and 73%, and 89% and 79%, respectively. The area under the receiver operating characteristic curve was 0.96 for reader 1 and 0.91 for reader 2 for the differentiation of the presence of oedema from no oedema. The optimal water mass density to classify the presence of oedema for reader 1 was 951 mg/cm³ with 93% sensitivity and 93% specificity, and for reader 2 was 957 mg/cm³ with 80% sensitivity and 80% specificity.
Conclusion: Dual-energy water-HAP images showed good diagnostic performance for bone marrow oedema in patients with non-traumatic hip pain.
Limitations: Only two readers were involved in this study. Subcortical zones could not be evaluated to reduce artefacts. We evaluated only water-HAP images without conventional CT images to minimise bias.
Ethics committee approval: This retrospective study was approved by IRB.
Funding: No funding was received for this work.

Early functional and morphological changes of calf muscles in delayed onset muscle soreness (DOMS) assessed with 7T MRI

R. Heiß, R. Janka, M. S. May, W. Wuest, T. Hotfiel, M. Uder, A. Nagel, F. W. Roemer*; Erlangen/DE (Rafael.Heiss@uk-erlangen.de)*

Purpose: To assess morphological and functional alterations of the skeletal muscle after induction of delayed onset muscle soreness (DOMS) using 7 Tesla (T) magnetic resonance imaging (MRI).
Methods and materials: DOMS was induced in 16 participants who performed a standardised eccentric exercise protocol of the calf muscles. 7T MRI including 2D T1w- (0.18x0.18x1 mm^3), 2D T2w-sequences (0.2x0.2x2 mm^3), T2-mapping (0.5x0.5x5 mm^3), and 3D quantitative susceptibility mapping (QSM, 0.7x0.7x0.7 mm^3) was acquired at baseline (prior the exercise), directly (t1), and 60 hours (t2) after the exercise. T2 signal intensity (SI), T2 values [ms], T1 SI, and computed quantitative susceptibility maps [ppb] were assessed in the medial (MG) and lateral gastrocnemius muscle (LG), in the soleus muscle (SM), and in the tibialis anterior muscle (AM).
Results: Directly after exercise (t1), T2 SI (p=0.03) and T2-values (p=0.03) had increased significantly in the LG, whereas no change was observed for MG, SM, or AM. At t2, T2 SI and T2-values of LG (p=0.001, p=0.02) and MG (p=0.04, p=0.03) had increased significantly compared to baseline. T1 SI and susceptibility did not change in any muscle at any time point. No structural muscle injuries could be visually detected, regardless of the degree of intramuscular oedema. Clinical parameters confirmed the induction of DOMS in every participant.
Conclusion: MRI at 7T allows the visualisation of DOMS immediately after the inducing exercise, whereas expected changes in susceptibility e.g. reflecting micro-haemorrhage could not be detected with quantitative susceptibility mapping.
Limitations: The limited number of patients.
Ethics committee approval: Institutional review board approval was obtained from Friedrich-Alexander-University Erlangen-Nuremberg, Germany.
Funding: Funded by the German Society of Musculoskeletal Radiology (DGMSR).

Clinical usefulness of cross-sectional imaging modalities in grading the severity of sarcopenia in liver cirrhosis patients and its impact on morbidity and mortality

H. A. Kamal, N. E. M. A. El Liethy*; Cairo/EG (hebakamala@gmail.com)*

Purpose: To assess the severity of sarcopenia in liver cirrhosis patients by quantifying muscle mass through CT at L3 level, measuring appendicular muscle thickness by musclo-skeletal ultrasound, then correlating their results with handgrip strength as representative of functional status.
Methods and materials: This study included 100 cirrhotic patients/30 controls who had a CT to calculate the psoas muscle cross-sectional area, volume, and muscle index, musculoskeletal ultrasound to calculate the anterior mid-arm/mid-thigh muscle thickness and quadriceps muscle index, and lastly handgrip strength calculated by dynamometry.
Results: This study included 130 subjects, 71 men and 49 females. Cirrhotic patients were graded into three groups according to a Child scoring system. The mean CT psoas volume, psoas surface area, and psoas muscle index for Child (A+B) were 25.44±6.96, 7.97±2.23, and 4.58±1.21, while for Child C were 15.85±6.02, 5.02±1.80, and 2.96±1.00. The musculoskeletal ultrasound mean mid-arm, mid-thigh, and quadriceps thickness index were 2.00±0.29, 2.93±0.33, and 1.69±0.17 for Child (A+B), while were 1.53±0.25, 2.30±0.45, and 1.36±0.26 for Child C. The quadriceps thickness index cut-off was 1.6750 $cm/m^2$and psoas muscle index cut off was 4.5 cm^2/m^2.
Conclusion: Psoas muscle index as well as appendicular muscle thickness measurements were well correlated with handgrip strength and proved to be independent prognostic factors for grading sarcopenia in cirrhotic patients.
Limitations: There are no normal values for muscle thickness among Egyptians. We didn't follow up patients after discharge for quality of life, readmissions, and post-hospital mortality.
Ethics committee approval: The study had been approved by the research ethics committee of the Faculty of Medicine at Cairo University in Egypt on201572016 in compliance with the Helsinki declaration (DoH-oct20081).
Written and informed consent was obtained.
Funding: No funding was received for this work.

Low skeletal muscle mass is a predictor of hospitalisation length in patients with a sternal fracture and concomitant injuries

H. G. Yavaş, A. Akçay, F. Ufuk*; Denizli/TR (huseyingokhanyavas@gmail.com)*

Purpose: Total muscle area (TMA) and psoas muscle area (PMA) at the L3 vertebrae level have been shown as strong indicators of skeletal muscle mass (SMM). Our aim was to investigate the prognostic significance of SMM in patients with sternal fractures and concomitant injuries due to blunt trauma on full-body computed tomography (CT).
Methods and materials: CT reports of patients who had full-body CT due to blunt chest trauma were analysed retrospectively from 01/01/2009-06/01/2019. Patients with sternal fracture were re-evaluated. TMA and PMA were measured separately at the L3 vertebrae level.
Results: A total of 55 patients with sternal fracture were evaluated. Isolated sternal fractures were detected in 20% (n=11) of the patients. The most common mechanism of injury was motor vehicle collisions (n=45) and the predominant fracture location was in the manubrium sterni (n=36). The most common injuries accompanying sternum fracture were rib fracture (n=30) and lung contusion (n=24). There was a statistically significant relationship between PMA (p=0.0001, r=-0.587, and r=-0.471, respectively) and TMA (p=0.0001, r=-0.376, and r=-0.263, respectively) values, and hospitalisation length and length of stay in an intensive care unit. There was a positive correlation between the sternal displacement grade (mild, moderate, and severe) and the death of the patient within one-month and the presence and thickness of a retrosternal haematoma. The presence of a retrosternal haematoma, vertebra corpus fracture, pneumothorax, haemothorax, splenic injury, and the inferior part of the sternum body fracture were significantly correlated with hospitalisation length.
Conclusion: Low TMA and PMA are strong predictors of hospitalisation length in patients with sternal fractures and concomitant injuries.
Limitations: The descriptive data was retrospectively collected. The number of patients was relatively low.
Ethics committee approval: Ethics committee approval obtained.
Funding: No funding was received for this work.

The assessment of intramuscular tissue perfusion in PRICE therapy using contrast-enhanced ultrasound (CEUS)

R. Heiß[1], M. Hoppe[2], C. Lutter[3], R. Forst[1], M. S. May[1], W. Wuest[1], P. D. M. Engelhardt[2], C. Grim[2], T. Hotfiel[1]; *[1]Erlangen/DE, [2]Osnabrück/DE, [3]Rostock/DE (Rafael.Heiss@uk-erlangen.de)*

Purpose: To investigate intramuscular tissue perfusion (ITP) in athletes before, during, and after PRICE-therapy in sport-specific conditions and to prove the hypothesis of reactive hyperemia after PRICE-therapy.
Methods and materials: 20 healthy athletes (11 female, 9 males: age 25±3; 21-30 years (mean±SD; range), BMI 23±3 kg/m^2) were randomised into a PRICE or control group. Quantifiable contrast-enhanced ultrasound (CEUS) was assessed to analyse microvascular blood flow of the anterior thigh (rectus femoris muscle, RF; vastus intermedius muscle, VI). Baseline perfusion measurements (T_0) were compared to exercise (cycling, T_1), intervention (PRICE or control (rest), (T_2)), and to 60 min follow-up (T_3). PRICE included rest, cryotherapy (3° celsius), compression (35 mmHg), and elevation.
Results: After cycling, an upregulation of ITP was observed in the VI and RF for both groups. The PRICE measurements revealed a decrease of ITP, corresponding to a 47% and 53% decrease in the VI (WiAUC, PE; p=0.01, n.s.) and a 50% and 72% decrease in the RF (p=0.037; p=0.002). In contrast, an increase of ITP was observed for the control group at T_1 and T_2. At T_3, the superficial RF (PRICE) revealed a significant persistent decrease of 15% and 50% (n.s.; p=0.003), whereas the RF (control) and VI (both groups) showed no significant changes to baseline conditions.
Conclusion: Our study highlights the fundamental impact of PRICE on ITP. PRICE applied after exercise leads to a downregulation of microvascular blood flow in superficial as well as deep muscle layers. The termination of PRICE is not associated with a reactive hyperemia.
Limitations: The imited number of participants. No cross-over design.
Ethics committee approval: IRB approval was obtained from Friedrich-Alexander-University Erlangen-Nuremberg, Germany. All participants signed an institutionally approved informed-consent document.
Funding: No funding was received for this work.

Evaluation of aortic inflammation on ^{18}F-FDG PET/CT in rheumatoid arthritis patients treated with biologic therapies
T. T. Dam, K. Okamura, T. Nakajima, Y. Yonemoto, T. Suto, H. Sakane, H. Chikuda, Y. Tsushima*; Maebashi/JP*
(trangbeo.fsh@gmail.com)

Purpose: Biologic therapies have been shown to reduce cardiovascular risk in rheumatoid arthritis (RA) patients. We evaluated the inflammatory activity of the ascending aorta in RA patients who received biologic treatment and to assess the RA-related factors that influence the aortic status.
Methods and materials: ^{18}F-fluorodeoxyglucose (FDG) positron emission tomography/computed tomography scans were performed for 64 patients with RA, before and after 6 months of biologic therapies, and the clinical characteristics were evaluated. The aortic wall inflammation was assessed by the FDG uptake in the ascending aorta, calculated as the standardised uptake value (SUV) and the target-to-background ratio (TBR). Clinical evaluations included the disease activity scores 28-joint erythrocyte sedimentation rate (DAS28-ESR) and several serum markers (ESR, C-reactive protein [CRP], anti-cyclic citrullinated peptide antibody [ACPA], and rheumatoid factor (RF).
Results: At 6 months, the decrease in TBR value was observed in 44% of patients. The FDG parameters, the DAS28-ESR, ESR, CRP, ACPA, and RF in the decreased-TBR group changed significantly after the treatment. The FDG parameters at baseline in the decreased-TBR group were significantly higher than those in the increased-TBR group. In a logistic regression analysis, the SUV at baseline was the most important contributor to the decrease in the aortic TBR after biologic treatment.
Conclusion: The cardioprotective effects of biologics might not apply to all RA patients. The SUV at baseline of the ascending aorta was identified as the significant factor predicting the improvement of the aortic wall inflammatory state after biologic therapies.
Limitations: The choice of biologic agents for RA patients might lead to bias since each drug has its own mechanism on RA pathogenesis.
Ethics committee approval: The study protocol was approved by the IRB of Gunma University Hospital.
Funding: No funding was received for this work.

RPS 110-13 09:42
Osteophytes, osteochondrosis, and a sclerotic aorta: to use or not to use lumbar spine dual-energy x-ray absorptiometry (DXA)?
M. Radeva[1], A. Malich[1], N. Valous[2], A. Pfeil[3], I. Papageorgiou[1]*;*
[1]Nordhausen/DE, [2]Heidelberg/DE, [3]Jena/DE
(ismini.e.papageorgiou@gmail.com)

Purpose: Dual-energy x-ray absorptiometry (DXA) quantifies the bone mass density (BMD) and reports it as the number of standard deviations from the sex-and-race-norm (T-score). Osteophytes, osteochondrosis, arthrosis, and atherosclerosis are known to contaminate the BMD, hence affecting the diagnostic accuracy. Although the confounding effect of large scale degeneration is undoubted, the influence of low-grade degenerative changes is a grey-zone in DXA interpretation.
The aim is to quantify the influence of low- and intermediate-grade degenerative changes in the lumbar spine DXA.
Methods and materials: A retrospective diagnostic accuracy study for N=446 female patients 65±14 years was conducted. The degree of spinal degeneration was described with a custom-developed point-system assessing arthrosis, end-plate osteophytes, and atherosclerotic plaques in a semiquantitative scale 0-4. The inclusion criteria were female, adult, and DXA from the hip and lumbar spine within 3 months. The index test was a DXA T-score. The ground truth was a hip total T-score <-2.5. Statistical analysis in MatLab 2017b.
Results: For spinal degeneration grade of 0/1/2/3/4, N=98/121/96/71/60 (total 446). Pearson's analysis returned a positive correlation between the spinal T-score and degeneration rate (P 0.0004).
The ROC analysis showed that, in the absence of degeneration (grade 0), DXA of the spine was a very sensitive surrogate marker for osteoporosis (AUC 0.97), sensitivity/specificity (Se/Spe) 100/81%. This declined upon low- or intermediate-grade degenerative changes, grade-1 AUC 0.83 (Se/Spe 91/67%), Fisher p<0.0001; grade-2 AUC 0.66 (Se/Spe 54/72%), Fisher p=0.03.
Conclusion: Even low- or intermediate grade degenerative changes in the lumbar spine significantly influence the sensitivity of DXA and should be considered as a significant confounding factor in the diagnosis of osteoporosis.
Limitations: The retrospective design not adjusted for other confounding factors.
Ethics committee approval: The study was approved by the local ethics committee.
Funding: No funding was received for this work.

MRI lumbosacral spine: is the workload really justified? An audit of indications and referral patterns at a tertiary care hospital
A. Faryad, A. Mansoor, M. Masood*; Lahore/PK*
(mahjabeentafazzul@gmail.com)

Purpose: To evaluate the clinical indications of MRI for the lumbosacral spine; referral sources and appropriateness of requests with respect to the appropriateness criteria of the American College of Radiology for MRI in low back pain patients.
Methods and materials: This study was conducted in the MRI centre of the radiology department, Mayo Hospital Lahore, which is a tertiary care hospital. From July 1, 2019-August 31, 2019, about 1,285 MRIs were done, of which 303 (23%) were MRI lumbosacral spine for low back pain. We included 200 patients between ages 18-80 years who were referred from different sources with a complaint of low back pain within a period of 2 months in our study. These were then assessed for indications and appropriateness criteria.
Results: Out of 200 patients who underwent MRI lumbosacral spine for LBP within a period of 2 months, 32.5% requests were “usually appropriate”, 24.5% “may be appropriate”, and 43% were “usually not appropriate” according to the appropriateness criteria of the American College of Radiology.
Conclusion: Judicious use of MRIs in patients with low back pain is necessary to avoid wastage of resources and a burden on healthcare facilities.
Limitations: No local guidelines available regarding appropriateness.
Ethics committee approval: Ethics committee approval was sought.
Funding: No funding was received for this work.

Synthetic imaging MAGIC (magnetic resonance image compilation) applications beyond the brain
R. Vadapalli[1], A. S. Vadapalli[2]*; [1]Hyderabad/IN, [2]London/UK*
(rammohanvsv@gmail.com)

Purpose: To elucidate the emerging clinical applications of MAGIC (magnetic resonance image compilation) beyond the brain.
Methods and materials: 79 subjects aged from 28-64 years with a M:F ratio of 3:2 who were referred for MR examinations for neck mass (n=3), pelvis (n=16), knee pain (n=19), hip pain (n=9), shoulder injury (n=11), ankle and foot pain (n=16), and wrist and hand (n=5) were included in the study.
MR imaging protocols were supplemented with the MAGIC sequence with 6 image contrasts. T1, T2, PD, STIR, DIR, and PSIR with quantitative T1 and T2 R1.R2 maps in 4 minutes.
The images were randomised and independently assessed for diagnostic quality, morphologic legibility, and diagnostic radiologic findings. The MAGIC T2 quantitative maps of the knee and hip with ROIs on cartilage were compared with cartigram maps.
Results: The overall diagnostic quality of synthetic MR images was non-inferior to conventional MR imaging on a 5-level Likert scale (P<0.001).

The legibility of synthetic and conventional morphology agreed in >95%.
Morphological findings like joint effusion, erosions, chondromalacia, ligament, tendon injuries, meniscal and labral tears, and sacroiliitis showed acceptable concordance.
STIR and DIR views of MAGIC contributed the maximum for detections of sacroiliitis, tenosynovitis, and chondromalacia, and so as quantitative T2 maps of MAGIC. Interobserver variability was in acceptable limits (Cohen's kappa 0.9).
Conclusion: Synthetic MR imaging quality was similar to that of conventional joint and MSK imaging with the facility of additional contrast views: STIR, PSIR and DIR quantitative T1, T2, R1, and R2 maps thus increasing the sensitivity and specificity.
Limitations: The small sample size.
Ethics committee approval: Waiver from ERB as it is a supplementary sequence to conventional imaging.
Funding: No funding was received for this work.

Deep learning to increase lung cancer detection in chest x-rays: a retrospective cohort analysis of national lung screening trial participants
H. Yoo[1], K. H. Kim[1], S. Park[1], M. Kalra[2]; [1]Seoul/KR, [2]Boston, MA/US
(hyunsuky@lunit.io)

Purpose: To verify whether lung cancer detection can be improved if radiologists use an artificial intelligence (AI) algorithm in a chest x-ray (CXR) screen setting.
Methods and materials: The testing was based on the data from the ACRIN of the National Lung Screening Trial (NLST) (n=5491), a multicentre cohort of current and formerly heavy smokers. We estimated the performance of radiologists in detecting lung cancer diagnosed at baseline (T0) or first (T1) study year if the AI algorithm was used during initial radiologic evaluation and compared it with raw radiologist performance. The algorithm used in this study was a deep learning-based model (Lunit INSIGHT CXR1) trained from an external dataset, which produced an abnormality score that ranged from 0-100%, reflecting the probability that the lesion was malignant. A threshold abnormality score of 30% was adopted as the cut-off for classification. TNM stage, size, location, and overlapping anatomical areas in CXR of the lesion detected by radiologists and the algorithm were compared.
Results: Radiologists with the AI algorithm showed a significantly higher detection rate (73.5%(64.0%-83.0%)[61/83] vs. 53.0%(42.3%-63.7%)[44/83]; P<0.001) than without the algorithm. The lesions missed by radiologists but found by the algorithm mostly had no annotated abnormalities (6/17) or abnormalities that did not warrant further workup (8/17). There was no significant difference in TNM stage, size, location, and overlapping anatomical areas between lung cancer found with and without the algorithm.
Conclusion: The detection rate of the radiologists with AI significantly improved compared to raw radiologists. Using AI during lung cancer screening may lead to earlier diagnosis, due to the detection of nodules not suspected by radiologists.
Limitations: Because of retrospective design of our study, AI analysis was performed after radiologist reading.
Ethics committee approval: n/a

AI-based non-small cell lung cancer detection and segmentation on CT images with RECIST functionality
S. Primakov[1], A. Ibrahim[1], S. Sanduleanu[1], G. Wu[1], H. Gietma[1], L. Hendriks[1], O. Morin[2], H. C. Woodruff[1], P. Lambin[1]; [1]Maastricht/NL, [2]San Francisco/US
(s.primakov@maastrichtuniversity.nl)

Purpose: Localising and delineating lung tumours is essential for radiotherapy planning and various quantitative imaging workflows. However, manual contouring is highly laborious and time-consuming, as well as being prone to variability and poor reproducibility. To address these issues we created a fully automated pipeline for detecting and segmenting lung tumours on CT images.
Methods and materials: Multicentric CT images from 1,043 NSCLC patients with expert delineations of the gross tumour volume were used to train, test, and validate our detection and segmentation method. A three-step approach was developed, consisting of data pre-processing, lung isolation, and tumour segmentation. A pre-processing algorithm was developed with regard to hardware and acquisition parameters. A 2D U-net type convolutional neural network with test-time augmentation and volumetric post-processing was trained on 936 CT scans. We evaluated model performance on the remaining 107 scans by using a Dice similarity coefficient (DSC), Jaccard index (J), and 95th Hausdorff distance (H95th). In addition, we implemented the RECIST and volumetric-RECIST (VRECIST) functionality.
Results: On the external validation dataset, we achieved a median slice-wise detection accuracy of 0.99 (IQR=0.01), a specificity of 0.99, and a sensitivity of 0.90. Generated segmentations achieved an average DSC of 0.81, median of 0.88 (IQR = 0.12), average J of 0.71, median of 0.78 (IQR = 0.19), and H95th of 6 mm.
Conclusion: The proposed pipeline can potentially provide a low-cost, observer-independent, and reproducible method for the detection and segmentation of lung cancers on CT images. Moreover, it can be used for automated tumour response evaluation using RECIST or VRECIST.
Limitations: The ground truth depended on the quality of doctor's contours.

Automated detection of primary lung cancer of all stages and associated metastases on FDG-PET/CT using three retina U-Net algorithms
T. J. Weikert[1], P. Jäger[2], J. Bremerich[1], G. Sommer[1], B. Stieltjes[1], S. Yang[1], K. H. Maier-Hein[2], A. W. Sauter[1]; [1]Basel/CH, [2]Heidelberg/DE
(thomas.weikert@usb.ch)

Purpose: To develop and evaluate Retina U-net algorithms with a different fore- and background balance for the detection of primary lung tumours of all stages and associated lymphatic and non-lymphatic metastases on FDG-PET-CTs.
Methods and materials: We selected 364 patients with histologically confirmed lung cancer that underwent FDG-PET/CT between 01/2010-06/2016. The dataset comprised tumours of all stages according to the 8th edition of TNM classification in lung cancer. To establish a standard of reference, all lung tumours (T), lymphatic metastases (N), and distant metastases (M) were manually segmented as 3D-volumes using the transverse, fused whole-body PET/CT series. The dataset was split in a training (n=216), validation (n=74), and testing dataset (n=74). We trained and validated three Retina-U-net-based algorithms on (A) solely T-lesions, (B) T&N-lesions, and (C) T,N&M-lesions. We evaluated the performance of the algorithms for detection of all lesions at

multiple classifier-thresholds, calculating sensitivity, specificity, false-positive findings-per-case (FPC), area-under-the-ROC, and free-response-ROC-curves.
Results: We found very good detection rates of more than 90% for T3 and T4 lesions at low FPCs of 1.1 for the algorithm (C) trained on T,N&M-lesions. Performance of the algorithms (A) and (B) were worse. The detection rate of M-lesions in approach (C) was 72.3 %.
Conclusion: The algorithms presented in this study can serve as a foundation for automated detection of TNM-lesions in PET/CTs. This can reduce the rate of missed lesions. Training on all T,N&M-lesions yielded better results than training on solely T- or T&N-lesions.
Limitations: There was no distinction of T-/N- and M-lesions by the algorithm. 3D image segmentation for the establishment of ground truth was complete by only two readers.
Ethics committee approval: Written informed consent was waived by the Swiss regional ethics committee (project number: 2016-01649).

Evolving UNet architecture for lung cancer segmentation
S. Thulasi Seetha[1], K. Driessens[2], H. C. Woodruff[2], U. Pastorino[1], E. Bertocchi[1], P. Lambin[2]; [1]Milan/IT, [2]Maastricht/NL
(s.thulasiseetha@maastrichtuniversity.nl)

Purpose: Automatic image segmentation through deep learning currently requires a laborious trial-and-error search for a bespoke network architecture. Our aim was to automate this search using an evolutionary algorithm we named gNEAT (gradient-based NEAT) and test it for lung cancer segmentation.
Methods and materials: gNEAT searched for a fitting neural network starting from a fixed, UNet-based, outer-skeleton and evolves the convolutional blocks within it. The computational complexity of training each candidate network through gradient descent was offset by using a proxy dataset (a resizing of the original images) during the search. By grouping similar networks as species, diversity was kept intact. gNEAT's incremental growth feature allowed a compact architectural search and removed the need for a customised initialisation. We also evaluated the influence of the model augmentation trick on the hand-designed and the model generated by gNEAT.
We tested the approach on the open-source lung-1 CT imaging data containing manually delineated tumours.
Results: The final model evolved by gNEAT yielded higher Dice scores than a through trial-and-error designed model (based on domain knowledge). Moreover, the augmented models have a better Dice score on both validation and test set.
Conclusion: gNEAT may replace the laborious but necessary task of hand-designing task-specific deep network architectures. The outcome also suggests that the performance of a model can be boosted by augmenting its depth.
Limitations: gNEAT is computationally complex and the generational approach taken can be difficult to parallelise efficiently.

RPS 105-5 09:04
The effectiveness of deep learning combined with multiple tumour-related antigen autoantibodies to diagnose lung cancers at T0-TⅡ stages
Q. Meng[1], J. Ding[2], X. J. Chen[1]; [1]Zhengzhou/CN, [2]Beijing/CN
(mengke436@163.com)

Purpose: To estimate the value of combining deep learning (DL) with seven tumour-related antigen autoantibodies (7-TAAbs) to diagnose lung cancers (LC) at T0-TII stages.
Methods and materials: 136 patients who underwent LDCT and serum 7-TAAbs pre-operative tests were reviewed and analysed by deep learning (DL). The inclusion criteria for the study are as follows: 1) chest CT revealed one or more indeterminate pulmonary nodules, 2) no history of tuberculosis, 3) no history of lung cancer, and 4) no currently known extrathoracic malignancies. The sensitivity, specificity, accuracy, and receiver operating characteristics curve of diagnosing LC among DL, 7-TAAbs, and DL and/or 7-TAAbs were analysed.
Results: The positive expression rate of 7-TAAbs in LC patients was 45.4% (54/119), which had no relation to the gender or age of patients and size or type of nodule, TNM stage, and CT signs (all $P > 0.05$), but was related only to the type of pathology. The predictive ability of 7-TAAbs in LC diagnosis was better than that of DL or DL and 7-TAAbs, which had the best specificity, YI, +LR, PPV, and SUV. The performance of DL or 7-TAAbs for LC screening had a higher sensitivity, accuracy, YI, and lower FNR than those of DL and 7-TAAbs.
Conclusion: The 7-TAAbs was the best method for diagnosing LC and showed good performance for screening when assisted by DL, which could benefit scaled LDCT screening of LC.
Limitations: The limitations for this retrospective single-centre study was selection bias according to small number of patients and lack of tumour control group
Ethics committee approval: This single-centre study protocol was approved by the Affiliated Tumor Hospital of Zhengzhou University Medical Ethics Committee according to the established legal regulations.
Funding: No funding was received for this work.

Lung screening assistance: how to cut down the false-positive rate and detect lung cancer earlier (a retrospective study)
S. Lopez[1], P. Fillard[2], Y. Diascorn[1], B. Padovani[1]; [1]Nice/FR, [2]Palaiseau/FR
(stephanie.lopez@univ-cotedazur.fr)

Purpose: Is it possible to significantly reduce false-positive candidates while detecting all true-positive cases, considering prior chest CT-scans? What about detecting lung cancer earlier?
Methods and materials: In our retrospective study based on the NLST dataset, we included 1,102 patients with 3 annual chest CT-scans (T_0, T1, and T_2): 104 being diagnosed with cancer at T_2 and 998 with no cancer evidence 3 years after the last CT-scan. We developed an AI algorithm based on neural networks using these 3 CT-scans to predict the cancer status.
Results: We developed an AI algorithm that detected all cancers at T_2 (100% sensitivity).
Considering the CT-scan at T_2 only, algorithm specificity is 64% compared to 22% for radiologists (+42%). When considering the prior (T_0 and T_1), AI specificity was 82% versus 58% for radiologists (+24%). Based on the data, this implies that the AI would reduce the number of unnecessary exams by half. The same AI algorithm executed on scans at T_1 was able to classify correctly 76% of the cancer-positive patients at T_2, while radiologists screened positively 70% of them (+6%). AI specificity was measured at 80% versus 25% for radiologists (+55%) at T_1.
Conclusion: Our preliminary results show that radiologists could be provided with reliable guidance based on AI to detect cancer earlier (76% and 64%, respectively, 1 and 2 years before).
The data indicates many patients with negative biopsies that then developed cancer 1 or 2 years later. The reasons remain unclear and further research should focus on automated nodule detection and guided biopsies.
Limitations: The NLST dataset is large but geographically limited to a North American screening population.
Ethics committee approval: n/a

Impact of computed tomography reconstruction kernel selection on the performance of deep learning based lung nodule detection

S. K. Verma[1], S. Vaidya[2], K. Vaidhya[2], D. S. Mahra[2], K. C. Kaluva[2], A. Chunduru[2], S. Dhawan[3]; [1]Delhi/IN, [2]Bengaluru/IN, [3]New Delhi/IN (dr.sdhawan@gmail.com)

Purpose: To evaluate the relationship between computed tomography reconstruction kernels and the sensitivity of deep learning algorithms for lung nodule detection. We attempted to understand consistencies and discrepancies for the same.

Methods and materials: A 20-layer deep residual convolutional neural network based on 3D Feature pyramid networks was trained and validated on 888 CTs from the LIDC-IDRI dataset for lung nodule detection. The LIDC-IDRI dataset had a good mixture of CTs with different reconstruction kernels: soft-tissue (58%), lung (27%), and sharp (13%).

100 pairs of CTs with soft-tissue and lung kernels were randomly sampled from the NLST dataset. Ground truth for the same studies was annotated by a pair of junior and senior radiologists, with the AI's prediction used as priors.

A post-study analysis was done to measure the relationship between sensitivity and the reconstruction kernels (soft-tissue and lung) used in the CTs from NLST at different false-positive rates.

Results: The AI showed a sensitivity of 88% at 1 FP/scan for detection of >= 4 mm nodules on 177 LIDC-IDRI CTs when compared against the consensus of 3 out of 4 radiologists, and a sensitivity of 75% at 1.5 FPs/scan for 100 lung kernel CTs and 75% at 1.6 FPs/scan for 100 soft-tissue kernel CTs from NLST with AI + radiologists as ground truth.

The difference in performance by the AI in soft-tissue kernel CTs and lung kernel CTs was not found to be statistically significant as the one-way ANOVA revealed p=0.9938 and p=0.90, respectively, for sensitivity and false-positives per scan.

Conclusion: Deep learning algorithms are proving to be robust in the detection of lung nodules between CTs reconstructed from different kernels.

Limitations: The analysis of differences.

Ethics committee approval: Ethics committee approval obtained.

Funding: No funding was received for this work.

The influence of kernel reconstruction and nodule size in computer-aided detection (CAD) of lung nodules

A. Paternain Nuin, I. Soriano Aguadero, P. Malmierca Ordoqui, A. C. Igual Rouilleault, L. García Del Barrio, J. Larrache, J. C. Pueyo Villoslada, G. Bastarrika Alemañ; Pamplona/ES (alberpanu@gmail.com)

Purpose: To determine the impact of two different reconstruction filters in the performance of a commercially available computer-aided detection (CAD) software for lung nodule detection.

Methods and materials: 78 patients who underwent a low-dose chest CT scan for lung cancer screening were prospectively recruited. Each scan was read by a radiologist and by a CAD software (syngo.CT Lung CAD, Siemens Healthineers) using filter reconstructions for soft tissues (kernel A) and for lung parenchyma (kernel B). Nodules less than 3 mm in size were excluded from the analysis. The detection rate (DR) of both reconstructions was analysed according to the nodule size, considering a diameter of 6 mm as clinically relevant. The consensus between the radiologist and CAD software was set as the reference standard. Features like nodule composition, location, and relation to anatomical structures were also evaluated. Data analysis was performed with a Chi-square test and Student t-tests. A p-value <0.05 was considered statistically significant.

Results: 301 lung nodules were detected. Overall, kernel A had significantly higher DR (65.1%) than kernel B (56.8%) (p<0.01), even considering the pulmonary nodules larger than 6 mm (DR of 85.7% vs 77.1%, respectively, p<0.01). There were no significant differences in the average number of false-positive results per scan (1.33 for kernel A vs. 1.00 for kernel B, p=0.21).

Conclusion: In the evaluated CAD system, the use of a soft tissue reconstruction filter allowed for higher detection rates than the lung parenchyma filter with a similar number of false-positive results, even for clinically relevant nodules.

Limitations: A small sample size.

Ethics committee approval: Ethics committee approval obtained.

Funding: No funding was received for this work.

RPS 105-9 09:28

A comparison of lung nodule detection sensitivity of deep learning algorithms in comparison with 3 radiologists of varying experience levels

K. C. Kaluva[1], S. Vaidya[1], V. K. Venugopal[2], S. Rajan[2], P. S. Shad[3], V. Mahajan[2], H. Mahajan[2], A. Raj[1], S. Upadhyay[1]; [1]Bengaluru/IN, [2]New Delhi/IN, [3]Delhi/IN (vasanthdrv@gmail.com)

Purpose: To compare the performance of deep learning algorithms for lung nodule detection against 3 independent radiologists of different experience levels (28 yrs, 20 yrs, and 14 yrs) on a retrospective chest CT dataset of 240 patients

Methods and materials: In a retrospective clinical validation study, three independent radiologists were required to annotate 240 chest CTs for all visible nodules between 5-30 mm in size. The annotations were compared with outputs of a deep learning algorithm (Predible Health) for nodule detection

All nodules were sub-classified as having consensus among 1, 2, or 3 radiologists. The deep learning algorithm was individually tested on nodule datasets with varying consensus levels. When testing on the 2/3 and 3/3 consensus dataset, we marked the 1/3 consensus nodules as irrelevant findings and did not penalise the algorithm for its detection.

Results: After considering for overlaps, there were a total of 146 nodules marked by the radiologists. The algorithm had a sensitivity of 96% (47/49) on nodules with 3/3 consensus and sensitivity of 91.1% (72/79) on nodules with 2/3 consensus, both at 1 false-positives per scan. The algorithm had an overall FROC score of 0.91 on nodules with 3/3 consensus and 0.86 on nodules with 2/3 consensus. Combining the algorithms' findings with each radiologist' and comparing with the consensus of the other two as ground truth, we observe an increased sensitivity ranging from 5 to 20%.

Conclusion: This study demonstrates that lung nodule detection algorithms can improve the sensitivity of radiologists by as much as 20%, helping them report quicker.

Limitations: A possible improvement in study design if nodules without consensus can be adjudicated by an experienced thoracic radiologist.

Ethics committee approval: Required Ethics Committee approvals were obtained for the study.

Funding: Funded by Predible Health.

Classification of lung opacities in supine chest radiographs: artificial intelligence approach (external algorithm evaluation) versus a radiological assessment

J. Rueckel[1], W. G. Kunz[1], B. Hoppe[1], M. Notohamiprodjo[2], F. Meinel[3], C. C. Cyran[1], M. Ingrisch[1], J. Ricke[1], B. O. T. Sabel[1]; [1]Munich/DE, [2]Tübingen/DE, [3]Rostock/DE (johannes.rueckel@googlemail.com)

Purpose: We evaluated an AI algorithm aiming to automatically classify basal lung opacities in SCXRs according to underlying pneumonia or pleural effusions. Algorithm accuracy was compared with radiologist's (board-certified) diagnostic performance.

Methods and materials: The algorithm was trained on publicly available datasets. A retrospectively identified evaluation dataset was analysed (166 patients with SCXR and CT scan both within 90 minutes without any intervention

in between). Radiologists evaluated SCXRs according to following reading-scores: 0="no pneumonia/effusion", 1="possible pneumonia/effusion" and 2="highly suspected pneumonia/effusion".
Algorithm performance was quantified by receiver-operating curves (ROCs), hereby statistically compared with radiologist's operating points characterised by sensitivity/specificity and corresponding 95%CIs.
Results: Radiologists achieved a maximum diagnostic accuracy for pneumonia detection up to 0.87 (95%CI 0.78-0.93) when considering only the SCXR-reading-score 2 as positive for pneumonia. Radiological assessment achieved non-significant numerically higher results compared with algorithm ROCs (AUROC 0.737/0.796/0.834 with reference standard CT/SCXR-reading-score 0 and 1 as negative for pneumonia/SCXR-reading-score 1 and 2 as positive for pneumonia).
Regarding pleural effusion detection, there was no significant difference between the radiologist's diagnostic accuracy (sensitivity/specificity/PPV/NPV/accuracy 0.67/0.69/0.71/0.68) and the AI algorithm (AUROC 0.740/0.847/0.883 with reference standard CT/SCXR-reading-score 0 and 1 as negative for pleural effusions/SCXR-reading-score 1 and 2 as positive for pleural effusions).
Conclusion: Considering the minor level of performance differences between the AI algorithm and radiological assessment, we regard AI to be a promising clinical decision support tool in clinical routine.
Limitations: Limitations mainly refer to the labelling of the underlying public datasets used for algorithm training, but also to the limited number of radiological readers not allowing for inter-reader variability analysis.
Ethics committee approval: Approval was obtained for this study.

Takeaways from the validation of an AI-based malignancy likelihood estimation for lung cancer screening when used on routine CT studies in a tertiary care hospital

V. Chaudhry[1], V. Saxena[1], S. Vaidya[2], D. S. Mahra[2], K. Vaidhya[2], A. Chunduru[2], B. Aggarwal[3]; [1]*Delhi/IN*, [2]*Bengaluru/IN*, [3]*New Delhi/IN* *(vivek_saxena67@hotmail.com)*

Purpose: To assess the performance of a deep learning-based malignancy likelihood estimation system trained on screening data from the National Lung Cancer Screening Trial (NLST) on a retrospective dataset of biopsy-proven studies from a large tertiary hospital in North India. The retrospective clinical validation dataset consisted of cases with primary cancers (64%), metastatic cancers (13%), and benign conditions (23%).
Methods and materials: The deep learning algorithm was trained on 1,245 scans from the NLST trial with pathologically proven ground truths to determine the malignancy status of a lung nodule. Retrospective data of 123 patients over 20 months who underwent CT-guided lung biopsy were chosen as suitable for the validation study. All patient studies were evaluated on follow-up scans to ensure conformance with biopsy results.
Results: The AI model showed a sensitivity of 75% (95% CI: 64%-83%) on 95 malignant nodules with a PPV of 86% (95% CI: 79%-90%). It is notable that 6 studies that appeared negative on histological findings were correctly predicted by the AI model as malignant, as confirmed by follow-up scans and re-biopsy. The AI model had a specificity of 58% (95% CI: 37%-76%) on 28 benign nodules with an NPV of 40% (95% CI: 29%-51%).
Conclusion: The algorithm can be positioned as an adjunct tool to the histology report that sometimes suffers an error rate due to erroneous sampling. Cancer screening settings only account for a limited context in training data due to specific inclusion criteria and hence further enhancement using a larger and more diverse training dataset is required before it can be used in routine practice.
Limitations: A studying mechanism of failure by the AI algorithm.
Ethics committee approval: Ethics committee approved.

Deep learning-based automatic biomarkers extraction from chest CT in diffuse interstitial lung diseases: a correlation study with pulmonary function tests

M. Colevray, P.-J. Lartaud, O. Nempont, T. K. Y. Broussaud, V. Cottin, L. Boussel*; Lyons/FR (marion.colevray@yahoo.fr)*

Purpose: Lung volume monitoring is essential to assess the evolution of pulmonary fibrosis in diffuse interstitial lung diseases (DILD), however, current automatic software often fails to accurately segment lungs.
We aimed to develop a deep learning-based automatic segmentation tool to quantify lungs parameters on unenhanced chest CT and validate the results in comparison with pulmonary function test (PFT) parameters.
Methods and materials: A 3D-U-net convolutional neural network was trained on 90 randomly selected unenhanced chest CT scans of patients presenting with DILD and validated on 50 others (sex ratio M/F=34/16, mean age=60±15.2 years). The mean Dice coefficient and root mean squared error (RMSE) were calculated on the validation dataset. The network was then applied on 1,171 CT exams (from 424 adult DILD patients, sex-ratio M/F=256/168, mean age=64.6±13.29 years) and the following parameters were calculated: total lung volume (CT_{vol}), mean (CT_{dens}), kurtosis (CT_{kurt}), and skewness (CT_{skew}) of lung density. Pearson correlation coefficients (r) and regression analysis were performed to assess the relationship between CT and PFT parameters (forced vital capacity (FVC), total lung capacity (TLC), and carbon monoxide diffusing capacity (DLCO)).
Results: On the validation dataset, the mean Dice was 0.97±0.01 (range 0.91-0.99) with an RMSE of 0.007 l.
The mean CT_{vol} was 3.33±1.23 l with an overestimation of FCV (2.51±0.91 l) and an underestimation of TLC (4.18±1.34 l). Very good correlations were found between CT_{vol} and FVC and TLC (r=0.87 and 0.85, respectively, p<0.0001). DLCO was poorly correlated with CT parameters with r-values of -0.31, 0.48, and 0.51 (p<0.0001) for CT_{dens}, CT_{kurt}, and CT_{skew}, respectively.
Conclusion: Our deep learning-based automated segmentation method allows for the accurate quantification of lung volume on chest CT with a good correlation with FVC and TLC.

Automatic pleural effusion detection on chest x-ray as a triage tool

J. J. Visser[1], M. Rossius[1], Y. Blinder[2], M. Cohen-Sfady[2], C. Brestel[2], E. Ziv[2], A. Akselrod-Ballin[2], E. Elnekave[3], E. Goz[4], E. Zvi[4], R. Wities[4]; [1]*Rotterdam/NL*, [2]*Kibbutz Shefayim/IL*, [3]*Petach Tikva/IL*, [4]*Shefayim/IL* *(m.rossius@erasmusmc.nl)*

Purpose: A shortage of radiologists, combined with the progression of radiological training toward cross-sectional exams, has combined to create a growing gap in the time to CXR reporting. An automatic chest x-ray (CXR) triage tool could mitigate the clinical consequences of interpretation delays. One common corollary sign of acute disease is the presence of pleural effusion. Our purpose was to validate an AI based CXR-pleural effusion detection algorithm.
Methods and materials: 488 consecutive CXRs were included in the analysis. Each study was scored algorithmically for the detection of pleural effusion. A gold standard was established independently by an expert radiologist with 10 years of clinical experience.
Results: 105/488 cases showed pleural effusion. The algorithm achieved 92.4% sensitivity and 90.1% specificity. In this series, the corresponding positive predictive value was 71.9% and the negative predictive value was 97.7%.
Of note, 64/105 of the positive cases were accompanied by other findings of acute disease such as consolidation. 13/38 of the false-positive results were, in fact, positive for acute consolidations. All 8 false-negative cases involved small pleural effusions.
Conclusion: We observed an excellent capability for automatic detection of pleural effusion, which in this random sample was highly correlated with other findings of acute cardiopulmonary disease. Further investigation and development is warranted to accomplish more comprehensive triage capability for chest x-rays.
Limitations: The retrospective nature of the study. A gold standard based on single chest x-ray interpretation.
Ethics committee approval: Institutional Review Board approval was obtained.
Funding: No funding was received for this work.

Palliative ablation by CT brachytherapy in hepatic metastatic NET
F. Feldhaus[1], H. Jann[1], M. Jonczyk[1], G. Wieners[1], U. Fehrenbach[1], M. Pavel[1], B. Gebauer[1], B. Wiedenmann[1], T. Denecke[2]; [1]*Berlin/DE,* [2]*Leipzig/DE (felix.feldhaus@charite.de)*

Purpose: Hepatic metastases of gastroenteropancreatic neuroendocrine tumours (GEP-NETs) may induce prognosis-relevant complications in an otherwise stable systemic disease after resection of the primary. The present study should determine the period by which the CT-guided high-dose-rate brachytherapy (CT-HDRBT) of rapidly growing liver metastases can delay the onset of palliative systemic therapy with an otherwise stable disease course.
Methods and materials: In this retrospective, monocentric observational study, a total of n=23 patients (n=37 CT-HDRBT sessions) from one nationwide ENETS centre were included. In addition to parameters described in previous studies (local tumour control (LTC), progression-free survival (PFS), and overall survival (OS)), this study intended to determine the delay of a therapy escalation by individual, highly selective CT-HDBRT in oligotopic hepatic progression (due to ENETS-tumour board vote).
Results: For n=23 patients (n=37 CT-HDRBT sessions) with GEP-NET hepatic metastases, the median follow up was 31 months, range 6-87, and OS was 82% after 84 months. The median LTC was 16 months (quartiles, 7.5-34), the median PFS (RECIST oriented) was 10.5 months (quartiles 2.0-24.25), and the median OS was 27.5 months (quartiles, 10.0-38.25). No further escalation of therapy (watch and wait- and/or SSA-therapy) after solitary HDRBT was necessary in 11/23 cases (48%). In the case of systemic therapy, a delay of a mean 16 (±16) months and a median of 12 months (range, 0-60 months) compared to an immediate escalation of therapy was achieved.
Conclusion: In patients with disseminated GEP-NET and oligotopic hepatic progression within essentially stable disease, CT-guided interstitial HDRBT can delay the onset of systemic therapy escalation. As shown in a pilot study, CT-HDRBT is a reliable and effective treatment option for local ablation of GEP-NET hepatic metastases.
Limitations: A retospective and observational study design with pre-selected patients.
Ethics committee approval: n/a

Ultrasound fusion imaging in the percutaneous ablation of focal liver malignancies
A. Drudi, A. Lucarelli, A. Beleù, A. Giaretta, G. Rizzo, S. Conci, M. D'onofrio; *Verona/IT (drudi.ale@gmail.com)*

Purpose: To evaluate the efficacy, advantages, and limitations of the ultrasound fusion imaging (US-FI) technique in percutaneous ablation of focal hepatic malignant tumours and to assess the change in the timing of the procedures performed under US-FI guidance.
Methods and materials: 16 consecutive patients with 33 focal hepatic malignant tumours (27 hepatocellular carcinomas, 6 metastases) were prospectively enrolled between January and May 2019 and treated with percutaneous radiofrequency ablation or ethanol injection under US-FI guidance. Procedures were performed by two expert radiologists who answered several scored questions (from 1 to 10) of a survey about US-FI technique at the end of every procedure. The times of the procedure with and without US-FI were monitored and compared. The mean qualitative and quantitative parameters of the tumour were evaluated by CT/MRI before and after the procedures.
Results: US-FI was judged more useful, the less conspicuous the lesion was in B-mode ($p<0.001$), increasing operator confidence in 88.2% of cases. US-FI changed the perception of lesion size in 70.5% of cases, correcting the choice of needle path in 76.5% of the procedures. The synchronization process is more precise when the lesion diameter is larger ($p=0.047$). The mean time of the procedures was 17min and 50s and the total duration of the procedure did not influence the radiologists' judgment about the utility of US-FI ($p>0.05$). The complete ablation of lesions was achieved in 67% of tumours. No post-procedural complication was observed.
Conclusion: US-FI significantly increases the confidence of operators, enhancing the conspicuity of the target lesion and permitting to plan the needle path more precisely. The technique does not significantly prolong the total time of the procedure.
Limitations: Interoperator variability.

Transcatheter arterial chemoembolisation of liver metastases by degradable starch microspheres (DSM-TACE) loaded with different chemotherapeutic drugs: a retrospective single-center analysis
R. Marcello, G. Marcello, G. Assegnati, D. Konda, E. Pofi; *Rome/IT, (robermarcello@gmail.com)*

Purpose: To evaluate the effectiveness and safety of DSM-TACE using irinotecan, oxaliplatin, and adriblastine loaded with absorbable microspheres (50 micron in size) for the treatment of colorectal, gastro-oesophagal breast cancer, NET and GIST liver metastases in a salvage setting of patients refractory to or not able to tolerate chemotherapy.
Methods and materials: A total of 39 DSM-TACE were performed in 29 patients (mean 2.4/patient, range 1-3). The interval between treatments ranged from 4 to 6 weeks (mean 5.0 weeks, median 4 weeks). TACE was done with lobar delivery (22 via the right hepatic artery, 17 via the left hepatic artery). Microcatheters 2.7 Fr in diameter were used for all treatments (Progreat Terumo, JAP). C-arm CT was performed during arterial test injections (flow 2 cc/sec, volume 24 cc, delay 4s, scan 8s,) before TACE in 31 procedures to confirm the appropriate catheter position.
Results: All patients had upper abdominal pain and nausea lasting for 1-3 days after TACE. The pain was graded severe in 32%, moderate in 40%, and mild in 28% of procedures. Nausea was graded ECOG 3 in 12%, ECOG 2 in 43%, and ECOG 1 in 45%.
At 3 months, the complete absence of tumour enhancement during CT was seen in 9 patients and necrosis comprising about 50% of tumour volume in 16 patients.
Conclusion: TACE using DSM-TACE is safe and effective in patients with liver metastases who had been treated with systemic chemotherapy before. The median time to progression was 5 months, however, all patients showed intrahepatic tumour progression during follow-up (median follow-up 9 months).
Limitations: No potential bias.

Real-time CT thermometry during hepatic radiofrequency ablation: an investigation of the correlation between CT number shift, tissue temperature, and feasibility in a clinical setting

P. L. Cheah, C. H. Yeong, N. Sulaiman, Y. H. Wong, D. L. Lee, D. Tan, K.-S. Lim, B. J. Abdullah*; Kuala Lumpur/MY (pengloon78@hotmail.com)*

Purpose: Post-radiofrequency ablation (RFA) evaluation of liver tumours are currently based on visual inspection of computed tomography (CT) images. This study aimed to investigate the correlation between CT number shift and temperature change in order to create CT thermal maps for objective assessment of ablation margins.
Methods and materials: RFA was conducted on ex-vivo bovine livers (n=40) with constant temperature monitoring via embedded fibre-optic sensors at various locations within the ablation volume. CT scans were performed at 3-minute intervals throughout the ablation and cooling process. CT numbers were obtained from points that corresponded to the locations of the temperature sensors. The correlation between CT number shift and temperature change was analysed using SPSS and MATLAB software. CT thermal maps for the real-time monitoring of tissue temperature were then developed and tested on patients undergoing hepatic RFA.
Results: A negative linear correlation was found between CT number shift (y) and temperature change (x): y =-4.99-1.16x (r=0.84). CT number decreased as tissue temperature increased during ablation and vice versa during the cooling period at a rate of 1.16 HU/°C. In clinical settings, the CT thermal maps were feasible in the intra-ablation scans but demonstrated poor results in delayed post-ablation scans.
Conclusion: There was a strong correlation between CT number shift and tissue temperature during RFA. Using the equation developed from this study and the aid of thermal map algorithms, it is possible to estimate tissue temperature based on CT number shift during real-time CT-guided RFA. This approach would improve the objective evaluation of ablation margins.
Limitations: The small number of human subjects with RFA images suitable for thermal map testing.
Ethics committee approval: University of Malaya Medical Centre MREC ID No:20161025-4414.

The role of intra-arterial ^{177}Lu-DOTATATE therapy in the treatment of hepatic metastasis from neuroendocrine tumours

M. Rajasekaran, I. Subbanna, V. Bhargavi, J. Moideen*; Bangalore/IN, (muthusubramanian1989@gmail.com)*

Purpose: The propensity of currently practised intravenous 177Lu therapy to produce side-effects warrants any novel techniques to reduce the side-effects without compromising the dose delivered to the target areas. GEP-NETs have the tendency to metastasize to the liver, but seldomly to other organs. We have postulated the selective intra-arterial administration of 177Lu-DOTATATE to hepatic arteries will reduce unwanted side-effects and increasing the dose delivered to target areas due to the first-pass extraction of the radiopeptides by the tumour.
Methods and materials: A prospective evaluation of 36 patients who underwent intra-arterial Lu-177 DOTATATE therapy for hepatic neuroendocrine metastasis in our institution from June 2014-September 2018 was done. CAPTEM-PRRT regimen based on Columbia University protocol was adopted in our study. RECIST and PERCIST crieterias were used for reponse evaluation based on pre-procedure and follow-up ^{68}Ga-DOTANOC PET-CT.
Results: We found that 88% (CR+PR) of patients had a significant radiological tumour response and 12% showed a stabilisation of the disease. No patients were found to have progressive disease. We observed the highest proportion of radiological responders in our study when compared to previous intra-arterial studies.
Conclusion: We conclude that intra-arterial ^{177}Lu DOTATATE therapy is a promising effective treatment option for hepatic metastasis from neuroendocrine tumours. Given the limited success in the management of metastatic NETs with surgery, long-acting octreotide therapy, and chemotherapy, and the tendency of intravenous PRRT to produce side-effects, intra-arterial ^{177}Lu DOTATATE therapy stands alone as a novel technique with fewer side-effects and commendable outcomes.
Limitations: A single-centre study. Resources for evaluation of serum chromogranin A levels are limited and expensive in Indian.
Ethics committee approval: Ethics committee approval obtained.
Funding: No funding received for this work.

Introduction and early experience with percutaneous microwave ablation in Croatia: our first 150 cases

L. Novosel*; Zagreb/HR (novosel_luka@hotmail.com)*

Purpose: To show the road we took to introduce percutaneous ablative therapy for tumours in Croatia, which was practically non-existing until 2017, to now having a growing demand by oncologists and surgeons after treating our first 150 patients.
Methods and materials: This is a retrospective analysis of 150 patients treated with percutaneous CT-guided microwave ablation from January 2017-October 2019. We treated 78 kidney tumours, 42 liver tumours (including 34 CRC metastasis and 8 HCC), 9 bone tumours, and 22 lung tumours (including 14 metastases and 8 lung cancers).
We used HS Amica, Emprint, and Eco ablation devices, with internally cooled ablation probes, usually 14 or 16G, with high energy output.
Results: Best results were achieved with kidney cancer ablation, with only 3 cases of residual tumour after the initial treatment, which were additionally treated with second MWA. Our secondary efficacy is 100% until now. There was only one case of severe bleeding after ablation which was treated with embolisation in the angio suite.
We had the highest rate of recurrence with CRC liver metastases, where 18 patients showed residual tumour tissue. In 12 cases, there were adittional new metastases found in the follow-up period. There were 2 cases of significant complications with biliary tree injury and colon injury that were treated surgicaly.
Conclusion: Percutaneous CT-guided microwave ablation has a growing role in the therapy of liver, kidney, lung, and bone tumours in Croatia, and with our good results in the first 150 patients since 2017, there is a higher awareness about the role of interventional radiology in cancer treatment.
Limitations: A retrospective observational study.

Contrast-enhanced ultrasound-guided feeding artery ablation as an add-on to percutaneous radiofrequency ablation for hepatocellular carcinoma: technical feasibility and therapeutic outcomes

X. Li, M. Xu, X. Xie*; [1]Guangzhou/CN (johnsylee@foxmail.com)*

Purpose: To evaluate the technical feasibility and therapeutic outcomes of contrast-enhanced ultrasound-guided feeding artery ablation (FAA) as an add on to percutaneous radiofrequency ablation (RFA) for hepatocellular carcinoma (HCC), and to compare with conventional RFA (con-RFA).
Methods and materials: For this retrospective study, June 2014-August 2016, 49 patients were assigned to a FAA-RFA or con-RFA group according to the technical feasibility evaluated by 2D- and real-time 3D-contrast-enhanced ultrasound (CEUS). Technical success of FAA and subsequent tumour perfusion change was evaluated. Ablation sizes and therapeutic outcomes were compared between the two groups.
Results: FAA was considered feasible in 25 (51.0%) of 49 HCCs. The most common reason for FAA infeasibility was that the presumed FAA point was less than 1 cm to the bifurcation of non-feeding branches. The technical success rate of FAA was 100%. 13/25 (52.0%) target tumours were evaluated as complete perfusion response, while 12/25 (48.0%) were partial perfusion response. The ablation volume was 41.9±17.5cm^3 (14.9-78.2) in the FAA-RFA group, which was larger than that of 26.2±8.2cm^3 (12.4-45.5) in the con-RFA group ($p < 0.001$). The cumulative rates of LTP at 1-, 2-, and 3-year were respectively 0.0%,

4.2%, and 4.2% for the FAA-RFA group versus 8.3%, 18.7%, and 25.0% for the con-RFA group (p=0.073). Con-RFA and target tumour size were independent risk factors of LTP. The major complications rate did not differ between the two groups.
Conclusion: As an add on to conventional percutaneous RFA, FAA tailored to feeding artery characteristics provides larger ablation size and good local control for HCC.
Limitations: The retrospective nature and relatively small sample size.
Ethics committee approval: This technique was approved by the institutional review board of the hospital. Informed consent was waived.

The role of intravoxel incoherent motion (IVIM) MRI imaging in the response evaluation of hepatocellular carcinoma after transarterial chemoembolisation (TACE)

M. R. Bursupalle, V. Jineesh, A. Ayyappan, A. Alex*; Trivandrum/IN (maheshreddy.bursupalle@gmail.com)*

Purpose: To evaluate the role of IVIM imaging in the response evaluation of HCC after TACE.
Methods and materials: 15 patients underwent TACE with 40-60 mg epirubicin from April 2018-Oct 2019. MRI-DWI with IVIM and T1 dynamic CEMR imaging was done in 3T GE machine before TACE procedure and at 6 weeks and 12 weeks after TACE. Response evaluation was analysed by comparing IVIM parameters (like D*,f, and ADC) before and after TACE procedure and also with dynamic CEMR imaging.
Results: IVIM parameters after TACE showed a decrease in values when compared to pre-TACE values. Decreased IVIM values correlated well with nonenhancing and minimal enhancing regions. Before TACE, mean D*, f, and ADC values were 25x10-4 +/- 5x10-4 mm2/s, 12+/- 6%, and 750x10-6 +/- 150x10-6 mm2/s, respectively. After TACE, mean D*, f, and ADC values were 15x10-4 +/- 5x10-4 mm2/s, 5 +/- 2% and 1500x10-6 +/- 150x10-6 mm2/s, respectively
Conclusion: IVIM is useful to evaluate tumour response and may obviate the need for contrast usage in some situations.
Limitations: Small sample size and lack of pathological validation of the MRI results.
Ethics committee approval: Approved by Ethics committee of SCTIMST, Trivandrum, Kerala, India.
Funding: Funding received from the STIMST institute.

Yttrium-90 transarterial radioembolisation in advanced-stage HCC: the impact of portal vein thrombosis on survival

L. D'acierno, F. Somma, V. Stoia, R. D'angelo, F. Fiore*; Naples/IT (ludovicad.a@gmail.com)*

Purpose: To assess and compare the effectiveness and safety of HCC patients with PVT and without PVT, after Y-90 Transarterial radioembolisation (TARE).
Methods and materials: From November 2005-November 2012, Y-90 resin-based TARE was performed in an IRB-approved prospective protocol, on 89 patients with unresectable HCC. 33/89 patients had PVT, the remaining 56 were resistant-to-cTACE or underwent TARE as a downstaging therapy. All patients were studied with multi-detector computed tomography (MDCT), angiography, 99mTc-MAA-scintigraphy, and a liver biopsy. The gastroduodenal artery was embolised in most cases. Proton-pump inhibitors were administered to prevent gastritis and ulcers. A $\chi 2$ test with Yates correction and log-rank test were used to compare the two proportions and Kaplan-Meier survival curves, respectively.
Results: The average activity administered was 1.7 ± 0.4 GBq. After the treatment, CTCAE grade 2 adverse events occurred in 46% (41/89) patients. In particular, fever and abdominal pain were found in 25 and 16 patients, respectively. No major side-effect was observed. According to the mRECIST criteria, partial response or complete response was found in 70% of patient three months after the treatment and in 90.5% nine months after the treatment. No significant difference was found in the survival of patients with PVT compared to those without PVT (p=0.672). Complete regression of PVT was observed in almost half of the patients (13/27, 48.1%).
Conclusion: Portal vein invasion does not affect survival in advanced-stage HCC-patients undergoing TARE using Y-90 resin-based microspheres. The Y90 procedure is associated with a regression of portal vein tumour thrombus.
Limitations: A single-centre, retrospective study.

Balloon-occluded microwave ablation plus balloon-occluded TACE in patients with a single large HCC: preliminary results

A. Tanzilli, R. Iezzi, A. Posa, F. Carchesio, A. Gasbarrini, R. Manfredi*; Rome/IT (alessandrotanzilli93@gmail.com)*

Purpose: To evaluate the feasibility, safety, and efficacy of combined single-step therapy in patients with an unresectable single large (>3 cm) hepatocellular carcinoma (HCC) with balloon-occluded microwave ablation (BO-MWA) plus transcatheter arterial balloon-occluded chemoembolisation (BO-TACE).
Methods and materials: 10 consecutive child-A patients (mean age: 69.7±9y, range: 62-78y) with an unresectable single large HCC (>3 cm) (mean size: 5.6±0.43 cm-range: 4.2-8 cm) were enrolled in our pilot study. The schedule consisted of percutaneous microwave ablation of the lesion during occlusion of the hepatic artery supplying the tumour (BO-MWA), followed by TACE under the occlusion of feeding arteries by a micro-balloon catheter (BO-TACE). Adverse events and intra and periprocedural complications were clinically assessed. Early local efficacy was evaluated on 1-month follow-up multiphasic computed tomography (CT) on the basis of m-RECIST criteria.
Results: Technical success was obtained in all procedures. No major complications occurred. A mean necrotic area of 6.2±1.03 cm was obtained, with a complete response of 80% obtained at 1-month follow-up, with 2 partial responses (less than 30% of residual tumour). All lesions smaller than 5 cm in size were completely necrotic.
Conclusion: Our preliminary experience seems to demonstrate that BO-MWA plus BO-TACE could be a safe and effective combined therapy for unresectable large HCC lesions, allowing a high rate of local response also in lesion exceeding 5 cm in size.
Limitations: A small number of cases.
Ethics committee approval: Written informed consent was obtained.
Funding: No funding was received for this work.

The treatment of hepatocellular carcinoma (HCC) using thermal ablation: microwave ablation (MWA) versus laser-induced thermotherapy (LITT) regarding local tumour control, side-effects, and survival rates

T. J. Vogl, H. Adwan, N.-E. A. Nour-Eldin, T. Gruber-Rouh*; Frankfurt am Main/DE (t.vogl@em.uni-frankfurt.de)*

Purpose: To compare microwave ablation (MWA) with laser-induced thermotherapy (LITT) in the treatment of hepatocellular carcinoma (HCC) regarding local tumour control, survival rate, and complications.
Methods and materials: Of 277 patients, 231 patients (177 males, 54 females; mean:65.8 years) were treated with MWA and 46 patients (36 males, 10 females; mean:67.1 years) with LITT. All ablations were evaluated for the location of the lesion, diameter, volume, post-ablation volume, device, power, duration of therapy, and local tumour control.
Results: The mean tumour diameter and volume were 21.13 mm and 4.8 cm^3 in the MWA group and 24.33 mm and 5.4 cm^3 in the LITT group. The mean post-ablation volume was 30 cm^3 in the MWA group and 47.6 cm^3 in the LITT group. The local recurrence rate was 4.3% (10/231) in the MWA group and 2.2% (1/46) in the LITT group. The complete remission rate was 23.8% (55/231) in the MWA group and 34.8% (16/46) in the LITT group. The rate of newly developed HCC lesions was 71.9% (166/231) in the MWA group and 63% (29/46) in the LITT group. The complication rate was 4.32% in the MWA group versus 13% (6/46)

in LITT. Survival time was 922 days in the MWA group versus 1,293 days in the LITT group, with a significant difference in the survival time (p=0.002).
Conclusion: MWA and LITT are both effective for the local treatment of HCC. LITT patients had an overall longer survival time than MWA patients with a higher rate of complications.
Limitations: A retrospective study design.
Ethics committee approval: Approved by the Institutional Review Board.
Funding: No funding was received for this work.

Radiofrequency ablation versus repeat resection for recurrent hepatocellular carcinoma (≤5 cm) after initial curative resection
X. Zhao; *Jinan/CN (zhaoxinya2000@126.com)*

Purpose: To compare the efficacy and safety of radiofrequency ablation (RFA) and repeat resection as the first-line treatment in recurrent HCC.
Methods and materials: This retrospective study analysed 290 patients who underwent RFA (n=199) or repeat resection (n=91) between January 2006 and December 2016 for locally recurrent HCC (≤5 cm) following primary resection. We compared overall survival (OS), progression-free survival (PFS), and complications between the two treatment groups for the total cohort and the propensity score matched (PSM) cohort.
Results: The 1, 3, and 5-year OS (90.7%, 69.04%, 55.6% versus 87.7%, 62.9%, 38.1%, p=0.11) and PFS (56.5%, 27.9%, 14.6% versus 50.2%, 21.9%, 19.2%, p=0.80) were similar in the RFA group and the repeat resection group. However, RFA was superior to repeat resection in the complication rate and hospital stay (p≤0.001). We observed similar findings in the PSM cohort of 50 pairs of patients and when OS and PFS were measured from the time of the primary resection. The OS of the RFA group was significantly better than the repeat resection group among those with 2 or 3 recurrent tumour nodules in both the total cohort (p=0.009) and the PSM cohort (p=0.038).
Conclusion: RFA has the same efficacy as repeat resection in recurrent HCC patients, but with fewer complications. RFA is more efficient and safer than repeat resection in patients with 2 or 3 recurrent tumour nodules.
Limitations: Our study is limited by the noninterventional nonrandomised study design, but we used the propensity score matching method.
Ethics committee approval: The study was approved by Shandong Provincial Hospital review board with a waiver of patient informed consent.
Funding: This work was supported by Shandong Provincial Medical Health Technology Development Projects (No. 2017WS472).

Percutaneous thermal ablation of colorectal liver metastases: CT radiomic features of the surrounding liver parenchyma as predictors of local tumour progression
F. Fumarola[1], M. Calandri[1], V. Giannini[2], D. Regge[3], P. Fonio[1], A. Veltri[4], C. Gazzera[1]; *[1]Turin/IT, [2]Candiolo/IT, [3]Candiolo-Torino/IT, [4]Orbassano/IT*

Purpose: To investigate the correlation between radiomic features of the surrounding liver parenchyma and local tumour progression (LTP) after ablative treatments of colorectal liver metastases (CLM). No pertinent data concerning the role of radiomics in this setting are present in the literature.
Methods and materials: 39 CT-based radiomic features were extracted from 37 CLM in 35 consecutive patients who underwent image-guided thermal ablation. Patients with preprocedural CT acquired earlier than 30 days before the procedure were excluded. Ablation margins, size of the lesion, chemotherapy regimens, and technology (radiofrequency or microwave) were also evaluated.
CT images of CLM were manually segmented on portal phase acquisitions (ITKsnap software, version 3.6.0). Subsequently, a volume including 1 cm in width of surrounding liver parenchyma was automatically generated. Radiomic features were extrapolated using in-house software developed in C++ with ITK libraries. Statistical analysis was performed using a Mann-Whitney U test and Pearson test. ROC curves and AUC were also evaluated.
Results: 1st percentile (p=0.023; AUC=0.738) and 10st percentile (p=0.043; AUC=0.713) had a direct correlation with LTP in all pre-treatment lesions. In the 24 lesions with ablation margins ≥5 mm (LTP in 7/24 cases, 29.2%), 7 features (1st percentile, contrast, entropy, diffEntropy, infCorr1, dissimilarity, and SRE) and 6 features (including correlation, energy, homogeneity, infCorr2, diffVariance, and maxGLCM), respectively showed a direct and an indirect correlation with LTP (p<0.005).
Conclusion: CT radiomic features of the surrounding liver parenchyma of CLM with LTP significantly differ from ablated CLM without LTP, especially in the case of adequate safety margins (≥5 mm). These preliminary findings suggest a role for radiomic features as predicting factors of the outcome of CLM ablation.
Limitations: The limited number of patients.
Ethics committee approval: n/a

Advanced cholangiocarcinoma with data from a tertiary referral centre: best supportive care versus TACE versus systemic chemotherapy
T. J. Vogl, C. Koch, W. Bechstein, A. Schnitzbauer, N. Filmann, T. Gruber-Rouh, S. Zeuzem, O. Waidmann, J. Trojan; *Frankfurt am Main/DE (t.vogl@em.uni-frankfurt.de)*

Purpose: To evaluate the role of best supportive care (BSC) versus systemic chemotherapy versus regional chemoembolisation (TACE) in patients with unresectable cholangiocarcinoma (CCC). The treatment performed was documented and the survival of the patients with unresectable CCC treated at a tertiary referral centre was analysed.
Methods and materials: In 220 consecutive patients with CCC, systemic chemotherapy, using cisplatin and gemcitabine, and TACE using mitomycin, cisplatin, and lipiodol, was performed. Survival curves were calculated according to the Kaplan-Meier method and the log-rank test was applied for survival analysis.
Results: Any palliative treatment was beneficial for patients with unresectable CCC when compared to BSC alone; the median OS with BSC was 10 weeks (BSC vs. TACE p=0.017, HR=0.36; BSC vs. TACE/chemotherapy p<0.001, HR=0.24; BSC vs. chemotherapy p<0.001, HR=0.31). A combination of TACE and chemotherapy prolonged overall survival as compared to TACE alone (105 weeks vs. 43 weeks, p=0.045).
Conclusion: The majority of patients with biliary tract cancer are diagnosed with intrahepatic CCC and have a poor prognosis with advanced stage CCC. Multimodal treatment in palliative patients significantly prolongs survival.
Limitations: A retrospective study design.
Ethics committee approval: Approval by the Institutional Review Board.
Funding: No funding was received for this work.

RPS 109-15 09:48
Percutaneous thermal ablation of neuroendocrine liver metastases
F. Darvizeh[1], F. Ullo[1], M. Calandri[1], B. C. Odisio[2], S. Yevich[2], A. Veltri[1], P. Fonio[1], C. Gazzera[1]; *[1]Turin/IT, [2]Houston/US (fdarvizeh@gmail.com)*

Purpose: To evaluate the local tumour progression (LTP) and overall survival (OS) in patients with neuroendocrine liver metastases (NLMs) who have undergone percutaneous thermal ablation.
Methods and materials: The retrospective two-centre study was conducted on 36 patients (67 lesions) with NLM who were treated with percutaneous thermal ablation and subsequent intra-arterial therapy, if necessary. Uni/multivariate analyses were performed using logistic regression and Cox-regression models.
Results: The midgut was the most frequent primary tumour site (34.3%) followed by the pancreas (21%).
100% of the secondary hepatic lesions were ablated completely at the first cross-sectional imaging control and only 6% showed LTP (4/67).
The median OS was calculated as 11.26 years and the midgut (site of origin) was shown as the main independent predictor of OS (HR: 7.39, p=0.001). Furthermore, patients with non-functional NETs had a reduced OS compared to functional NET (HR: 0.027, p=0.027). No immediate post-procedural complications were found.

Conclusion: Percutaneous thermal ablation procedures appear feasible and safe in the treatment of well-differentiated NLMs and allow an effective local tumour control with a low LTP rate. However, furthur study is required to show if radiologic procedures themself might really improve the relatively high OS.
Limitations: A relatively small series.
Ethics committee approval: Ethics committee approval obtained.
Funding: No funding was received for this work.

The effect of humour as a cognitive technique for decreasing anxiety during mammography
A. M. A. Oliveira[1], A. F. Abrantes[2], L. P. V. Ribeiro[3], R. P. P. Almeida[2], A. D. M. Ribeiro[1], S. Rodrigues[2], K. B. Azevedo[2]; [1]*Portimão/PT,* [2]*Faro/PT,* [3]*Parchal/PT (alexandra.m.oliveira@hotmail.com)*

Purpose: Mammography is the most effective method available for the early detection of breast cancer but many women report experiencing some anxiety, pain, and discomfort when they undergo these procedures. In recent years, substantial research claims that humour and laughter possess unique characteristics for coping with pain and stress. The aim of this study was to determine the effect of humour on levels of anxiety during mammography.
Methods and materials: A total sample of 120 outpatients from public and private facilities was divided into a control group (n=60) and an experimental group (n=60). Sociodemographic interview and state-trait anxiety inventory were applied to both after consent of participation in the study. The experimental group watched funny videos before mammography while the control group did not watch any videos.
Results: Cronbach's alpha coefficient was excellent (0.909). No significant correlations between the control group and the experimental group (r=0.831, P=0.831) were observed. However, in the private facility, there was a slight decrease in anxiety levels in the experimental group (66% of the patients who watched the videos had a low state of anxiety compared to 60% in the control group), but the levels were the same in the public facility for both groups (90% of women reported a low to moderate state of anxiety).
Conclusion: Results from this study have provided important information regarding anxiety levels during mammography but can't confirm that humour techniques can decrease anxiety. Additional research on the effects of humour and other techniques (such as music) is recommended to explore new skills that can help to decrease patient's anxiety, pain, and discomfort.
Limitations: The sample size.
Ethics committee approval: The ethics committee approved the study and written informed consent was obtained.
Funding: No funding was received for this work.

RPS 214-2 10:36
Improving the performance of mammographers in a breast cancer screening program: the ASL Latina experience
S. Pacifici[1], G. P. Fanelli[2], N. Ravazzolo[1], A. Tomei[1], P. Bellardini[3]; [1]*Rome/IT,* [2]*Borgo Carso Latina/IT,* [3]*Latina/IT (s_pacifici@virgilio.it)*

Purpose: The success of a screening program is guaranteed, among other things, by the synergy between the radiologist and the mammographer. The mammographer is the main actor, as both the quality of the services and the adherence to the program is subordinate to its technical-professional and relational skills. Thus, a mammography screening program needs mammographers trained, responsible, and aware; all qualities that can be developed and consolidated solely through a theoretical-practical training program tailored to the specific needs of each service. With this background, a training project was launched at the ASL of Latina.
Methods and materials: The quality assessment and training activities were entrusted to an external senior mammographer consultant with specific skills and qualifications in breast imaging. The choice of an external professional ensured the establishment of a fiduciary and peer relationship with the recipients of the project. The project included theoretical and practical meetings.
A PGMI system was used to evaluate the images.
Results: The scores of 136 images randomly selected before the project started were as follows: P 9.5%, G 7.5%, M 50%, and I 33%.
23 mammograms contained at least one inadequate image (67.50% of the total) and 8 inadequate to recall (6% of the total). At one month from the end of both training and corrective steps, the images classified as M presented a strong percentage reduction (30% vs 50%) for the benefit of the images classified as P and G (now, respectively 51.25% and 30%), with a total reset of I images.
Conclusion: The excellent results of the project confirmed that the verification and monitoring of a mammographer's performance is a powerful tool for improving the technical-diagnostic quality of mammography screening programs.

Supplementary imaging procedures for women with dense breasts undergoing breast cancer screening: a systematic review
D. Mizzi[1], P. H. Hogg[2], A. England[3], J. F. Kelly[4], F. Zarb[1], N. Mercieca[5]; [1]*Msida/MT,* [2]*Salford/UK,* [3]*Manchester/UK,* [4]*Chester/UK,* [5]*Gozo/MT (deborah.mizzi@um.edu.mt)*

Purpose: To evaluate published evidence and calculate the diagnostic test performance of supplementary imaging procedures for breast cancer screening in women with dense breasts.
Methods and materials: Data sources for identifying journal publications included MEDLINE (ProQuest), CINAHL, Health and Medicine Databases (ProQuest), Web of Science, and the Cochrane library. Reference lists of the studies and relevant systematic reviews that were retrieved were reviewed to identify relevant articles that were not identified in the literature searches. Two reviewers independently reviewed the titles, abstracts, and full-text articles to determine if studies met the inclusion and exclusion criteria. All studies were required to report diagnostic test performance characteristics using a supplementary screening with any imaging modality after a negative digital screening mammogram in asymptomatic women with dense breasts (BI-RADS C/D) as the sole risk factor. Discordance throughout the process was resolved by a third reviewer. Study quality was assessed using QUADAS-2 tool.
Results: 28 journal publications satisfied the inclusion criteria. 16 of these reported on hand-held ultrasound, 2 reported on automated whole breast ultrasound, 5 reported on MRI, 2 reported on digital breast-tomosynthesis, and 2 reported on molecular breast imaging. Only 1 study reported on contrast-enhanced digital mammography. Overall, the evidence indicates that supplementary screening among women with dense breasts and recent negative mammography can consistently identify additional cancers, most of which are invasive, but also leads to unnecessary recalls and biopsies.
Conclusion: Supplementary imaging procedures consistently detected additional breast cancers not identified by digital mammography in asymptomatic women with dense breasts. The inclusion of supplementary imaging into routine screening of dense breasts is recommended but will need to consider the availability and local yield.

The impact of self-compression on breast dose and thickness in mammography
P. Bravhar[1], N. Mekis[2], E. Alukić[2]; [1]*Breazovica/SI,* [2]*Ljubljana/SI*

Purpose: To determine whether the use of self-compression in mammography increases compression force, which will lead to a decreased thickness of breast and lower mean glandular dose (MGD).
Methods and materials: Measurements were performed on 132 patients that were referred to mammography. Patients were randomly divided into two equal groups. In one group, women compressed the right breast themselves and the radiographer compressed the left, and in the other group, they switched roles. MGD, compression force, and thickness of the breast were obtained for each patient. The image quality was not assessed in this part of the study. Data comparison was done with a related-samples Wilcoxon signed rank test.
Results: When the compression was done by the trained radiographer, the average compression force was 89.9 N, average breast thickness was 52.3 mm, and MGD was 1.48 mGy when compared to the self-compression, where the average compression force was 107.9 N, thickness 48.9 mm, and MGD 1.36 mGy, respectively. We have proven a significant increase in average compression force for 20% ($p<0.001$), and a decrease in breast thickness by 7% ($p<0.001$) and MGD by 8% ($p=0.002$).
Conclusion: The results showed that the use of self-compression in mammography in CC projection leads to a decrease of MGD and thickness, which is the result of greater compression force. All the stated facts could lead to better image quality, which will be assessed in the second part of the study.
Limitations: Due to the limitations of the mammography unit, self-compression could only be performed on craniocaudal (CC) projection.
Ethics committee approval: Approved by the national medical ethics committee. Patient consent was obtained.
Funding: No funding was received for this work.

The eye-tracking system as an assessment tool for mammography positioning
H. Yamashina[1], A. Yagahara[1], T. Suzuki[2], K. Ogasawara[1]; [1]*Sapporo/JP,* [2]*Iwamizawa/JP (y-hiroko@med.hokudai.ac.jp)*

Purpose: In Japan, an objective structured clinical examination (OSCE) is an emerging trend. One of the most difficult positioning techniques to be acquired is breast positioning in mammography. In this study, we evaluated the effectiveness of the eye-tracking system as an assessment tool.
Methods and materials: Two skilled mammographers (A and B) and two third-year university students (C and D) were recruited for a preliminary study. Three areas of interest (AOIs) were selected to detect visual attention: a) the juxtathoracic region (pectoral muscle), b) entire glandular tissue, and c) abdominal tissue (infra-mammary fold). Saccade-fixation eye movements were detected using gaze plots and heat maps. Dwell time was also assessed within selected AOIs.
Results: Heat maps during the moving of the compression device into the position illustrated the differences of visual attention among participants. Expert A was gazing at the pectoral muscle and glandular tissue but had no gaze at the infra-mammary fold. Expert B was found to have strong visual attention on the pectoral muscle. Student C did not show any gaze within the selected AOIs. Student D was gazing at the pectoral muscle and infra-mammary fold. In addition, gaze at the display of the compression force was observed among students. Dwell time within AOIs also showed the differences in visual attention among participants.
Conclusion: An eye-tracking system can be used as an assessment tool for mammography positioning. Using both a heat map and dwell time within AOIs should be applied for a more accurate assessment.
Limitations: We need to further examine the association between the obtained clinical images with visual attention to investigate the effectiveness of the eye-tracking system.
Ethics committee approval: Informed consent was obtained from all participants.
Funding: No funding was received for this work.

RPS 214-6 11:00
The influence of digital breast tomosynthesis on PGMI classification of 2D screening-detected cancers and baseline 2D screening examinations of interval cancer (IC) in the Oslo tomosynthesis screening trial
R. Gullien[1], A. E. Haakull[1], A. S. Bakken[2], J.-G. Andersen[1]; [1]*Oslo/NO,* [2]*Royken/NO (uxraul@ous-hf.no)*

Purpose: To examine whether tomosynthesis has an impact on the classification of mammograms classified as moderately-good (M) when DBT was used in addition to 2D.
Methods and materials: 130 of 230 SDC from OTST with at least one normal score at independent double reading and 51 IC were included. Two incomplete exams were excluded. 179 cases with CC and MLO (2D and 2D+DBT) of each breast, n=716 mammograms, were included. Two radiographers independently assessed mammograms using criteria from a quality-assurance manual (QAM) from BreastScreen Norway. 2D and DBT were classified separately: P=perfect, G=good, M=moderately-good, and I=inadequate. P+G were pooled. Images classified as M were selected for analysis and divided into sub-groups: a=pectoral muscle not to nipple level, b=nipple not in profile, c=inframammary angle not clearly demonstrated, d=skin folds/overlying tissue, and e=asymmetry.
Results: PGMI results for 2D were P+G=498/716 (70%), M=24% 173/716 (24%), and I=6% 45/716 (6%). Images classified as M included 39/173 (23%) in CC projection and 134/173 (77%) in MLO projection. All 39 CC images (22 RCC and 17 LCC) retained the classification. 93/134 (69%) of MLO images were upgraded from M to G when 2D+DBT images were used for comparison. The remaining 41/134 (31%) M MLO images retained classification. No CC or MLO were downgraded. The main reasons for re-classifying MLO images to M were sub-group d 44/134 (33%), followed by sub-group c 44/134 (33%), sub-group a 26/134 (19%), sub-group b 20/134 (15%) and no images in sub-group e. In sub-group d, 39/44 89% were upgraded. In sub-group a, 2/26 (8%) were upgraded. In sub-group b and c, all retained the classification.
Conclusion: Most moderately-good images were in MLO-projection. Adding DBT to 2D for PGMI classification resulted in upgrading moderately-good MLO images to good when reasons were skin folds/overlying tissue.

Retrospective PGMI classifys and examines compression force (CF) of screening-detected cancers and mammograms prior to diagnosis interval cancer from the Oslo tomosynthesis screening trial
R. Gullien[1], A. E. Haakull[1], A. S. Bakken[2], J.-G. Andersen[1]; [1]*Oslo/NO,* [2]*Royken/NO (uxraul@ous-hf.no)*

Purpose: To examine if CF on mammograms of screening-detected cancers (SDC) and screening mammograms prior to an interval cancer (IC) diagnose classified as inadequate had any impact on the PGMI classification.
Methods and materials: 130 of 230 SDC from OTST with at least one normal score at independent double reading and 51 IC were included. Two incomplete exams were excluded. 179 cases with CC and MLO (2D and 2D+DBT) of each breast, n=716, mammograms were included. Two radiographers independently assessed the mammograms using criteria from a quality-assurance manual (QAM) from BreastScreen Norway, 2003 edition. 2D and DBT were classified separately: P=perfect, G=good, M=moderately-good, and I=inadequate. P+G were pooled. The QAM recommend CF between 10N and 18N, usually between 12N and 15N. Images with CF outside the recommendation (10-18N) and images classified as inadequate were selected for analysis.
Results: The mean CF for all images was 12, 4N, the median of all CC images=12N, and the median of all MLO images=13N, and were within the recommendations. 64 images had a lower (42 CC projection, 22 MLO projection) and 2 CC images had a higher CF than recommended. Overall, the lowest CF was 6, 0N (LMLO=inadequate) and the highest was 18, 3N (LCC=perfect). 45 images were classified as inadequate, (26 RCC, 17 LCC, 1 RMLO, and 1 LMLO). 19 of the 26 RCC images were within recommendations, 7 were lower, and none were higher than recommended. Of the 17 LCC images, 16 images were within the recommendations and 1 was lower. 1 inadequate MLO image was lower than

recommended. The main reason for classifying images as inadequate was that part of the breast tissue was missing.
Conclusion: It seems that there were no correlations between the compression-force and mammograms classified as inadequate. Inadequate mammograms and reasons for low compression force should be further investigated.
Limitations: Only internal radiographers classified the mammograms. No control group with CF, only recommendations in the QAM for comparison.
Ethics committee approval: Clinical Trials NCT 01248546, Regional Ethic Committees 2010/144.

Identification of image quality criteria for the assessment of mammography images with breast implants using the Delphi method by radiographers and radiologists

C. S. D. Reis, I. Gremion, N. Richli*; Lausanne/CH*

Purpose: To identify the most relevant image quality (IQ) criteria that should be used to assess breast implants mammograms (BIM) according to radiographers' and radiologists' working in breast cancer screening programs perspectives.
Methods and materials: A two-round Delphi method using a questionnaire was applied, asking the experts to rank each image criteria encountered in the literature according to 4 possible answers: 1=need to have/2=nice to have/3=not relevant/4=does not know. Criteria for craniocaudal, mediolateral-oblique, and lateral, performed with and without Ecklund manoeuvre, were included. This process was repeated modifying criteria in the second round by removing the less relevant criteria highlighted during the first round and including participants' suggestions.
Results: Visualisation of anatomical details (extension of the pectoral muscle, nipple in profile) was considered the most relevant criteria by radiographers during the first round, while general criteria were prioritised by radiologists in both rounds, namely the sharpness of glandular tissue, absence of artefacts, and the spread of breast tissue. The analysis of implant flow, the BI anterior edge, and its maximum retropulsion when the Eklund manoeuvre was performed were the specific criteria for BIM considered as the most relevant to be assessed. The visualisation of retroglandular adipose tissue and axillary tail were considered as "nice to have".
Conclusion: The importance of each criterion used to assess BIM was not the same for radiographers and radiologists, which suggests the two groups of experts are looking for different aspects of the image. Further education and training are necessary to align the strategy to assess IQ of BIM and reduce subjectivity.
Limitations: This study did not include all BCS centres available in the country, not being possible to generalise these results.
Ethics committee approval: n/a
Funding: Funding provided by HES-SO.

Does radiographer assessment of image quality align with that required for diagnosis?

R. G. L. Decoster, R. Toomey, M.-L. Ryan*; Dublin/IE*

Purpose: Previous research indicates that radiologists and radiographers agree on the visibility of anatomical structures in radiographs but not on the clinical usability. The impact of the differences in the acceptance of a radiograph on the radiologist's confidence to diagnose is unknown.
Methods and materials: 24 radiographers and 6 radiologists scored 40 PA chest radiographs (24 without and 16 with pathology) for clinical usability (RadLex) in the detection of lung lesions. Additionally, radiologists classified the radiographs as normal or abnormal and scored their confidence on a 5-point scale. AUC_{ROC}were calculated for each RadLex category to evaluate the alignment between the radiographer's assessment and the radiologist's performance.
Results: Based on the AUC_{ROC}, the classification of the radiographs by radiographers in terms of clinical usability was no predictor for the clinical performance of the radiologist. A significant different ($p<0.01$) classification was noticed between radiographers and radiologists. 25.3% of the cases, rejected by the radiographers (rejected 56%), sufficiently supported the detection of pathology for the radiologist (rejected 30.7%).
Conclusion: Almost half of the radiographs rejected by radiographers were potentially diagnostic, with useful doses likely being discarded. The discrepancy between professions in the evaluation of clinical usability alludes to a different approach in image evaluation. Future research is needed to align both professions, with agreement and collaboration being untapped niches for potential dose optimisation strategies.
Limitations: The number of cases was relatively low to facilitate observers with limited availability and so the prevalence did not reflect the clinical practice.
Ethics committee approval: n/a
Funding: No funding was received for this work.

Are image quality judgements by radiographers guided by a global signal or "gist"?

R. Toomey, J. Ryan, R. G. L. Decoster, J. G. Stowe, M. O'connor, K. G. Cronin, L. A. Rainford*; Dublin/IE*

Purpose: Radiographers differ from radiologists in their assessment of image quality, which may have connotations for patient diagnosis and radiation dose. Understanding the perceptual basis for these judgements is warranted.
Expert radiologists are thought to be guided in pathology detection by an initial global impression, detecting abnormalities at a rate higher than chance in under 250 ms. This study aims to determine whether radiographers employ a similar process, detecting a global signal for "inadequate" image quality.
Methods and materials: 27 qualified radiographers attending the EFRS Research Hub 2019 viewed 24 chest radiographs of varying quality under two conditions and rated the image quality of each on a scale of 1 (very inadequate) to 5 (excellent); ratings of 1 or 2 indicated a repeat image was necessary.
In the first condition ("flash"), a sequence of fixation cross (750 ms), radiograph (200 ms), mask (50 ms), and a blank screen with rating scale (unlimited) were presented for each radiograph. In the second condition ("free"), images were presented in a different order with unlimited time, representing standard viewing conditions.
Results: 35.69% of the images had identical ratings in each condition. 69.61% were given the same decision to accept/reject in both conditions. Where the decision changed, 74.6% were initially accepted. Flash and free ratings were correlated ($r=0.507$, $p<0.01$); mean flash ratings were higher than free ($p<0.01$).
Conclusion: Radiographers may use a global impression in determining image quality, though further research is required.
Limitations: Selection bias is possible as all participants were ECR attendees. The limited number and range of images limits the findings.
Ethics committee approval: The work was submitted to the home institution human research ethics committee and declared exempt from a full review.
Funding: The study was conducted at the EFRS Research Hub and used monitors donated by Barco.

Radiographers' visual acuity performance can impact image quality evaluation

C. S. D. Reis[1], F. A. P. S. Soares[2], G. M. Bartoli[1], K. Dastan[3], Z. Dhlamini[4], A. Hussain[5], D. Kroode[6], M. F. M. McEntee[7], J. D. Thompson[3], N. Mekis[8]; *[1]Lausanne/CH, [2]Florianopolis/BR, [3]Salford/UK, [4]Bloemfontein/ZA, [5]Derby/UK, [6]Groningen/NL, [7]Cork/IE, [8]Ljubljana/SI*

Purpose: To determine the impact of reduced visual acuity on object counting and image evaluation of anatomical details in appendicular radiographs.
Methods and materials: Phantom images were produced for the purpose of counting objects and image appraisal of anatomical structures was performed on anonymised radiographies. A 4-point Likert-scale was applied to characterise the level of anatomical definition (1-not defined; 4-clearly defined). The tasks were performed under 3 conditions: wearing 2, 1, and 0 pairs of simulation glasses, which provided different magnitudes of reduced visual acuity. Inferential statistics were carried out using SPSS and areas under the visual grading characteristic curve (AUC_{VGC}) were used as figure-of-merit. The tasks were completed by radiography students participating in a research summer school.
Results: Observers were not able to count low-contrast objects with 2 pairs of glasses (13). The evaluation of anatomical details was performed by 7 radiography students wearing 0 and 2 pairs of glasses, but total interpretation

time was longer when visual acuity was reduced (15.4 versus 8.9min). VGC analysis showed that observers can lose the ability to detect anatomical and contrast differences when they have a simulated visual acuity reduction, with low-contrast detection presenting more of a challenge (soft tissues). No simulation glasses compared with 1 pair gives binomial AUC_{VGC} of 0.302 (0.280, 0.333), that decreases to 0.197 (0.175, 0.223) when using 2 pairs.
Conclusion: Reduced visual acuity has a negative impact on the evaluation of test-objects and clinical images. Further work is required to test the reduced visual acuity impact on the technical evaluation of different imaging, pathologies, and levels of experience.
Limitations: There was no optometrist available to measure the differences on observers' visual acuity.
Ethics committee approval: HSR1819-115.
Funding: No funding was received for this work.

RPS 214-12 11:36
Quality assessment of paediatric chest radiographs: differences between radiologists and radiographers
C. I. D. C. T. Martins[1], F. M. Nogueira[1], J. Santos[2];
[1]Lisbon/PT, [2]Coimbra/PT
(claudia.teles.martins@gmail.com)

Purpose: To characterise differences in the evaluation of the quality of paediatric chest radiographs between radiographers and radiologists.
Methods and materials: 24 paediatric chest radiographs, performed before and after the implementation of a dose optimisation program, were analysed by 5 observers: 2 radiologists and 3 radiographers. This evaluation was performed blindly, independently, and without a time limit. The evaluation included an analysis of anatomical criteria (1 to 5-point Likert scale) and visual perception of physical image characteristics (1 to 3-point Likert scale) such as noise, resolution, and contrast (11 criteria). Visual grading analysis and visual grading characteristics analysis were performed.
Results: The analysis of the scores was performed by criterion and by phase in the different weight ranges, and 1,320 scores were obtained. No statistically significant differences were found for scores between both phases (p=0.131). Regarding the differences between professional classes, radiographers gave lower scores than radiologists in almost all criteria and all weight levels, regardless of the phase. The average scores assigned by radiographers ranged from 1.3-4.9, with the most frequent average score being 4.7 (8.0%). The average scores given by the radiologists ranged from 2.0-5.0, with the most frequent mean score being 5.0 (43.2%). In the two analysed phases (before and after optimisation), in all weight ranges and criteria, statistically significant differences ($p<0.05$) were found between the evaluations performed by radiographers and radiologists.
Conclusion: The evaluation of the quality of chest radiographs was influenced by the evaluator's academic background, which may have implications for adherence to x-ray exposure optimisation programs.
Limitations: The number of images and observers were limited.
Ethics committee approval: Approved by the ethical board of the hosting hospital.
Funding: No funding was received for this work.

A comparison of the success rate and radiation burden between radiography students when imaging the thoracic and lumbar spine
R. Viltužnik, N. Mekis; *Ljubljana/SI*

Purpose: To investigate if there are differences in the radiation burden (DAP, effective dose) and success rate among radiography students in Slovenia.
Methods and materials: 124 students participated in the study: 1st (n=39), 2nd (n=30), and 3rd (n=30) year students of the 1st cycle degree and students from both 2nd cycle degree years that were put in one group (n=25) due to the poor representation of each study year. The students were unaware of what kind of study they participated in. They were asked to perform thoracic and lumbar spine imaging in both standard projections on an anthropomorphic phantom. DAP measurements and field size were obtained and the effective dose and dose to organs were calculated. All images were evaluated according to the criteria in professional literature. Only the optimal images were further included in the analysis.
Results: There were no significant differences between the number of rejected and optimal images in thoracic spine radiography in both projections. In the AP view of the thoracic spine, the 1st year students had the best results in DAP and effective dose. In the lateral view, the 2nd year students used the smallest field size. Significant differences were found between the number of optimal and rejected images in lumbar spine radiography, where the 1st year students had the far higher number of rejected images. No significant differences in image field size, DAP, and effective dose between all four groups in lumbar spine radiography were found.
Conclusion: We cannot point out the best group of students based on imaging field size, DAP, and effective dose. However, the best results in the number of optimal images were achieved by the 2nd cycle degree students.
Limitations: All students should have participated.

An investigation of how exposure faults can be accounted for in the reject analysis of digital radiographs
C. Mc Keown, K. Matthews; *Dublin/IE (ciaramck97@gmail.com)*

Purpose: Reject analyses (RA) in digital radiography report low reject rates for inadequate exposure because digital systems can produce diagnostic images over a broad range of exposure levels. A review of current literature indicates a lack of investigation into whether reduced rates of exposure error are actual or whether they are masked by post-processing techniques that optimally render images for display such that less-than-optimal exposure goes unnoticed. The current study aimed to investigate how exposure faults can be accounted for in the RA of digital radiographs.
Methods and materials: A system to store digital reject images was set up. Rejects and their associated anonymised data were collected over an audit period of one month. To facilitate the analysis of exposure through the calculation of the deviation index (DI), examination specific target exposure values were derived in compliance with IEC advice. An objective quality analysis of the images was conducted at a RIS-PACS workstation at the researchers' university.
Results: A comparison of the frequency of exposure error reported in the RA (5.7%) and DI analysis (20%) revealed that RA of itself is not effective in identifying exposure error in digital radiographs. Image quality evaluation using Spearman's non-parametric test of correlation confirmed that no significant correlation existed between SNR or CNR and DI values.
Conclusion: RA without further consideration of exposure is not effective in identifying exposure error in digital radiographs. The addition of exposure analysis using DIs provides information that can be used to inform optimisation strategies for digital radiographs. Thresholds for SNR and CNR in terms of diagnostic efficacy should be investigated to determine whether target exposures could be reduced without an image detriment.
Limitations: The study is specific to a site using Siemens technology. The method, however, is robust/reproducible and could be adapted/replicated in other sites.
Ethics committee approval: Ethical approval from UCD SM UREC was granted (November 2018).
Funding: No funding was received for this work.

A reject analysis targeted to identify the techniques of undergraduate radiographers that may benefit from further development
C. Lynch, K. Matthews; *Dublin/IE (chloe.lynch@ucdconnect.ie)*

Purpose: As well as contributing to quality assurance, reject analysis can provide staff and students with targeted feedback so they can learn from mistakes and improve practice. However, in the study centres, there were no mechanisms in place to retrieve rejected images specifically for student feedback. The aims of this study were to develop a mechanism to retrieve images performed by student radiographers for reject analysis across multiple sites and analyse the findings of reject analysis on these images to establish any themes that might contribute to focused teaching.
Methods and materials: An archive folder in the RIS-PACS was established to receive images identified as rejected and performed by students. From a list of 8 categories, reasons for rejection were recorded by the researcher. For quality

assurance, a small sample was also assessed blindly by an expert radiographer with Cramer's V revealing a significant, strong association (V=1.0, p=0.00) between the two sets of data and thus establishing the credibility of the researcher reject analysis.
Results: 164 rejected images across 42 different projections were harvested. The lower limb was the most repeated body region. Positioning, centring, and artefact were the most frequent reasons for rejection. Lateral knees, lateral wrists, and PA chests were the most frequently rejected projections. These findings strongly aligned with findings reported in published papers.
Conclusion: Detailed reject analysis provides information that can enhance optimisation. Consideration of reasons for rejection can provoke staff consideration of technique and highlight areas where the teaching of students could be focussed. These could lead to a reduction in repeats and reduced patient doses.
Limitations: The overall reject rate could not be calculated.
Ethics committee approval: An ethical exemption was granted by the undergraduate research and ethics committee.
Funding: No funding was received for this work.

A new insight of brain reorganisation in the sensorimotor cortex after spinal cord injury
Q. Chen, N. Chen, Z. Wang*; Beijing/CN (chenqian8319@163.com)*

Purpose: To investigate possible brain reorganisation after spinal cord injury (SCI) using multimodal fMRI and to further study their association with clinical variables.
Methods and materials: 21 traumatic SCI patients and 21 healthy controls (HCs) were recruited. The 3D whole-brain structural and resting-state functional images were acquired from all participants using a 3.0 Tesla MRI system. VBM and TBSS analysis were conducted to investigate the differences in brain structure between SCI patients and HCs, separately. Seed-based FC analysis was performed to explore the whole-brain functional changes using the results of brain structure as seeds. The association between brain changes and clinical variables was performed.
Results: SCI patients showed GMV decrease in the dorsal anterior cingulate cortex (dACC), bilateral anterior insular cortex (aIC), bilateral orbital frontal cortex (OFC), and right superior temporal gyrus (STG). No significant difference in WM was found. When the seeds were located in the left aIC and right STG, SCI patients showed decreased FC in the bilateral primary sensorimotor cortex and left inferior parietal lobule (IPL), separately. Additionally, the FC value in the right primary sensorimotor cortex was positively correlated with the total motor score, while the FC value in the left IPL was positively correlated with the left/right/total motor score in SCI patients.
Conclusion: These findings indicate that SCI can cause brain reorganisation in some higher cognitive areas, which are not related to sensorimotor function directly. More importantly, reorganisation of these regions may be vital factors in sensorimotor dysfunction through the decreased FC with sensorimotor areas after SCI.
Limitations: We did not conduct a longitudinal study.
Ethics committee approval: The study protocol was approved by the ethics committee of our hospital.
Funding: National Natural Science Foundation of China (No.81871339).

Paediatric retroclival epidural haematoma in the acute trauma setting: a sign of tectorial membrane stripping injury
P. Fiester, D. Rao, S. Andreou, E. Soule, J. Patel*; Jacksonville, FL/US, (peterfiester@gmail.com)*

Purpose: A traumatic retroclival epidural haematoma (REH) is a rare sign of significant cervical flexion-extension injury in the paediatric population. The purpose of our study was to identify paediatric patients with an REH and a record the haematoma size and extent and examine the major craniocervical ligaments for injury.
Methods and materials: Paediatric patients who suffered a REH were identified retrospectively using the keywords 'clivus', 'epidural haematoma', and 'retroclival' included in head CT reports from 2012-2018 using Nuance mPower software. The cervical and brain MRI exams for these patients were reviewed for craniocervical ligament injury by two CAQ certified neuroradiologists. Detailed descriptions of patient injuries were recorded along with demographic information, clinical history, patient management, and outcome.
Results: Ten paediatric patients were identified with an acute, post-traumatic REH with an average anteroposterior size of 4.4 mm and craniocaudal size of 4.3 cm. All patients demonstrated either a stripping (90%) or partial stripping (10%) injury of the tectorial membrane. The disruption of the additional major craniocervical ligaments (alar ligament, transverse ligament, longitudinal ligaments, and ligamentum flavum) was relatively rare. The most common associated ligamentous injuries involved the anterior atlantooccipital membrane, apical ligament, and interspinous ligaments. The majority of patients were managed conservatively with excellent clinical outcomes.
Conclusion: A post-traumatic REH in the paediatric population is associated with a stripping of the tectorial membrane from the posterior clivus. We propose that the identification of an REH on initial head CT should trigger a cervical MRI to evaluate the integrity of the tectorial membrane and other craniocervical ligaments.
Limitations: The mall sample size for this rare injury.
Ethics committee approval: A waiver of informed consent was granted by the University of Florida Health Jacksonville IRB-03 chairman.
Funding: No funding was recieved for this work.

Impact of incomplete investigation of suspected cauda equina syndrome before referral to specialist spinal units
R. Duarte Armindo[1], D. Fountain[2], S. Davies[1], D. Ballard[1]*; [1]London/UK, [2]Cambridge/UK (ruimigueldarmindo@gmail.com)*

Purpose: International guidelines state that patients with suspected cauda equina syndrome (CES) should undergo urgent lumbar MRI, ideally before referral to specialist spinal surgery units. This work, part of the evaluation of national treatment and investigation of cauda equina (ENTICE) study, aims to characterise the implications on patient care and for the receiving units of referrals with an incomplete investigation in this setting.
Methods and materials: A retrospective, multicentre observational study of the investigation and management of patients with suspected CES was conducted across the UK, including all patients referred to a spinal unit from 1st October 2016-31st March 2017.
Results: From a total of 4,441 referrals to 28 UK spinal units, more than half were made without any previous imaging and less than a fifth resulted in surgical decompression. In patients with incomplete initial studies, there was a statistically significant increase in time from presentation to MRI (median 13.9 vs 3.1 hours, p<0.001), but no significant increase in time from presentation to decompression. Approximately 85% of patients transferred for MRI were discharged without surgical intervention. Strict adherence to existing guidelines over this period would have resulted in a reduction of referrals and transfers by over 70%.
Conclusion: For the majority of cases, an adequate investigation was not completed prior to a referral to specialist centres. Previous studies suggest that the costs associated with an incomplete investigation before referral clearly outweigh those of providing access to MRI scanning 24/7 in smaller hospitals. More studies, from countries with different levels of MRI availability and/or other systems of patient referral, are needed to understand the clinical magnitude of this problem and to establish transversally applicable guidelines.
Limitations: A retrospective study with little information on long-term clinical outcomes.
Ethics committee approval: n/a
Funding: No funding was received for this work.

T2-mapping of the distal sciatic nerve in healthy subjects and patients suffering from lumbar disc herniation with nerve compression
N. Sollmann, D. Weidlich, E. Klupp, B. Cervantes, C. Ganter, C. Zimmer, T. Baum, J. S. Kirschke, D. C. Karampinos*; Munich/DE (nico.sollmann@tum.de)*

Purpose: To provide reference T2 values for magnetic resonance neurography (MRN) of the distal sciatic nerve and compare these to T2 changes in patients with nerve compression.
Methods and materials: 22 subjects (28.3±3.5 years) and 5 patients with unilateral sciatica due to degenerative disc disease with disc herniation underwent MRN using a T2-prepared turbo spin-echo (TSE) sequence of the distal sciatic nerve bilaterally. 5 and 2 healthy subjects further underwent a commonly used multi-echo spin-echo (MESE) sequence and magnetic resonance spectroscopy (MRS) as the gold-standard method, respectively. Measurements of T2 values were performed by two readers.
Results: T2 values based on the T2-prepared TSE sequence were 44.4±3.0 ms (left) and 44.5±2.7 ms (right; p>0.05) in the healthy subjects and showed good inter-reader reliability. In patients, distal sciatic nerves showed T2 values of 61.5±6.2 ms (side of nerve affection) vs 43.3±2.4 ms (unaffected side). T2 values of MRS were in good agreement with measurements from the T2-prepared TSE sequence. However, they were not in agreement with those of the MESE sequence, which showed clearly higher values (62.8±3.2 ms [left] and 62.7±2.8 ms [right]).
Conclusion: A T2-prepared TSE sequence enables the determination of accurate T2 values of the distal sciatic nerve, whereas a commonly used MESE sequence tends to overestimate nerve T2. Our approach may enable to quantitatively assess direct nerve affection in patients with nerve compression.
Limitations: The small size of the patient cohort, but it is only intended to form a first case series for comparison to reference values.
Ethics committee approval: This prospective study was approved by the IRB.

Advanced trends in magnetic resonance imaging in the assessment of lumbar intervertebral degenerative disc disease
R. S. Abou Khadrah*; Tanta/EG (rotinia2009@gmail.com)*

Purpose: To evaluate the sensitivity of T2-mapping and the apparent diffusion coefficient in the determination of an early stage of intervertebral disc degeneration.
Methods and materials: 60 patients (mean age of 47.50±7.88) and 20 volunteers presenting with low-back pain underwent T2-mapping and DWI. All the lumber discs were evaluated morphologically and given a grade according to Pfirrmann's grading (I to IV). Every disc was divided into three parts: central, peripheral, and all-disc. The values of both T2 and ADC were calculated and analysis. The different correlation between the result and age were done using a ROC curve for both T2-mapping and ADC value, aiming to determine the cut-off values.
Results: There was a negative correlation between T2 values and semi-quantitative grading (Pfirrmann grading) of disc degeneration and T2 values were significantly different when comparing grade I to V. A T2 value of nucleus pulposus was more sensitive than annulus fibrosus and the entire disc. ADC values were found to decrease with the increased degree of disc degeneration. There was a weakly significant negative correlation between age and T2-mapping values, ADC values of nucleus pulposus, and the entire disc.
Conclusion: T2-mapping was significantly different when comparing grade I to V while ADC value had a significant weak negative correlation with age. T2-mapping and, to a smaller extent, ADC can be used for quantitative analysis of early disc degeneration for early diagnosis and better management.
Limitations: The absence of histological correlation with the results, absence of direct relation between the morphological changes of disks and T2-mapping and DWI, and the subjective grading of disks by Pfirrmann grading.
Ethics committee approval: The study was approved by the ethical committee of Tanta University Hospital.
Funding: No funding was received for this work.

T2-mapping of the intervertebral disc: pre-treatment assessment, evaluation of changes, and the prognostic value in patients undergoing O2-O3 chemodiscolysis
F. Bruno, E. Tommasino, M. Varrassi, E. Di Cesare, A. Barile, C. Masciocchi, A. Splendiani*; L'Aquila/IT*

Purpose: To assess the MRI modifications of the intervertebral disc (IVD) treated by chemodiscolysis using T2-mapping sequences and possible associations with clinical and instrumental outcomes.
Methods and materials: 37 sciatica patients (20 males, 17 females; mean age 46.15 years) were enrolled for percutaneous CT-guided O2-O3 chemodiscolysis treatment. As a control group, we enrolled 28 patients treated by CT-guided periradicular injections. All patients were submitted to clinical (using visual analogue scale and Oswestry disability index) and imaging studies to evaluate the intervertebral disc area (IDA) and T2-mapping values of the IVD before, at 1-month, and 6-months follow-up.
Results: The mean pre-treatment T2 relaxation time values were 38.80±4.51ms, 44.05±0.91ms, and 45.45±14.11ms for anterior annulus fibrosus (aAF), nucleus pulposus (NP), and posterior annulus fibrosus (pAF), respectively, with a significant increase at the level of the NP (p<0.05) at the 1-month follow-up. The 6-months follow-up showed a reduction with normalisation of intradiscal T2-mapping values. The mean ODI and VAS scores showed significant improvement at the post-treatment follow-up (p<0.05). Correlation analysis of T2 relaxation time values showed a significant correlation of NP values with both the reduction of IDA (0.81, p<0.001) and the improvement of clinical scores (0.86, p<0.001). In the control group, despite the clinical improvement, we did not find significant IVA reduction nor significant T2 values changes after treatment.
Conclusion: T2-mapping may be a useful indicator to predict disc shrinkage and the clinical response to CT-guided O2-O3 injection.
Limitations: The relatively small patient sample.
Ethics committee approval: All procedures were in accordance with the ethical standards of the institutional and/or national research committee and with the Helsinki declaration.

Virtual non-calcium dual-energy CT: diagnostic accuracy for the colour-coded depiction of cervical disk herniation and spinal nerve root impingement in comparison with standard grey-scale CT
C. Booz, I. Yel, L. Lenga, S. S. Martin, K. Eichler, J. L. Wichmann, R. Hammerstingl, T. J. Vogl, M. H. Albrecht*; Frankfurt am Main/DE (MoritzAlbrecht@gmx.net)*

Purpose: To investigate the diagnostic accuracy of colour-coded dual-energy CT virtual non-calcium (VNCa) reconstructions for the depiction of cervical disk herniation and spinal nerve root impingement compared to conventional grey-scale CT.
Methods and materials: Data from 57 patients (337 intervertebral disks, 30 women and 27 men) who had undergone third-generation dual-source dual-energy CT and 3.0T MRI of the cervical spine within two weeks from January 2017-December 2018 were retrospectively analysed. 5 blinded radiologists independently analysed conventional grey-scale dual-energy CT series for the presence and degree of cervical disk herniation and spinal nerve root impingement. After 8 weeks, readers reassessed examinations by using colour-coded VNCa reconstructions. Two additional experienced blinded radiologists defined the reference standard in consensus MRI reading sessions. Sensitivity and specificity were primary indices of diagnostic accuracy.

Results: A total of 103 cervical disk herniations were visualised by MRI. Colour-coded VNCa reconstructions yielded significantly higher overall sensitivity (487/515 [95%] vs 392/515 [76%]) and specificity (1107/1170 [95%] vs 906/1170 [77%]) for depicting cervical disk herniation compared to standard CT (all comparisons, P<0.001). Regarding spinal nerve root impingement, VNCa reconstructions revealed higher diagnostic accuracy compared to standard CT (sensitivity, 195/230 [85%] vs 115/230 [50%]; specificity, 1430/1455 [98%] vs 1325/1455 [91%]; all comparisons, P<0.001). VNCa reconstructions provided improved diagnostic confidence (mean scores 4.85 vs 2.94) and image quality (mean scores 4.50 vs 3.15) compared with standard CT images (all comparisons, P<0.001).
Conclusion: Colour-coded VNCa reconstructions substantially improve diagnostic accuracy and confidence for the depiction of cervical disk herniation and spinal nerve root impingement compared to conventional grey-scale CT.
Limitations: The retrospective single-centre study design.
Ethics committee approval: This study was approved by the local IRB.
Funding: No funding was received for this work.

Sciatic nerve characteristics in follow-up patients with deep gluteal syndrome (DGS) who underwent surgery

S. B. Stajic[1], A. Vojvodic[2], M. Misic[2], M. Gasic[3], G. Lukic[2], D. Domokos Simic[2]; [1]*Pancevo/RS,* [2]*Belgrade/RS,* [3]*Kosovska Mitrovica/KV*
(stajicsava34@gmail.com)

Purpose: The hypothesis is the relevance of sciatic nerve stiffness in follow-up patients with deep gluteal syndrome (DGS) who underwent surgery. Neurological examinations, pelvic MRI, and electromyography (EMG) were performed. Our focus was to follow-up sciatic nerve characteristics in patients after surgery compared with data one year later.
Methods and materials: The sciatic nerve was scanned by strain elastography using ARFI (colour elastogram and stiffness ratio-SR), during knee movements in patients with DGS without surgery (89) and in patients (24) before and after surgery (follow-up 3 months) and one year later in 21 patients.
Results: The evidently based recovery of sciatic nerve diameter (4.9 to 8 mm, in extension, and 3.9 to 4.6 mm, in flexion) and stiffness (7.3 to 1.3SR in extension, 3.9 to 4.6SR in flexion) shortly after surgery (p<0.01) was partially annulled (6.8 mm, 3.2SR, in extension, 4.4 mm, 6.7SR, in flexion) one year later (p<0.05). Sciatic nerve recovery after surgery was marked (r=0.881) relative to one year later (r=0.579). The correlation between MRI and EMG findings and ARFI nerve stiffness values in patients scheduled for surgery was high (r=0.963) and in those one year later (r=0.749). The overall specificity of the method was 83.8%, sensitivity was 78.4%, and accuracy of 83.9%. Compression processes and the accrual of nerve fibrous strips were evident (MRI) in some patients one year later.
Conclusion: Elastography was a useful tool in decision-making for surgery and in the follow-up.
Limitations: The study has to be developed with more observed cases, but limitations depend on surgical procedures and MRI findings.
Ethics committee approval: n/a

Whether brain reorganisation occurs in patients with medullary cone injury: a pilot fMRI study

Q. Chen, N. Chen, Z. Wang*; Beijing/CN (chenqian8319@163.com)*

Purpose: To explore possible brain changes after MCI and to further study their associations with clinical variables.
Methods and materials: 10 MCI patients and 10 healthy controls (HCs) were recruited. The 3D high-resolution structural images and resting-state functional magnetic resonance imaging of all subjects were obtained using a 3.0 Tesla MRI system. VBM and TBSS analysis were conducted to investigate the differences in brain structure between MCI patients and HCs. ALFF and fALFF were used to characterise changes in regional neural activity. Seed-based functional connectivity (FC) analysis was performed to study the whole-brain changes using the results of structural and ALFF/fALFF as seed regions. Associations between brain changes and clinical variables were also analysed.
Results: MCI patients showed decreased ALFF in the right frontal lobe (FL). Additionally, when choosing the right FL as seed, MCI patients showed increased FC in the left orbital frontal cortex (OFC) and right cerebellum posterior lobe (CPL), separately. No significant difference was found in brain structure. The increased FC in the right CPL was negatively correlated with the VAS score.
Conclusion: MCI can cause alterations in brain function and have not yet reached the brain structure. All the changes were within the cognitive-related areas or between these areas and the sensorimotor region, which are closely associated with patients' neuropathic pain. These findings suggest that the real cause of neuropathic pain in MCI patients may be the functional change of cognitive-related brain areas or the change of the connectivity between cognitive-related brain areas and sensorimotor areas.
Limitations: We didn't conduct it as a longitudinal study.
Ethics committee approval: The study protocol was approved by the ethics committee of our hospital.
Funding: National Natural Science Foundation of China (No.81871339).

Association of statin dose and nerve damage in type 2 diabetes

J. M. E. Jende, D. S. Kopf, D. Z. Kender, D. J. Gröner, S. Heiland, P. D. P. Nawroth, M. Bendszus, F. Kurz*; Heidelberg/DE*
(johann.jende@gmx.de)

Purpose: Lowering serum cholesterol is an established treatment in type 2 diabetes (T2D). A recent study found that nerve lesions in T2D increase with low serum cholesterol levels, indicating that lowering serum cholesterol levels may contribute to diabetic neuropathy (DN) in T2D. The objective of this study was to investigate whether there is a correlation between statin doses and peripheral nerve lesions in T2D patients.
Methods and materials: 100 participants (52 under statin treatment, 48 without statin treatment) underwent magnetic resonance neurography (MRN) of the right leg at 3 Tesla and clinical, serological, and electrophysiological assessment. Three-dimensional reconstruction of the sciatic nerve was performed to quantify the nerve's diameter and lipid equivalent lesion load (LEL) with a subsequent correlation-analysis of all acquired clinical and serological data.
Results: LEL correlated negatively with nerve conduction velocities and amplitudes of the tibial (r=-0.33; p=0.014 and r=-0.31; p=0.020, respectively) and peroneal nerve (r=-0.51; p<0.001 and r=-0.28; p=0.034, respectively). The statin dose, calculated as the equivalent of simvastatin, correlated positively with the nerve's LEL (r=0.39; p=0.005) and the nerve's mean cross-sectional area (r=0.40;p=0.005). All correlations remained significant after multivariate analysis for patients' sex, age, disease duration, body-mass-index, HbA1c levels, triglycecides, and glomerular filtration rate.
Conclusion: Our findings indicate that the intake of statins in T2D DN is associated with a higher amount of nerve lesions and nerve swelling. These findings are relevant with regards to emerging therapies that promote an aggressive lowering of serum cholesterol in T2D. Further longitudinal studies on the impact of lipid lowering therapies on the course of DN are required.
Limitations: Only cross-sectional data was acquired.
Ethics committee approval: Local ethics number S-383/2016, clinicaltrials.gov identifier (NCT03022721).

Troponin T and peripheral nerve damage in type 2 diabetes

J. M. E. Jende, D. S. Kopf, D. Z. Kender, D. J. Gröner, P. D. P. Nawroth, M. Bendszus, F. Kurz*; Heidelberg/DE (johann.jende@gmx.de)*

Purpose: Clinical studies have suggested that changes in peripheral nerve microcirculation may contribute to nerve damage in diabetic neuropathy (DN). It has recently been shown that both high-sensitivity troponin assays (hsTNT) and N-terminal brain natriuretic peptide (pro-BNP) provide predictive values for both cardiac and peripheral microangiopathy in type 2 diabetes (T2D). The aim of this study was to investigate the association of sciatic nerve integrity in 3 Tesla magnetic resonance neurography (MRN) with hsTNT and pro-BNP serum levels in T2D patients.
Methods and materials: 51 patients with T2D (23 without DN, 28 with DN) and 10 control subjects without diabetes underwent diffusion-weighted MRN at 3 Tesla. The sciatic nerve's fractional anisotropy (FA), a marker for structural nerve integrity, was calculated in an automated approach. Results were correlated with clinical, electrophysiological, and serological data.
Results: In T2D patients, hsTNT showed a negative correlation with the sciatic nerve's FA (r=-0.52; p<0.001) with a closer correlation in DN patients (r=-0.66; p<0.001). HsTNT further correlated positively with the neuropathy disability score (NDS; r=0.39, p=0.005). Negative correlations were found with sural nerve conduction velocities (NCVs; r=-0.65; p<0.001), tibial and peroneal NCVs (r=-0.44; p=0.002 and r=-0.42; p=0.003, respectively), and tibial and peroneal amplitudes (r=-0.53; p<0.001 and r=-0.29; p=0.044, respectively). No such correlations were found for pro-BNP.
Conclusion: This study is the first to show that hsTNT is a potential indicator for structural nerve damage in T2D. Our results support the hypothesis that peripheral microangiopathy is a key contributor to diabetic neuropathy in T2D.
Limitations: The number of participants precludes multivariate analysis for all parameters acquired.
Ethics committee approval: Local ethics number S-383/2016, clinicaltrials.gov identifier (NCT03022721).

The role of pre-operative MR and polysomnography in children with achondroplasia

N. Jenko, D. Connolly, A. Raghavan, H. Elphick, J. Fernandes, S. Ushewokunze, P. Arundel, A. C. Offiah*; Sheffield/UK (n@jenko.eu)*

Purpose: All children with achondroplasia have craniocervical junction (CCJ) stenosis, which may lead to cardio-respiratory arrest. There is an on-going debate as to whether routine MRI screening is indicated in infants. Our aim was to assess MR findings in a cohort of children with achondroplasia.
Methods and materials: The severity of stenosis was assessed independently by 2 observers in the following way: 1=narrowing of CCJ, 2=complete effacement of CSF, 3=distortion and compression of the spinal cord, and 4=T2 changes in the cord. MR findings, MR assessment of CSF flow, polysomnography results, and history of surgical decompression were recorded. Interobserver reliability was assessed using Cohen's kappa.
Results: A total of 85 children under the care of our institution were identified. 52 patients underwent MRI. 7 were excluded due to insufficient pre-decompression imaging.
Lumbar stenosis was demonstrated in 13 of the 36 patients for whom whole-spine imaging was available. The median age for children with distal stenosis was 12 years, compared to 1 year for children without. Interobserver reliability of the scoring was 0.60 (moderate), which improved to 0.81 (strong) when grades 1 and 2 were merged.
Conclusion: The distortion of the spinal cord at the CCJ (grades 3 and 4) correlates well with abnormal polysomnography. The presence of CSF flow does not exclude stenosis. In older children, we advocate acquiring whole-spine imaging due to the high prevalence of distal stenosis. To improve observer reliability, a 3 rather than 4-point MRI scoring system should be considered, merging the current grades 1 and 2.
Limitations: This work is a single-centre retrospective analysis. The grading system has not been validated.

The role of diffusion tensor imaging in Hirayama disease

A. Ignatius, B. P. S., D. R. S.*; Chennai/IN (dr.amalanignatius@gmail.com)*

Purpose: Hirayama's disease (HD) is a benign, self-limited, motor neuron disease that results in sporadic juvenile muscular atrophy of the distal upper extremities. The aim is to analyse diffusion tensor imaging (DTI) parameters of HD which helps in earlier diagnosis and predicts the microarchitectural damage of the spinal cord and to assess the DTI parameters in both neutral and flexion positions of patients with HD and compare that with normal sex and age-matched controls. The diagnosis will be confirmed based on clinical, electromyographic, MRI findings, and follow-up.
Methods and materials: This is a prospective study conducted in Barnard Institute of Radiology, MMC, and RGGGH. Consecutive subjects undergoing routine clinical spinal magnetic resonance for Hirayama Disease were invited to participate in this study. RESOLVE (readout segmentation of long variable echo trains) DTI was performed using a 1.5T scanner (Avato, Siemens) and FA, ADC (MD), E1 (AD), E2, E3, and RD values were analysed.
Results: 9 patients with HD had decreased FA and increased ADC values in the neutral position compared to age and sex-matched controls, among whom 8 patients had further decreased FA and increased ADC in the flexion position. 1 patient with HD had FA and ADC values similar to the controls.
Conclusion: DTI parameters confirm the damage of the cervical cord during flexion and non-invasively reveal the neural status of HD patients. FA and ADC is a useful micro-biomarker in diagnosing Hirayama disease.
Limitations: Further studies with larger cohorts are needed to infer a definite conclusion. Observer bias while marking the region of interest.
Ethics committee approval: The study in approved by Institutional Ethical Committee of Madras Medical College.
Funding: No funding was received for this work.

Morphometric analysis of the atlas in Down syndrome patients

F. Albadr, A. Al-Habib, A. Abujamea, A. Alatar, A. Alahmari, E. Alshail*; Riyadh/SA (abdul.alatar@gmail.com)*

Purpose: Atlantoaxial instability (AAI) is considered the most prevalent cervical abnormality in patients with Down syndrome (DS). No previous study has described the anatomy of the atlas lateral mass (ALM) in DS comparative to non-DS patients. This study aimed to provide a quantitative analysis of ALM morphology in DS patients to identify differences that might be relevant for safe instrumentation.
Methods and materials: A retrospective study. DS cases were identified. A control group included age-and sex-matched patients without DS who had a cervical CT scan were included. CT image reconstructions of these scans were made using Siemens syngo via Workstation to adjust any rotated images of C1. A neuroradiologist performed the measurements of anatomic details of ALM. The included radiologic measurements were the anterior height (AH), posterior height (PH), posterior height inferior to arch (PHIA), anteroposterior diameter (APD), and mid-width (MW), which were measured bilaterally. The posterior-to-anterior height ratio (PH/AH*100) was calculated. The measurements of patients with/without DS were compared.
Results: A total of 1,265 patients with DS were identified. 40 met our criteria, 18 of them were excluded due to poor CT quality. A total of 22 patients with and 22 without DS were included in the analysis. The median age for DS and non-DS was 15 years and 14.5 years, respectively. Three measurements were significantly smaller in patients with DS; anterior-height (p=0.001), posterior-height (p<0.001), and the posterior-anterior height ratio (p=0.001).
Conclusion: Patients with DS had a trapezoid-like geometry of their ALM with smaller heights of the posterior wall compared to the anterior wall. The distance available for screw insertion (below the posterior arch of ALM) is significantly smaller in DS patients. These variations should be considered during surgical planning for the safe placement of instrumentation.

Limitations: The retrospective nature of the study.
Ethics committee approval: Ethics committee approval obtained.
Funding: No funding was received for this work.

MR cisternography with 3DCISS as a screening test for the detection of active CSF leaks: a comparison with standard CT and MR cisternography
P. Reddy[1], S. Ismail[2], B. B. Das[3], B. Nagabhushana Reddy[1], S. Viswamitra[1]; *[1]Bangalore/IN, [2]Puttaparthi, [3]Bangalore, Karnataka/IN (86prashanth.reddy@gmail.com)*

Purpose: To assess the diagnostic performance of the 3DCISS MRI sequence in the detection of CSF rhinorrhea in patients with active leaks.
Methods and materials: A retrospective review of our database was performed and imaging studies meeting the inclusion criteria were used for the study. The inclusion criteria were patients with active CSF leak due to any aetiology and patients with both 3DCISS MRI and conventional CT or MR cisternography. The exclusion criteria were recurrent CSF leaks following endoscopic surgery and studies with suboptimal image quality. The sample size was 21 patients.
All CT images were acquired using a 128 slice CT scanner. MR imaging was performed on 1.5T a scanner (Siemens Aera). CT/MR cisternography was performed as per standard protocol.
Images were analysed for the presence, site, and the number of skull-base defects by 2 blinded reviewers with 5 years and 6 years of experience in neuroradiology.
Results: 25 cases were included in the study. 11 patients had spontaneous leaks and 14 had non-spontaneous leaks.
3DCISS MRI had a sensitivity, specificity, positive predictive value, and negative predictive value of 100%, 71.4%, 90%, and 100%, respectively, with p=0.00085 for the detection of a CSF leak irrespective of aetiology.
For spontaneous CSF leaks, the sensitivity, specificity, positive predictive value, and negative predictive value were 100%, 62.5%, 85.7%, and 100%, respectively, with p=0.09.
Conclusion: 3D CISS MR cisternography has very high sensitivity and negative predictive value for the detection of CSF leaks, irrespective of aetiology, and may be used as an initial screening test.
Limitations: The small sample size and retrospective design.
Ethics committee approval: The need for informed consent was waived due to the retrospective nature of the study.

Axillary lymph node status in BIRADS 4-5 female patients: a management cornerstone. Can ultrasound elastography help?
S. T. Hamed, O. M. M. N. Nada, O. Zakaria, D. Elmesidy, M. A. G. A. M. Eissa; *Cairo/EG (dr.chipsy@gmail.com)*

Purpose: Assess accuracy and additive value of breast elastography in evaluation of axillary lymph node status in patients with BIRADS 4 and 5 breast lesions, diagnosed on sono-mammography.
Methods and materials: 60 female patients with BIRADS 4 or 5 lesions were included. Conventional ultrasonography "US", strain "SE" and shear wave "SWE" elastography examinations for their lymph nodes done and their imaging findings evaluated individually and correlated with pathology. US: lymph nodes were evaluated regarding shape (ovoid or non-ovoid), cortical thickening > 3mm "according to its calculated cutoff value" (present or not, and if present "diffuse or focal or irregular mass"), Hilum (central, effaced, eccentric or not-preserved), Vascularity (hilar or non-hilar). Elastography: lymph nodes were evaluated regarding the percentage of the stiff cortex on colour-coded images with a modulated scoring system. Also cutoff values for strain ratio "SR" (in SE) and maximum elasticity "Emax", elasticity ratio "Eratio" (in SWE) calculated.
Results: In US, Cortical thickness was the most sensitive criteria (100% sensitivity). And the vascular pattern was the second sensitive. Eratio showed the highest diagnostic indices compared to rest of SWE criteria with sensitivity, specificity, accuracy (76.9%,100%,85% respectively). SR showed higher specificity & accuracy than qualitative SE (76.2% vs 57.14% and 83.33% vs 80% respectively), with relatively lower sensitivity (87.2 % vs 92.31% respectively). US showed highest sensitivity & accuracy (100%, 88.33% respectively) among the rest of used modalities. with relatively lower specificity (66.67%).
Conclusion: Addition of strain or shear wave elastogrphy offer no significant benefit over conventional ultrasound alone in evaluation of axillary lymph nodes in breast cancer patients.
Limitations: Tissue compression extent influences elasticity image.
Ethics committee approval: All participated patients provided informed written consents following our institutional ethical committee approval.
Funding: No funding was received for this work.

Mammographic density and risk factors collected by direct interview in breast interval and screen-detected cancers
L. La Corte[1], L. Baglietto[1], D. Caramella[1], C. Iacconi[2]; *[1]Pisa/IT, [2]Carrara/IT (lacorte.luisa@gmail.com)*

Purpose: To evaluate risk factors in a cohort of women in a mammographic screening programme.
Methods and materials: In a retrospective cohort of 140.504 women, 45 to 70 years old between 2007 and 2017, a total of 94 interval cancers (IC), 501 screen-detected cancers (SDC) and 282 healthy women (CONTROLS) were recruited. For each IC, a blind experienced radiologist compared the last negative mammogram and the diagnostic one to classify cancers (true interval, minimal sign, occult, false negative). On every mammogram the ACR BI-RADS density score was reported; each woman received a phone interview to collect data on risk factors.
Results: Mammographic density in IC and SDC was distributed as follows: A 13% vs 29%, B 24% vs 49%, C 59% vs 17%, D 5% in both types. Proportion of tumour subtypes is similar in both cancer types with a prevalence of LUM B HER2- (41-48%). Tumour dimensions: prevalent size IC > 1 cm (66%) vs SDC <1cm (55%). The evaluation of BMI in IC and SDC and its comparison with controls results in a p value < 0.002. Death rate is 1,4% for SDC vs. 7,4 for IC. Other risk factors were not significantly different.
Conclusion: In our analysis, we found a higher mammographic density in IC than in SDC, confirming dense breast as one of the most important factors linked to intervals. The higher tumour dimensions in IC may depends on faster spreading and higher aggressiveness of the cancer and could explain the higher death rate. The result of the chi square test underlines the importance of BMI as an independent risk factor and the necessity to control body weight for breast cancer prevention.
Limitations: Retrospective analysis.
Ethics committee approval: The study was approved by the ethics committee.
Funding: No funding was received.

MRI and PET/CT in parallel for the detection of axillary lymph node metastases in breast cancer patients: a meta-analysis
X. Zhang, H. Luo, J. Zhang, Y. Liu; *Chengdu/CN*

Purpose: To evaluate the diagnostic accuracy of MRI and PET/CT in direct comparative studies as noninvasive modalities in detecting axillary lymph node metastases in breast cancer patients.
Methods and materials: A systematic literature search in the PubMed, EMBASE, Web of Science, Cochrane, and Chinese Biomedical Literature Databases to identify relevant original studies. Study quality was assessed using the Quality Assessment of Diagnostic Accuracy Studies (version 2). Study data

were independently extracted to calculate sensitivity and specificity, as well as areas under summary receiver operating characteristic curves (AUCs).
Results: The sample comprised 9 studies including patients with breast cancer, and in which MRI and PET/CT were both performed to assess axillary lymph node status. Pooled sensitivity were 0.56 (95% confidence interval [CI] 0.51–0.61) on both MRI and PET/CT; pooled specificity were 0.87 (95% confidence interval [CI] 0.85–0.90) and 0.93 (95% CI 0.91–0.95) on MRI and PET/CT respectively. The diagnostic odds ratio was 7.62 (95% CI 5.52–10.52) on MRI and 14.45 (95% CI 9.95–20.99) on PET/CT respectively. The AUC and Q* index were 0.8333 and 0.7656 on MRI; the AUC and Q* index were 0.8772 and 0.8076 on PET/CT.
Conclusion: For detecting lymph node metastases noninvasively, MRI and PET/CT both had low sensitivity; MRI had moderately high specificity, while PET/CT had high specificity. Large-scale, quality-controlled, prospective studies are needed to verify the diagnostic accuracy of these modalities.
Limitations: First, a small number of studies was included. Second, most included studies were retrospective, which may have caused patient selection bias. Third, most studies used only morphologic features (without functional features) on MRI as criteria for detecting axillary lymph node metastases, which may have contributed to the low sensitivity and specificity of MRI.
Ethics committee approval: n/a

A preliminary study of the combination of ultrafast and abbreviated dynamic contrast-enhanced breast MRI
S. Jeong, S. M. Ha, H. S. Ahn, S. Woo, H.-C. Shin*; Seoul/KR (fofrl@naver.com)*

Purpose: We combined the abbreviated and ultrafast MRI technique with the standard MRI protocol and compared lesion characterisation quantitatively and qualitatively to the standard MRI protocol.
Methods and materials: Fifty-six patients with breast cancer who underwent MRI from June 2017 to May 2018 and fulfilled our inclusion criteria were included. Three radiologists measured the lesion sizes, described the MRI findings using BI-RADS lexicon and demarcated the regions of interest to extract the volumetric quantitative and semi-quantitative parameters. We used Pearson's correlation analysis comparing the quantitative and semi-quantitative parameters. To evaluate the inter-observer variability, we calculated the intra-correlation coefficient. We also analysed the correlation in BI-RADS lexicon.
Results: There were 45 (80.4%) luminal and 11 (19.6%) non-luminal breast cancers, and the most common tumour subtype was invasive carcinoma (n=48, 85.7%), followed by ductal carcinoma in situ (n=8, 14.3%). Regarding correlation between the quantitative and semi-quantitative parameters, K^{trans} significantly correlated with the wash-in factor (r, 0.862; $p < 0.001$) and AUC value (r, 0.951; $p < 0.001$). The lesion size measured by standard and combined abbreviated-ultrafast phases and that from the surgical pathological specimens showed moderate agreement (ICC range, 0.516−0.578). The ICCs among the three readers were excellent for lesion size measurement, BI-RADS lexicon regarding lesion type, mass shape, margin, internal enhancement, non-mass enhancement distribution, and internal enhancement by the standard and combined abbreviated-ultrafast protocols.
Conclusion: The use of the modified and combined abbreviated-ultrafast MRI protocol provides a reliable measurement of the quantitative parameters and may aid in the screening of breast cancer.
Limitations: This study was a retrospective one and conducted in a single centre. Further, this study involved a small number of cases with only breast cancer.

Missed breast lesions in mammography: what factors are we overlooking?
M. Malik*; Islamabad/PK (xz.mariam@gmail.com)*

Purpose: To determine frequency of false negative mammograms and various factors leading to missed breast lesions in mammography.
Methods and materials: This study was conducted at the radiology department of Combined Military Hospital Rawalpindi. 150 patients were included between 15th December 2014 till 10th January 2017. Patients in whom no con-commitment ultrasound or only unilateral mammography was done were excluded. Cases assigned BIRAD 4 and 5 in whom no other multicentric, multifocal or contralateral breast carcinoma was detected were excluded. Two standard views of mammography namely craniocaudal and mediolateral oblique positions of both breasts were obtained. Cause of missed breast carcinoma on the initial mammogram was analysed and classified into the four factors of patient, tumour, technical and provider. Frequency of false-negative mammograms was recorded.
Results: In our study, the percentage of the false-negative mammogram was 29.59%. Lesion factors were seen in 59 (39.67%) patients and included subtle carcinomas, signs of malignancy, small groups of amorphous or punctuate microcalcifications, focal asymmetric densities, dilated ducts, relatively well-circumscribed masses, masked carcinomas, multifocal carcinomas, multicentric and synchronous carcinomas and diffuse oedema pattern. Patient factors were seen in 40 (26.67%) patients and included dense breasts. Provider factors of mis-interpretation and bad interpretation were seen in 29 (19.33%) patients and technical factors of bad exposure and malpositioned breasts in 22 (26.67%) patients.
Conclusion: Lesion factors were the most common cause of false-negative mammograms followed by patient factors, technical factors and provider factors respectively. Recognition of these would decrease the frequency of false-negative mammogram and in turn breast cancer morbidity and mortality.
Limitations: There are no potential limitations of our study.
Ethics committee approval: Study was approved by Institutional Review Board of Combined Military Hospital Rawalpindi.
Funding: No funding was received.

Breast lesions of uncertain malignant potential (B3): can different vacuum-assisted biopsy needles (11G vs 8G) affect the outcome?
A. Franconeri[1], C. Bellini[2], G. Bicchierai[2], D. de Benedetto[2], F. Di Naro[2], J. Nori[2], V. Miele[2]*; [1]Pavia/IT, [2]Florence/IT (afrancon88@gmail.com)*

Purpose: To evaluate if the use of 11G or 8G needle in vacuum-assisted biopsy (VAB) can predict different outcomes of breast lesions of uncertain malignant potential (B3).
Methods and materials: We retrospectively screened 1025 women with a histological diagnosis of B3 from 2000 to 2018. All patients underwent needle core biopsy (NCB) or vacuum-assisted biopsy (VAB) at our centre. We selected patients with VAB and histological surgical specimen after open excision (OE) or vacuum-assisted excision (VAE) or proof of stability on follow-up, with a final population of 378 women. Biopsy guidance systems were stereotactic/tomosynthesis (STX/TOMO) and ultrasound (US). We evaluated positive predictive values (PPV) of the malignant outcome of the two biopsy needles in each B3 histological subtype. Chi-square test and Fisher exact test were used to compare groups.
Results: Out of 378 VABs, 377 were STX/TOMO-guided and 1 US-guided. 86 (22.8%) were performed with 11G and 292 (77.2%) with 8G. Overall VAB PPV of malignant outcome was 16.1% (9.3% carcinoma in situ, 6.9% invasive). 11G and 8G PPV was 20.9% vs 14.7%, respectively (p-value=0.2271). No statistically significant differences in upgrade rates were found between 11G and 8G in not pure ADH (p=0.1043), pure ADH (p=0.0685), FEA (p=1), not pure LN (p=0.8595), pure LN (p=0.7973).
Conclusion: Our results showed that 11G or 8G needle in VAB does not affect B3 outcome in any subtype. In the special case of ADH, we think that the limited group sample may have affected the statistical significance between the two groups.
Limitations: The retrospective nature of the study and different numeric sample between 11G and 8G.

Breast arterial calcification on mammography does not predict coronary artery disease on invasive coronary angiography

A. Fathala; *Riyadh/SA (ahm35799@hotmail.com)*

Purpose: The main purpose of this retrospective associated was to investigate the association between visually detected BAC on screening mammography and coronary artery disease based on conventional invasive coronary angiography (CAG).
Methods and materials: The sample was formed of 190 female patients, with a mean age of 60.5 ± 7 years old ranging from 51 to 87 years. All our patients had undergone a mammography screening and cardiac catheterisations with mean interval 3.6 ± 2.8 months ranging from 1 to 12 months. Digital mammography: grades of calcification: (1) scattered calcifications, (2) few punctate vascular calcifications, (3) coarse or tram track calcifications affecting < 3 vessels, (4) coarse or tram track calcifications affecting ≥3 vessels. Conventional invasive coronary angiography (CAG). Two main groups based on the presence or absence of luminal stenosis were formed: patients without (CHD−) and patients with (CHD+) CHD.
Results: The sample was formed of 190 female patients, with a mean age of 60.5 ± 7 years old ranging from 51 to 87 years. Out of 190, BAC was found in 113 (60%). There was strong association between BAC and CAD risk factors (hypertension (P-value 0.01), diabetes (P-value <0.03), and chronic kidney disease (P-value <0.001). There was no association between BAC and dyslipidemia and smoking. The strongest predictors of CAD on CAG were bAC and hyperlipidemia.
Conclusion: BAC on mammography does not predict angiographically proven CAD. There is a strong association between BAC and age and many other conventional CAD risk factors.
Limitations: This study is a retrospective, single-centre study.
Ethics committee approval: The study was approved by the hospital research ethics committee.
Funding: No funding was received.

Diagnostic performance of unenhanced T2-weighted and IVIM DW MRI for axillary lymph nodal staging in breast cancer

Y. Liu, H. Luo, C. Wang, M. Wang, J. Ren; *Chengdu/CN*

Purpose: To investigate the performance of IVIM parameters compared with unenhanced T2-weighted traditional features in diagnosing axillary lymph nodes (LN) metastases in newly diagnosed breast cancer patients.
Methods and materials: 88 patients with histopathologically proven breast cancer were prospectively enrolled, who underwent 3.0 T T2-weighted imaging (T2WI) and IVIM DWI. Two radiologists independently identified metastatic LN by traditional features (including long axis [L] , short axis [S], L/S ratio [<1.6], fatty hilum, margin, signal intensity). Then on IVIM DW imaging, IVIM parameters (including ADC value, D, D* and f) were obtained. The Mann-Whitney U test was used to compare the performance of the aforementioned criteria to determine benignity or malignancy of axillary LN.
Results: 38 patients were found with metastatic LN, while 50 patients with non-metastatic LN. All above IVIM parameters, L, S, L/S ratio, fatty hilum and margin showed no significant differences between the two groups. Metastatic LNs were with abnormal signal intensity compared with non-metastatic LNs (P =0.007); sensitivity and specificity of which for differentiation were 73% and 60% respectively. If combing all the features on T2WI, the sensitivity and specificity for diagnosing metastatic LN were 69% and 66% respectively.
Conclusion: IVIM DWI was not useful to distinguish metastatic from non-metastatic LNs in axilla. The features on unenhanced T2WI also had low sensitivity and specificity.
Limitations: First, the patient number was small. Second, most axillary LNs with a short diameter smaller than 5 mm, which would prone to be influenced by artefact or partial volume effect from adjacent tissue. Third, we used only unenhanced features (not including features on dynamic contrast-enhanced MRI) as criteria for detecting LN metastases.
Ethics committee approval: This prospective study was approved by the institutional review board of our hospital.
Funding: No funding was received for this study.

Role of ultrasound vs contrast-enhanced mammography in the characterisation of lesions in dense breasts

R. R. M. Abdel Gawad; *Cairo/EG (reemramadan1@hotmail.com)*

Purpose: Breast density affects mammographic sensitivity by a masking phenomenon; as the dense tissue may obscure an underlying malignancy. Breast density has been reported to be a strong independent risk factor for breast cancer. Purpose of this work is to study the impact of breast ultrasound vs contrast-enhanced spectral mammography in the detection and diagnosis of lesions in the mammography dense breasts.
Methods and materials: This study was done on 50 cases with mammography dense breast classified as (C) or (D). All patients underwent digital mammography, breast ultrasound and contrast-enhanced spectral mammography.
Results: By comparing both modalities, they both revealed the same specificity 65%, with higher sensitivity in CESM 97% compared to 88% in ultrasound and thus total accuracy was higher in CESM 85% compared to 79% in ultrasound.
Conclusion: CESM revealed superior diagnostic accuracy and higher sensitivity than ultrasound and hence, permitted better detection of malignant lesions. CESM can be performed in routine practice changing the diagnostic, and further, the treatment strategy. Bilateral CESM is feasible, easily accomplished and well-tolerated. CESM is cost-effective, easily feasible and radiation dose is a minor drawback as it is only slightly higher than for conventional mammography. Future studies should investigate the performance of CESM in larger population groups to evaluate the diagnostic accuracy of this promising imaging method particularly in women at high risk and women with dense breasts.
Limitations: Our study is limited by small sample size and the fact that was performed in a single institution. Multi-centre with multi-reader studies are needed. Also the increased number of malignant lesions 33/53 lesions (62.3 %), this could be attributed to the work nature of the institute and the targeted study population.
Ethics committee approval: n/a
Funding: No funding was received for this work.

Outcome of B3 breast lesions with 14G needle core biopsy (NCB): 18-years monocentric experience

C. Bellini[1], A. Franconeri[2], G. Bicchierai[1], D. de Benedetto[1], F. Di Naro[1], J. Nori[1], V. Miele[1]; *[1]Florence/IT, [2]Pavia/IT (1chiarabellini@gmail.com)*

Purpose: To evaluate the outcome of histological subtypes of breast lesions of uncertain malignant potential (B3), using 14G needle core biopsy.
Methods and materials: We retrospectively screened 1025 women with a histological diagnosis of B3 from 2000 to 2018. All patients underwent needle core biopsy (NCB) or vacuum-assisted biopsy (VAB) at our centre. We selected patients with 14G NCB and histological surgical specimen after open excision (OE) or vacuum-assisted excision (VAE) or proof of stability on follow-up, with a final population of 400 women. Biopsy guidance systems were ultrasound (US) and clinical (freehand). We evaluated positive predictive values (PPV) of malignant outcome in each B3 histological subtype. Chi-square and t student tests were used to assess statistically significant differences between groups.
Results: Out of 400 NCBs, 394 (98.5%) were US-guided and 6 (1.5%) freehand. Overall NCB PPV of malignant outcome was 27.3% (13% carcinoma in situ, 14.3% invasive). Out of 44 carcinomas in situ, 14 (32%) were G1, 25 (57%) G2 and 5 (11%) G3, while out of 45 invasive, 21 (47%) were G1, 20 (44%) G2 and 4 (9%) G3. Mean size of carcinomas in situ and invasive was 18.43±10.32 mm (range: 4.00-80.00) vs 41.88±65.63 mm (range: 4.00-200.00), respectively (p= 0.0215). The histological subtypes with the highest association with malignancy were pure atypical ductal hyperplasia-ADH (68.3%), not pure ADH (64.3%), flat epithelial atipia-FEA (26.9%), pure lobular neoplasia-LN (20%) and not pure LN (21.7%). No statistically significant difference was found between pure ADH and not pure ADH (p=0.725) and between pure LN and not pure LN (p =1).
Conclusion: Our results using 14G NCB showed the highest malignancy outcome rates for ADH (64.3%), FEA (26.9%) and LN (21.7%).
Limitations: This study is a retrospective study.

Whole-lesion texture analysis of apparent diffusion coefficients for monitoring early response in patients with breast cancer undergoing concurrent chemotherapy

W. Wang, J. Cheng*; Zhengzhou/CN*

Purpose: To explore the role of whole-tumour texture analysis of apparent diffusion coefficient (ADC) related parameters in the early assessment of treatment response during the concurrent chemotherapy (CCT) course of breast cancer.
Methods and materials: We retrospectively evaluated findings in 42 patients with breast cancer who underwent diffusion-weighted imaging (b=0,800 s/mm^2) at 3T with the acquisition of corresponding ADC maps before CCT, at the end of 2nd and 4th week during chemotherapy. Whole lesion ADC texture analysis generated several texture analysis-related parameters including skewness, kurtosis, mean, variance and per cent. The ADC texture analysiss of 42 patients were generated to visually observe dynamic changes in the texture analysis parameters following CCT.
Results: All parameters except mean and variance showed significant changes during CCT (all $P < 0.05$). Skewness and kurtosis both showed high early decline rate (25%, 32 %) at the end of 2nd week of CCT. The percent of ADC texture analysis also changed obviously following CCT.
Conclusion: Whole lesion texture analysis of ADC held the potential in monitoring early tumour response in patients with breast cancer undergoing CCT.
Limitations: It is a small-scale retrospective research in which the number of patients per tumour is unbalanced. The correlation between ADC texture analysis parameters and histopathological characteristics needs further study.
Ethics committee approval: No ethics committee approval was obtained.
Funding: National Key R&D Program of China (2016YFC0106900). The investigation of equipment evaluation and clinical applications in magnetic resonance imaging.

Digital breast tomosynthesis-guided vacuum-assisted breast biopsy (DBT-VABB): comparing two different ways of local anaesthesia administration

M. A. Orsi, F. Leone, M. Cellina, G. Oliva*; Milan/IT (m.orsi83@gmail.com)*

Purpose: To understand if the adjunction of a small amount of lidoicaine, directly administered via the biopsy needle, could reduce the pain in DBT-VABB.
Methods and materials: Between November 2017 and September 2019, consecutive patients subjected to DBT-VABB performed in a single institution, were randomly selected to receive or local needle lidocaine injection before biopsy (lido 1) or local needle lidocaine injection plus direct lidocaine administration via the biopsy needle (4 cc) (lido 2). Right after the biopsy a pain scale chart from 1 to 10 was collected.
Results: Out of 124 consecutive patients treated, 61 were "lido 1" and 63 "lido 2". The "lido 2" group experienced less pain than the "lido 1" group: the mean pain scale value for "lido 1" group was 5.3 and for "lido 2" group was 3.7.
Conclusion: Adding local anaesthesia administration via the biopsy needle could reduce the pain in DBT-VABB. This is a preliminary prospective experience; more cases are needed to confirm these preliminary data.
Limitations: This study has following limitations: a single centre study, operators not blinded to the patient's assigned group, more lidocaine administration in the "lido 2" group.
Ethics committee approval: Written informed consent was obtained.
Funding: No funding was received for this work.

Breast's density and CAD: could a suspicous lesion change the assessment of computer-aided detection? A retrospective study

F. Leone, M. A. Orsi, M. Cellina, G. Oliva*; Milan/IT (federica-leone@live.it)*

Purpose: To compare mammograms density rated by radiologists and computer-aided detection (CAD) in order to investigate how a suspicious lesion could change the assessment.
Methods and materials: We reviewed a retrospective cohort of 6453 patients with mammograms acquired in a single hospital between January and September 2019. We included the mammograms with breast suspicious lesion (BIRADS 4 and 5) histopathology proven, with a focus on microcalcification, and images in full compliance with standard quality. We evaluated radiologist's breast density and CAD's breast density.
Results: We obtained a final cohort of 68 images (CC and MLO) and a total of 40 cases of breast lesions (with benign and malignant histopathology). We found not statistically significant differences between the two assessments.
Conclusion: CAD is not susceptible of error in breast density evaluation even for mammograms within a suspicious lesion which gives to CAD a main role in the breast cancer risk assessment.
Limitations: We evaluated a small cohort of mammograms since CAD is available in our center starting in January in just one mammography. The cohort was from screening programme where patients are asymptomatic so we collected suspicious lesions chatateriser by a diameter in a range of 0.4-1.8 mm. It is a retrospective study.
Ethics committee approval: n/a
Funding: No funding was received for this work.

Value of machine learning with MRI radiomics for early prediction of pathological complete response to neoadjuvant chemotherapy in HER2-positive invasive breast cancer

L. Qin, G. Yajia*; Shanghai/CN (liqincelery@163.com)*

Purpose: To assess the value of machine learning with radiomics based on DCE-MRI for early prediction of pCR to NAT in HER2 positive invasive breast cancer.
Methods and materials: 127 patients with HER2 positive invasive breast cancer confirmed by pathology were enrolled in this retrospective study. All patients underwent DCE-MRI before NAT, and performed surgery after completion of NAT. 1316 radiomic features for every patient were extracted. To avoid overfitting, a forward stepwise regression was used to select potential features. The number of selected features was determined by Akaike information criterion. 23 classifiers based on the 1st postcontrast and multi-phases DCE-MRI were constructed respectively. The performence of the classifiers were assessed by accuracy, sensitivity, specificity, and AUC.
Results: For pCR classification, 6 features from the 1st post-contrast phase and 6 from multiphases DCE-MRI scan were selected. The linear SVM based on multiphase DCE-MRI scans outperformed the logistic regression model using the single 1st post-contrast DCE-MRI sequence with an AUC of 0.84 vs 0.69. In mass and non-mass enhancement groups, the accuracy of linear SVM achieved 76% and 84%.
Conclusion: Machine learning based on pretreatment multi phases DCE-MRI may offer more information for early prediction of pCR to NAC in patients with locally HER2 positive invasive breast cancer.
Limitations: The work presented in our study had several limitations. First, this was a retrospective study and all patients were recruited from a single centre. Second, we compared the performance of machion learning models based on radiomic of pretreatment the 1st postcontrast sequence and multiphases DCE-MRI imaging. However, the study lacked an independent validation cohort, external validation of our results pending adequate patient follow-up will be entailed in the future work.
Ethics committee approval: n/a
Funding: No funding was received for this work.

Ultrasonographical evaluation of BI-RADS® 4 breast injuries and their histological correlation

L. L. Ospino Ortiz[1], A. P. Ortiz Gomez[2], K. Catein[2]*; [1]Rio de Janeiro/BR, [2]Petropolis/BR (loreospino_1991@hotmail.com)*

Purpose: Does the histopathological diagnosis of ultrasound-guided core biopsy breast agree with the morphological characteristics of the lesions in patients previously classified as BIRADS 4?
Methods and materials: Patients with category 4 BI-RADS ultrasound reports performed outside the study period and those whose BI-RADS classification did not have any of the 4A, 4B and 4C subdivisions were excluded; patients with incomplete medical records and lack of access to the histopathological report of the core biopsy. From the reports selected according to the inclusion and exclusion criteria: identification, age, breast distinction, diagnostic hypothesis and ultrasound-based BI-RADS classification, in addition to the final diagnosis after histopathological results.

Results: The mean age of the patients was 52.58 years (±17.05), with prevalence for the involvement of left breast lesions (n=104, 52%) and for the BI-RADS® 4C classification (n=87, 43.5%), and most had a positive final diagnosis for breast cancer (58.3%). This level of agreement was statistically (p=0.00) higher in patients diagnosed with cancer (72.1%).
Conclusion: The use of the BI-RADS® system showed a high predictive value for cases classified in category 4, with an accuracy level of 80%, except for patients with inconclusive final diagnosis and those without initial diagnosis in the medical records. It was concluded that the BI-RADS® category 4 ultrasound classification system associated with the histopathological result of core biopsies is an effective method to predict and aid the management of breast cancer, and further studies are needed to confirm the findings.
Limitations: The percentage of population treated in preventive medicine that uses the radiology service and the possible underreporting bias that may exist due to using the clinical file as a source of information.
Ethics committee approval: n/a
Funding: No funding was received.

In-vivo measurements of ADC of invasive ductal breast cancer: a multicentric study to assess the quality of DWI protocols in breast MRI at 1.5T

S. Atzori[1], L. Baglietto[1], M. Fornili[1], D. della Latta[2], D. Caramella[1], C. Iacconi[3]; *[1]Pisa/IT, [2]Massa/IT, [3]Carrara/IT (s.atzori1@libero.it)*

Purpose: Evaluating the diagnostic performances of diffusion-weighted Imaging (DWI) sequences of three magnetic resonance (MR) scanners in women undergoing breast MR for breast cancer.
Methods and materials: 90 women aged 28-78, 30 for each centre, underwent multiparametric contrast-enhanced breast MR with DWI for invasive ductal carcinoma with mass-like features. Every centre has a 1.5T MR scanner with similar DWI protocols. For every tumour, a circular ROI encompassing the lesion was drawn in the ADC sequence. Centimetric ROIs were drawn in the contralateral healthy breast in the retro areolar and upper outer quadrant (UOQ) as normal glandular controls. ROI in the normal tissue was not registered in case of bilateral tumours (n=3), and in in one case of extremely fatty breasts, obtaining 86 normal controls (29 in centre 1, 29 in centre 2 and 28 in centre 3). Fibroglandular tissue (FGT) was annotated as well. Data were compared for age, FGT (1-4 BIRADS classes), tumour size (1-2cm, 2-4cm, >4cm) and ADC values. Fisher exact test for size and FGT and Kruskal-Wallis test for continuous variables were used.
Results: Age, size and FGT don't vary significantly between the three centres (p=0.15, 0.82 and 0.96, respectively). Tumoural ADC values vary significantly (p=0.001), with an inter-centre mean variation of 17%. Retroareolar and UOQ ADC values don't vary significantly (p=0.76 and 0.43, respectively), as well as their mean (p=0.87).
Conclusion: With similar DWI protocols, ADC values in breast tumours vary significantly between the three centres. Multicentric trials should consider this difference in the quantitative evaluation of lesions.
Limitations: Scarce cohort numerosity and inhomogeneity of breast tumours (even of similar histology) may influence the significativity of some results.

The use of digital breast tomosynthesis in the surveillance of breast cancer patients following breast conservative surgery

S. Ahmed, R. Hassan*; Assiut/EG (shimaaabdalla@aun.edu.eg)*

Purpose: To evaluate the added value of DBT in the surveillance of patients following breast conservative surgery (BCS) and evaluate its role in the management of the architectural distortion (AD).
Methods and materials: 410 asymptomatic breast cancer patients underwent both DM and DBT for routine surveillance following BCS. Three radiologists reviewed all examinations. The area under the ROC curve (AUC) was calculated for BI-RADS assessment by DM and DM + DBT. Multivariate logistic regression analysis was performed to identify the imaging features that can predict outcome in AD.
Results: DM + DBT detected 212 mammographic abnormalities in 170 (41.55) patients, the final diagnosis was benign in 109 (64.1%) patients and second breast cancer was diagnosed in 61(35.9%) patients. Masses had the highest PPV for malignancy (43.8%), while asymmetry had the lowest (16.7%). AUC for BI-RADS assessment increased significantly (P=0.01) from 0.696 for DM to 0.843 for DM+ DBT. In the setting of AD, multivariate analysis demonstrated that scar area AD and non-scar area AD with negative sonographic correlation are significantly associated with benign outcome. Only DBT detected AD, and positive sonographic correlation in non-scar area AD was not significantly associated with malignancy.
Conclusion: DBT is strongly recommended to be a standard combination in the surveillance of patients following BCS. In the setting of AD, DBT can accurately exclude postoperative bed recurrence, non-scar area AD with negative sonographic correlation was significantly associated with the benign outcome; however, a biopsy cannot be omitted because 50% of the surgically excised, only DBT-detected AD were malignant.
Limitations: The present study was not a part of an integrated population-based surveillance programme for patients with CBS.
Ethics committee approval: IRB approval was obtained.
Funding: No funding was received.

Prognostic value of MRI complete radiological response in breast cancer patients after neadjuvant chemotherapy

M. Costilla Frías, J. H. Del Riego Ferrari, L. Tortajada Gimenez, A. Martín Oloriz, C. Aynes, M. T. Villajos, F. Escribano Alcantara, C. Codina*; Sabadell/ES (mcostilla@tauli.cat)*

Purpose: Neoadjuvant chemotherapy (NAC) has an essential role in the treatment of patients with breast cancer. A subgroup of these patients achieves a pathologic complete response (pCR) after NAC, defined as the absence of invasive cancer in breast surgery. pCR is related to higher long-term survival, especially in aggressive phenotypes. MRI is able to predict non-invasively and accurately the presence of pCR by rCR, defined as the absence of enhancement at tumour bed after NAC. The main purpose of our study is to assess rCR as a surrogate outcome of survival in breast cancer patients treated with NAC.
Methods and materials: We retrospectively reviewed contrast-enhanced and diffusion-weighted MRI studies of breast cancer patients treated with NAC at the diagnosis, during (early response) and after NAC (late response) and determined if they presented a complete, partial or not radiological response. We reviewed survival outcomes (overall survival and disease-free survival) and assessed its realationship to rCR.
Results: Preliminary data: We included >200 patients. The hypothesis is that the presence of rCR was related to a higher short and long-term survival, with differences according to the tumour fenotype. The combined use of CE and DW-MRI rCR had good correlation when predicting pCR.
Conclusion: rCR seems to be a prognostic survival outcome in breast cancer patients treated with NAC. The combined use of CE and DW-MRI is accurate in predicting pCR.
Limitations: The main limitation is the change of diagnostic methods and criteria in evaluating radiological response. To try to compensate it, a review of all MRI studies was done by two radiologists with exclusive dedication to breast radiology (JdR and LT).

Radiomic features of tumour and fibro-grandular tissue for predicting sentinel lymph node metastasis of breast cancer

X. Chen*; Chengdu/CN (1121790150@qq.com)*

Purpose: This study aimed to predict sentinel lymph node metastasis (SLNM) of breast cancer via radiomic features of tumour and fibro-glandular tissue based on the contrast-enhanced magnetic resonance imaging (DCE-MRI).
Methods and materials: Preoperative magnetic resonance imaging data from 36 women with histopathologically confirmed breast cancer, consisting of 16 SLNM positive and 20 SLNM negative proven by surgery, were retrospectively studied.198 radiomic features of the whole tumours and 198 radiomic features

of ipsilateral fibro-grandular tissue were extracted, based on pharmacokinetic modelling dynamic contrast-enhanced magnetic resonance imaging (PK-DCE-MRI). The least absolute shrinkage and selection operator (LASSO) regression was used to select useful radiomic features. Logistic regression was used to build predictive models for SLNM in breast cancer.
Results: All the radiomic features of the whole tumour and ipsilateral fibro-grandular tissue were reduced to 33 SLN status-related features by LASSO. The predictive model based on radiomic features of tumour's radiomic features and ipsilateral fibro-grandular tissue was developed. Their prediction ability was moderate, with an area under the curve (AUC) of 0.682.
Conclusion: Radiomic analysis of radiomic features of tumour and fibro-grandular tissue based on the DCE-MRI has the potential to more accurately predicting SLNM in breast cancer patients.
Limitations: Case source is not multi-centre.

Comparison of prone digital breast tomosynthesis–guided vacuum-assisted biopsy (DBT-guided VAB) and prone atereotactic-guided vacuum-assisted biopsy (S-guided VAB)
G. Boffelli[1], C. Ferranti[2], C. Depretto[2], C. G. Monaco[2], A. Liguori[2], A. Borelli[2], G. Scaperrotta[2]; *[1]Bergamo/IT, [2]Milan/IT (giuliaboffelli@hotmail.it)*

Purpose: To compare the performance of prone DBT–guided VAB with prone S-guided VAB, focusing on time of procedure, number of expositions, average glandular dose and complications.
Methods and materials: The institutional review board approved this retrospective study and informed consent was waived. From July 2015 to January 2017, 306 patients with 306 suspicious mammographic findings (BI-RADS ≥4) underwent to a mammography-guided biopsy, prone S-guided or prone DBT-guided VAB. T student Test, Chi-squared and multivariate regression statistics were used.
Results: During the study period, 155 prone S-guided VAB in 155 patients (mean age, 56 years; age range, 39–84 years) and 151 DBT guided VAB in 151 patients (mean age, 57 years; age range, 33–84 years) were performed. Mean procedure time was briefer with DBT-guided VAB versus S-guided VAB (14,5 vs 17,4 minutes, respectively; P <0,001), and fewer expositions were acquired with DBT-guided VAB versus S-guided VAB (8 vs 11, respectively; P <0,001); therefore the average glandular dose (AGD) was significantly lower in DBT-guided VAB versus S-guided VAB (11,8 mGy vs 18 mGy respectively; P <0,001). There were no differences in the distribution of histologic results (P = 0,74) and in breast density (P = 0,09) between the two groups. No major complications were observed in either group.
Conclusion: Performance of prone DBT-guided VAB was superior to prone S-guided VAB, because it allows a faster procedure, with a fewer radiological expositions and lower radiation dose.
Limitations: We included in our study all the procedures that were actually performed in our institution, so technical success was not considered.
Ethics committee approval: The institutional review board approved this retrospective study and informed consent was waived.
Funding: No funding was received for this work.

RPS 203-1 10:30
Improved sensitivity in diagnosing myocardial infarction using frequency selective nonlinear blending in computed tomography
E. Stock, R. Schwarz, J. Herrmann, C. Artzner, K. Nikolaou, M. Bongers; *Tübingen/DE (eva.stock@med.uni-tuebingen.de)*

Purpose: To evaluate the effect of frequency selective nonlinear blending (NLB) on the detectability of clinically suspected myocardial infarction in computed tomography (CT) images.
Methods and materials: A retrospective patient search in our institution's PACS yielded 32 patients with myocardial infarction who underwent both contrast-enhanced CT (CECT) and invasive coronary angiography (ICA) between 2015 and 2019. ICA was used as a standard of reference. NLB was applied to CECT images, which were obtained in the portal-venous phase. Two readers independently determined optimal NLB settings and independently rated image quality (equidistant Likert). Objective image quality was determined using a ROI-based calculation of contrast-to-noise ratios (CNR). The acquired data was statistically compared between CECT and NLB using non-parametric tests. Interobserver agreement was calculated using kappa statistics.
Results: On average, a centre of 110 HU, a delta of 20 HU, and a slope of 5 resulted in the best overall delineation of hypodense areas of myocardial infarction. Averaged CNR of myocardial infarctions could be significantly increased using NLB (CECT:5, 73 [2,88;12,83]; NLB:11, 28 [6,56;23,19]; p<0,0001). Interobserver agreement showed substantial agreement (kappa: 0,70). Subjective image quality was significantly higher for NLB CT images in comparison with CECT images (CECT:2 [2;2],NLB:4 [3;4],p<0,0001).
Conclusion: This pilot study demonstrated that frequency selective nonlinear blending of CECT images allows a significant improvement of the delineation of myocardial infarction. Further clinical studies are warranted in order to validate these initial results.
Limitations: A small study population.
Ethics committee approval: This study was approved by our local ethics committee.
Funding: No funding was received for this work.

Myocardial perfusion status in patients with coronary chronic total occlusion: evaluated by 16-cm wide detector CT
K. Liu, Z. Li; *Chengdu/CN (634270986@qq.com)*

Purpose: To evaluate the myocardial perfusion status of patients with coronary chronic total occlusion (CTO) by 16-cm wide detector CT and explore the differences of perfusion parameters between myocardial segments dominated by CTO and non-CTO vessels.
Methods and materials: 34 patients with CTO confirmed by coronary angiography (CAG) were enrolled and their data about dynamic myocardial computed tomography perfusion (CTP) imaging on a 16-cm wide detector CT was analysed retrospectively. Based on a standardised 17-segment model of AHA, perfusion parameters of myocardial segments were measured using a "CT dynamic myocardial perfusion" module on Ziostation2 software, including myocardial blood volume (MBV) and myocardial blood flow (MBF). CT attenuation values of each myocardial segment were alsoi measured. The occlusive vessel was determined by CAG results and the differences of parameters between myocardial segments dominated by CTO and non-CTO vessels were analysed.

Results: There was a significant difference in CT attenuation values between myocardial segments dominated by CTO and non-CTO vessels [(94.9±25.4) Hu vs. (114.0±24.6) Hu, P=0.003). Compared with myocardial segments dominated by non-CTO vessels, MBV and MBF of myocardial segments dominated by CTO vessels significantly decreased [MBV: (17.09±7.9) ml/100ml vs. (23.6±8.5) ml/100ml, P=0.002; MBF: (226.5±85.2) ml/(100ml·s) vs. (334.7±163.3) ml/(100ml·s), P=0.001].
Conclusion: Myocardial perfusion status was different in myocardial segments dominated by CTO and non-CTO vessels. MBV and MBF may have the potential to differentiate normal myocardium from ischemic myocardium in CTO patients.
Limitations: A small sample size and a lack of studies about the diagnostic performance of MBV and MBF.
Ethics committee approval: This study was approved by the Institutional Medical Ethics Committee of our institute. Written informed consent was obtained.
Funding: This work was supported by the "1.3.5" project for disciplines of excellence, West China Hospital, Sichuan University, China [ZYGD18019].

Extracellular volume fraction and infarct size determined by LGE CMR predict left ventricular remodeling within the first 6 months following an acute myocardial infarction

E. Tahir, M. Sinn, J. Stáreková, M. Avanesov, U. Radunski, K. Müllerleile, C. Stehning, G. Adam, G. Lund*; Hamburg/DE (e.tahir@uke.de)*

Purpose: Tissue characterisation could provide incremental information to predict left ventricular (LV) remodeling after myocardial infarction (MI). We investigated the clinical utility of an approach using novel mapping techniques compared to standard CMR to predict LV remodeling.
Methods and materials: 74 patients with reperfused MI were enrolled. CMRs were obtained at 8±5 days after MI. Cine sequences were used to determine LV remodelling at baseline and 6 months after infarction. T2 relaxation times were quantified using a free-breathing, navigator-gated multi-echo sequence. T1 relaxation times were measured using the modified look-locker inversion recovery sequence. Parametric maps were generated with OsiriX. LGE was used to identify the infarcted areas.
Results: A total of 11 patients (15%) developed LV remodelling. ECV and infarct size had the best predictive performance to identify patients at risk of LV remodelling after AMI with AUCs of 0.843 and 0.806, respectively. Infarct size was significantly better than native T1 with an AUC of 0.549 (P<0.05). T2 and oedema size also showed good AUCs of 0.768 and 0.743, respectively. The optimal cut-off of ≥57% for ECV provided a sensitivity and specificity of 86% and 85%, respectively. The optimal cut-off of ≥17.2 %LV for infarct size provided a sensitivity and specificity of 82% and 76%, respectively. The optimal cut-offs for the other CMR parameters were oedema size ≥27 %LV, ≥1236ms for native T1 and ≥88ms for T2.
Conclusion: ECV and infarct size are the best predictors for LV remodelling within a follow-up period of 6 months and show a better discriminatory performance than non-contrast standard and parametric mapping techniques.
Limitations: The main limitation of this study is the small number of patients.
Ethics committee approval: This study was approved by the Ärztekammer Hamburg.

The prognostic value of the myocardial salvage index measured by magnetic resonance imaging after ST-segment elevation myocardial infarction: a systematic review and meta-regression analysis

B. Kendziora, M. Dewey*; Berlin/DE (benjamin.kendziora@charite.de)*

Purpose: To summarise published data on the prognostic value of the proportion of salvaged myocardium inside previously ischaemic myocardium (myocardial salvage index) measured by T2-weighted and T1-weighted late gadolinium enhancement magnetic resonance imaging (MRI) after ST-segment elevation myocardial infarction (STEMI).
Methods and materials: We systematically searched for studies stating both the myocardial salvage index measured by T2-weighted and T1-weighted late gadolinium enhancement MRI after STEMI and the incidence of major cardiac events (MACE) during follow-up, defined as cardiac death, nonfatal myocardial infarction, or admission for heart failure. Random and mixed effects models were used for data analysis.
Results: The search revealed 10 studies with 2,697 patients. The pooled myocardial salvage index, calculated as the proportion of nonnecrotic myocardium inside edematous myocardium measured by T2-weighted and T1-weighted late gadolinium enhancement MRI after STEMI, was 43.0% (95% confidence interval [CI]: 37.4, 48.6). The pooled length of follow-up was 12.3 months (95 % CI: 7.0, 17.6). The pooled incidence of MACE during follow-up was 10.6 % (95% CI: 5.7, 15.5). With every 1% increase in the myocardial salvage index, there was an absolute decrease of 1.7% in the incidence of MACE during follow-up (95 % CI: 1.6, 1.9). Heterogeneity between studies was considerable ($\tau = 21.3$).
Conclusion: An analysis of the published data suggests that the myocardial salvage index measured by T2-weighted and T1-weighted late gadolinium enhancement MRI after STEMI provides prognostic information on the risk of MACE. However, there is considerable heterogeneity between studies.
Limitations: In consequence of the heterogeneity between studies, exact thresholds of the myocardial salvage index for low or high risk of MACE cannot be provided.

Normal range of quantified myocardial perfusion with whole heart coverage CT scanner in subjects with normal coronary artery

Y. Gao, N. Zhao, W. Ma, W. Geng, B. Lyu*; Beijing/CN (gaoyang226@126.com)*

Purpose: To determine the range and regional heterogeneity of myocardial perfusion in subjects with normal coronary artery on dynamic perfusion computed tomography.
Methods and materials: Participants without a history of hypertension, hyperlipidemia, diabetes, smoking, and chest pain were prospectively enrolled. Coronary computed tomography angiography was performed to verify the normal coronary artery without any plaque or stenosis. Myocardial perfusion was assessed at rest and during triphosadenine-induced hyperemia using a Revolution CT (GE Healthcare, Milwaukee, Wisconsin). Myocardial blood flow (MBF) and myocardial blood volume (MBV) were quantified based on a 17-segment American Heart Association model.
Results: 34 (age 33–65 years; 15 men) participants were enrolled. The mean global MBF_{rest} and MBF_{stress}, MBV_{rest} and MBV_{stress} were 116.2±39.2 ml/100g/min and 210.7±56.3 ml/100g/min, 17.6±4.8 ml/100g and 25.7±5.6 ml/100g, respectively. Mean MBF_{rest} (123.9±39.4 ml/100g/min) and MBF_{stress} (216.9±56.5 ml/100g/min) of the anterior region were higher than in other regions. The mean MBF_{rest} (103.2±34.2 ml/100g/min) and MBF_{stress} (205.8±50 ml/100g/min) of the inferoseptum regions were lower than in other regions. The mean variation of MBF_{rest} was significantly higher than MBF_{stress} (21.1±6.4% vs. 17.7±4.3%, P=0.016) and MBV as well (15.9±6.1% vs. 11.8±5.5%, p<0.001). MBF_{stress} and MBV_{stress} of female were significantly higher than male subjects (226.4±56.9 ml/100g/min vs. 190.8±48.9 ml/100g/min, p<0.001 and 26.8±5.9 ml/100g vs. 24.3±4.8 ml/100g, p<0.001, respectively).
Conclusion: This study reveals normal myocardial perfusion parameter and regional heterogeneity on dynamic CT perfusion. Myocardial flow reserve were significantly higher in female than male participants.
Limitations: The results were from a single institution and the number of subjects was small. We did not compare CT MBF values to a reference standard from PET or cardiac MR.
Ethics committee approval: The institutional ethics committee of Fuwai Hospital approved this study.
Funding: The study received a grant from the National Key Research and Development Program of China (2016YFC1300402).

A comparison of iodine distribution characteristics in rest and stress first-pass perfusion of healthy myocardium as obtained by a dual-layer CT scanner

S. Boccalini[1], S. A. Si-Mohamed[2], L. Hanquier[1], L. Boussel[2], D. Revel[1], P. C. Douek[1]; [1]Lyons/FR, [2]Bron/FR (sara.boccalini@yahoo.com)

Purpose: To compare iodine distribution in healthy myocardium at first-pass perfusion imaging between stress and rest acquisitions using dual-layer CT (DLCT).
Methods and materials: Between May 2019 and September 2019, patients undergoing coronary-CT for typical thoracic pain without troponin elevation and patients with borderline stenosis at coronary CT underwent an additional CT acquisition after pharmacological stress. Both exams were performed on a DLCT. The injection protocols were 50mL of contrast material at 5mL/sec at rest 35mL in patients <80kg and 0.5mL/kg in patients >80 kg (maximum 45mL) at 2.5mL/sec under stress. Patients with coronary stenosis >50% and/or with positive invasive FFR were excluded. Regions-of-interest were manually drawn on the 16 AHA myocardial segments. Iodine concentration was measured on iodine-maps in mg/mL.
Results: 224 segments (112 rest/112 stress of the same patients) were analysed. No significant difference in iodine concentration was found between rest (median=1.48mg/mL; IQR=0.44) and stress (median=1.44mg/mL; IQR=0.53) (p=0.4). At rest, a significant difference between coronary territories was demonstrated (p=0.02; highest values in the territory of the circumflex (median=1.66mg/mL; IQR=0.49). After stress iodine concentration was homogeneous in different coronary territories (p=0.2). The difference of iodine values between rest and stress was not significantly different in the 16 segments (p=0.94) nor in coronary territories (p=0.37).
Conclusion: In healthy myocardium, significant differences between coronary territories were shown at rest but not after stress, probably because of different injection protocols. Therefore, an injection protocol with a low dose and slow flow is preferable to evaluate myocardial perfusion after pharmacological stress. The difference between rest and stress iodine values of healthy myocardium was homogeneous, without focal reduction of iodine content.
Limitations: Few patients.
Ethics committee approval: n/a
Funding: No funding was received for this work.

Histological validation of cardiac magnetic resonance T1 mapping for evaluating the myocardial alterations on day 1, day 7, and 3 months in a swine model with myocardial infarction

L. Zhang, Y.-K. Guo, C. Fu, H.-Y. Xu, M.-X. Yang, R. Xu, L. Chen; *Chengdu/CN (zhanglu_scu2018@163.com)*

Purpose: To explore how native T1 and extracellular volume (ECV) measured on CMR changed with time in infarcted myocardium after myocardial infarction (MI) and the correlation between ECV and native T1 against histopathological findings.
Methods and materials: A total of 22 pigs were subjected to occlude anterior descending artery and underwent serial CMR examinations in acute (within 24h, n = 22), subacute (7 days, n = 13), and chronic (3 months, n = 6). The CMR protocol included cine, modified look-lock inversion (MOLLI) recovery and late gadolinium enhancement (LGE). Hematoxylin-eosin and Masson trichrome staining were conducted following scanning. The CMR and histopathological examinations were performed on the same day.
Results: Infarcted native T1 changed with peaking at 7 days ($p < 0.05$), while a progressive increase was observed in ECV during 3 months ($p < 0.05$). The histology-evaluated ECV demonstrated a good correlation in the comparison with native T1 (acute, $r = 0.89$, $p < 0.001$; subacute, $r = 0.94$, $p < 0.001$; chronic, $r = 0.83$, $p < 0.001$) and a similar correlation was found compared with CMR-measured ECV (acute, $r = 0.89$, $p < 0.001$; subacute, $r=0.96$, $p < 0.001$; chronic, $r = 0.82$, $p < 0.001$).
Conclusion: Both native T1 and ECV in infarcted myocardium demonstrated a dynamical change in time and had a good correlation with histology. This may be explained by the severe interstitial oedema and the progressive collagenous deposition, indicating the implication for the timing of CMR imaging early after MI for individual therapy and prognosis.
Limitations: The experimental setup did not allow for baseline examination.
Ethics committee approval: The experimental study was approved by the institutional ethics review board.
Funding: No funding was received for this work.

Fractal analysis of perfusion using 4D dynamic CT to differentiate microvascular and macrovascular ischemia

F. Michallek[1], S. Nakamura[2], H. Ota[3], H. Sakuma[2], M. Dewey[1], K. Kitagawa[2]; [1]Berlin/DE, [2]Tsu/JP, [3]Sendai/JP (florian.michallek@charite.de)

Purpose: To understand the chaos of myocardial perfusion under physiological and ischaemic conditions, and to non-invasively differentiate microvascular and macrovascular causes of ischaemia.
Methods and materials: Four-dimensional dynamic first-pass perfusion CT (4D-CTP) data from the AMPLIFiED multicentre study was assessed using 4D fractal analysis. The chaos of perfusion was quantified by fractal dimension (FD). As combined reference, invasive coronary angiography and CTP defined coronary macrovascular artery disease (CAD, ≥80% diameter stenosis or positive FFR with abnormal subendocardial perfusion on CTP), coronary microvascular disease (CMD, <30% diameter stenosis and negative FFR with abnormal subendocardial perfusion on CTP), and normal controls. Analysis was conducted per-segment according to the AHA-17-segments model. Differences in median FD (with interquartile range, IQR) after elimination of intrapatient-clustering were tested using Kruskal-Wallis and Mann-Whitney-U-test (post hoc). Analysis software was developed by the first-author (FM). The STARD-guidelines have been adhered to.
Results: A cohort of n=30 patients was analysed (CMD: n=10 [123 segments]; CAD: n=10 [93 segments]; normal: n=10 [170 segments]). In normal perfusion, physiological chaos was high ($FD_{normal} = 4.49$, $IQR_{normal} = 0.07$). In ischaemia, perfusion was markedly more homogeneous compared to normal perfusion with significantly ($p<0.001$) less chaos in macrovascular ($FD_{CAD}=4.26$, $IQR_{CAD}=0.03$) than microvascular ischaemia ($FD_{CMD} = 4.37$, $IQR_{CMD} = 0.01$) with a coefficient of determination $r^2 = 0.82$.
Conclusion: Perfusion features inherent physiological chaos, which is reduced in ischaemia. Reduction of perfusion chaos depends on the underlying pathophysiology with perfusion being more homogeneous in macrovascular (CAD) than microvascular (CMD) ischaemia.
Limitations: It remains to be determined if fractal analysis can predict clinical outcomes.

Diagnosing and predicting performance of myocardial injury in acute STEMI based on texture analysis of non-contrast-enhanced T1-mapping

Q. Ma[1], Y. Hou[1], X. Lu[1], J. Wang[2], X. Wang[1]; [1]Shenyang/CN, [2]Beijing/CN (444656285@qq.com)

Purpose: To evaluate the feasibility of texture analysis on non-contrast-enhanced T1 maps of cardiac MRI for the diagnosis of myocardial injury in acute myocardial infarction.
Methods and materials: 68 ST-segment–elevation myocardial infarction patients (mean age 55.7 ± 10.5 years, 57 males and 11 females) underwent acute 3T CMR after a percutaneous coronary intervention (PCI), 40 of whom also underwent a 6-month follow-up CMR. Texture analysis was applied to the T1 maps using a software package that was freely available (MaZda, version 4.6). Stepwise dimension reduction and selection of texture features were performed to evaluate the myocardial injury severity using late gadolinium enhancement (LGE) as the standard reference.
Results: A total of 1,088 segments of the acute CMR images were analysed, where 103 (9.5%) segments showed MVO and 557 (51.2%) segments showed myocardial infarction. A total of 244 (38.1%) segments showed irreversible myocardial infarction. A radiomics signature based on T1 maps resulted in a good diagnostic performance of MVO in the training set (AUC: 0.85, 95% CI, 0.80 – 0.89) and the validation set (AUC: 0.85, 95% CI, 0.78 – 0.93), and a fair diagnostic performance of myocardial infarction in the training set (AUC: 0.78, 95% CI, 0.75 – 0.82) and the validation set (AUC: 0.79, 95% CI, 0.74 – 0.84). The radiomics signature also predicted the irreversible myocardial at 6 months with a good performance in the training set (AUC: 0.78, 95% CI, 0.74 – 0.83) and the validation set (AUC: 0.80, 95% CI, 0.74 – 0.86).
Conclusion: Non-contrast-enhanced T1-mapping allows the assessment of the severity of the acute myocardial injury, especially MVO. It also predicted irreversible myocardial damage at 6 months.

Sequential strategy including FFR_{CT} plus stress-CTP impacts on the management of patients with stable chest pain: the stress-CTP RIPCORD study

A. Baggiano[1], M. Guglielmo[1], G. Muscogiuri[1], L. Fusini[1], A. Del Torto[1], A. I. Guaricci[2], A. L. Bartorelli[1], M. Pepi[1], G. Pontone[1]; [1]Milan/IT, [2]Bari/IT (andrea.baggiano@ccfm.it)

Purpose: Stress computed tomography perfusion (Stress-CTP) and CT-derived fractional flow reserve (FFR_{CT}) are functional techniques that can be added to coronary CT angiography (cCTA) to improve management of patients with suspected coronary artery disease (CAD).
We sought to determine impact of FFR_{CT} and Stress-CTP added to cCTA on management of patients with suspected CAD.
Methods and materials: Patients scheduled for invasive coronary angiography (ICA) were evaluated with cCTA, FFR_{CT}, and stress-CTP. A management plan defined as optimal medical therapy (OMT) or revascularisation was recorded for the following strategies: cCTA alone, cCTA+FFR_{CT}, cCTA+stress-CTP, and cCTA+FFR_{CT}+stress-CTP. These strategies were then compared with the clinical decision based on ICA plus invasive FFR. Endpoints for each strategy were overall evaluability, effective radiation dose (ED), rate of reclassification, agreement with therapeutic decision making, and the rate of agreement in terms of vessels to be revascularised.
Results: 291 consecutive patients were enrolled. cCTA alone, cCTA+FFR_{CT}, cCTA+stress-CTP, and cCTA+FFR_{CT}+stress-CTP showed similar evaluability (91%, 89%, 90%, and 87%, respectively) and a similar rate of reclassification of cCTA findings when FFR_{CT} and stress-CTP were added (28% and 34%, respectively). cCTA, cCTA+FFR_{CT}, cCTA+stress-CTP, and cCTA+FFR_{CT}+stress-CTP showed a rate of agreement versus the final therapeutic decision and a rate of agreement in terms of vessels to be revascularised of 63%, 71%, 89%, and 84% (cCTA+stress-CTP and cCTA+FFR_{CT}+stress-CTP vs cCTA and cCTA+FFR_{CT}:p<0.01), and 57%, 64%, 74%, and 71% (cCTA+stress-CTP and cCTA+FFR_{CT}+stress-CTP vs cCTA and cCTA+FFR_{CT}:p<0.01), respectively, with an ED of 2.9±1.3mSv, 2.9±1.3mSv, 5.9±2.7mSv, and 3.1±2.1mSv (cCTA+FFR_{CT}+stress-CTP vs cCTA+stress-CTP:p<0.001).
Conclusion: The addition of functional assessment with FFR_{CT} and stress-CTP provides incremental therapeutic decision-making value compared to cCTA alone. Sequential strategy with cCTA+FFR_{CT}+stress-CTP is associated with the best compromise in terms of clinical impact and radiation exposure.
Limitations: A single-centre study.

Invisible to the eye: radiomics revealing alterations in apparently healthy myocardial tissue of patients with ischemic disease

A. Cavaliere[1], L. Baffoni[2], R. Motta[1], B. Giorgi[1], E. Quaia[1], M. de Lazzari[1], M. Perazzolo Marra[1], C. Giraudo[1]; [1]Padua/IT, [2]Montebelluna/IT (annachiara88cavaliere@gmail.com)

Purpose: To characterise by radiomic analyses the healthy myocardial tissue (i.e. without any visual alteration at MR imaging) of patients with ischaemic and non-ischaemic myocardial disease.
Methods and materials: Patients with ischaemic and non-ischaemic disease who underwent a contrast-enhanced cardiac MR from January 2018 to September 2019 were included in this retrospective study. One radiologist expert in cardiovascular imaging, blind to the clinical information, applied a 5 mm standardised region of interest (i.e. using the phase-sensitive inversion recovery images) on the healthy myocardial tissue of each patient and on the myocardium of 10 controls (patients without myocardial infarction) using a 3D Slicer. 56 radiomic features belonging to three categories were extracted: first-order statistics (FOS), grey-level co-occurrence matrix (GLCM), and grey-level run-length matrix (GLRLM). One-way repeated-measures analysis of variance (ANOVA) with Greenhouse-Geisser correction and Bonferroni post hoc tests were used to evaluate the differences among all datasets (p<0.05).
Results: 10 patients with ischaemic injury (1 female; mean age 60.6 ±10.8 yrs), 11 with non-ischaemic infarction (3 females, mean age 51.8 ±21.4), and 10 controls (3 females, mean age 35.1 ±15.1) were examined. For 25/56 investigated features, the myocardium of the ischaemic patients differed from that of the non-ischaemic patients and controls (4 FOS, 13 GLCM, and 8 GLRLM features; p<0.05 each). No statistically significant differences emerged between the non-ischaemic patients and the controls for any of the examined variables (p>0.05, each).
Conclusion: Radiomic analyses suggest that ischaemic injuries also affect myocardial tissue visually healthy on MR imaging.
Limitations: Further studies including a larger population and a longitudinal approach are necessary to fully address this evidence and its clinical implications.
Ethics committee approval: Ethics committee approval obtained.

DWI sequence in cardiac imaging: a valid contrast-free substitute for late gadolinium enhancement (LGE) and T2-STIR in patients with acute myocardial infarction

C. Marzi[1], C. Martini[2], N. Gaibazzi[2], A. Palumbo[2], G. W. Antonucci[3]; [1]Reggio Emilia/IT, [2]Parma/IT, [3]Barletta/IT (martinic@ao.pr.it)

Purpose: To prove that the use of DWI sequences in C-MRI could be even better than T2-STIR in identifying an oedema zone after myocardial infarction and to demonstrate the potential for DW-CMR as a contrast-free alternative to LGE.
Methods and materials: Study eligibility criteria: studies about the comparison between DWI and T2-STIR in patients with acute myocardial infarction and studies about the possible substitution of late gadolinium enhancement (LGE)

with cardiac DWI. The information and the articles were mostly queried via PubMed and ResearchGate. Starting with 87 articles, a total of 28 relevant studies pertaining to cardiac DWI met the eligibility criteria. The MR equipment, the cardiac DWI type, the b factor values used for each sequence, the scan-time duration, the slice thickness, and/or the number of slices were extracted from the selected trials.
Results: DWI vs T2-STIR: the sensitivity was higher on DWI images (83% vs 61%) and the specificity was 90% for both sequences. The area of oedema was higher in DWI images.
DWI vs LGE: the area of infarct-related high intensity on DW-MRI showed significant linear correlation with LGE area in 20 patients with AMI.
Conclusion: DWI has been more sensitive than T2-STIR in all the studies performed. While it has been equally effective in DWI vs LGE, the advantage of using DWI would be in its ability to detect the ischaemic area even in the absence of the contrast agent. The possibility of eliminating contrast media from this exam would lead to a reduction in the cost of the whole examination for the hospital and there would be a total elimination of renal stress for the patient, which would be especially useful for patients suffering from kidney failure.
Limitations: The operator skills.

A comparison of qualitative tagging and late gadolinium enhancement with PET- CT in the evaluation of myocardial viability
M. Y. A. Moideenbawa Abdulmajed[1], U. Debi[1], V. Bhatia[2], A. Sood[1], R. M. Kumar, M. S. Sandhu; *Chandigarh/IN*
(aser2125@gmail.com)

Purpose: To compare the efficacy of tagging and late gadolinium enhancement in assessing myocardial viability, keeping PET CT as a gold standard.
Methods and materials: We conducted a prospective analytical study comprised of 28 adult patients with perfusion/metabolism matched or mismatched defects in PET CT. These patients were taken for cardiac MR evaluation, mainly assessing tagging and late gadolinium enhancement for motion and scar respectively. Tagging was assessed using wall grid motion and grid crunching. Scoring was from 1 to 5 in increasing order of wall motion abnormality. Late gadolinium enhancement was graded from 0 to 4, ranging from no enhancement to complete transmural enhancement.
Results: Out of 448 myocardial segments, 6% (n=27) of the segments were considered non-viable with the matched defect, 56.5% (n=253) were normal, and 37.5% (n=168) were hibernating according to PET CT. 51.1 % (n= 86) of the hibernating segments were akinetic and 48% (n=82) were hypokinetic with the sensitivity of 66.03% (P < 0.001). However, 88.8% (n=24) of the non-viable segments showed severe akinesia with specificity and PPV of tagging of 88.89% and 98.93%, respectively (P<0.001). There was a good concordance between regional wall motion abnormalities detected using tagging and the percentage of transmural enhancement detected using LGE. LGE showed good sensitivity, 91.7%, as compared to PET CT in identifying hibernating myocardium. However, specificity was low at 44.4%.
Conclusion: Tagging has a good correlation with the late gadolinium enhancement, and as a standalone, MRI parameter shows increased specificity and positive predictive value in identifying non-viable myocardium compared with PET/CT.
Limitations: A small sample size. Stress examination was not done.
Ethics committee approval: Approved by an institutional ethics committee.
Funding: No funding was received for this work.

Myocardial perfusion recovery after steroid therapy predicts cardiac events in cardiac sarcoidosis
K. Koyanagawa[1], M. Naya[2], T. Aikawa[2], O. Manabe[2], S. Furuya[2], M. Kuzume[2], S. Tsuneta[1], N. Oyama-Manabe[2], T. Anzai[2];
[1]Sapporo, Hokkaido/JP, [2]Sapporo/JP
(k.koyanagawa0607@med.hokudai.ac.jp)

Purpose: Whether immunosuppression therapy improves myocardial perfusion in patients with cardiac sarcoidosis (CS) and the association between myocardial perfusion recovery and prognosis are unknown. This study aimed to clarify myocardial perfusion recovery after steroid therapy and its prognostic value for major adverse cardiac events (MACE) in CS patients.
Methods and materials: 38 consecutive patients with steroid-naive CS (median age, 63 IQR 51–68 years; 10 men) underwent electrocardiography (ECG)-gated ^{99m}Tc-MIBI SPECT pre- and post-steroid therapy. Patients were classified based on summed rest score (SRS) of pre-steroid therapy and ΔSRS values ($SRS_{post} - SRS_{pre}$) as follows: improvement ($SRS_{pre} > 0$ and ΔSRS < 0), non-improvement ($SRS_{pre} > 0$ and ΔSRS ≥ 0), preservation ($SRS_{pre} = 0$ and ΔSRS = 0), and progression ($SRS_{pre} = 0$ and ΔSRS > 0) groups. In addition, we defined the improvement and preservation groups as the recovery group, whereas the non-improvement and progression groups were the non-recovery group.
Results: From the results of SPECT, 23, 10, 3, and 2 patients were classified into the improvement, non-improvement, preserved, and progression group, respectively. Therefore, 26 patients were assigned to the recovery group and 12 patients to the non-recovery group. MACE occurred in 8 patients after 2.88 years of follow-up. The Kaplan-Meier curves revealed a significantly higher rate of MACE in the non-recovery group (17.4%/y vs. 2.9%/y, P = 0.007).
Conclusion: Myocardial perfusion was recovered by steroid therapy in 23 (61%) and preserved in 3 (8%) CS patients. Myocardial perfusion recovery after steroid therapy was significantly associated with a low incidence of MACE.
Limitations: A single-centre study with a small number of patients and events.
Ethics committee approval: Approved by the Ethics Committee of Hokkaido University Hospital.

Intravoxel incoherent motion imaging for the study of placental microstructure in intrauterine growth restriction: a prenatal in vivo MR study
A. Antonelli[1], S. Capuani[1], G. Ercolani[1], S. Bernardo[1], B. Kuehn[2], R. Grimm[2], A. de Rinaldis[2], L. Manganaro[1], C. Catalano[1]; *[1]Rome/IT, [2]Erlangen/DE*
(amanda.antonelli@uniroma1.it)

Purpose: To investigate the role of intravoxel incoherent motion (IVIM) MRI for the study of placental microvascular and microstructural impairment in intrauterine growth restriction (IUGR) compared to normal placentae.
Methods and materials: 63 singleton pregnancies (49 normal and 14 IUGR subjects) were enrolled. Advanced diffusion-weighted EPI with 10 b-values (0, 10, 30, 50, 75, 100, 150, 400, 700, and 1,000s/mm2) was performed at 1.5T. MR body diffusion toolbox prototype software was used to obtain perfusion fraction (f), pseudo-diffusion coefficient (D*), and diffusion coefficient (D) maps. For each subject, ROIs were manually placed in whole foetal and whole maternal placenta and in three parenchymal areas (umbilical (U), central (C), and peripheral (P)) in both the foetal and maternal side. Differences between f, D, and D* mean values and their correlation with gestational age (GA) were investigated in both the normal and IUGR group.
Results: f was significantly lower ($p=10^{-9}$) in IUGR compared to the normal group in whole maternal and whole foetal ROIs, in U-, C-, and P- maternal and foetal ROIs, whereas D was higher in IUGR compared to normal pregnancies (p=0.01) in whole, U-, C-, and P- foetal ROIs. D* was significantly lower in IUGR than in the healthy group in the whole maternal side (p=0.02) and in the foetal P-ROI. D showed a significant negative correlation with GA in the whole placenta (p<0.0001) and in U-, C-, and P- maternal and foetal ROIs.

Conclusion: According to our results, the IVIM model is able to quantify in vivo microvascular and microstructural impairment of placental parenchyma in IUGR compared to normal pregnancies, detecting dysfunctional perfusion and diffusion qualities in vivo. Placental IVIM-MRI is a useful tool in the microstructural analysis of placental insufficiency affecting IUGR pregnancies.
Limitations: The heterogeneity of the IUGR group.
Ethics committee approval: The study was approved by the local ethics committee.
Funding: No funding was received for this work.

Is there a worldwide standard normal foetal lung volume by MRI measurement?

S. Sefidbakht[1], A. Dehdashtian[1], S. Bagheri[1], F. Bagheri[1], N. Rahimirad[1], P. Keshavarz[1], B. Bijan[2]; [1]*Shiraz/IR,* [2]*Sacramento, CA/US*
(SepidehSefidbakht@yahoo.com)

Purpose: To evaluate the application of prenatal magnetic resonance imaging in order to predict pulmonary hypoplasia, the foetal lung volume (FLV) was measured with the aim to establish reference data in normal foetuses.
Methods and materials: 342 foetuses with abnormal ultrasound findings underwent fast spin-echo T2-weighted MR imaging. Data of 241 foetuses at 18-36 weeks gestation without thoracic malformations were obtained for an FLV normative curve. This resulted in a formula calculating the expected foetal lung volume dependent on the gestational age.
Results: Normal FLV increased with the gestational age as the spread of values. The expected foetal lung volume was derived from the following formula: foetal lung volume (mL)=0.002×(GA^2.913), in which GA is the gestational weeks. FLV in our population had a more consistent correlation with Japanese foetuses than European or American foetuses.
Conclusion: In foetuses with normal lungs, FLV distribution against the gestational age is simply measured prenatally with MR imaging. A single universal formula might not be suitable for foetuses worldwide. In our region, acquired data was more consistent with Asian normal values.
Limitations: Sampling was not performed among a strictly healthy population and it may involve foetuses with structural abnormalities outside the chest cavity referred for prenatal MR imaging. Lung volume measurements may alter with the cardiac cycle or foetal breathing. In this study, such an effect tried to be degraded via the acquisition time and by multiple measurements, and by obtaining a mean foetal lung volume. Two plane measurement and 3D volumetry were not accessible for comparison.
Ethics committee approval: The study protocol was approved by the local institutional review board and informed consent was waived by the institutional ethics committee.
Funding: No funding was received for this work.

CMR imaging derived systemic to pulmonary collateral flow exceeding 20% of stroke volume considerably reduces antegrade pulmonary flow in univentricular heart patients

A. Yanovskiy, L. Martelius, J. Salminen, T. Ojala; *Helsinki/FI*
(yanovskiy.anna@gmail.com)

Purpose: Systemic to pulmonary collateral flow (SPCF) is a significant haemodynamic burden in univentricular heart (UVH) patients after a bidirectional Glenn operation and diminishes to some extent after a total cavopulmonary connection (TCPC). By cardiac magnetic resonance imaging (CMR), pulmonary flow (Qp) and pulmonary-to-systemic-blood-flow ratio (Qp/Qs) can be estimated from pulmonary arteries and pulmonary veins. Our objective was to define if these methods differ in operated UVH patients and if this difference correlates to the amount of SPCF.
Methods and materials: A retrospective single-centre study included 82 consecutive CMR examinations of patients with UVH (pre-TCPC stage n=17 (21%), post-TCPC n=65 (79%)) was conducted. For each patient, phase-contrast velocity mapping derived Qp was calculated twice; as the sum of the pulmonary arteries flows (QpPA) and pulmonary vein flows (QpPV). Qp/Qs ratios were calculated based on both QpPA and QpPV. The relationship between delta Qp/Qs (calculated as $[(Qp_{PV}/Qs)-(Qp_{PA}/Qs)]$) and the SPCF was computed using the Pearson correlation coefficient. Minimal clinically important difference (MCID) in Qp/Qs ratios was estimated as ≥0.5, ROC curve, and cut-off analyses were performed.
Results: In the pre-TCPC group, SPCF was significantly higher compared to the post-TCPC group (26%(10%-60%) and 14%(3%-37%), respectively, p<0.001). In both groups, QpPA/Qs was smaller or rarely equal to QpPV/Qs (p<0.001). Delta Qp/Qs and SPCF showed a strong positive correlation (r=0.85, p<0.001). ROC analysis suggests the cut-off for MCID ≥0.5 at about 20% of SPCF with a sensitivity of 80%, specificity of 84%, and excellent accuracy (AUC=0.92±0.04).
Conclusion: SPCF violates Qp and Qp/Qs ratio measurements based only on PA, resulting in their underestimation. At any stage of UVH palliation, SPCF exceeding 20% of stroke volume decreases the antegrade pulmonary artery flow remarkably.

Left atrial dysfunction in children and adolescents with severe obesity: a cardiac magnetic resonance imaging myocardial strain study

E. Xu[1], N. Kachenoura[1], V. della Valle[1], B. Dubern[1], A. Karsenty[1], R. Layese[2], J. Lamy[1], A. Redheuil[1], E. Blondiaux[1]; [1]*Paris/FR,* [2]*Créteil/FR*
(ericxu.pro@gmail.com)

Purpose: Paediatric severe obesity has tripled in the last decades along with associated complications. Less is known regarding left atrial (LA) dysfunction and its association with left and right ventricular (LV, RV) remodelling. Our aim was to assess the effects of severe childhood obesity using strain analysis by cardiac magnetic resonance (CMR).
Methods and materials: Children prospectively recruited were categorised into two groups according to their body mass index (BMI). Strain measurements were derived from standard cine images using a dedicated CMR imaging feature-tracking (FT) software.
Results: 36 children were recruited. Reduced values were found in children with obesity for LA reservoir function (23.9% vs 32%, p=0.008), contractile function (4.6% vs 10.9%, p=0.004), and LA ejection fraction (EF). An increasing BMI was significantly associated with decreasing absolute values in LA strain in reservoir and contraction phases and in LAEF. Absolute RV radial motion fraction was reduced by 42% and circumferential strain by 31% in children with obesity. Obese children showed a reduced LV radial strain.
Conclusion: CMR FT identifies LA dysfunction in severely obese children with impaired reservoir and atrial contraction phases, suggesting an early loss in the compensatory ability of atrial contraction in case of severe obesity. CMR FT strain measurements could help to detect early signs of cardiac dysfunction related to obesity in childhood and adolescence.
Limitations: The limited sample size of our study population. We also lacked the availability of several clinical data e.g. the percentage of body fat that could have been valuable clinical parameter to correlate with our CMR findings.
Ethics committee approval: Ethical approval was obtained and patients and parents gave informed consent.
Funding: This work was supported by the French Society of Radiology.

Chest x-ray or lung ultrasound in neonatal lung disease?
S. Deftereos, S. Foutzitzi; *Alexandroupolis/GR*
(foutzita@gmail.com)

Purpose: Early and reliable diagnosis is important for neonatal patients with respiratory diseases (RD) which are common in the neonatal intensive care unit (NICU). Lung ultrasound (LUS) on the contrary of chest x-ray (CXR) and computed tomography present increased use in everyday practice due to their safety and mobility (bedside method) as well as their ability to produce real-time continuous images.
Methods and materials: 99 neonates from NICU with a gestational age ranging from 25 weeks-40 weeks and respiratory distress were included in this study. All babies after clinical estimation (Apgar score, vital signs, and laboratory tests etc.) underwent CXR followed by LUS. The findings were compared between them.
Results: Clinically 77 (78.8%) neonates suffered from respiratory distress syndrome (RDS), 3 (3%) revealed pneumothorax, and 14 (14.1%) full-term neonates presented with transient tachypnea of the newborn. 2 (2%) neonates with pleural fluids, 1 (1%) with meconium aspiration syndrome, 1 (1%) with a hernia, and 2 (2%) with right upper lobe collapse were diagnosed. The basis of our diagnosis was clinical decision. According to this, the severity of illness was estimated by chest x-ray as well as by LUS. CXR had the most sensitivity and specificity in pneumothorax and hernia (100%) while LUS had 66% and 100%, respectively. In RDS, CXR achieved 73.9% sensitivity and 82% specificity, and in LUS, had 99% sensitivity but only 64.1% specificity.
Conclusion: CXR remains the method of choice in RD diagnosis. LUS is a useful tool in NICU. It is reliable, easy-to-use, convenient, non-invasive, and free of a radiation method with the potential to become a tool for bedside dynamic respiratory monitoring.

Chronic aspiration in children: a retrospective study of CT findings and videofluoroscopy correlations
R. Meshaka, S. Zimmels, A. Kelly, T. R. Semple; *London/UK*
(riwa.meshaka@nhs.net)

Purpose: Chronic aspiration is a common childhood cause of recurrent lower respiratory tract infection. Diagnosis is made clinically and supported by videofluoroscopy (VF), but chronic aspiration is often suggested when right upper and bilateral lower lobe disease is seen on chest radiography or CT, despite limited evidence to support this. The objective of this study was to investigate CT findings in VF-proven aspiration.
Methods and materials: Children under 5 years with VF and CT data were identified from a speech and language therapy referrals database. Aspiration was assessed as present/absent on VF. 9 CT features of aspiration (atelectasis, bronchial wall thickening, mosaic attenuation, mucus plugging, bronchiectasis, ground glass, consolidation, volume loss, and interstitial lung disease) were assessed as present/absent and scored for severity/extent on a 3-point scale.
Results: 61 patients were identified (44 aspiration, 17 no aspiration, mean age 1.5 vs 2.1 years respectively, p=0.22). There were more CT features in the aspiration group (mean 6 vs 4.8) with greater extent/severity scores (7.3 vs 5.0), but neither reached significance (p=0.24 and 0.46). The presence of atelectasis (in any lobe) suggested aspiration (p=0.04), with aspiration extent nearing significance (p=0.07). No other feature reached statistical significance. Most features demonstrated a right upper, right lower, and left lower lobe predominance in both cohorts.
Conclusion: Our small cohort supports the use of atelectasis on CT as a prompt for the investigation of aspiration. The RUL, RLL, and LLL predominant distribution alone is not diagnostic and VF continues as the gold standard investigation for aspiration.
Limitations: Our small cohort is based at a tertiary heart and lung centre; patients often have other comorbidities.
Ethics committee approval: Currently under submission.
Funding: No funding was received for this work.

RPS 212-7 11:06
The upper airway after open airway surgery for laryngotracheal stenosis: a magnetic resonance study
B. Elders, B. Pullens, H. A. W. M. Tiddens, P. A. Wielopolski, P. Ciet; *Rotterdam/NL (b.elders@erasmusmc.nl)*

Purpose: Laryngotracheal stenosis (LTS) is often successfully corrected with open airway surgery. However, the majority of patients remain with respiratory and vocal sequelae. A better understanding of these sequelae is needed to improve clinical care and surgical interventions. The aim of this study was to image the upper airway of paediatric patients with a history of open airway surgery for LTS using magnetic resonance imaging (MRI).
Methods and materials: 48 patients (age 14.4 (range 7.5-30.7) years) and 11 healthy volunteers (age 15.9 (range 8.2-28.8) years) were included, spirometry and static and dynamic upper airway MRI (30 minutes, 3T GE scanner, 6CH carotid coil, spatial resolution 0.5x0.5 (in-plane) x2 mm, temporal resolution: 240 ms) were conducted. MRI analysis included the assessment of post-operative anatomy and measurements of airway areas and diameters during static and dynamic (inspiration and phonation) acquisitions.
Results: Good image quality was achieved for static and dynamic images (61.4% and 70.2%) without artefacts (70.2%). Excellent MRI visualisation showed vocal cord thickening in 80.9% of patients and a significant decrease in lumen area at the vocal cord level (22.0 (IQR 17.7-30.3) mm^2 vs 35.1 (IQR 21.2-54.7) mm^2, p=0.03) but not the cricoid (62.0 ± 27.3 mm^2 vs 66.2 ± 34.8 mm^2, p=0.68) compared to healthy volunteers. Furthermore, 53.2% of patients had an a-frame deformation of the trachea at the site of the previous tracheal cannula, showing even further lumen collapse during inspiration. 37 (78.7%) patients showed signs of possible fibrosis/chronic oedema, mostly located at the arytenoids or vocal cords.
Conclusion: Static and dynamic MRI is suitable for the extensive evaluation of the upper airway in post LTS children.

3Tesla lung MRI in children with pneumonia
S. Yücel[1], T. Aycicek[2], M. Ceyhan Bilgici[2], O. S. Dincer[1], L. Tomak[2], S. G. Sensoy[2]; *[1]Mus/TR, [2]Samsun/TR (serapyucl@gmail.com)*

Purpose: As an alternative to chest x-ray and CT, which exposes patients to ionising radiation, this paper aims to investigate the utility of fast 3T sequences for the detection of pulmonary abnormalities in children with pneumonia.
Methods and materials: 47 children with clinically suspected pneumonia were prospectively included in this study. All children underwent thoracic MRI (3T) and PA chest x-ray. 15 patients had contrast-enhanced thorax CT or HRCT. MRI protocol included axial and coronal T2-weighted spectral presaturation with inversion recovery (SPIR) MultiVane XD, axial echo-planar imaging (EPI), and diffusion-weighted imaging (DWI) with respiratory gating. Kappa statistics, Cochran Q and McNemar tests were used to investigate the results.
Results: There was a statistically substantial agreement between chest radiographs and MRIs in detecting consolidation/infiltration (k=0.64), peribronchial thickening (0.78), and bronchiectasis (k=1), a moderate agreement for detecting cavities (k=0.54) and pleural effusion n (k=0.44), and a fair agreement for detecting empyema (k=0.32) and bilateral involvement of the lungs (k=0.23). MRI was superior to chest x-ray in detecting bilateral involvement (p=0.000), lymph nodes (p=0.000), pleural effusion (p=0.000), and empyema (p=0.003). MRI detected all consolidation or infiltration detected on CT imaging. The kappa test showed a moderate agreement between MRI and CT in detecting pleural effusion (k=0.48) and ground-glass opacity (k=0.44), and a substantial agreement for all other pathologies (k=0.61-0.99). No statistically significant difference was observed between MRI and MDCT for detecting pneumonia associated pathologies by the McNemar test.
Conclusion: Thoracic 3T MRI is an accurate and effective technique to evaluate children with pneumonia. MRI detected more pathologies than chest x-ray and had similar results compared with thorax CT.
Limitations: The timeline between imaging modalities was 0-3 days. Patients older than 6 years old were included to avoid giving sedation to patients.
Ethics committee approval: The study was approved by the Ondokuz Mayis University Ethical Committee on 30th of March, 2017.
Funding: Ondokuz Mayis University BAP-project office.

Acoustic radiation force impulse imaging for predicting liver cirrhosis in infants with biliary atresia
Y. Chen, S. Gu, Y. Zhu*; Shanghai/CN (joychen1266@126.com)*

Purpose: To evaluate acoustic radiation force impulse (ARFI) in assessing liver cirrhosis preoperatively in infants with biliary atresia (BA).
Methods and materials: A total of 138 infants with BA scheduled for Kasai surgery were enrolled in this retrospective cohort study. All infants underwent ARFI imaging to evaluate liver stiffness by measuring shear-wave speeds (SWSs) followed by a liver biopsy within 3 days after imaging. The liver fibrosis stages of specimens were classified using the Batts-Ludwig scoring system. The Spearman correlation coefficient value between the SWSs and fibrosis stage was calculated. Receiver operating characteristic (ROC) curves were used for evaluating the diagnostic performance of ARFI imaging in diagnosing liver cirrhosis (fibrosis stage F4).
Results: The median age of infants at the day of imaging was 56d. The biopsy histopathology confirmed 27 infants with fibrosis stage F1, 42 infants with fibrosis stage F2, 55 infants with fibrosis stage F3, and 14 infants with fibrosis stage F4. The median SWS of infants with F1, F2, F3, and F4 was 1.43m/s, 1.61m/s, 1.95m/s, and 2.39m/s, respectively (P<0.001). A significant correlation was found between SWS values and the fibrosis stage with a Spearman correlation coefficient of 0.744 (P<0.001). The AUC of SWS values for diagnosing cirrhosis was 0.948 (95% CI: 0.896, 0.978). The best cut-off value for predicting cirrhosis was 2.06m/s, with the sensitivity of 92.9% and specificity of 91.1%.
Conclusion: The SWS value measured by ARFI imaging showed excellent correlation with the liver fibrosis stage and might be an ideal non-invasive approach in predicting liver cirrhosis in infants with BA preoperatively.
Limitations: The retrospective study design.
Ethics committee approval: Appoved by insitute ethics committee (XHEC-D-2015-160).

ARFI elastography of the liver and spleen in patients with Gaucher disease type 1: correlations with clinical data and markers of disease severity
A. Lollert, C. Hoffmann, M. Lache, J. König, M. Brixius-Huth, J. Hennermann, C. Düber, G. Staatz*; Mainz/DE (andre.lollert@unimedizin-mainz.de)*

Purpose: To evaluate the feasibility of acoustic force impulse (ARFI) elastography of the liver and spleen in patients with Gaucher disease type 1 (GD1) and to assess correlations between organ stiffness and clinico-radiologic data, such as the Gaucher disease type 1 severity scoring system (GD-DS3).
Methods and materials: We retrospectively evaluated the results of ARFI elastography as measures of liver and spleen stiffness in 57 patients with GD1. The feasibility of the method was assessed. Correlations between elastography data and clinical data related to the metabolic syndrome, laboratory tests, and GD1-related clinico-radiologic data (bone marrow burden score, GD-DS3) were assessed.
Results: ARFI elastography provided reliable results (i.e. standard deviation <30% of the mean value between the measurements) in 50/57 patients. Significant liver fibrosis was present in 35/50 patients (70%). Liver stiffness correlated significantly with the GD-DS3 score (P=0.029). Spleen stiffness correlated significantly with age (P=0.021), body mass index (P=0.002), several laboratory parameters, and near-significantly with the GD-DS3 score (P=0.059).
Conclusion: ARFI elastography is a useful tool for a more profound assessment of disease severity in patients with GD1, which adds relevant information to the standard clinical scores. Thus, elastography might allow for extended therapy monitoring, especially in patients with significant liver fibrosis. Spleen elastography showed promising results and its role should be further investigated.
Limitations: The retrospective study design and heterogeneity of the study cohort. Therapy-related factors were not analysed.
Ethics committee approval: The study was approved by the local independent ethics committee.

Diffusion-weighted imaging for the differentiation of biliary atresia and grading of hepatic fibrosis in infants
J. Kim, H. J. Shin, H. Yoon, S. J. Han, H. Koh, M.-J. Kim, M.-J. Lee*; Seoul/KR*

Purpose: To determine whether the values of the hepatic apparent diffusion coefficient (ADC) can differentiate biliary atresia (BA) from non-BA or be correlated with the grade of hepatic fibrosis in infants with cholestasis.
Methods and materials: This retrospective cohort study included infants who received liver MRI examinations to evaluate cholestasis from July 2009-October 2017. Liver ADC, ADC ratio of liver/spleen, aspartate aminotransferase to platelet ratio index (APRI), and spleen size were compared between the BA and non-BA groups. The diagnostic performances of all parameters for significant fibrosis (F3-4) were obtained by receiver-operating characteristics (ROC) curve analysis.
Results: A total of 227 infants (M:F=98:129; mean age=57±36.3), including 125 BA patients, were analysed. Liver ADC values were lower (p=0.012) and spleen size was larger (p<0.001) in the BA group compared to the non-BA group. There were 34 patients with F0, 15 with F1, 71 with F2, 36 with F3, and 12 with F4. There were significant correlations between fibrosis grades and all 4 parameters of APRI (τ=0.289), spleen size (τ=0.297), liver ADC (τ=-0.206), and ADC ratio (τ=-0.249) (all, p<0.001). The cut-off values for significant fibrosis (F3-4) were 0.712 for APRI (area under the ROC curve [AUC], 0.712), 5.9 cm for spleen size (AUC, 0.701), 1.044×10^{-3} mm/sec for liver ADC (AUC, 0.666), and 1.22 for ADC ratio (AUC, 0.647).
Conclusion: Liver ADC values could be helpful in differentiating BA from non-BA and predicting significant hepatic fibrosis in infants with cholestasis.
Limitations: A retrospective study. The lack of evaluation for additional effects on conventional US or MR-based diagnoses.
Ethics committee approval: n/a

Postoperative hepatic artery ultrasound evaluation of liver transplants in children: the results from a tertiary-care paediatric hospital
A. Antón Jiménez, A. Coma, J. Piqueras Pardellans, L. Riera Soler, L. Riaza Martin, E. Vazquez Mendez*; Barcelona/ES (alba.antonj@gmail.com)*

Purpose: To establish the normal reference values of a hepatic artery US Doppler postoperative evaluation after liver transplant in the paediatric population and to associate acute vascular complications with these US Doppler parameters.
Methods and materials: A retrospective study of US Doppler parameters of liver transplants in children from 2016-2019 in a tertiary-care paediatrics hospital was performed.
Patient age, liver underlying disease, the introduction of enteral feeding, and surgical technique were recorded.
Peak systolic velocity (psV) and resistive index (RI) at US Doppler studies were analysed every 24 hours during the first 5 days after liver transplantation.
Results: 40 children (19 girls and 21 boys; mean age 5.4 years) enrolled during 2016-2019. One patient required retransplantation.
Of the 41 liver transplantations performed, 21 were living donor and deceased split-liver grafts.
6 acute arterial complications occurred, 4 anastomotic stenosis, and 2 arterial thromboses.
There was a significant association between psV and RI and with arterial complications. Range interval psV was inferior in partial-liver compared to total-liver transplants and in paediatric transplants compared to adults. A value of psV ≤30 cm/s after transplantation correlated with a risk of acute vascular complication and it was frequently observed after the 3rd day. A reduction of RI usually happened 1-2 days after the psV decrease.

Conclusion: Normal reference psV range is inferior in paediatric liver transplant compared to that described in adults.
psV and RI correlate with arterial complications in the postoperative period. psV ≤30 cm/s value can predict potential acute arterial complications before RI.
CT should be performed to confirm US findings when psV ≤30 cm/s.
Limitations: A retrospective study.

RPS 212-13 11:42
Dynamic MR lymphangiography to find the location of chylus leakage in children
W. M. Klein, B. Verhoeven, F. Udink Ten Cate, L. J. Schultze Kool; *Nijmegen/NL (willemijn.klein@radboudumc.nl)*

Purpose: Chylus leakage can occur in cases with congenital lymphatic malformations or flow abnormalities. The loss of proteins and fat leads to severe morbidity, social impairment, and mortality. Standard treatment is a low-fat diet, drainage, and ultimately radiological or surgical intervention.
Dynamic MRI lymphangiography (DMRL) is a minimal-invasive imaging method to detect the location of leakage and therefore guide intervention. We present this innovative technique in paediatric cases.
Methods and materials: Paediatric patients with severe congenital chylus leakage and failing conservative treatment were included. Lower inguinal lymph nodes were punctured using ultrasound guidance with the placement of 25G spinal needles. The MRI scan consisted of T1- and T2-weighted imaging of the thorax and abdomen, followed by intranodal injection of gadolinium and dynamic lymphangiography demonstrating the lymph flow and any leakage.
Results: 6 children were included who underwent DMRL. 2 boys with scrotal chylus leakages appeared to have retroperitoneal retrograde flow; both improved with interventional embolisation. One boy with severe chylothorax showed mediastinal leakage, which was successfully embolised. A syndromal boy showed an abnormal thoracic duct for which we have no treatment options. Two Noonan-like neonates with severe chylothorax showed extensive leakages. They had embolising interventions, however, leakages could not be stopped and both eventually died.
Conclusion: DMRL is a minimally invasive method to demonstrate flow and leakage of lymph or chylus and can serve as well as a guiding map for intervention.
More knowledge of congenital lymph malformations and flow abnormalities is needed to help more patients who have no current treatment options.
Limitations: This is a pilot study with a small number of patients.

A comparison of image quality between single- and split-filter dual-energy paediatric abdominal CTs for radiation dose optimisation: a phantom study
K. Zhang[1], Y. Dou[2], W. Shen[1]; *[1]Tianjin/CN, [2]Beijing/CN (13516258019@163.com)*

Purpose: To compare the image quality of abdominal split-filter dual-energy CT (SF-DECT) to single-energy CT (SECT) and optimise the radiation dose using the paediatric phantom.
Methods and materials: The abdomen regions of an anthropomorphic phantom representing a 5-year-old patient were scanned using SECT and SF-DECT retrospectively in different radiation dose groups. SF-DECT scans were reconstructed into composed images. Objective image quality, including CT values, image noise and contrast-to-noise (CNR) of liver and kidney, was measured and compared between SF-DECT and SECT in every radiation dose group. The results between SF-DECT and SECT were compared using the Mann–Whitney U test. After performing a Kruskal–Wallis test, objective image quality parameters were analysed among the different dose groups.
Results: Image noise of SF-DECT was significantly lower than SECT in 3 mGy and 4 mGy ($p < 0.001$), and there was no difference in the 1 mGy and 2 mGy group (p=0.925 and 0.547, respectively). CNR of the liver and kidney of SF-DECT was significantly higher than SECT in all dose groups, except CNR of kidney in the 1 mGy group (p=0.862) and CNR of the liver in the 1 mGy and 2mGy group. The image noise decreased with the increase of dose in SF-DECT with the CNR increasing ($p < 0.001$). Furthermore, there were no differences between 3 mGy and 4 mGy groups for both the image noise and CNR.
Conclusion: The use of split-filter dual-energy in paediatric abdominal CT could provide comparable, even superior image quality at different levels of radiation dose compared to standard SECT.
Limitations: This is a phantom study that does not fully represent the condition of real children. We do not implement the subjective score of image quality.
Ethics committee approval: n/a

A comparison of image quality and radiation dose between split-filter dual-energy images and single-energy images in paediatric abdominal CTs
Y. Gao, Y. Chen, Y. Dai; *Guangzhou/CN (gyinger423@163.com)*

Purpose: Few studies have reported the use of split-filter dual-energy CT (SF-DECT) in paediatric patients. This study aims to compare image quality and radiation dose of paediatric abdominal SF-DECT to single-energy CT (SECT) with automatic voltage selection (ATVS).
Methods and materials: 30 paediatric patients prospectively underwent abdominal SF-DECT (70Kev and 150Kev, Force, Siemens). Another 30 paediatric patients who received abdominal SECT with ATVS (80kv for baby<1y and 100kv for others, Aquilion One, Toshiba) were also reviewed. Objective and subjective image quality were compared. CNR and FOM were separately calculated for the liver (CNR_{liv}) and the portal vein (CNR_{pv}). Size-specific dose estimate (SSDE) was used to compare the radiation dose. A Mann-Whitney U test was used to compare the ranked data. T-tests were used to compare the numeric data.
Results: The radiation dose was 57% lower for SF-DECT compared to SECT (22.7±3.7 vs 9.6±2.4, p<0.01). Though CNR_{liv} and CNR_{pv} and noise were slightly higher in DECT images (15.6±3.6 vs 11.5±1.5, 2.2±0.9 vs 1.6±0.6, and 12.3±1.9 vs 15.3±1.6, p<0.05), FOM_{liv} and FOM_{pv} were equal between the two groups (12.9±8.8 vs 14.6±4.2 and 0.25±0.20 vs 0.31±0.28, p>0.05). Subjective artefacts, noise, sharpness, and diagnostic confidence were equal between the two groups (p>0.05).
Conclusion: The use of split-filter dual-source dual-energy CT images can significantly reduce the radiation dose compare to SECT with ATVS, which still provides comparable objective and subjective image quality.
Limitations: Further multicentre studies with larger sample sizes are needed.
Ethics committee approval: This study was approved by the IRB of the First Affiliated Hospital, Sun Yat-sen University.
Funding: No funding was reveived for this work.

Gadolinium retention in the human body: the awareness of radiologists and impacts on daily radiology practice

M. E. Adin; *Istanbul/TR (emin.adin@gmail.com)*

Purpose: To assess the awareness and impact of awareness of the emerging gadolinium retention data on the preferences of radiologists in daily radiology practice and to demonstrate gadolinium-enhanced MRI exercise diversities across radiologists with respect to background factors like the type of affiliations, experience in radiology, attendance to scientific events, and scope of daily radiology practice.
Methods and materials: A 21 question survey was addressed to radiologists who were at least one year from completing residency and/or fellowship training. A closed survey link was emailed to the members of the Turkish Society of Radiology and was active for four weeks (October-November 2018). The results were presented as descriptive data and grouped findings were statistically analysed.
Results: 1,133 eligible members received the emails and 335 radiologists completed the survey. 89% of respondents were aware of emerging gadolinium retention data. 45% of respondents decreased the amount of gadolinium administration and/or the frequency of gadolinium-enhanced scans since the emergence of gadolinium retention data. 88% of radiologists, who were aware of the molecular classification, used a macrocyclic agent. 39% (n=130) switched to a macrocyclic agent from linear agents within the last three years. Radiologists' attitude toward gadolinium retention was significantly associated with their background factors. The observance of HDN due to gadolinium retention was uncommon in daily practice (64% never observed).
Conclusion: Gadolinium retention data affected radiologists' approach to contrast-enhanced MRI scans, mostly in the form of switching to a macrocyclic gadolinium agent and increasing the indicative threshold for gadolinium administration. The translation of recent gadolinium retention data to clinical practice varied among radiologists with respect to background factors like experience in radiology and subspeciality training.
Limitations: The study was conducted in a single European country and may not necessarily be applicable worldwide.
Ethics committee approval: n/a
Funding: No funding was received for this work.

MRI evidence of progressive gadolinium deposition in bone during monthly triple-dose gadolinium CE-MRIs and its relationship to hypophosphataemia

J. J. Debevits[1], D. Bageac[1], P. Dicamillo[2], R. Munbodh[1], R. Wu[1], S. Dhin-Jalbut[3], L. J. Wolansky[1], D. Karimeddini[1]; [1]*Farmington, CT/US,* [2]*Cleveland/US,* [3]*New Brunswick/US (debevits@uchc.edu)*

Purpose: To investigate for MRI evidence of calvarial gadolinium (Gd) deposition during monthly high-dose contrast administration over two years and at 10 years, and to interrogate whether osseous Gd deposition correlates with hypophosphataemia.
Methods and materials: The study cohort consisted of a retrospective analysis of 67 patients with MS or CIS who had participated in the BECOME trial and who received monthly off-label triple-dose gadopentetate dimeglumine (0.3mmol/kg) enhanced MRIs for up to 26 months. Pre-MRI blood samples were collected. An ROI mask was created in the diploic space (DS) using manual segmentation and co-registered to track signal intensity (SI) changes on fat-suppressed non-Gd T1-weighted. S/N ratios (SI Bone/SI Air) established an average SI change over time. To evaluate the association between SI changes and hypophosphataemia, we performed linear mixed regression modelling with a random intercept to test the linear trend in the SI change between the groups with and without hypophosphataemia.
Results: The monthly rate of T1-SI change in the diploic space during the first 14 months of triple-dose Gd administration was S/N=0.039 (S.E. 0.008; p<0.0001). ~10 years after the study termination, diploic S/N decreased to pre-study levels (N=28). Patients who developed hypophosphataemia (<2.5 mg/dl) at least once experienced a significantly slower increase of T1-hyperintensity compared to patients without hypophosphataemia (mean monthly S/N difference=0.034; p=0.037). Those who experienced >=1 episode of moderate hypophosphataemia (<2.0 mg/dl) did not experience any significant change in monthly diploic S/N.
Conclusion: Monthly administration of triple-dose Gd is associated with progressive T1 hyperintensity in the cranial diploic space, suggesting Gd deposition in bone. This change was lower in patients who developed hypophosphataemia and washed out after 10 years.
Limitations: The volume averaging, segmentation technique, and updates in MRI technique.

Gadolinium-based contrast agent in the aqueous chamber of infantile healthy eyes promptly after intravenous injection

K. Deike-Hofmann[1], P. von Lampe[2], H.-P. Schlemmer[1], N. Bechrakis[2], C. Kleinschnitz[2], M. Forsting[2], A. Radbruch[2]; [1]*Heidelberg/DE,* [2]*Essen/DE (k.deike@dkfz-heidelberg.de)*

Purpose: To investigate whether a gadolinium-based contrast agent (GBCA) can be detected on T1-weighted MRIs in the anterior chamber of infantile eyes promptly post-injection (p.i.).
Methods and materials: Orbital MRIs of 200 healthy eyes of children suffering from retinoblastoma were assessed. The MRIs were performed with orbital coils with the children under general anaesthesia. Differences of signal intensity ratios (ΔSIRs) of the AC to the lense were determined between pre- and post-contrast-enhanced T1-weighting (Dotarem®, 0.1 ml/kg, mean p.i. time=12min).
Results: A highly significant signal intensity increase was found in the AC of healthy eyes 12min p.i. (median ΔSIR=+0.08, p<0.0001). In addition, gadolinium-enhancement showed a strong negative correlation with children's age in multivariate analysis with adjustment for p.i. time (p<0.0001).
Conclusion: GBCA leakage into the AC of healthy infantile eyes was found promptly after injection. The negative correlation between the patient's age and GBCA-enhancement might be explained by a maturation process of the blood-aqueous barrier or Schlemm's canal. Future studies should assess the duration and potential diagnostic applications as well as possible safety concerns of gadolinium presence in the AC.
Limitations: T1-weighting is semi-quantitative in nature, that's why the calculated ΔSIRs do not allow conclusions to be drawn regarding true GBCA concentrations. Furthermore, serial p.i. scans would have been desirable as the concentration peak of the GBCA in the AC might have exceeded the p.i. time. However, ΔSIRs of the longest p.i. times did not clearly surpass the other ΔSIRs, which suggests that AC enhancement might have already reached saturation.
Ethics committee approval: This retrospective study was approved by the ethics committee of the University of Essen.
Funding: No funding was received for this work.

RPS 311-4 14:28

High signal intensity in the globus pallidus (GP) and dentate nucleus (DN) on unenhanced T1-weighted magnetic resonance images: an assessment of two macrocyclic gadolinium-based agents

S. Rozenblatt[1], J. Luckman[2]; [1]*Tel Aviv/IL,* [2]*Ramat Hasharon/IL (rozshira@gmail.com)*

Purpose: To compare changes in the signal intensity (SI) measured at the dentate nucleus (DN) and globus pallidus (GP) on unenhanced T1-weighted magnetic resonance (MR) images in patients who received gadobutrol (gadavist) to those who received gadoterate meglumine (dotarem).
Methods and materials: 47 patients with CNS tumours who had undergone at least 4 MRI exams were divided into two groups. Group 1=25 patients who underwent gadoterate meglumine-enhanced MR imaging. Group 2=22 patients who underwent gadobutrol-enhanced MR imaging. Region of interest measurements were applied to unenhanced T1-weighted images by two radiologists. GP to the thalamus (TH), DN to middle cerebellar peduncle (MCP) SI ratio, and relative change (Rchange) between the initial and final examinations were calculated for each patient. The differences in the mean Rchange were analysed using a non-parametric regression test. The relationship between Rchange and the number of enhanced MR imaging examinations was evaluated using a Pearson correlation coefficient.
Results: Gadobutrol-enhanced MR imaging showed a significant increase in Rchange for DN-MCP (P<0.004). Contrarily, gadoterate meglumine-enhanced MR imaging showed no significant increase in Rchange for DN-MCP. There was a significant linear association between the number of MRI examinations and an

increase in Rchange for DN-MCP (r=0.56, P=0.001) and for GP-TH (r=0.53, P=0.007) in patients who received gadobutrol.
Conclusion: A statistically significant dose-dependent T1-weighted signal increment observed in DN and GP is associated with multiple gadobutrol administrations but not with gadoterate meglumine administrations.
Limitations: A retrospective design consisting of patients with CNS tumours and damaged blood brain barrier, lacking a control group of patients who never received GBCAs.
Ethics committee approval: The institutional review board approved this study.
Funding: No funding was received for this work.

RPS 311-5 14:34
The absence of T1 hyperintensity in the brain of high-risk iron-loaded thalassemia patients after multiple administrations of high-dose gadobutrol
A. Meloni[1], D. Montanaro[1], M. C. Resta[2], P. Keilberg[1], L. Pistoia[1], T. Casini[3], S. de Cori[1], V. Positano[1], A. Pepe[1]; [1]Pisa/IT, [2]Bari/IT, [3]Florence/IT
(alessia.pepe@ftgm.it)

Purpose: We evaluated signal changes in the dentate nucleus, globus pallidus, pons, and thalamus (normalised to the deep cerebellum white matter) in T1-weighted magnetic resonance (MR) images after serial injections of gadobutrol in patients with thalassemia without neurological lesions.
Methods and materials: Three study groups were scanned at both 1.5T and 3T: 15 thalassemia patients who were transfused and chelated with ≥4 gadobutrol administrations at a high dose (0.2 mmol/Kg per scan) for cardiovascular MR, 8 thalassemia patients, and 13 healthy subjects who never received gadolinium-based contrast agents (GBCA). The iron overload was assessed by the T2* technique.
Results: Demographics were comparable among the groups. Signal intensity (SI) ratios and T2* values at 1.5T in all regions were comparable among the three groups. No correlation was detected between SI ratios and T2* values. In patients with more than 4 GBCA administrations, the SI ratios were not associated with the total cumulative gadolinium dose and the total number of contrast-enhanced examinations. The SI ratios at 1.5T were significantly higher than those obtained at 3T. Moreover, no correlation was found between SI ratios at 1.5T and 3T.
Conclusion: Our study describes the lack of increased SI in T1-weighted MR images after repeated administrations of gadobutrol for cardiovascular MR studies in a high-risk population (high dose per scan, iron overload that can facilitate the transmetallation of gadolinium). A potential role of chelation therapy cannot be excluded. Moreover, SI ratios in the sampled anatomical areas differ between 1.5T and 3T machine, which is to be taken into account in trials or group analysis studies.
Limitations: The limited sample size.

No changes in T1 relaxometry after a mean of eleven administrations of gadobutrol
K. Deike-Hofmann[1], J. Reuter[1], R. Haase[1], T. Kuder[1], D. Paech[1], M. Forsting[2], H.-P. Schlemmer[1], C. P. Heußel[1], A. Radbruch[1]; [1]Heidelberg/DE, [2]Essen/DE
(k.deike@dkfz-heidelberg.de)

Purpose: Quantitative T1 relaxometry is the benchmark in imaging potential gadolinium deposition and is known to be superior to semi-quantitative signal-intensity-ratio analyses. However, T1 relaxometry studies are rare, commonly limited to a few target structures, and reported results are inconsistent.
We systematically investigated quantitative T1 relaxation times (qT1) of a variety of brain nuclei after serial application of gadobutrol.
Methods and materials: Retrospectively, qT1 measurements were performed in a patient cohort with a mean number of 11 gadobutrol applications (n=46) compared to a control group with no prior GBCA administration (n=48). 13 target structures were evaluated including the dentate nucleus, globus pallidus (GP), thalamus, hippocampus, putamen, caudate, amygdala, and frontal white matter. Subsequently, a multivariate regression analysis was performed.
Results: No assessed site revealed a significant correlation between qT1 and the number of gadobutrol administrations in multivariate regression analyses. A significant negative correlation between qT1 and age was found for the GP and thalamus ($p<0.05$ each).
Conclusion: No T1 relaxation time shortening was found in any assessed brain structure after the serial injection of 11 doses gadobutrol.
Limitations: Unknown injections of GBCAs cannot definitely be excluded. However, a potentially higher GBCA exposition would have increased the probability of qT1 changes even more. Moreover, cerebral involvement was more frequent in the GBCA group. Therefore, this potential confounder was included in the multivariate analysis even though this would have theoretically just meant an even higher vulnerability for cerebral GBCA leakage and deposition.
Ethics committee approval: Written informed consent was waived due to the retrospective character of this institutional review board approved study.
Funding: This study was financially supported by Bayer AG (Berlin, Germany). The authors had sole control of the data and the information submitted for publication.

A comparison of the effects of gadolinium-based contrast agents on neuronal cells
M. A. Erdogan, M. Apaydin, G. Armagan, D. Taskiran; *Izmir/TR*
(meldapaydin@gmail.com)

Purpose: Gadolinium-based contrast agents (GBCAs) are widely used in magnetic resonance imaging (MRI). Recently, an increased signal intensity has been reported in specific brain areas such as the dentate nucleus, globus pallidus, and cerebellum after repeated administrations of GBCAs. The aim of the study was to investigate the toxic effects of GBCAs on neuronal cells by using SH-SY5Y neuroblastoma cells.
Methods and materials: For toxicity assays, SH-SY5Y cells were seeded in 96-well dishes (5,000 cells/well) and incubated with different doses (0-1,000 µM) of several macrocyclic (gadoteric acid and gadobutrol) and linear GBCAs (gadoversetamide, gadopentetic acid, gadodiamide, and gadoxetic acid) for 72 hours. Cell viability and mitochondrial activity were evaluated by using MTS assay, colony-forming assay, and Hoechst staining. Alpoptotic markers, Bax and Bcl-2, were assessed by Western blotting. The results were expressed as mean ± SEM. A $p<0.05$ was accepted as statistically significant.
Results: Both macrocyclic and linear GBCAs significantly and dose-dependently reduced cell viability in neuronal cells compared to untreated cells. Cell viability was measured between 89.49±4.09 % and 60.99±0.77% in GBCAs-treated groups. In addition, neurotoxicity was more prominent in linear GBCAs-treated cultures ($p<0.0005$). Bax protein levels were increased in GBCA-treated cells, especially those treated with linear agents, whereas Bcl-2 expression was decreased concomitantly.
Conclusion: The results of the study indicate that exposure to specific GBCAs, even at low micro-molar concentrations, may have detrimental effects on neuronal survival. Further investigations are required to clarify the molecular mechanism underlying GBCAs-induced cell death.
Limitations: The in vitro study should be supported an in vivo study.

Dynamic susceptibility MR perfusion imaging of the brain: not just a question of contrast molarity
V. Panara, P. Chiacchiaretta, M. Parenti, M. Caulo; *Chieti/IT*
(valepana@libero.it)

Purpose: Dynamic-susceptibility-contrast (DSC) perfusion (PWI) MR is based on the quantification of the signal loss on T2*-weighted images during the first pass of a contrast bolus through the brain immediately after injection of a

gadolinium (Gd)-based contrast agent. Gd-based contrast agents with higher molarity are generally considered more suitable for DSC imaging, although a greater loss of signal intensity can be achieved using a faster bolus of a less viscous contrast agent that might compensate for lower molarity. The aim of this cross-sectional study was to retrospectively analyse and compare DSC PWI studies performed with gadobutrol (1M) and gadoteridol (0.5M) on the healthy hemisphere of patients with brain tumours.
Methods and materials: DSC-PWI MRs of 36 patients (9 pts gadobutrol flow 4 ml/s, 15 pts gadoteridol 4 ml/s, and 12 pts gadoteridol 6 ml/s) with brain tumours involving only one hemisphere were retrospectively evaluated. A quantitative assessment was performed. A neuroradiologist manually positioned 4 ROIs (2 in proximity to MCA and 2 in proximity of the occipital cortex) in the healthy hemispheres. A simplified formulation of the gamma-variate (GV) model function was applied to estimate the mean of maximum (peak), AUC, and FHWM of the perfusion parameter derived from DR2* signal. Each derived CBV parametric map was qualitatively reviewed by two neuroradiologists by assigning a 4-point imaging quality score.
Results: No quantitative nor qualitative differences between the two contrast agents were observed in terms of peak, AUC, FHWM, and quality score. The agreement between readers was excellent (k=0.81).
Conclusion: In this DSC MRI study, no significant differences were found between gadobutrol and gadoteridol in terms of quantitative and qualitative perfusional parameters.
Limitations: A single-center cross-sectional study with a small group of patients.
Ethics committee approval: n/a
Funding: No funding was received for this work.

Impact of the novel contrast agent gadopiclenol on decision making in patients with brain metastases

F. A. Giordano[1], J. Fleckenstein[1], M. Eckl[1], L. Hoppen[1], F. Wenz[1], M. Essig[2], M. Bendszus[3]; [1]*Mannheim/DE,* [2]*Winnipeg, MB/CA,* [3]*Heidelberg/DE (Frank.Giordano@umm.de)*

Purpose: Brain metastases (BM) are either treated with stereotactic radiosurgery (SRS) or whole-brain radiotherapy (WBRT), whereas the number of lesions detected is crucial for choosing adequate modality. Here we evaluate the impact on decision making and treatment planning of BM using the novel contrast agent, gadopiclenol.
Methods and materials: This is a post-hoc analysis of data from a phase IIb study, where patients underwent two separate MRI scans with gadopiclenol and gadobenate dimeglumine, both at 0.1 mmol/kg. Patients with ≥1BM detected in any scan were subjected to an investigator-blinded analysis. Radiation treatment plans (SRS or WBRT) were calculated for both MRIs, with the gross tumour volume (GTV) indicating the contrast-enhancing aspects of the tumour and the V_{12Gy} indicating the volume receiving ≥12Gy.
Results: A total of 13 patients (31% females) were eligible for this analysis. In 2 patients, gadopiclenol-based MRI scanning detected additional BMs that were undetected with gadobenate-based scans. In one patient, a single metastasis was seen only with gadopiclenol, changing the decision from no treatment to SRS. In the second patient, gadopiclenol detected 5 additional metastases, changing the decision from SRS to WBRT. In addition, the mean GTV was higher in therapy plans calculated on gadopiclenol-based scans than on gadobenate-based scans (4.74 vs 4.32 cm^3), indicating a different appearance of BM sizes. Logically, the mean V_{12Gy} was also higher with gadopiclenol than with gadobenate-based scans (14 vs 11 cm^3).
Conclusion: Gadopiclenol improved the detection of BM in 2 of 13 patients, which led to a change in treatment decisions (from no therapy to SRS and from SRS to WBRT) and to treatment plans with larger GTVs.
Limitations: The small patient numbers.

The value of 4D-MR angiography at 3T compared to DSA for the follow-up of treated dural arteriovenous fistulas

B. Dissaux[1], F. Eugene[2], J. Ognard[1], J.-C. Gentric[1], J.-C. Ferre[2]; [1]*Brest/FR,* [2]*Rennes/FR (brieg.dissaux@gmail.com)*

Purpose: The value of 4D-MRA for the follow-up of treated dural arteriovenous fistulas (DAVF) has rarely been evaluated.
We hypothesized that this technique could be valuable for the follow-up and post-therapeutic assessment of DAVF. The purpose of this study was to evaluate the performance of 4D-MRA at 3T for the follow-up of patients with treated DAVF.
Methods and materials: Patients treated for a DAVF in two centres from 2008-2019 were included if they met the following criteria: DAVF treated by embolisation or surgery and imaging during the follow-up with both 4D-MRA at 3T and DSA performed within 6 months. One reader analysed DSA and two readers analysed 4D-MRA.
For both modalities, 4D-MRA and DSA, readers first evaluated in a binary fashion whether a residual/recurrent DAVF was present or not. Then, when present, each residual/recurrent DAVF was classified according to the criteria of Cognard et al. The intertechnic agreement was assessed for detection of residual/recurrent DAVF and bleeding risk grading using Cohen's kappa.
Results: We recorded 59 couples of examinations for 52 patients with a median age of 64 years (range 24-86 years). Sensibility, specificity, predictive positive value, and predictive negative values of 4D-MRA for the detection of a residual/recurrent DAVF were 58.3% (95% CI: 41.8% to 74.8%) and 91.4% (95% CI: 83.9% to 98.8%), respectively. Predictive positive value and predictive negative values of 4D-MRA for the detection of a residual/recurrent DAVF were 82% (95% CI: 71.6% to 93%) and 76% (95% CI: 63.7% to 88.6%). The intertechnic agreement was moderate with k=0.5 (95% CI: 0.3 to 0.7).
Conclusion: 4D-MRA at 3T could be interesting for the follow-up of treated DAVF.
Limitations: A retrospective study.

The application of neurovascular 4Dflow MRI in the assessment of haemodynamics on patients with Moyamoya disease

J.-G. Zhang, Z. Li*; Chengdu/CN (zjgscuhx@126.com)*

Purpose: To analyse and compare the change of haemodynamics between pre and postoperation on patients of Moyamoya disease (MMD) using neurovascular 4Dflow MRI (phase-contrast MRA).
Methods and materials: In this study, 28 MMD patients who underwent an operation of encephaloduroarteriosynangiosis (EDAS) were enrolled. We analysed the haemodynamics of these patients by 4Dflow MRI scanning and compared the parameters between pre and postoperation including wall shear stress (WSS), flow rate, and relative pressure.
Results: The WSS and relative pressure of postoperation measured at the distal part of the internal carotid artery (ICA), the initial part of the anterior cerebral artery (ACA), and the middle cerebral artery (MCA) were significantly lower than those of preoperation (all $P < 0.05$). The flow rate significantly increased (all $P < 0.05$) after the operation.
Conclusion: The operation of EDAS can effectively improve the blood flow of MMD patients and decrease the pressure on the cerebral vascular wall. As a non-invasive, multi-parameter, and quantitative imaging technique, 4Dflow MRI has the potential to improve the diagnosis and assessment of cerebrovascular diseases.
Limitations: The sample size was small.
Ethics committee approval: This study was approved by the Ethics Committee of West China Hospital and written informed consent was obtained.

Deep learning-based automated detection of cerebral aneurysms: a comparison of reading performance between radiologists and neurosurgeons

S. Koshino, A. Choppin, M. Suzuki, T. Takamura, Y. Adachi, O. Abe, S. Aoki; *Tokyo/JP (saori.koshino@gmail.com)*

Purpose: To demonstrate the effects of deep learning-based computer-aided detection (CAD) on the reader's performance for the detection of cerebral aneurysms in MR angiography (MRA).
Methods and materials: 200 brain MRA datasets (93 men and 107 women; mean age, 64.7 years±15.3 [standard deviation]; mean aneurysm size, 3.3 mm±1.74), 50 with unruptured cerebral aneurysms and 150 without, were acquired on scanners from 3 different vendors at 1.5 or 3T and were retrospectively evaluated. 20 physicians (10 radiologists including 5 certificated radiologists and 5 non-certificated radiologists, and 10 neurosurgeons including 4 certificated neurosurgeons and 6 non-certificated neurosurgeons) were asked to detect cerebral aneurysms on MRA scans and associated projection images without and with CAD using ResNet–18, a convolutional neural network. The observers' performance was evaluated using a jackknife free-response receiver operating characteristics (JAFROC) analysis.
Results: The figure-of-merit (FOM) values computed using the JAFROC program significantly improved from 0.717 without CAD to 0.751 with CAD for all readers (P<0.001). The average sensitivity increased from 68.2% to 77.2% for all readers, whereas the average specificity decreased from 79.4% to 72.1%. On subgroup analyses, the FOM values increased from 0.647 to 0.697 for non-certificated radiologists, from 0.799 to 0.822 for certificated radiologists, from 0.645 to 0.681 for non-certificated neurosurgeons, and from 0.810 to 0.836 for certificated neurosurgeons. There was no statistical significance in the reading performances between radiologists and neurosurgeons both without CAD (P=0.826) and with CAD (P=0.753). However, the performances between non-certificated neurosurgeons and certificated neurosurgeons with CAD showed a significant difference (P=0.0479).
Conclusion: The diagnostic accuracy of cerebral aneurysms improved for radiologists and neurosurgeons with CAD.
Limitations: n/a

Value of histogram analysis from a stretched exponential model on diffusion-weighted imaging in evaluating clinically significant prostate cancer

K. E. Kim, C. K. Kim; *Seoul/KR (ganne1113@gmail.com)*

Purpose: To evaluate the usefulness of histogram analysis of a stretched exponential model (SEM) on diffusion-weighted imaging (DWI) in evaluating clinically significant prostate cancer (CSC).
Methods and materials: 85 patients were enrolled who had prostate cancer and underwent 3-T multiparametric MRI, followed by radical prostatectomy. Histogram parameters of the tumour from the SEM (distributed diffusion coefficient [DDC] and alpha) and the monoexponential model (MEM; apparent diffusion coefficient [ADC]) were evaluated. The associations between parameters and a Gleason score (GS) or prostate imaging reporting and data system (PI-RADS) v2 were evaluated. The area under the receiver operating characteristics curve (AUC) was calculated to evaluate the diagnostic performance of parameters in predicting CSC.
Results: The values of histogram parameters of DDC and ADC were significantly lower in patients with CSC than in patients without CSC (P<0.05), except for skewness and kurtosis. The value of the 25th percentile of alpha was significantly lower in patients with CSC than in patients without CSC (P=0.014). Histogram parameters of ADC and DDC had significant weak to moderate negative associations with the Gleason score (GS) or PI-RADS v2 (P<0.001), except for skewness and kurtosis. For predicting CSC, the AUCs of mean ADC (0.856), 50th percentile DDC (0.852), and 25th percentile alpha (0.707) yielded the highest values compared to other histogram parameters from each group.
Conclusion: Histogram analysis of the SEM on DWI may be a useful quantitative tool for evaluating CSC. However, the SEM did not outperform the MEM.
Limitations: A retrospective study at a single institution, inevitable errors for quantitative measurements, and no application of multiexponential diffusion attenuation.
Ethics committee approval: Our institutional review board approved this retrospective study and the requirement for informed consent was waived.
Funding: No funding was received for this work.

Individualised prostate cancer risk assessment using MRI-based deep learning compared to multivariate risk modelling including PI-RADSv2: a decision curve analysis

D. Deniffel[1], N. Abraham[1], K. Namdar[1], S. Motamed[1], I. Gujrathi[2], E. Salinas-Miranda[1], F. Khalvati[1], M. A. Haider[1]; [1]*Toronto/CA,* [2]*Boston/US (ddeniffel@lunenfeld.ca)*

Purpose: To compare the clinical utility of a convolutional neural network (CNN)-based model applied to multiparametric MRI (mpMRI) with a risk model (RM) combining PI-RADSv2 and clinical parameters, for risk assessment of clinically significant prostate cancer (csPCa; ISUP≥grade 2).
Methods and materials: We retrospectively analysed 499 patients who underwent mpMRI and MRI-targeted biopsy. A 3D-CNN classifier was trained on diffusion-weighted MRIs and ADC maps of 400 patients (training cohort). CNN output probabilities were recalibrated to provide interpretable risk estimates for csPCa. A subset of the training cohort (n=290) was used to build an RM incorporating PI-RADSv2 scores and clinical parameters (prostate volume, PSA density, and age). Model discrimination in the validation cohort (n=99) was compared using the area under the ROC curve (AUC). Clinical usefulness of both models and PI-RADSv2 (cut-off≥4) was assessed using decision curves illustrating the clinical net benefit, which balances the benefits of detecting csPCa against the harms of unnecessary biopsies.
Results: The CNN's discrimination (AUC=0.83) was not superior to the RM (AUC=0.83) (p=0.95); however, across the entire range of clinically relevant risk thresholds (5-20%), the CNN had a higher net benefit than PI-RADSv2 and the RM. The CNN showed a clear net benefit at a risk threshold ≥5% for biopsy referral, resulting in a biopsy reduction of 21% (21/99) without missing csPCa (0/37). Applying a risk threshold ≥10% for the CNN and RM resulted in a 25% (25/99) and 7% (7/99) biopsy reduction, missing 3% (1/37) and 0% (0/37) of csPCas, respectively.
Conclusion: Our CNN model with calibrated risk estimates could reduce biopsies by 21% without missing any csPCa and is potentially superior to a multivariate RM combining PI-RADSv2 and clinical parameters.
Limitations: A single-centre, retrospective study.
Ethics committee approval: IRB-approved study.

Independent validation of deep learning-based automated patient assessment on prostate MRI: the influence of image co-registration

P. Schelb[1], X. Wang[1], S. Kohl[1], M. Görtz[1], M. Wiesenfarth[1], M. Hohenfellner[1], H.-P. Schlemmer[1], K. H. Maier-Hein[1], D. Bonekamp[2]; [1]*Heidelberg/DE,* [2]*Hirschberg/DE*

Purpose: To apply a previously developed convolutional neural network (CNN) ensemble to a new set of prostate MRI examinations from consecutive patients for further validation and to examine the influence of different image co-registration approaches on CNN predictions.
Methods and materials: 3 Tesla MRI from 147 consecutive patients with 251 MR lesions (70 sPC positive) were included. DICOM images of T2-weighted, DWI b=1500 s/mm2, and corresponding ADC maps were analysed by a fully automatic analysis pipeline consisting of DWI/ADC to T2W image co-registration utilising three approaches (rigid, affine, and b-spline) prior to evaluation by the CNN ensemble. Maximum CNN tumour map probability above 0.33 (calibrated previously to correspond to PI-RADS>=4 assessment) indicated positive, otherwise regarded as negative. Both individual and combined maximum probability of the three co-registrations was evaluated.
Results: Sensitivity/specificity/accuracy was 65%/84%/75% for rigid, 71%/73%/72% for b-spline, 73%/72%/71% for affine, and 77%/70%/71% for combined compared to 89%/60%/73% for PI-RADS>=4. Accuracy (p=0.87), sensitivity (p=0.08), and specificity (p=0.36) of CNN predictions on combined co-registration were not significantly different from PI-RADS>=4 assessment.
Conclusion: The best CNN sensitivity was achieved by combined registration, highlighting the importance of registration on the performance for detection of small lesions. While achieving a lower sensitivity than PI-RADS at higher specificity, the CNN approach showed promising performance. Importantly, lowering the probability threshold of the CNN ensemble could increase the sensitivity more to match the specificity of PI-RADS. However, more data is required to justify adjusting the threshold.
Limitations: This is a single institution, single scanner CNN model, which requires multi-institutional, multi-scanner validation in the future, however, benefits from standardised conditions in the current setting.
Ethics committee approval: Approved by an ethics committee. Written informed consent waived (S-156/2018).

PI-RADS 3 lesions: role of prostate MRI texture analysis in the identification of prostate cancer

R. Cannella, D. Giambelluca, F. Vernuccio, A. Comelli, A. Pavone, L. Salvaggio, M. Midiri, R. Lagalla, G. Salvaggio*; Palermo/IT (rob.cannella89@gmail.com)*

Purpose: To determine the diagnostic performance of the texture analysis of prostate MRI for the diagnosis of prostate cancer among PI-RADS 3 lesions.
Methods and materials: 43 patients with at least one PI-RADS 3 lesion on prostate MRI performed between June 2016 and January 2019 were retrospectively included. The reference standard was a pathological analysis of radical prostatectomy specimens or MRI-targeted biopsies. Texture analysis extraction of target lesions and non-lesional prostate glands was performed on axial T2-weighted images and ADC maps using a radiomic software. Lesions were categorised as prostate cancer (Gleason score≥6) and no prostate cancer. Statistical analysis was performed using the generalised linear model (GLM) regression and the discriminant analysis (DA). AUROC with 95% C.I. were calculated to assess the diagnostic performance of standalone features and predictive models for the diagnosis of prostate cancer.
Results: The analysis of 46 PI-RADS 3 lesions (i.e. 27 [58.7%] no prostate cancers; 19 [41.3%] prostate cancers) revealed 9 and 6 independent texture parameters significantly correlated with the final histopathological results on T2-weighted and ADC maps images (r_{pb} of 0.274-0.387 and 0.293-0.371), respectively. The resulting GLM and DA predictive models for the diagnosis of prostate cancer yielded an AUROC of 0.775 and 0.779 on T2-weighted images or 0.815 and 0.821 on ADC maps images.
Conclusion: Texture analysis of PI-RADS 3 lesions on T2-weighted and ADC maps images helps to identify prostate cancer. The good diagnostic performance of the combination of multiple radiomic features for the diagnosis of prostate cancer may help in predicting lesions where aggressive management may be warranted.
Limitations: Retrospective analysis, only pathologically proven lesions, and small sample size.
Ethics committee approval: IRB-approved study, informed consent was waived.
Funding: No funding was received for this work.

RPS 307-5 14:24

Added value of quantitative DCE imaging on mpMRI prediction of stage ≥pT3 prostate cancer

A. Cretese, F. Bonato, L. Cereser, G. Como, C. Zuiani, R. Girometti*; Udine/IT (rgirometti@sirm.org)*

Purpose: To investigate whether quantitative dynamic contrast-enhanced imaging (DCE) can improve the diagnosis of pathological stage ≥T3 (≥pT3) when staging prostate cancer (PCa) with multiparametric magnetic resonance imaging (mpMRI).
Methods and materials: Over a three year period, we retrospectively included 63 patients with biopsy-proven PCa who underwent preoperative mpMRI on 3.0T equipment, using a prostate imaging reporting and data system version 2 (PI-RADSv2)-compliant protocol. The study included two readers in consensus (3 and 10 years of experience), blinded to final pathology, manually drawn volumetric regions of interest over PI-RADS ≥2 observations, calculating the volume transfer constant (K^{trans}) and rate constant (K_{ep}) with the Tofts extended model. Readers assessed extraprostatic disease by using a morphological 1-5 PI-RADSv2-derived score. We calculated the sensitivity and specificity for stage ≥pT3 of mpMRI alone, mpMRI+K^{trans}, mpMRI+ K_{ep}, and mpMRI+ K^{trans}+ K_{ep}. Thresholds for K^{trans}/K_{ep} and areas under the curve (AUC) were derived from a receiver operating characteristic analysis.
Results: The final pathology found 70 cancers, showing stage ≥pT3 in 30.0% of cases. mpMRI alone showed 61.9% (95%CI 38.4-81.9) sensitivity, 89.8% (95%CI 77.8-96.6) specificity, and AUC of 0.76 (95%C.I. 0.64-0.85). Cut-off values for K^{trans} and K_{ep} were 0.28 and 1.39, respectively. Sensitivity, specificity, and AUC were 95.2% (95%CI 76.2-99.9), 55.1% (95%CI 40.2-69.3), and 0.75 (95%C.I. 0.634- 0.847) for mpMRI+k^{trans}, 95.2% (95%CI 76.2-99.9), 63.3% (95%CI 48.3-76.6), and 0.79 (95%CI 0.68 to 0.88) for mpMRI+k_{ep}, and 90.5% (95%CI 69.6-98.8), 75.5% (95%CI 61.1-86.7), and 0.83 (95%CI 0.72-0.91) for mpMRI+k^{trans}+k_{ep}.
Conclusion: Adding K^{trans} and K_{ep} to mpMRI significantly increased the sensitivity for stage ≥pT3. DCE-derived parameters might be useful in the routine staging setting.
Limitations: A monocentric retrospective study and lack of absolute threshold for quantitative DCE values.

Comparison of first-order radiomic parameters to the mean ADC for the prediction of clinically significant cancer from prostate MRI

X. Wang[1], V. Schütz[1], M. Görtz[1], D. Tichy[1], P. D. A. Stenzinger[1], M. Hohenfellner[1], H.-P. Schlemmer[1], D. Bonekamp[2]; *[1]Heidelberg/DE, [2]Hirschberg/DE*

Purpose: To explore first-order ADC radiomics metrics other than the ADC mean value (known to be one of the strongest monoparameteris in quantitative assessment) regarding their ability to further increase the predictive value of prostate MRI for detecting clinically significant prostate cancer (csPC).
Methods and materials: Consecutive patients with a clinical suspicion for csPC examined on a single 3 Tesla MR scanner who underwent MR-guided targeted and systematic biopsy in 2017 and had visible MR lesions were included. A board-certified radiologist re-reviewed MRIs blinded to clinical information and segmented lesions on MRI images. The mean ADC (mADC) and 18 other first-order ADC radiomic parameters were calculated. Logistic regression with variable selection was used to determine the optimal parameters for csPC prediction. Receiver operating characteristics (ROC) and a likelihood-ratio test (LRT) were used for comparison of performance.

Results: 253 patients harboured 392 MR lesions (302 in the peripheral zone), of which 129 lesions were csPC positive. The univariate model ROC area under the curve (AUC) was 0.66 for mADC and 0.68 for entropy. Variable selection retained only mADC and entropy in the final model, while none of the other radiomic parameters contributed further. The combined model had ROC AUC of 0.73 (p<0.001 LRT compared to the univariate mADC model).
Conclusion: Entropy provides important additional information to mADC, thereby improving quantitative assessment of prostate MRI.
Limitations: All patients were examined on a single scanner system, limiting the generalisability of our results, however, providing a highly standardised mADC measurement which entropy was able to provide added value to.
Ethics committee approval: Approved by an ethics committee with written informed consent waived (S-156/2018).

RPS 307-7 14:36

Added-value of dynamic contrast-enhanced (DCE) MRI in a lesion-based quantitative analysis of multiparametric prostate MRI in consecutive at-risk patients

A. A. Tavakoli[1], P. Badura[1], T. Tubtawee[2], V. Schütz[1], D. Tichy[1], A. Stenzinger[1], M. Hohenfellner[1], H.-P. Schlemmer[1], D. Bonekamp[3]; [1]Heidelberg/DE, [2]Songkhla/TH, [3]Hirschberg/DE*

Purpose: To examine the added-value of DCE in multi-parametric prostate MRI with a region-of-interest based quantitative evaluation.
Methods and materials: Clinical lesions reported in 3 Tesla MR exams from 315 consecutive patients with suspicion for prostate cancer were retrospectively segmented on ADC maps and a visually identified early DCE time-point. DCE was normalised to minimally enhancing parenchyma (DCEnorm). Multiple heuristic and pharmacokinetic parameters were determined, including the difference in bolus arrival time between the femoral artery and lesion (BATlesdiff) and normalised lesion AUC (AUCnorm). A basic logistic regression model included mean ADC and DCEnorm while a second model was extended by heuristic and pharmacokinetic parameters. The binary outcome was a Gleason grade group (GGG) >=2 from a targeted biopsy core for lesion-based analysis and maximum targeted GGG for patient-based analysis.
Results: Of 308 patients with successful exams, 274 had 454 MR lesions that served as biopsy targets. 211 patients had a total of 275 MR lesions in the PZ. In the PZ, the model was simplified to ADCmean, DCEnorm (both p<0.001), BATlesdiff (p=0.04), and AUCnorm (p=0.15) by variable selection. This model performed significantly better (patient-based: AUROC 0.84 vs 0.80, p=0.04; lesion-based: AUROC 0.80 vs 0.76, p=0.03) than the ADC-only model. In the TZ, the model was reduced to the ADC-only model and no added benefit of any DCE-parameter was found.
Conclusion: In a comprehensive quantitative ROI-based analysis, DCE demonstrates the ability to improve MRI assessment in the peripheral zone but not the transition zone.
Limitations: Our results provide data on a typical PI-RADS compliant DCE protocol, however, cannot provide information on how to best trade off spatial for temporal resolution.
Ethics committee approval: Approved by an ethics committee with written informed consent waived (S-156/2018).
Funding: No funding was received for this work.

Texture analysis on multiparametric prostate magnetic resonance imaging (mpMRI) for evaluation of prostate cancer (PCa) aggressiveness

I. Ruggirello[1], M. Gatti[1], A. Motta[1], V. Giannini[2], M. Petracchini[1], S. Cirillo[1], D. Regge[2], P. Fonio[1], R. Faletti[1]; [1]Turin/IT, [2]Candiolo/IT (ireneruggirello@gmail.com)*

Purpose: To develop and validate a classifier system for the prediction of prostate cancer (PCa) aggressiveness using MRI texture analysis.
Methods and materials: 106 patients with histologically confirmed PCa were included in this retrospective study for model development and internal validation. Another 51 patients were included for independent external validation. A total of 64 first-order parameters and second-order texture parameters derived from the grey-level co-occurrence matrix were extracted from manually segmented tumours on T2w MRI and ADC maps. Data was analysed with a parametric test and Lasso logistic regression was used for feature selection and developing radiomics signatures to discriminate tumours with 4+3 vs > 3+4 GS high- and low-grade disease respectively (HG and LG). The predictive performance of the signature was evaluated via a receiver operating curve (ROC).
Results: A total of 25 radiomics features significantly different between the two groups (highest correlation for ADC entropy: r=0.33, p<0.001) in the training group. We developed two radiomics signature based on 6 (l=min) and 1 (l=1.SE) features, respectively. The signatures resulted in AUC of 0.74 (0.65-0.84), p<0.001 and AUC of 0.73 (0.63-0.82), p<0.001, in the training group, and 0.64 (0.48-0.80), p<0.001 and AUC of 0.65 (0.49-0.80), p<0.001, in the validation set.
Conclusion: MRI texture features could serve as potential diagnostic markers in assessing PCa biological aggressiveness.
Limitations: A retrospective analysis, the absence of evaluation of contrast-enhanced sequences and maps, and relatively poor AUC values.
Ethics committee approval: n/a
Funding: No funding was received for this work.

Radiomics in DW-MRI detects non-clinically significant prostate cancer and reduces overtreatment

A. Bevilacqua[1], M. Mottola[1], F. Ferroni[2], G. Gavelli[2], D. Barone[2]; [1]Bologna/IT, [2]Meldola/IT (margherita.mottola@unibo.it)*

Purpose: To assess to what extent radiomic features computed on high b-value DWI sequences (b=2000s/mm^2) could reliably detect non-clinically significant (NCS) prostate cancer and reduce overtreatment.
Methods and materials: This study retrospectively enrolled 25 patients of our institution, randomly extracted from PACS with a clinical suspicion of PCa who underwent prostate 3T-mpMRI. 10 patients reported NCS-PCa after TRUS biopsy, with a Gleason Score (GS)≤3+3, 15 were CS-PCa. PCa regions of interest (ROIs) were outlined in all slices by two experienced radiologists in consensus and reported on the DWI sequences, when needed, where 84 radiomic features with the corresponding ROC curves were computed. In order to prevent overfitting, a one-only feature was selected yielding the highest AUC and p-value<0.001 at the one-tail Wilcoxon rank-sum test.
Results: The dispersion of local skewness (LS) of DWI values is higher for CS-PCa (p-value~10^{-4}) and AUC=0.92 (95%CI, 0.70-0.99). Sensitivity and specificity for NCS were 90% and 87%, respectively (1 FN and 2 FP), with a false omission rate (FOR) equal to 7%, this representing a very low risk of overtreatment. Moreover, the two FPs have GS=3+4, the CS-PCa group closest to NCS one.
Conclusion: Radiomic features extracted from high b-values DWI sequences allows highlighting non-visible image properties related to the complexity of the tumour habitat. The higher variability of LS hints at increasing heterogeneity of tumour micro-environment for CS-PCa. In addition, this excellent performance stresses the promising role of DWI-based radiomics in discriminating CS-PCa from NCS-PCa.
Limitations: No clinical parameters were considered for differentiation. However, at most, they could improve these results. In addition, the number of patients is limited, but uneven in their characteristics, since not derived from any dedicated study.
Ethics committee approval: IRB approval, written informed consent was waived.
Funding: No funding was received for this work.

The role of dynamic contrast-enhanced sequences on the learning curve in prostate MRI interpretation: a comparison with biparametric examinations in readers with different experiences

L. Panebianco, M. Martino, A. Izzo, G. Bianchi, F. Formiconi, C. Gianneramo, A. Pace, R. Manetta, C. Masciocchi; *L'Aquila/IT (aivlim@hotmail.it)*

Purpose: To assess the value of dynamic contrast-enhancement (DCE) use in detecting prostatic index lesions when evaluating the performance of two radiologists with different experience with biparametric (bpMRI) and multiparametric (mpMRI) examinations.
Methods and materials: A retrospective study of 150 patients was performed including 3 Tesla prostate mpMRI.
Two radiologists, with advanced and limited experience, respectively, blinded to clinical and histological data, classified each index lesion using PI-RADS v2. Images were revisited with a reading, including diffusion-weighted imaging (DWI), apparent diffusion coefficient (ADC) maps, T2-weighted (T2W) imaging, and, after 3 months, DCE.
Results were matched with Gleason patterns. The performance was quantified by sensitivity (SNS), specificity (SPC), and area under the curve (AUC) of the ROC (receiver operating characteristics).
Results: Concordance was good for the expert reader: weighted Cohen's k ≈ 0.809 (95% CI 0.707-0.912), unlike the performance of the inexperienced reader, which resulted in a Cohen's k 0.396 (95% CI 0.241-0.551). The expert reader performed as well in bpMRI as in mpMRI (SNS=0.73–0.70, AUC=0.744–0.819; p=0.087). The inexperienced reader performed well in mpMRI, but significantly worse in bpMR: SNS=27.94 versus 64.71 and AUC=0.634 versus 0.807 (p=0.0024).
Conclusion: Results based on the expert reader showed no substantial differences between the performance with bpMRI and mpMRI. The experience gained in mpMRI could advantage the reader in the transition to bpMRI.
Quite differently, the outcome for the inexperienced reader in mpMRI was similar to the expert reader, but in the absence of DCE, the performance dropped significantly.
Limitations: The involvement of one radiologist for each category (experienced and non-experienced) could be limiting in the evaluation of results.
Ethics committee approval: n/a

A multicentre-multivendor study to evaluate the generalisability of a radiomics model for classifying prostate cancer

J. M. Castillo[1], M. P. A. Starmans[2], M. Arif[1], W. J. Niessen[2], S. Klein[2], I. G. Schoots[2], J. Veenland[2]; [1]*Rotterdam, Zuid-Holland/NL,* [2]*Rotterdam/NL (j.castillotovar@erasmusmc.nl)*

Purpose: Radiomics applied to magnetic resonance imaging (MRI) has shown promising results in classifying prostate cancer (PCa). However, the effects of these models on unseen data from different centres have rarely been addressed. Our goal is to evaluate the generalisability of radiomic models in the context of PCa classification and to compare the performance between our models and radiologists using prostate imaging reporting and data system (PIRADS) v2.
Methods and materials: The data comprised multiparametric MRI, histology of radical prostatectomy, and pathology reports of 107 patients from three centres. By correlating the MRI with histology, 204 lesions were identified. From each lesion, radiomics features were extracted. Radiomics models for discriminating between high-grade and low-grade lesions were automatically developed using machine learning, either single-centre through cross-validation, or multicenter. For comparison with the multicentre setting, a subset of the dataset was classified by two expert radiologists using PIRADS.
Results: The single-centre models obtained a mean AUC of 0.75 for the internal cross-validation; when testing on unseen data, the mean AUC decreased to 0.54. In the multicentre setting, the radiologists obtained a mean AUC of 0.47, while the radiomics model obtained a mean AUC of 0.75.
Conclusion: Radiomic models may obtain a decent performance when tested in a single-centre setting. However, there can be a considerable drop in classification performance when testing these models on data from different centres. On a multicenter dataset, our radiomics model outperformed PIRADS and may represent a more accurate alternative for malignancy prediction.
Limitations: Despite developing a multicenter-multivendor study, our cohort size is limited.
Ethics committee approval: The Medical ethics review committee of Erasmus MC (NL32105.078.10). The national Dutch trials register (ID: NL2368).

Multi-parametric magnetic resonance imaging of prostate cancer: correlation between Ktrans, a Gleason score, and a PI-RADS score

E. Lucertini[1], D. Caruso[1], M. Zerunian[1], D. de Santis[1], T. Biondi[2], N. Panvini[3], A. Laghi[1]; [1]*Rome/IT,* [2]*Belvedere Marittimo/IT,* [3]*Latina/IT (elena.lucertini@gmail.com)*

Purpose: To measure K^{trans} and correlate it with a Gleason score (GS) and a PI-RADS score in patients with prostate cancer.
Methods and materials: This retrospective study included patients with pathologically proven prostate cancer who had undergone clinically indicated 1.5 Tesla multi-parametric magnetic resonance imaging (MRI) examination. T2 weighted (T2w) images, diffusion-weighted images (DWI), and dynamic contrast-enhanced (DCE) sequences were obtained. A PI-RADS score was calculated for all tumour lesions. From a DCE-MRI dataset, K^{trans} was computed and compared between patients with clinically insignificant (GS≤6) and clinically significant (GS≥7) prostate cancer. The Spearman rank-order correlation coefficient (ρ) was used to assess the correlation strength between K^{trans} and GS and between K^{trans} and a PI-RADS score.
Results: 21 patients (age: 67±12 years; BMI: 26.63±4.04 Kg/m^2) with a PSA of 7.91±3.01 were included in the study. 7 patients (33.3%) had clinically insignificant prostate cancer while 14 patients (66.7%) were diagnosed with clinically significant prostate cancer. The mean K^{trans} value was 0.42±0.20 min^{-1} (range: 0.15–0.75). K^{trans} was significantly higher (0.52±0.14 min^{-1}) in clinically significant prostate cancer compared to clinical insignificant prostate cancer (0.23±0.15 min^{-1}; P=0.016). K^{trans} showed moderate significant correlation with GS (ρ=0.575, P=0.006), while it showed no significant correlation with PI-RADS (ρ=0.386, P=0.069).
Conclusion: K^{trans} may discriminate between clinically insignificant and significant prostate cancer and show a moderate correlation with GS. This MP-MRI may serve as an imaging biomarker in prostate cancer.
Limitations: Limitations of this study are the small sample size and the inclusion of only patients with proven prostate cancer, despite its design requiring a selected patient population to assess the correlation between K^{trans} and GS.
Ethics committee approval: Written informed consent obtained.
Funding: No funding was received for this work.

A comparison between biparametric and multiparametric prostatic MRI: added value of DCE in PCa detection using new PI-RADS v 2.1 classification

A. Grecchi, M. C. Ambrosetti, A. Mazzaro, G. Zamboni, G. Mansueto; *Verona/IT (annamaria.grecchi88@gmail.com)*

Purpose: The indiscriminate use of contrast-enhanced MRI for the detection of PCa has been questioned in the new PIRADS v2.1. Our purpose is to compare

multiparametric MRI (mpMRI) and biparametric MRI (bpMRI) for prostatic cancer (PCa) detection using PIRADSv 2.1.
Methods and materials: The mpMRI exams performed between June and October 2019 were considered and lesions with a PIRADS from 3 to 5 in the reports were independently reviewed by two radiologists having 3 (reader A) and 10 (reader B) years experience. Evaluation of T2, DWI, ADC (bpMRI), and DCE (mpMRI) was performed, indicating a partial score for each parameter of bpMRI and a final PIRADS score for every lesion, both with and without DCE. Inter-rater agreement (Cohen's Kappa) was calculated regarding PIRADS for bpMRI and mpMRI. Data analysis was performed for cases upgraded to PIRADS 4-5 after DCE.
Results: 47 prostate MRIs were considered for 61 total lesions (47 PZ, 14 TZ). Inter-rater agreement was Kappa=0.9 and 0.8 (very good) for assigned PIRADS, respectively, for bpMRI and mpMRI. Inter-rater agreement was only moderate (Kappa=0.5) for T2 score: 11/13 lesions were in PZ and therefore this had little impact.
23 PZ lesions with PIRADS 3 were upgraded to PIRADS 4 or 5 after DCE (the same lesions for both readers). Out of 23 upgraded lesions, 13 for reader A and 6 for reader B did not show any worrisome feature in DWI or ADC map, while in the other cases, either DWI or ADC was considered as “markedly abnormal”.
Conclusion: DCE appears to have a useful role in staging lesions with PIRADSv2.1 only for PZ lesions with a PIRADS 3 score, independent of the DWI features.
Limitations: A small series.
Ethics committee approval: Written informed consent obtained.
Funding: No funding was received for this work.

RPS 307-14 15:18
A stepwise logistic regression model based on MRI radiomic features to predict histopathological aggressiveness of prostate cancer (PCa)
G. Stranieri[1], D. Basile[2], M. Calandri[3], V. Giannini[4], S. Mazzetti[4], A. de Pascale[5], F. Russo[3], A. Veltri[5], D. Regge[4]; [1]Catanzaro/IT, [2]Rivoli/IT, [3]Turin/IT, [4]Candiolo/IT, [5]Orbassano/IT
(giuseppestranieri92@gmail.com)

Purpose: To develop and externally validate a stepwise logistic regression model based on MRI radiomic features to predict different Gleason scores (GS) of prostate cancer (PCa).
Methods and materials: A dataset was composed of 97 patients (105 PCas), enrolled in two institutions with different MRI scanners and protocols, who underwent robot-assisted radical-prostatectomy for PCa after mpMRI. Lesions were classified as low aggressive (LA) if their pathological Gleason score was ≤3+4 and high aggressive (HA) if it was ≥4+3. A previously developed computer-aided diagnosis (CAD) system able to detect PCas was applied to the dataset and the output of CAD was used as a PCa segmentation mask. From the segmented masks of ADC maps and T2w images, 59 first- and second-order radiomics features were extracted (i.e. skewness, kurtosis, and texture parameters from GLCM and GLRLM matrices). Patients from institution-A were used as training and testing dataset, while patients from institution-B as a validation set. A stepwise logistic regression model was created using 70% of lesions as a training set and 30% as a testing set, all randomly selected. Since the composition of a training and testing set might affect the performance of the model, this selection was repeated 5 times and the model reaching the highest accuracy in the testing set was chosen and applied to the validation set.
Results: Accuracy of the training set was 96.6% (54/56), with a sensitivity in detecting HA PCas of 95.6% (22/23) and a specificity of 96.9% (32/33). The accuracy of the testing set was 83.3% (20/24), with a sensitivity of 60% (6/10) and a specificity of 100% (14/14). the accuracy of the validation set was 68% (17/25), with a sensitivity of 40% (4/10) and a specificity of 86.7% (13/15).
Conclusion: MRI radiomic features are promising markers in discriminating PCa aggressiveness on the histopathological level.
Limitations: Further confirmations are required by larger series.
Ethics committee approval: Approved by an ethical committee.
Funding: No funding was received for this work.

RPS 307-15 15:24
Assessment of prostate cancer aggressiveness using deep learning and radiomic data: a pilot study
L. Mercatelli[1], E. Bertelli[1], M. A. Pascali[2], S. Colantonio[2], D. Germanese[2], A. Barucci[1], C. Caudai[2], S. Agostini[1], V. Miele[1]; [1]Florence/IT, [2]Pisa/IT
(mercatelli.laura@gmail.com)

Purpose: To investigate the potential role of radiomic and deep learning features extracted from multiparametric MRI (mp-MRI) in predicting prostate cancer (PCa) aggressiveness, correlated with a Gleason score (GS). The aim of this study is to define a predictive model to distinguish low--grade (GS <=3+4) from intermediate/high-grade (GS >=4+3) PCa.
Methods and materials: Our population was composed of 50 peripheral zone PCa patients (PIRADS score 3--5) who underwent a 1.5 T mp-MRI and freehand transperineal MRI/US fusion-guided targeted biopsy (62 lesions: 41 with GS<=3+4 and 21 with GS>=4+3). The lesions were segmented on T2w images and ADC maps. Two analyses were then carried out. (i) Radiomic features were computed, identifying the most discriminative set (signature). A support vector machine was trained on 52 cases (35 GS<=3+4 and 17 GS>=4+3) and tested on the remaining 10 (6 GS<=3+4 and 4 GS>=4+3). (ii) Three deep learning architectures were trained on the same dataset, augmented with rigid and non-rigid deformations, in order to limit overfitting.
Results: The radiomic approach, using 6 features, allowed the correct classification of all cases (accuracy 100%, sensitivity 100%, and specificity 100%). The best performing DL model (based on VGG16) achieved accuracy 87.3%, sensitivity 97.2%, and specificity 74% on T2w images.
Conclusion: Radiomic features can be useful in the assessment of lesion aggressiveness. The DL features need more investigations on a larger population and a more balanced distribution.
Limitations: Our main limitation is the small number of patients.
Ethics committee approval: The study was approved by our Institutional Review Board.
Funding: No funding was received for this work.

Comparison of free breathing 3D mDIXON with 3D inversion recovery and 3D spectral presaturation with inversion recovery sequences for the assessment of late gadolinium enhancement
R. A. K. Dessouky[1], V. Destasio[2], S. Boccalini[3], S. A. Si-Mohamed[3], T. K. Y. Broussaud[4], P. C. Douek[4], M. Sigovan[5]; [1]Zagazig/EG, [2]Rome/IT, [3]Bron/FR, [4]Lyons/FR, [5]Villeurbanne/FR (rihamdessouky@gmail.com)

Purpose: Three dimensional (3D) late gadolinium enhancement (LGE) MRI sequences are increasingly used in clinical practice. Knowledge of strengths/limitations of each sequence can guide sequence choice. We aimed to evaluate technical and diagnostic performance of three dimensional (3D) mDIXON versus 3D inversion recovery (3D VIAB) and 3D spectral presaturation with inversion recovery (3D SPIR) LGE sequences.
Methods and materials: A total of 78 patients (50 males and 28 females, age 49±18 years) with 1.5T CMR including 3 different 3D LGE sequences (3D mDIXON, 3D VIAB, and 3D SPIR) were evaluated for technical and diagnostic performance by two readers. Qualitative scores and quantitative signal to noise (SNR) and contrast to noise (CNR) measurements were compared among sequences. Qualitative comparisons were made using Friedman and Wilcoxon signed rank tests. Quantitative comparisons were made using one way ANOVA. Reader agreements were tested using Kohen’s Kappa. Any p-value <0.05 was significant.

Results: Technically, 19 out of 78 (24 %) patients were excluded due to poor (grade 4) image quality and reader agreements were excellent (= 0.91-0.96, p<0.001) for all sequences. Diagnostically, 3D mDIXON showed higher confidence in the diagnosis of pericardial enhancement (p-values =0.007, 0.034 and 0.025 for three sequences, 3D VIAB, and 3D SPIR comparisons). 3D mDIXON outperformed 3D SPIR in both visualisation of LGE (p=0.02) and quality of fat suppression (p=0.001).
Conclusion: 3D mDIXON is a diagnostic problem-solving tool, especially when making a diagnosis of epicardial enhancement and/or fat suppression is needed. Choice of 3D LGE sequence should be based on a patient's breath-hold ability, diagnostic needs, and institutional availability considering the strengths and limitations of each sequence.
Limitations: A possible differences in timing between gadolinium injection and image acquisition.

Late gadolinium enhancement at right ventricular insertion points in subjects with structurally normal hearts is prognostically irrelevant
C. Grigoratos[1], A. Pantano[2], L. Ait-Ali[1], A. Barison[1], G. Todiere[1], G. Festa[3], G. Sinagra[2], G. D. Aquaro[1]; [1]Pisa/IT, [2]Trieste/IT, [3]Massa/IT
(cgrigoratos@ftgm.it)

Purpose: Late gadolinium enhancement (LGE) is the current non-invasive gold standard for fibrosis assessment. The diagnostic and prognostic significance of different LGE patterns have already been described, but the clinical importance of isolated right ventricular insertion points (RVIP) LGE is yet to be defined.
Methods and materials: We retrospectively analysed 420 patients (270 males, mean age 38±17 years) with structurally normal hearts except for the presence of RVIP-LGE (44 patients), other-LGE (midwall or subepicardial; 36 patients), or no-LGE (340 patients). All patients underwent cardiac magnetic resonance with LGE sequences. Clinical follow-up was performed for a median of 2,177 days. The primary composite endpoint included cardiac death, resuscitated cardiac arrest, and appropriate implantable cardiac defibrillator shock.
Results: The prevalence of cardiac events was significantly lower in RVIP-LGE than those with other-LGE (p=0.006). The Kaplan Meier curve analysis demonstrated no significant differences between patients with RVIP-LGE and no-LGE for the primary endpoint. On contrast, patients with other-LGE had a worse prognosis than those with RVIP-LGE or no-LGE (p<0.0001). Among patients with other-LGE, the midwall pattern of LGE distribution was associated with a worse prognosis than a subepicardial one (p =0.0044).
Conclusion: RVIP-LGE in subjects without additional evidence of cardiac damage does not convey a worse prognosis when compared with subjects without LGE and it is therefore not to be considered a marker of disease. Its diagnostic and prognostic significance is to be considered irrelevant.
Limitations: A small number of cardiac events occurred as expected given the low cardiac risk population considered. To overcome this limit, a bigger follow-up period was obtained. Parametric imaging such as T1 and T2 mapping was not routinely performed. The main reason was that this technique was not commercially available when the majority of patients were scanned.

Correcting versus resolving respiratory motion in free-breathing whole-heart MRA: a comparison in patients with thoracic aortic disease
T. Leonard[1], R. Stroud[1], D. Piccini[2], U. J. Schoepf[1], J. Heerfordt[2], J. Yerly[2], L. Di Sopra[2], P. Suranyi[1], A. Varga-Szemes[1]; [1]Charleston, SC/US, [2]Lausanne/CH *(leonarty@musc.edu)*

Purpose: Whole-heart magnetic resonance angiography (MRA) requires sophisticated methods accounting for respiratory motion. Our purpose was to evaluate the image quality of compressed sensing-based respiratory motion-resolved three-dimensional (3D) whole-heart MRA compared with self-navigated motion-corrected whole-heart MRA in patients with known thoracic aorta dilation.
Methods and materials: 25 patients were prospectively enrolled in this ethically approved study. Whole-heart 1.5T MRA was acquired using a prototype 3D radial steady-state free-precession free-breathing sequence. The same data was reconstructed with a one-dimensional motion-correction algorithm (1D-MCA) and an extradimensional golden-angle radial sparse parallel reconstruction (XD-GRASP). Subjective image quality was scored and objective image quality was quantified (signal intensity ratio, SIR, and vessel sharpness). Wilcoxon, McNemar, and paired t-tests were used.
Results: Subjective image quality was significantly higher using XD-GRASP compared to 1D-MCA (median 4.5, interquartile range 4.5–5.0 versus 4.0 [2.25–4.75]; p < 0.001), as well as signal homogeneity (3.0 [3.0–3.0] versus 2.0 [2.0–3.0]; p = 0.003), and image sharpness (3.0 [2.0–3.0] vs 2.0 [1.25–3.0]; p < 0.001). SIR with the 1D-MCA and XD-GRASP was 6.1±3.9 versus 7.4±2.5, respectively (p < 0.001), while signal homogeneity was 274.2±265.0 versus 199.8±67.2 (p = 0.129). XD-GRASP provided a higher vessel sharpness (45.3±10.7 versus 40.6±101, p = 0.025).
Conclusion: XD-GRASP-based motion-resolved reconstruction of free-breathing 3D whole-heart MRA datasets provides improved image contrast, sharpness, and signal homogeneity, and seems to be a promising technique that overcomes some of the limitations of motion correction or respiratory navigator gating.
Limitations: A limited sample size and computational power heavy post-processing.
Ethics committee approval: IRB approved and written informed consent was obtained.

Delayed enhancement of papillary muscles on cardiac MRI in patients with mitral regurgitation
S. J. Lim, H. J. J. Koo, J.-W. Kang, D. H. Yang; *Seoul/KR*
(vitamindasa@hanmail.net)

Purpose: Left ventricular (LV) fibrosis in patients with mitral regurgitation (MR) has been reported due to mitral valve prolapse (MVP) and MVP has been associated with sudden cardiac death. We evaluated the presence and characteristics of late gadolinium enhancement (LGE) at mitral apparatus on cardiac magnetic resonance imaging (MRI) in MR patients with and without MVP.
Methods and materials: Between January 2000 and December 2017, 88 patients (mean age, 58.3±12.0; male, 42%) with MR underwent cardiac MRI. LGE on cardiac MRI, clinical characteristics including echocardiographic findings, and a history of arrhythmia were reviewed. After patients were classified into an MVP or non-MVP group, clinical and imaging parameters were compared. Factors associated with LGE were evaluated using logistic regression analysis.
Results: In 88 MR patients (43 MVP, 45 non-MVP), LV myocardial enhancement was more common in the MVP group (28% vs. 11%, p <0.046). Papillary muscle enhancement was found in 8 (9.1%) patients (1 pure MVP, 3 MVP with TR, 2 functional MR with TR, and 2 rheumatic MR). In 31 pure MVP patients, 9 showed LGE (8 LV myocardium and 1 papillary muscle). One of them had bilateral diffuse papillary muscle enhancement and an event of sudden cardiac arrest due to ventricular fibrillation. Systolic blood pressure (BP) (odds ratio [OR], 1.08; 95% confidence interval [CI], 1.02 – 1.14; p=0.01) and ventricular arrhythmia (OR, 22.58; 95% CI, 2.32 – 219.60; p=0.01) were associated with LGE at papillary muscles.
Conclusion: LGE at papillary muscles was not uncommon (9.1%) in MR. High systolic BP and ventricular arrhythmia were associated with LGE at papillary muscles. Papillary muscle enhancement on cardiac MRI should not be overlooked.
Limitations: Not all patients were evaluated by Holter monitoring. Quantification of LGE was unavailable.
Ethics committee approval: n/a

RPS 303-5 14:24

Compressed sensing 4D flow assessment of aortic and pulmonary artery flow volumes

U. Reiter[1], C. Reiter[1], N. Jin[2], F. Testud[3], V. Nizhnikava[1], D. Giese[3], A. Triebl[1], M. Fuchsjäger[1], G. Reiter[1]; [1]Graz/AT, [2]Chicago/US, [3]Malmö/SE
(ursula.reiter@medunigraz.at)

Purpose: Although cardiac magnetic resonance four-dimensional (4D) flow imaging is considered an adequate technique for the assessment and "conservation of mass" comparisons of flow volumes, its widespread use is limited by long scan times. The purpose of the study was to investigate if the acceleration of whole-heart 4D flow imaging by compressed sensing (CS) can be employed to derive aortic and pulmonary flow volumes.
Methods and materials: 11 prospectively recruited cardiac patients without known or suspected shunts and with a regular heart rhythm underwent 3T (Magnetom Skyra, Siemens Healthcare, Erlangen, Germany) retrospectively ECG- and navigator-gated whole-heart 4D flow imaging with (acceleration-factor=7.6) and without CS (parallel acquisition acceleration-factor=3) employing a prototype sequence. Spatial resolution and the number of reconstructed frames were matched in the respective 4D flow protocols. For both data sets, aortic (Qa) and pulmonary (Qp) net flow volumes were evaluated using prototype software (4DFlow, Siemens Healthcare, Erlangen, Germany). The relationships between results derived with and without compressed sensing were analysed by correlation analysis; means and variances were compared employing t- and Levene test.
Results: Scan times were significantly shorter when employing CS (369±92 s vs. 618±119 s, p<0.01). Flow volumes from CS measurements (Qa=81±20 ml; Qp=82±18 ml) had no significant bias compared to measurements without CS (Qa=83±21 ml, p=0.42; Qp=82±19 ml, p=0.80) and demonstrated strong correlations (r=0.97 and 0.95, for Qa and Qp, respectively). Pulmonary-to-systemic blood flow ratios (Qp/Qa=1.02±0.11 and Qp/Qa=1.01±0.09, with and without CS, respectively) did not differ significantly, neither in means (p=0.80) nor in variances (p=0.67).
Conclusion: Compressed sensing allows for substantial acceleration of 4D flow acquisition without significant impact on the precision of derived aortic and pulmonary flow volumes.
Limitations: A small patient number.

Compressed sensing 4DFlow MRI for the assessment of the left ventricular stroke volume

B. Longere[1], G. Braye[1], V. Silvestri[1], N. Jin[2], S. Toupin[3], A. Simeone[1], J. Pagniez[1], F. Pontana[1]; [1]Lille/FR, [2]Chicago/US, [3]Paris/FR
(fpontana@gmail.com)

Purpose: 4DFlow MRI provides haemodynamic assessment but is time-consuming. The aim of our study was to evaluate the accuracy of a prototype 4DFlow sequence featuring acceleration technique based on compressed sensing for the assessment of the left ventricular (LV) stroke volume.
Methods and materials: 22 adult patients referred for cardiac MRI underwent a comprehensive protocol on a 1.5T scanner (MAGNETOM Aera, Siemens Healthcare) including at least (a) standard segmented steady-state-free precession cine sequences with one short-axis stack, one vertical, and one horizontal 2-chamber slice for measuring LV stroke volume (cineSV), (b) a single-breath-hold 2D phase-contrast sequence (2D-PC) at the level of the sino-tubular junction for direct quantification of the aortic forward volume (2DSV), and (c) a prototype free-breathing compressed sensing 4DFlow (CS4DF) sequence covering the entire thoracic aorta. Multiplanar reconstructions were used to place the region of interest at the same anatomical level as the 2D-PC sequence.
Results: CS4DF sequence mean scan time was 4.2 ±0.8 min. A mean cineSV of 96.3 ±28.4 mL was provided by LV contouring, a mean 2DSV was 92.0 ±26.7 mL and a mean 4DSV was 89.9 ±25.4 mL (p=0.944). Linear regression demonstrated strong correlation of 4DSV with 2DSV (R^2=0.89). There was a very good inter-rater and intra-rater agreement with an ICC of 0.96 and 0.97, respectively.
Conclusion: CS4DF is a robust and fast option to quantify aortic forward volume, with excellent intra- and inter-observer agreement. This sequence is promising to reach widespread clinical practice of 4DFlow imaging since the thoracic aorta could be scanned in less than 5 minutes.
Limitations: No major limitation except sample size.
Ethics committee approval: Each patient gave written informed consent.

RPS 303-7 14:36

Value of T2 mapping in patients with chronic thromboembolic pulmonary hypertension (CTEPH) before and after balloon pulmonary angioplasty (BPA)

A. Hasse[1], V. Bethke[1], A. Brose[1], A. Breithecker[1], C. B. Wiedenroth[2], K. Tello[1], W. Seeger[1], G. Krombach[1], F. Roller[1]; [1]Giessen/DE, [2]Bad Nauheim/DE
(alexander.hasse@mail.de)

Purpose: Native T1 mapping as a marker of myocardial fibrosis showed promising correlations to right heart function and pulmonary haemodynamics in pulmonary hypertension. However, myocardial texture changes, like oedema, occur long before fibrosis arises. Therefore, the aim of this study was to assess the value of T2 mapping in patients with inoperable CTEPH before and after BPA.
Methods and materials: MRI at 1.5 Tesla including T2 mapping and right heart catheterisation were performed before and 6 months after BPA in 30 consecutive patients (mean age 63.4 ± 10.6 years; 17 female). T2 values were measured in the right ventricular insertion points (upper and lower RVIP) and in the interventricular septum at the basal short-axis section. The results were correlated to right ventricular function (RVEF) and pulmonary haemodynamics (mPAP and PVR).
Results: RVEF, mPAP, and PVR significantly improved after BPA (all p<0.0001). T2 values were elevated and decreased significantly after BPA (upper RVIP 61.6ms ± 6.1 to 57.0ms ± 4.5 and lower RVIP 64.4ms ± 5.6 to 58.9ms ± 4.5, p<0.0001, septum 60.2ms ± 4.0 to 58.9ms ± 3.9, p<0.02). The T2 values of the lower RVIP revealed the best correlations to RVEF, mPAP, and PVR before (r=-0.33, r=0.45 and r = 0.45 both p=0.013) and after BPA (r=-0.16, r=0.35 and r=0.14).
Conclusion: In our cohort of CTEPH patients, septal and RVIP myocardial T2 times were elevated before BPA and decreased significantly after BPA. It is therefore highly suspected that myocardial oedema is present in mechanically demanded myocardium in pulmonary hypertension and that BPA leads to a significant oedema reduction. Therefore, we conclude that T2 mapping might enable new insights regarding therapy-response, monitoring, and prognosis.
Limitations: A small study cohort.

RPS 303-8 14:42

The impact of a new deep learning denoising algorithm on LGE images

G. Muscogiuri[1], S. Dell'aversana[2], F. Ricci[3], M. Gatti[4], A. I. Guaricci[5], M. Guglielmo[1], A. Baggiano[1], M. Pepi[1], G. Pontone[1]; [1]Milan/IT, [2]Naples/IT, [3]Rome/IT, [4]Turin/IT, [5]Bari (BA)/IT (g.muscogiuri@gmail.com)

Purpose: To assess the reliability of 2D segmented late gadolinium enhancement (2D-S_{LGE}) reconstructed with a DL denoising approach of 50% and 75% of strength.

Methods and materials: 20 patients who underwent cardiac MR were enrolled in September 2019. 2D-S_{LGE} were retrospectively reconstructed in magnitude and phase-sensitive sequences using the DL denoising approach with respectively 50% and 75%. Overall subjective image quality in both magnitude and phase-sensitive sequences with standard and DL denoising reconstructions was evaluated using a 3-point Likert scale image. Objective image quality was evaluated calculating the signal to noise ratio (SNR) and contrast to noise ratio (CNR) using different images DL denoising reconstruction. A cut off value of $p<0.05$ was considered statistically significant.
Results: The overall analysis of subjective image quality was statistically significant (p:0.004), better only in magnitude images reconstructed with 75% of DL denoising compared to standard magnitude images. The CNR between scar and myocardium in phase-sensitive was not significantly different between the standard and DL denoising approach. Conversely in magnitude, the CNR improve significantly in the 50% DL denoising (p:0.01) and 75% DL denoising (p:0.02) approaches. A statistically significant improvement of SNR compared to standard magnitude reconstruction was observed for 50% DL denoising in terms of scar (p:0.02). While myocardial magnitude SNR resulted in significant improvement if compared to reconstruction in 50% DL denoising (p:0.01) and 75% DL denoising (p:0.01).
Conclusion: The best DL denoising approach seems to be shown in magnitude reconstruction with 75% DL denoising.
Limitations: Diagnostic accuracy should be performed.
Ethics committee approval: Still in process.

4D-flow assessment of early-diastolic mitral annular peak tissue velocity: a comparison with echocardiography

C. Reiter, G. Reiter, C. Kräuter, E. Kolesnik, A. Schmidt, D. Scherr, A. Triebl, M. Fuchsjäger, U. Reiter*; Graz/AT (Clemens.Reiter@medunigraz.at)*

Purpose: Early-diastolic mitral annular peak tissue velocities represent important parameters in the evaluation of left ventricular diastolic function. Their measurement is well-established in echocardiography but not in cardiac magnetic resonance (CMR) imaging. The purpose of the present study was to investigate the feasibility of derivation of early-diastolic mitral annular peak tissue velocities from CMR four-dimensional (4D) flow imaging and to compare the results with echocardiography.
Methods and materials: 74 subjects (male/female, 33/41; age 60±10 years) were prospectively recruited to undergo echocardiography and CMR whole heart 4D-flow imaging at 3 Tesla. Echocardiographic medial (e' medial) and lateral (e' lateral) early-diastolic mitral annular peak tissue velocities were acquired following current guidelines. Corresponding 4D-flow-based early-diastolic mitral annular peak tissue velocities were determined as early-diastolic peak mean through-plane tissue velocities in the inferoseptal (4DFe' medial) and the anterolateral (4DFe' lateral) segments of multiplanar reformatted short-axis planes just below the mitral valve using a prototype software (4DFlow, Siemens Healthcare, Erlangen, Germany). A comparison of CMR and echocardiography data was performed by means of correlation and a Bland-Altman analysis.
Results: Tissue velocities from 4D-flow measurements (4DFe' medial=7.4±2.3cm/s; 4DFe' lateral=9.3±2.5cm/s) had no significant bias compared to echocardiographically obtained tissue velocities (e' medial=7.6±2.4cm/s, p=0.43; e' lateral=9.3±2.9cm/s, p=0.95) while showing strong correlations (r=0.77 and 0.84, for medial and lateral assessment, respectively). The clinically frequently used average of medial and lateral velocities showed even stronger correlation (r=0.90) without bias (4DFe' average=8.4±2.2cm/s vs. e' average = 8.5±2.4cm/s, p=0.52).
Conclusion: Early-diastolic mitral annular peak tissue velocities from echocardiography and CMR 4D-flow correlate strongly and demonstrate no bias, suggesting 4D-flow as a potential technique for its assessment interchangeable with echocardiography.
Limitations: A single observer and single-centre study.

Prognostic validity of coronary flow reserve (CFR) derived from mapping-stress MRI in the risk stratification of chronic coronary syndrome patients

P. Palumbo, E. Cannizzaro, C. de Cataldo, S. Torlone, M. C. de Donato, A. Corridore, M. Latessa, E. Di Cesare, C. Masciocchi*; L'Aquila/IT (palumbopierpaolo89@gmail.com)*

Purpose: The need for a prognostic assessment of CAD patients is continuously increasing. Some studies have tried to validate the accuracy of novel T1 mapping application during adenosine stress in detecting coronary flow alteration. The purpose of our study was to evaluate its prognostic validity during an intermediate-to-long term follow-up.
Methods and materials: 34 patient (68,42±8,9 y; 30 males; 4 females) submitted on a 3.0T stress CMR with a CT evidence of CAD were included. Ischaemic or infarctuated CAD patients were distinguished from non-obstructive CAD patients (negative first-pass perfusion or LGE). A major adverse cardiac event and secondary cardiac outcomes were reported. The mean follow-up was 30.26±5.28 months.
Results: All measurements were firstly repeated with two different vendors and inter-vendor agreement were calculated. Secondly, cardiac outcomes were compared with T1 values. A high incidence of cardiac outcomes was recorded in the ischaemic/infarctuated CCS patients, with no significant increase in T1 values during adenosine infusion (p-value=0,158). Among non-obstructive patients, the 56.25% referred mainly secondary cardiac outcomes. Interestingly, a lack of T1 mapping stress reactivity was found. A significant difference was found between different T1 responders and non-responders group in a Kaplan-Meier survival analysis (p-value=0,001).
Conclusion: Our study confirms the prevalent role of stress CMR as a predictive prognostic factor in the outcome of a heart patient. T1 mapping sequences result in more sensitive and specific identification of microvascular abnormalities, increasing the clinical utility of stress CMR in identifying high-risk patients.
Limitations: A lack of catheter-based FFR and myocardial blood flow estimation do not allow a definitive comparison with the current gold standard to confirm our findings. Moreover, the small sample size was considered with potential selection bias.
Ethics committee approval: Our study was conducted in accordance with the declaration of Helsinki.
Funding: No funding was received for this work.

Two-shot compressed sensing techniques accelerate cardiac cine sequence acquisition and quantitative evaluation of diagnostic efficacy

J. Wang[1], L. Lin[1], J. An[1], M. Schmidt[2], C. Forman[2], Y. Wang[1]*; [1]Beijing/CN, [2]Erlangen/DE (wangjian_511@sina.com)*

Purpose: In this prospective study, we tried to introduce a 2-shot compressed sensing (CS) cine technique in cardiac magnetic resonance (CMR) to obtain fast high-quality cine images and accurately access cardiac function close to standard cine sequence than the single-shot (ss) CS cine technique.
Methods and materials: Enrolled patients underwent CMR on a 3T scanner from July to December, 2018. Cine image was performed with 3 different methods: a standard segment cine sequence, a real-time single-shot CS (ss CS) cine sequence, and a prototype 2-shot CS cine sequence. Quantitative analysis of image quality used a 0-4 score system and cardiac function analysis was performed on all 3 types of cine images.

Results: 35 patients completed all 3 types of cine sequences. The average scan time was (100.3±20.6)s for standard cine, (20.1±4.1)s for ss CS cine, and (30.1±6.2)s for 2-shot CS cine. The median total image quality score was 4 for standard and 2-shot CS cine and 3 for ss CS cine. There was a significant difference in total quality between standard cine and ss CS cine, but not with 2-shot CS cine. The differences between the standard cine and the ss CS cine were not statistically significant except for LV mass and LVESV, and there were no statistical differences between the standard cine and the 2-shot cine. There was a good correlation between standard cine and ss CS cine, and standard cine and 2-shot CS cine (P<0.01).
Conclusion: The 2-shot cine sequence can acquire images that are closer to the quality of the standard cine sequence and can be used to accurately evaluate the cardiac function.
Limitations: A small study cohort.

RPS 303-12 15:06
A prospective randomised non-inferiority study of low iodine dual-energy coronary CT-angiography
D. C. Rotzinger[1], S. A. Si-Mohamed[2], L. Boussel[2], R. A. Meuli[1], P. C. Douek[3]; [1]Lausanne/CH, [2]Bron/FR, [3]Lyons/FR (david.rotzinger@chuv.ch)

Purpose: To demonstrate the non-inferiority of low iodine dose dual-layer spectral detector coronary CTA (CCTA) compared to standard injection conventional CCTA for the evaluation of coronary artery disease and to compare the contrast-to-noise ratio between monochromatic and conventional CCTA reconstructions.
Methods and materials: 108 patients were randomised to undergo either a standard iodine injection protocol A (flow rate, 5 mL/s) or a reduced flow rate protocol B (flow rate, 2.5 mL/s) CCTA on a dual-layer spectral detector CT system. Conventional images only were reconstructed for protocol A. For protocol B, 55 keV monochromatic images were reconstructed. Contrast-to-noise ratio (CNR) between lumen and fat was measured in 5 coronary segments (LM, distal LAD, distal LCx, proximal RCA, and distal RCA). Two independent radiologists rated 17 coronary segments per patient regarding image quality on a 4-point Likert scale (4=best score). An examination was considered diagnostic if no segment was scored 1.
Results: The injected contrast agent volume was 72.2±9.8 mL and 42.5±10.5 mL for protocol A and B, respectively (p<0.001). CNR was 23.3±14.2 and 28.9±18.2 in protocol A and B, respectively (p=0.015). The rate of diagnostic CCTA was 89.3% (n=50/56) and 96.2% (n=50/52) in protocols A and B, respectively. Non-inferiority of protocol B compared to A was inferred (95% CI of the difference= -0.1651 to 0.0277), with a pre-specified non-inferiority margin of 10%.
Conclusion: Spectral CCTA with 55 keV monochromatic reconstructions allows for a 40% reduction in iodine dose compared to conventional CT angiography of the coronary arteries. Additionally, monochromatic reconstructions can improve the CNR between the coronary lumen and surrounding fat.
Limitations: Only one monochromatic energy level (55 keV) was evaluated.
Ethics committee approval: Ethics committee approval and written informed consent were received.
Funding: Funding was received from Bracco.

Improvement of image quality in high-resolution coronary computed tomography angiography when using a new deep learning image reconstruction algorithm
L. Macron, J. Feignoux, C. Le Goff, J.-L. Sablayrolles; Saint-Denis/FR, (laurentmacron@gmail.com)

Purpose: High resolution (HiRes) acquisition mode is highly valuable for assessing challenging lesions on coronary computed tomography angiography (CCTA), especially for severely calcified plaques and stents. However, HiRes acquisition mode introduces higher noise due to lower tube current availability, limiting its use for large patients. The aim of this study was to assess the impact of a new deep learning-based image reconstruction (DLIR) algorithm (TrueFidelity, GE Healthcare) on imageqQuality (IQ) for HiRes CCTA.
Methods and materials: HiRes CCTA exams from 29 patients were reconstructed with adaptive statistical iterative reconstruction V 50% (ASIRV50) and DLIR. IQ of both data sets was assessed quantitatively by measuring signal-to-noise and contrast-to-noise ratios (SNR and CNR) of the left ventricle and ascending aorta, and subjectively by two radiologists on a 5-points Likert scale. One-way ANOVA and Kruskall-Wallis test were used to compare quantitative metrics and subjective IQ respectively; p value <0.05 was considered significant.
Results: The mean age was 67+/-8 years, 55% were men, median Body Mass Index was 23 kg/m^2 (from 18 to 28), and mean DLP was 149+/-40mGy/cm. The mean SNR and CNR were significantly higher with DLIR images compared to ASIRV50 (left ventricle: SNR = 17.7vs9.3, CNR = 21.6vs13.6; ascending aorta: SNR = 18.4vs10.9, CNR = 19.8vs9.3, respectively; p <0.0001 each) and subjective IQ was significantly improved with DLIR (4.6+/-0.5) compared to ASIRV50 (3.8+/-0.4; p<0.0001).
Conclusion: By further reducing image noise magnitude without altering texture compared to ASIRV50, DLIR could expand the use of HiRes acquisition mode for CCTA in clinical routine and improve coronary stenosis depiction and quantification.
Limitations: Only 29 patients were included.
Ethics committee approval: n/a
Funding: No funding was received for this work.

RPS 303-14 15:18
A new dual-energy algorithm for better displaying vessel wall borders of the coronary artery on coronary CT angiography
F. Zhang[1], W. Deng[2], K. Chen[2], H. Tan[3]; [1]Sanya, Hainan/CN, [2]Shanghai/CN, [3]Beijing/CN (fanzradiology@126.com)

Purpose: To evaluate the potential ability of better displaying the distal coronary artery by using a new algorithm which depicts only water attenuation contribution of each voxel on CTA.
Methods and materials: Coronary CTAs were acquired using a dual-layer detector CT (Spectral IQON®, Philips Healthcare, the Netherlands) on 23 patients with a normal body mass index (BMI, 20-25 kg/m^2). Conventional images (group A), the new algorithm images (group B), and Z effective images (group C) of each patient were divided into three groups. The mean image noise and CNR of different groups were measured on CT images compared using the one-way ANOVA test. In addition, image quality and vessel wall contour evaluation were performed by two radiologists, who were blinded to the reconstruction algorithm, using a five-point confidence scale (1 [poor] to 5 [excellent]). The results of the three groups were compared with the Mann-Whitney U-test.
Results: There was a significant difference in mean image noise, CNR, image quality, and the contour of the vessel wall in the three groups (p<0.00). By using the new algorithm, the CNR and image quality of images were better than conventional images and Z effective images. The vessel wall contour can be clearly displayed in group B, but not in group A and C.
Conclusion: A new dual-energy algorithm could significantly improve displaying distal coronary artery on CCTA.
Limitations: A lack of in vitro experiments to determine the accuracy of the new algorithm.
Ethics committee approval: n/a
Funding: Social development special project of hainan key research and development plan.

RPS 303-15 15:24
CT-FFR profiles in patients without coronary artery disease
T. Leonard[1], C. N. de Cecco[1], U. J. Schoepf[1], S. S. Martin[2], A. M. Fischer[1], R. R. Bayer[1], R. H. Savage[1], A. Varga-Szemes[1], M. van Assen[3]; [1]Charleston, SC/US, [2]Frankfurt am Main/DE, [3]Groningen/NL (leonarty@musc.edu)

Purpose: To evaluate the effect of measurement location and lumen area changes on CT-FFR values in patients without coronary artery disease (CAD).
Methods and materials: Patients who underwent calcium scoring (CACS) and CCTA with CT-FFR were retrospectively included. Exclusion occurred if their CACS was >0, troponin levels were elevated, or any cardiac-abnormality was found on CCTA studies. On-site CT-FFR based on an artificial intelligence,

deep-learning algorithm was computed for each coronary artery at proximal, mid, and distal segments. At each location, the lumen area and Hounsfield Unit (HU) value were measured. CT-FFR was considered positive with values <0.75. The relationship between lumen areas, HU-values, and CT-FFR was evaluated for each coronary artery and each location. Ratios between mid and distal values compared to proximal-values for lumen and HU parameters were calculated.
Results: 106 patients were included. In 39 (37%) patients, the LAD had CT-FFR values <0.75, with a decrease in CT-FFR from 0.97 (SD:0.04) proximally to 0.62 (SD:0.10) distally in the abnormal patients. The Cx showed a limited number of patients with CT-FFR values <0.75 (n=16, 15%), with a decrease in CT-FFR values from 0.96 (SD:0.04) proximally to 0.65 (SD:0.09) distally in those patients. The RCA had 36 (34%) patients with CT-FFR <0.75, with distal CT-FFR values of 0.61 (SD:0.12) and proximal CT-FFR values of 0.98 (SD:0.02). 12 abnormal CT-FFR values were measured mid-segment, while all others were measured at distal-segments. The lumen area was not significantly different between the abnormal and normal CT-FFR groups, while both HU and HU-ratios were significantly lower in the abnormal CT-FFR group for all three major coronary arteries.
Conclusion: CT-FFR values in patients without CAD can become abnormal at a distal location without indicating flow-limiting stenosis, which depends strongly on HU-values.
Limitations: A retrospective single-centre study with limited subject-availability.
Ethics committee approval: Institutional-Review-Board approval.

Stopping anticoagulation for isolated or incidental sub-segmental pulmonary embolism (STOAPE) trial
G. Robinson[1], D. Lasserson[2], S. Jowett[2], A. Turner[2], S. Greenfield[2], C. Cummins[2], M. Newnham[2], J. C. L. Rodrigues[1]; [1]Bath/UK, [2]Birmingham/UK (grobinson1@nhs.net)

Purpose: The UK National Institute for Health Research (NIHR) posed: Should patients with incidental or isolated subsegmental pulmonary emboli identified on imaging be treated with anticoagulants?
Methods and materials: A randomised prospective open blinded endpoint trial. 1466 patients enrolled across 50 sites with an entry criteria of an isolated/incidental SSPE on CTPA. Patients will be randomly allocated to anticoagulation or no anticoagulation for 3 months. Imaging will be reviewed by an 'expert panel'. Primary outcome: VTE recurrence and major bleeding and CRNMB at 3 months. Secondary outcomes: hospitalisations for VTE or bleeding events, VTE recurrence, cost-effectiveness, EQ-5D-5L, unscheduled healthcare visits, PE/VTE deaths.
Results: Patients will be recruited from 1st June 2020. Study Objectives: (1) Determine whether not anticoagulating for isolated SSPE reduces harm compared with three months of full anticoagulation. (2) Determine the rate of complications of anticoagulation therapy in patients with SSPE. (3) Determine whether not treating SSPE is acceptable to patients and clinicians. (4) Determine the reclassification rate of SSPE diagnoses made by acute reporting radiologists when reviewed by thoracic radiologists. (5) Assess cost-effectiveness of the no-treatment approach in patients with SSPE, taking a health service perspective. (6) Set up an acute PE research network to support follow-on research studies.
Conclusion: This will be the first randomised controlled trial of anticoagulation in subsegmental pulmonary embolism to establish the risks and benefits of treatment. This presentation shows the study design, discusses the role of radiology, and the imaging data/outcomes that can be captured.
Limitations: Radiological limitiation: misdiagnosis of sub-segmental pulmonary embolism as the main entry criteria; however, this reflects 'real-world practice' and has been considered by the authors and NIHR.
Ethics committee approval: UK National Institute for Health Research (NIHR).
Funding: UK National Institute for Health Research (NIHR).

Can additional cancers detected by digital breast tomosynthesis in screening be detected on the corresponding mammography examination using artificial intelligence?
V. Dahlblom, A. Tingberg, K. Lang, I. Andersson, S. Zackrisson, M. Dustler; *Malmö/SE (victor.dahlblom@med.lu.se)*

Purpose: To investigate whether additional digital breast tomosynthesis (DBT) screen-detected cancers could be detected on the corresponding digital mammography (DM) examination by a deep-learning based AI system, using paired data from a prospective tomosynthesis screening trial.
Methods and materials: We used a subgroup of 14768 women from the Malmö Breast Tomosynthesis Screening Trial. All participants were examined with both DM and DBT with independent readings. Of 136 screen-detected cancers, 41 cancers were detected only on DBT. We analysed DM with a mammography AI software (ScreenPoint Transpara™). The software identifies and scores suspicious areas in the images with a score between 1 and 100 (highest risk), and also provides a composite cancer risk score between 1 and 10 (highest risk) for the whole examination. A cancer was defined as detected by the software if the examination got the highest risk score and the cancer lesion was correctly localised and scored over 60. Descriptive statistics were used.
Results: 1797 examinations (12%) got the highest examination risk score. The AI software detected 15 of the 41 DBT-only detected cancers (37 %) on DM. A majority were invasive cancers, with 8 invasive ductal carcinomas, 4 invasive lobular carcinomas, and 1 invasive tubular carcinoma. Three cancers had histological grade 3, and 2 had lymph node metastases.
Conclusion: A substantial number of the additional DBT screen-detected cancers were also detected on DM with AI. The possibilities of using mammography plus AI in screening should be further investigated, taking effects on e.g. false positive recalls into account.
Limitations: Single-centre study with a single vendor.
Ethics committee approval: Approved, informed consent used.
Funding: AIDA Fellowship, Vinnova (V. Dahlblom) and Governmental Funding for Clinical Research, Region Skåne. ScreenPoint Medical provided the software, but did not participate in the study.

Digital Breast Tomosynthesis (CBT) as a primary screening test in a population-based screening program: results from the "Trento DBT pilot study" including interval carcinoma anlysis
D. Bernardi[1], M. A. Gentilini[2], M. Pellegrini[2], C. Fantò[2], M. Valentini[2], V. Sabatino[2], M. de Nisi[2], N. Houssami[3]; [1]Milan/IT, [2]Trent/IT, [3]Sydney/AU (Daniela.Bernardi@humanitas.it)

Purpose: To report the results of a prospective trial on the use of DBT in place of digital mammography (DM) in women who attended screening invitation.
Methods and materials: From mid October 2014 to December 2016, a prospective cohort of 46,343 women presenting for screening had a DBT mammography; synthetic 2D images were reconstructed and read in combination with DBT. Main screening-parameters, including interval cancer rate (IRC) at 2-year follow up and DBT sensitivity, were assessed and compared with those of a historical cohort of 37,436 women previously screened with DM. Rate ratio (RR) and 95% CI statistics were used.
Results: Cancer detection rate (CDR) was 8.67% for DBT versus 5.48 for MX (RR 1.58, 95% CI 1.34-1.87). DBT-screened had lower recall rate (RR) compared to DM-screened cohort (2.55% and 3.21% respectively; RR 0.79, 95% CI 0.73-0.86) and increased PPV (34.07% for DBT and 17.07 for MX; RR 1.99, 95% CI 1.68-2.37). DBT implementation was associated with a significantly higher CDR for stage I-II invasive cancers across all tumour size and grade categories. Most of the cancers detected by DBT were node-negative. Interval cancer rate (IRC) for DBT-screened were comparable to MX-screened cohort (1.10 and 1.36 per 1000 screens respectively; RR 0.81, 95% CI 0.55-1.19). Screening sensitivity was higher for DBT than MX although not significantly (88.74 % vs 80.08%; RR 1.11, 95% CI 0.94-1.31).
Conclusion: Population-based implementation of DBT screening was associated with increased CDR and reducing RR, but no significant change for interval cancer rate.
Limitations: The pilot is a non-randomised clinical trial.
Ethics committee approval: Approval by local health authorities.
Funding: No funding was received for this work.

MRI screening in women with extremely dense breasts: patient and MRI characteristics to distinguish between false-positives and true-positives
B. M. Den Dekker, M. F. Bakker, S. V. de Lange, R. M. Pijnappel, W. B. Veldhuis, C. van Gils; *Utrecht/NL (bm.den.dekker@hotmail.com)*

Purpose: To identify patient and MRI characteristics that are useful to distinguish true-positive screening MRI examinations from false-positives in women with extremely dense breasts.
Methods and materials: Patient and MRI characteristics of 454 Dutch breast cancer screening participants (50-75 years) with Volpara density category 4 on mammography and a positive first-round MRI screening result (BI-RADS 3/4/5) after a normal screening mammography, were collected prospectively (DENSE trial). Positive predictive values for malignancy in relation to patient and MRI characteristics were assessed. Multivariable logistic regression analysis with stepwise backward selection using AIC was used to find the optimal model to distinguish true-positives from false-positives.
Results: Of 454 women with a positive MRI screening examination, 79 were diagnosed with breast cancer, the remaining 375 MRI examinations were considered false-positive. In univariate analysis age (p-value<0.03), BMI (p-value 0.01), first degree relatives with breast cancer (p-value 0.002), MRI BI-RADS (p-value<0.001), lesion type (p-value 0.02) and lesion kinetics (p-value 0.02) were associated with breast cancer diagnosis. The optimal multivariable prediction model included MRI BI-RADS, age, previous breast biopsy, first degree relatives with breast cancer, and menopausal status (AUROC 0.829, 95%CI 0.779-0.880).
Conclusion: In addition to BI-RADS classification of screening MRI, the patient characteristics of age, previous breast biopsy, first degree relatives with breast cancer, and menopausal status might be useful to distinguish true-positive MRI examinations from false-positives in women with extremely dense breasts.
Limitations: The model has not yet been validated in an independent dataset.
Ethics committee approval: Ethical approval for the DENSE trial was obtained from the Dutch Minister of Health, Welfare and Sport (2011/19). Written informed consent from study participants was obtained.
Funding: Supported by UMC Utrecht, ZonMw, Dutch Cancer Society, Dutch Pink Ribbon/A Sister's Hope, Bayer AG Pharmaceuticals, stichting Kankerpreventie Midden-West, Volpara Health Technologies.

Dose reference levels during fluoroscopically-guided procedures performed using mobile X-ray systems in operating rooms
L. Hadid-Beurrier[1], M. Demonchy[2], J. Le Roy[3], B. Royer[4], D. Dabli[5]; [1]Paris/FR, [2]Frejus/FR, [3]Montpellier/FR, [4]Maxéville/FR, [5]Angers/FR (lama.hadid@aphp.fr)

Purpose: The French Society of Medical Physics (SFPM) initiated a task group to establish dose reference levels (DRL) for the most common procedures performed in operating rooms using mobile X-ray systems.
Methods and materials: This multicenter prospective study involved 57 french medical institutions of different categories. Anonymised data was collected for 10 to 30 consecutive interventions from a list of 62 procedures types, belonging to 7 surgery specialties (neurosurgery, orthopaedics, digestive, urology, cardiology, vascular, and multi-specialty). Dose-Area-Product (DAP) and fluoroscopy time Reference Levels (RL) were established based on the 3rd quartile of distributions. Correction coefficients from quality assurance reports were applied to DAP displayed values to improve their accuracy. The impact of the procedure complexity was also investigated.
Results: DRLs were established for 31 procedures performed with mobile C-arms. Important variations were observed between the different surgery specialties. Lowest doses were reported for orthopaedic procedures (DAP=0.07 $Gy.cm^2$ for hallux valgus, elbow, and hands), while highest doses were found in vascular procedures (DAP=85 $Gy.cm^2$ for abdominal aortic aneurysm repair). In urology, DRLs ranged between 2 $Gy.cm^2$ for ureteroscopy and 10 $Gy.cm^2$ for lithotripsy. In cardiology, DRLs were higher for 3-leads pacemakers than for 1 or 2-leads pacemakers. Moreover, results show values below those obtained from fixed interventional radiology facilities. Indeed, when compared to the french RL using fixed modalities, DAP is 6 times lower for lower-extremity arteriography and 3 times lower for biliary drainage.
Conclusion: DRLs were established to help medical physicists and surgeons to evaluate their practice and optimise patient radiation safety.
Limitations: Patients' body mass index was not considered.
Ethics committee approval: This study was approved by the National Commission for Data Protection and Liberties and registered in Clinicaltrials.gov.
Funding: No funding has been obtained.

CT screening for early lung cancer, cardiovascular disease, and COPD in China: rationale and design of the NELCIN-B3 study
Y. Du[1], M. Vonder[1], Q. Li[2], G. Sidorenkov[1], Z. Ye[3], X. Xie[2], W. Wang[2], M. Oudkerk[1], S. Liu[2]; [1]Groningen/NL, [2]Shanghai/CN, [3]Tianjin/CN (marleenvonder@gmail.com)

Purpose: To determine and optimise the diagnostic performance of the Netherlands-China Big-3 screening (NELCIN-B3) protocol for early detection of lung cancer, cardiovascular disease (CVD), and COPD by low-dose CT in a Chinese population.
Methods and materials: Diagnostic randomised controlled and prospective cohort studies are conducted in three hospitals in China. 14,000 participants between 40-74 y will be randomly allocated to intervention and control groups. Risk-factor questionnaires, lung function, and blood samples will be collected. Intervention group participants will undergo low-dose chest CT and management according to NELCIN-B3 protocol. Quantitative assessment of Big-3 imaging biomarkers will be performed: lung nodule volume, volume doubling time, coronary calcium score, and emphysema score. Control group participants will undergo default chest CT and be managed according to hospital protocol based on lung nodule diameter and visual assessment of COPD and coronary calcium. Four years after the initial assessment, the referral rate, incidence of the Big-3, and related mortality will be evaluated.
Results: The effectiveness of quantitative assessment of CT imaging biomarkers for the Big-3 in the intervention group will be evaluated and compared to the control group with regards to referral rate, clinical diagnosis of the Big-3, and related mortality.
Conclusion: We expect that the quantitative assessment of the CT imaging biomarkers will reduce the number of unnecessary referrals for early detected lung nodules and improve the early detection of CVD and COPD in a Chinese population.
Limitations: Management of non-solid nodules in the intervention group will be based on the diameter due to lack of validated volume-based protocol.
Ethics committee approval: Approval was issued by the Biomedical Research Ethics Committee of Shanghai Changzheng Hospital and written informed consent collected.
Funding: This study is funded by the Chinese Ministery of Sciences and Technology (MOST) and the Royal Dutch Academy of Sciences (KNAW).

Neurodevelopmental outcomes of posterior fossa anomalies diagnosed by foetal MRI
S. Sefidbakht[1], A. Teimouri[1], P. Katibeh[1], N. Rahimirad[1], N. Asadi[1], P. Keshavarz[1], P. Iranpour[1], F. Zarei[1], B. Bijan[2]; [1]Shiraz/IR, [2]Sacramento, CA/US (Arashteimourirad@gmail.com)

Purpose: To retrospectively evaluate neurodevelopmental outcomes (NDO) of prenatally diagnosed isolated posterior fossa abnormalities characterised on foetal MRI.
Methods and materials: Out of 821 foetal MRIs performed on pregnant women referred to a tertiary referral centre from May 2015-July 2018, 66 were done for the further evaluation of isolated posterior fossa abnormalities suspected in ultrasound. Post-delivery follow-up was done by a trained examiner using national registry data and parental phone calls. The abnormal outcome was defined as an ASQ score below the cut-off for age and related skill. Pregnancy termination due to a foetal anomaly or foetal death (TOPFA/FD) was recorded.
Results: The maternal age was 29.3±5.7. Gestational ages at the time of the MRI were 24.7±5.9. Out of 66 cases, 19 cases were diagnosed as normal, 3 were lost to follow-up (LTFU), 1 foetal death, 13 normal, and 2 abnormal NDO (minor communication, fine motor, and problem-solving issues). Out of 36 foetuses referred for possible vermian hypoplasia, 15 foetuses were diagnosed with inferior vermian hypoplasia (4 TOPFA/FD, 6 LTFU, 3 normal, and 2 abnormal NDO), 14 were diagnosed as possible BPC before 19 wks GA (2 LTFU, 2 TOPFA/FD, 8 normal, and 2 abnormal NDO (mean ASQ 217, minor communication issues)), and 5 were diagnosed as mega cisterna magna (1 LTFU and 4 normal NDO). The worse outcome was with cerebellar hypoplasia (5 TOPFA/FD and 1 LTFU) and dandy-walker malformation (6 TOPFA/FD and one abnormal NDO).
Conclusion: MRI is fairly accurate in ruling out clinically significant posterior fossa abnormality even before 19 weeks GA. Prenatally diagnosed cerebellar hypoplasia and DWM are uniformly associated with a poor prognosis. Most cases of BPC have a normal and most cases of IVH have an abnormal NDO.

Foetal optic structures: a postmortem MRI study
F. Prayer, C. Seitz, M. Weber, D. Prayer, P. Brugger, G. M. Gruber; Vienna/AT

Purpose: To establish normal values of foetal optic structures as a reference for future in vivo imaging studies.
Methods and materials: Postmortem foetal MRI data of 33 foetuses with normal development of optical structures and 25 foetuses with pathologies (GW 16-42) were analysed. The pathology group included complex malformations (15), intrauterine growth restriction (2), premature rupture of membranes (4), twin-associated problems (3), and stillbirth (1). MRI was performed on a 3 Tesla scanner utilising an 8-channel knee coil. Retrobulbar and intracranial optic nerve diameters, optic nerve length, the angle between optic nerves, and minimum transverse diameter of the optic chiasm were obtained. Correlations with gestational age were performed. Measurements were performed using free Image J software on T2-weighted images (TR 300ms, TE 140 ms, and isovoxel 0.4mm ciss 3d sequence).
Results: The optic nerve length increased from 10.5-29.41 mm within 26 GW. The retrobulbar optic nerve diameter increased from 0.83 (right)/0.860 (left) mm to 2.13 (right)/ 2.10 (left) mm. The transverse diameter of the optic chiasm increased from 4.1-6.7 mm within 24 weeks. The angle between the optic nerves decreased by 36.5 degrees within 26 weeks. Optic structure measurements correlated significantly with gestational age. Foetuses in the pathology group had at least one aberration from the normal values.
Conclusion: Postmortem foetal MRI-based optic structure measurements correlated with gestational age and showed a change in orientation of the optic chiasm from a U shape at early gestation towards a V shape at later gestation. Based on the presented normal values, developmental defects can be detected sensitively.
Limitations: More studies are needed to investigate translation to in vivo foetal MRI.
Ethics committee approval: This study was approved by the institutional review board.
Funding: No funding was received for this work.

Paediatric orbital masses: the value of adding diffusion-weighted imaging to conventional MRI in lesion categorisation

A. Youssef, I. Zaky, A. Mohammed Aly, D. Elgalaly, M. Afifi, H. Taha, H. Elzomor, A. Alieldin; *Cairo/EG (aydayoussefegypt@gmail.com)*

Purpose: To assess the diagnostic contribution of diffusion-weighted (MRI) using apparent diffusion coefficient (ADC) values for the characterisation of orbital masses and differentiation of benign and malignant lesions.
Methods and materials: 130 patients with recently diagnosed orbital masses who underwent preoperative conventional MRI and DWI were included. The average ADC obtained from each tumour was compared with the histopathological diagnosis determined from the subsequent surgical sample.
Results: 70 girls and 60 boys (age range: 1 month-18 years) with orbital masses were included. The globe was the seat of lesions in 33% of cases, optic nerve in 20.7%, and 7 cases had lesions in the lacrimal gland. 45 cases were diagnosed as benign masses and 85 as malignant lesions.
There was a statistically significant difference between the mean ADC value of the benign lesions (1.39±0.52 $x10^{-3}$ mm^2/s) and those of the malignant lesions (0.69±0.22 $x10^{-3}mm^2/s$).
The optimal ADC cut-off value that was deter-mined for the discrimination between these lesions was 1.075 $x10^{-3}mm^2/s$, with a sensitivity of 97.14% and specificity of 75%.
Using conventional MRI alone in predicting benign and malignant lesions has the sensitivity of 76% and specificity of 91%, with 94% positive predictive value and 67% negative predicative value.
Combining DWI and conventional MRI has increased accuracy, as the sensitivity 95% and specificity 86%, with 93% positive predictive value and 90% negative predictive value.
Conclusion: ADC values provide an accurate, sensitive, fast, and non-invasive means of characterising paediatric orbital tumours. A priori tumour characterisation is useful in timing and treatment planning for orbital tumours.
Limitations: Variable pathological subtypes in all orbital compartments were included.

Neurosensory hearing loss in children with Zika virus microcephaly and brain MRI evaluation

N. Anaissi Rocha Pessoa[1], M. de Carvalho Leal[1], S. Caldas Da Silva Neto[1], L. Ferreira Muniz[1], P. M Parizel[2], M. D. F. Vasco Aragao[1]; [1]*Recife/BR,* [2]*Perth/AU (fatima.vascoaragao@gmail.com)*

Purpose: To describe the findings of brain MRI in children affected by congenital Zika virus syndrome (CZS) and sensorineural hearing loss (SHL).
Methods and materials: A retrospective cross-sectional study with two groups was conducted. Group A consisted of 6 children with microcephaly and SHL and group B consisted of 27 children with microcephaly without SHL. All children had a diagnosis of CZS confirmed in a previous study, had a hearing evaluation through BERA, and had brain and/or inner ear MRI. The images were qualitatively evaluated by a radiologist and two otolaryngologists.
Results: In a partial result, we observed a frequency of brainstem hypoplasia in all patients in group A, being 17% moderate, 33% severe, and 50% very serious. In group B, it was 18.5% mild, 25.9% moderate, 44.4% severe, and 11.1% very serious. Regarding hypoplasia of regions of the lower frontal parenchyma, in group A there were 3 (50%) severe cases and 3 (50%) very serious cases. In group B, this division was 3.7% normal, 25.9% mild/moderate, 51.8% severe, and 18.5% very serious. In the evaluation of the temporal parenchyma, in group A we found 7% of severe cases and 83% of very serious cases. In group B, the numbers found were equal to the frontal parenchyma evaluation.
Conclusion: We can observe that the group of patients with hearing loss presents more severity in the classification of their brain alterations, which may reflect in the hearing ability.
Limitations: The small sample of children with CZS with sensorineural hearing loss.
Ethics committee approval: Ethics committee approval obtained.

Chronic rhinosinusitis in patients with primary ciliary dyskinesia: comparison with findings in cystic fibrosis

F. Wuennemann[1], O. Sommerburg[1], M. Stahl[1], H.-U. Kauczor[1], I. Baumann[1], M. A. Mall[2], M. Eichinger[1], M. O. Wielpütz[1]; [1]*Heidelberg/DE,* [2]*Berlin/DE*

Purpose: Primary ciliary dyskinesia (PCD) and cystic fibrosis (CF) are characterised by impaired mucociliary clearance. Though pulmonary involvement has been the focus of research in the past, upper airway manifestations with chronic rhinosinusitis (CRS) has been rarely studied. CRS results in an increased disease burden and might be a reservoir for recurrent pulmonary pathogens. Our aim was to evaluate the extent of CRS in patients with PCD and CF using MRI.
Methods and materials: MRI of the paranasal sinuses was performed in 12 PCD patients with 25 MR-examinations (mean age 10.21y, range 0.21-18.22y) and compared to 21 age-matched CF patients with 49 MR examinations (mean 10.78y, range 0.13-18.71y). Abnormalities of the paranasal sinuses (mucosal swelling, mucopyoceles, effusion, polyps, and displacement of the medial maxillary sinus wall) were assessed using a newly developed CRS MRI scoring system.
Results: The overall sum score was significantly lower in PCD compared to CF ($p=0.0011$). With respect to the individual sinuses, scores of the maxillary sinus, the frontal sinus, the sphenoid sinus, and ethmoid cells were significantly lower in PCD. The involvement of the mastoid cells was significantly higher in PCD ($p<0.001$). The prevalence of mucopyoceles per individual sinus was significantly higher in CF ($p<0.001$ per sinus).
Conclusion: MRI is sensitive in detecting CRS across the whole paediatric age range. The novel score is applicable to patients with PCD and revealed a lower extent of CRS in patients with PCD compared to CF, despite similar pathophysiology.
Limitations: Differences in structural abnormalities of CRS in PCD and CF were not yet correlated to clinical outcome parameters.
Ethics committee approval: Approved by the institutional ethics committee. Written consent was obtained from parents or legal guardians.

The paediatric voice after airway reconstruction on MRI

B. Elders, M. Hakkesteegt, B. Pullens, H. A. W. M. Tiddens, P. A. Wielopolski, P. Ciet; *Rotterdam/NL (b.elders@erasmusmc.nl)*

Purpose: Although the focus in patients after laryngotracheal stenosis (LTS) is mainly on airway function, dysphonia is a common sequela that strongly influences the quality of life of patients. Dysphonia is caused by pre-existing stenosis and anatomical distortion due to airway reconstruction. Magnetic resonance imaging (MRI) is ideal to assess the vocal cords in static and dynamic conditions. The aim of this study was to image the vocal cords in children post

airway reconstruction for LTS on static and dynamic MRI and to compare these findings to voice outcome.
Methods and materials: Patients filled out a voice-related questionnaire ((paediatric) voice handicap index (p)VHI), the quality of the voice was tested with the dysphonia severity index (DSI), and static and dynamic upper airway MRI during free-breathing, inspiration and phonation (3T GE scanner, 6CH carotid coil, spatial resolution 0.5x0.5 (in plane) x2 mm, temporal resolution: 240 ms) was performed. Post-surgical anatomy, areas, diameters, and movement of the vocal cords were analysed.
Results: 48 patients (age 14.4 (11.7-19.4) years) and 11 healthy volunteers (age 15.9 (8.4-20) years) were included. Patients showed a high score on the (p)VHI (26.2±18.6%) and a decrease in DSI score (-2.6±2.4 vs 0.68±2.9, p<0.001) compared to healthy volunteers, representing dysphonia. MRI showed vocal cord (80.9%) and arytenoid thickening (59.6%). Furthermore, impaired adduction during phonation (61.7%) was seen, highly correlated to both (p)VHI and DSI score (odds 1.05 (1.01-1.09), p=0.02 and 0.65 (0.48-0.88), p=0.006).
Conclusion: Static and dynamic MRI is an excellent, non-invasive method to visualise the causes of dysphonia in combination with anatomy in paediatric patients with a history of LTS.
Limitations: n/a
Ethics committee approval: Approval by the local medical ethics committee (MEC-2018-013) and written informed consent was obtained.

RPS 312-7 14:36

A preliminary study assessing a novel neonatal brain MRI in the neonatal ICU

N. Berkovitz[1], E. Ben-David[2], A. Pais[3], D. Rosenbaum[4], Y. Kassierer[2], A. Bin Nun[2]; [1]*Yad-Binyamin/IL,* [2]*Jerusalem/IL,* [3]*Shoham/IL,* [4]*New York/US (nadavber@gmail.com)*

Purpose: To compare images from an experimental 1T permanent MRI scanner in the NICU to clinical 1.5T images.
Methods and materials: This was a prospective, non-randomised, feasibility study. Stable premature infants born prior to 28th week, or born between the 28th-32nd week of pregnancy with IVH, US abnormalities, severe morbidity, or abnormal neurological exam, underwent scanning at near term equivalent age with both conventional 1.5T and dedicated neonatal 1T MRI. MRI scans included T1, T2, and diffusion-weighted imaging performed on a conventional 1.5T (Aera, Siemens) and on a novel 1T MRI (Embrace, Aspect) located in the NICU. No more than 72 hours elapsed between the two studies. 3 radiologists blindly reviewed the images for the following: 10 predetermined anatomical structures, bilateral measurement of ADC values in the supraventricular white matter and vitreous humour, and notation of pathological findings. Findings and comparisons were subject to statistical analysis.
Results: 55 neonates were included in the study. 17 were scanned only on the 1T NICU scanner due to lack of parental consent for a second scan. Identification of the anatomical structures was similar for all 10 locations (P=0.64). Normalised ADC values of the white matter were similar (P=0.31, 0.44 for left and right, respectively). Bland Altman analysis demonstrated excellent agreement. 131 pathological findings were noted involving the parenchyma and ventricles on both scanners. Conspicuity of haemorrhage was slightly better on the 1.5T scanner (P<0.01).
Conclusion: The 1T neonatal scanner performs as well as a clinical scanner and is a potential clinical tool for use in the NICU.
Limitations: At the time of the study, SWI imaging was not available on the 1T scanner.
Ethics committee approval: Approved by IRB. Parental consent required.
Funding: Aspect Imaging.

Cerebral white matter alterations in very preterm infants: the contribution of 2D shear-wave elastography

M. Francavilla[1], P. Picq[2], P. Boizeau[2], M. Tanter[2], O. Baud[3], S. Guilmin Crepon[2], V. Biran[2], M. Alison[4]; [1]*Bari/IT,* [2]*Paris/FR,* [3]*Geneva/CH,* [4]*Saint Mande/FR (marianto_fra@hotmail.it)*

Purpose: To describe the brain elasticity of very preterm infants during development compared to term-born controls and to determine the diagnostic role of cerebral quantitative shear-wave elastography (SWE) in preterm children compared to standard cranial ultrasound (US) examination.
Methods and materials: 34 very preterm from 24 to 27+6 gestational weeks (GW) and 47 preterms (28 to 31+6 GW) underwent sequential brain US with elasticity measurement from birth to term.
18 term-born controls had the same protocol at birth.
On conventional US, frontal and parietal white matter (WM) was classified as normal or abnormal according to its echogenicity compared to plexus. Quantitative measurements of brain stiffness were performed with SWE in bilateral frontal and parietal WM and thalami.
Descriptive statistical analysis and multivariate analysis (ANOVA) for comparison between groups were performed.
Results: A progressive increase of brain stiffness was demonstrated with increased gestational age in all brain areas.
Brain stiffness was higher in parietal than in frontal WM at any gestational age.
WM elasticity values measured at term remained significantly lower in both subgroups of preterms compared to controls (p=0.04 and p=0.003 in frontal WM; p=0.003 and p=0.09 in parietal WM).
Brain WM elasticity was similar between preterm infants with or without abnormal WM on standard US examination.
Conclusion: Brain stiffness values change according to the gestational age with an anteroposterior gradient that might reflect normal brain maturation.
WM stiffness of very preterm infants remains lower than control newborns even at term.
Brain stiffness values do not seem to reflect the WM alterations found on conventional US but should be compared to MRI as the gold standard method.
Limitations: The lack of interobserver correlation and the decreasing number of preterms throughout the study.
Ethics committee approval: Ethics committee approval obtained.
Funding: No funding was received for this work.

The neurodevelopmental effect of intracranial haemorrhage observed in hypoxic-ischaemic brain injury in hypothermia-treated asphyxiated neonates: an MRI study

A. Lakatos[1], M. Kolossvary[2], M. Szabó[2], Á. Jermendy[2], H. Barta[2], G. Gyebnár[2], G. Rudas[2], L. R. Kozák[2]; [1]*Miskolc/HU,* [2]*Budapest/HU (drea820317@gmail.com)*

Purpose: The importance of intracranial haemorrhage (ICH) being present concomitantly to hypoxic-ischaemic encephalopathy (HIE) in hypothermia-treated asphyxiated neonates had not been investigated despite the known influence of hypothermia on haemostasis. We aimed to determine whether the presence of ICH on MRI alongside the signs of HIE have an impact on prognosis.
Methods and materials: A retrospective study of 108 asphyxiated term infants treated with whole-body hypothermia having a brain MRI within one week of life was conducted. The presence or absence of HIE signs on MRI and on MR spectroscopy (MRS) and/or of the 5 major types of ICH were recorded. The neurodevelopmental outcome was measured with the BSID-II test. Death or abnormal neurodevelopment (BSID-II score<85) was considered a poor outcome in a Chi-square test. Multivariate logistic regression analysis was performed on the survivors.
Results: MRI and MRS signs of HIE were present in 72% and ICH in 36% of neonates. The Chi-square test showed a relationship between the neurodevelopmental outcome and initial MRI. Unadjusted logistic regression showed that neonates presenting imaging signs of HIE have 6.23 times higher odds for delayed mental development (OR=6.2292; CI95%=[1.2642; 30.6934], p = 0.0246) than infants without imaging alterations, with no ICH effect on the outcome. Adjustment for clinical and imaging parameters did not change the pattern of results.
Conclusion: HIE related MRI abnormalities proved to be important prognostic factors of poor outcome in cooled asphyxiated infants, suggesting that early MRI with MRS is beneficial for prognostication. Interestingly, ICHs present in 36% of

patients had no significant effect on the outcome, despite the known haemostasis altering effects of hypothermia.
Limitations: The retrospective nature of the study.
Ethics committee approval: Institutional and Medical Research Council Ethics Committee of Hungary approved this study. Written informed consent was obtained.
Funding: AJ[PPD460004]; LRK[Bolyai Research Fellowship]; GyGy[EFOP-3.6.3-VEKOP-16-2017-00009].

Quantitative paediatric MRI going clinical: comprehensive brain assessment from a single sequence based on quantitative brain maturation atlases

B. Morel[1], G. F. Piredda[2], T. Hilbert[2], C. Tauber[1], J. P. Cottier[1], B. Maréchal[2], T. Kober[2]; [1]*Tours/FR,* [2]*Lausanne/CH (doc.baptiste@gmail.com)*

Purpose: A quantitative anatomical 3D sequence was optimised for paediatric application and used to build quantitative brain maturation atlases, mapping both the volumetric and T1-relaxometry changes. This allows for a comprehensive assessment of anatomy, morphometry, and a marker for brain microstructure (T1 relaxometry).
Methods and materials: We performed a two-year single-centre prospective study recruiting infants aged 1-16 years from a university hospital to be scanned at 1.5T (MAGNETOM Aera, Siemens Healthcare, Erlangen, Germany) using a 20-channel head coil without sedation. A single prototype MP2RAGE scan (TI1/TI2=600/2,000 ms, TR=5,000 ms, voxel size=1.33x1.33x1.25 mm^3 isotropic, TA=6:42 min) was performed. The supposed medical condition was an isolated headache with spontaneously favourable evolution. Brain maturation was modelled based on resulting T1 maps and volumetry (using the MorphoBox prototype adapted for paediatrics).
Results: 63 normal brain MRIs (33 female) were obtained. Automated segmentation and T1-mapping was successful in all scans. The evolution of volumes and T1 values were modelled over age to obtain reference ranges (without gender difference). The absolute volume of white matter increased continuously during childhood, with stable cortical grey matter volumes. Reference regional T1 values decreased rapidly during the first two years of age (supposedly showing myelinisation) and then more smoothly.
Conclusion: In addition to anatomical T1 images, the 3D MP2RAGE sequence allows for automated morphometric and relaxometry assessment. Based on this data, we created reference brain maturation atlases covering the entire childhood which have the potential to quantitatively support clinical decision making in paediatrics.
Limitations: A single-centre study with a limited sample of patients.
Ethics committee approval: Approved by the local ethics committee for human research (RNI-2017-093).

Frequency-dependent changes of interhemispheric functional connectivity and aberrant cerebral synchronisation in idiopathic generalised epilepsy

X. Ma, L. Jiang, S. Li, T. Zhang*; Zunyi/CN (mxj2439630056@163.com)*

Purpose: To characterise the functional connectivities (FC) frequency-dependency between hemispheres and the alteration within the cerebral in patients with idiopathic generalised epilepsy (IGE).
Methods and materials: Resting-state functional imaging was performed in 21 patients with IGE and 22 healthy controls. The FC for different frequency bands between the bilateral hemispheres and within the cerebral were calculated and within-group differences were analysed. Altered interhemispheric FC regions shown in patients were selected as seed regions for cerebral FC analysis. Two-way ANOVA and threshold-free cluster enhancement were performed.
Results: Compared with the controls, patients with IGE showed decreased interhemispheric FC between the bilateral orbitofrontal cortex in the full frequency band (0.01-0.1 Hz) the putamen and the superior temporal gyrus in the slow-4 band (0.027-0.073 Hz), and the orbitofrontal cortex and lingual gyrus in the slow-5 band (0.01-0.027 Hz). Moreover, the cortical-subcortical FC was decreased, the connection within the default mode network (DMN) was segregated into the front and back parts, and the DMN and auditory perceptual processing network was enhanced.
Conclusion: Our findings suggested that the FC in patients with IGE is frequency-dependent and the interaction alteration of cortical-subcortical and the coupling change of brain functional networks may play a crucial role in the pathophysiology of IGE.
Limitations: We acquired the r-fMRI data without recording the patient's simultaneous EEG data. Some patients in this study are taking antiepileptic drugs, which may have effects on cognitive ability and inhibiting the functional synchronisation of brain networks. The sample size of our study is relatively small.
Ethics committee approval: The retrospective study was approved by the local medical ethics committee and written informed consent was obtained.
Funding: Zunyi Science and Technology Cooperation Program (Number: (2017) 46).

Fibre tractography and diffusion tensor imaging in children with corpus callosum anomalies: a clinico-radiologic correlation

N. F. El Ameen, M. Ibraheim, S. Mounir*; ElMinia/EG (nadia.elameen@yahoo.com)*

Purpose: To evaluate the role of fibre tractography (FT) and diffusion tensor imaging (DTI) of the brain in paediatric patients with corpus callosum anomalies and correlate the findings with the clinical presentation.
Methods and materials: A prospective study included 115 children with CT findings suggested corpus callosum anomalies. Their ages ranged from 4 months-8 years old. All patients were referred from a paediatric neurology unit to the radiology department from April 2018-December 2018. All patients underwent MRI tractography and diffusion tensor imaging.
Results: Our study included 42 males and 73 females. They were reviewed for the presence and type of corpus callosum anomalies according to the Hanna classification. The most common type was hypoplasia without dysplasia 37/115 (32 %). An isolated anomaly was seen in 90/115 (78.3%). Using DTI and fibre tractography, corpus callosum fibre defects were classified into fronto-rostral, caudal, and whole body. A significant statistical correlation was found between ADHD as well as autism and loss of fronto-rostral fibres. Epilepsy and developmental delay were correlated to a whole-body defect and caudal fibre tract defects.
Conclusion: Fibre tractography and diffusion tensor imaging are promising techniques in the assessment of patients with corpus callosum anomalies. They provide accurate localisation of the affected segment of callosal fibres and help to predict the clinical prognosis of patients that could not be explained by the morphological changes seen in conventional MRI alone.
Limitations: The small number of patients and the need for anesthesia in most of the patient cohort.
Ethics committee approval: The study was done after the approval of ethical committee of our institution and after written informed consent of patients' parent before the examination and before anesthesia.
Funding: No funding was received for this work.

Posterior reversible encephalopathy syndrome in children: the association of blood pressure with imaging severity

K. Khandwala[1], K. Hilal[1], N. Sajjad[1], A. Malik[2]; [1]*Karachi/PK,* [2]*Atlanta/US (kumail.khandwala@gmail.com)*

Purpose: To evaluate the association and correlation between blood pressure (BP) and posterior reversible encephalopathy syndrome (PRES) imaging severity in the paediatric population in whom radiological features and pathophysiology remains obscure.

Methods and materials: A retrospective evaluation of paediatric patients diagnosed with PRES over the last 10 years at Aga Khan University was performed. Radiological findings were reviewed by two paediatric radiologists along with the clinical profile and outcome. Imaging severity was categorised into mild, moderate, and severe. The distribution of lesions, enhancement, diffusion restriction, and haemorrhage were assessed. Various conditions that may resemble PRES were excluded.
Results: Out of 43 children, 20 were males and 23 were females with a mean age of 10.7 years. The most common primary disease was malignancy (28%) out of which lymphoma predominated. The mean systolic BP was 131.5 (70-205) mmHg and diastolic was 82.9 (35-170) mmHg. 14 children had hypertension higher than autoregulatory limits. Imaging showed a parieto-occipital lobe involvement pattern in 42% of cases, holohemisphereic pattern in 30.2%, cerebellar involvement in 23.3%, and superior frontal sulcus pattern in 2.3%. 4.7% had a haemorrhage, 25.6% had contrast enhancement, and 27.9% had a positive diffusion restriction (cytotoxic oedema). No statistically significant association of imaging severity with BP (P=0.70), imaging severity with haemorrhage (P=0.30), and diffusion restriction (P=0.64) with imaging severity and with each other (P=1) was seen.
Conclusion: We did not find any statistically significant association of blood pressure with imaging severity, haemorrhage, and diffusion restriction (cytotoxic oedema). Further prospective studies are needed to determine the pathophysiological mechanisms and their correlation with imaging findings in PRES in children.
Limitations: The retrospective study design and single-centre study.
Ethics committee approval: Ethics committee approval obtained.
Funding: No funding was received for this work.

Cerebral perfusion in children sedated with propofol: an arterial spin labelling (ASL) study
V. Maruotti, E. Piccirilli, P. Chiacchiaretta, A. Ferretti, V. Panara, M. Caulo; *Chieti/IT (valeriomaruotti@gmail.com)*

Purpose: Paediatric MRI is highly dependent on anaesthesia, but sedative-hypnotic drugs can modify the cerebral metabolic rate and cerebral perfusion. Arterial spin labelling (ASL) MRI allows the investigation of brain perfusion without administrating contrast material.
We sought to evaluate the effects of propofol on the dynamic of cerebral perfusion in early childhood.
Methods and materials: 21 young children (2-5 years old) had an MRI performed using a 3T scanner. None of the children were premature, nor had a stroke, brain tumour, metabolic diseases, seizure, or brain malformations. Patients were sedated immediately before the MRI with an intravenous bolus of propofol. ASL was performed after the reference scout in 7 children (t1a), 3 minutes later in 7 children (t1b), and 6 minutes later in 7 children (t1c). All children underwent ASL at the end of sedation (t2 a, b, c). Individual brain perfusion maps were extracted to evaluate the average whole-brain perfusion (WBP). Mean values of CBF for each group were determined and the differences between groups using a t-test.
Results: The mean CBF (mL/100 g/min) were (t1) 34.7 ±6.4 and (t2) 32.6 ±6.7 (p= 0.0004). The subgroup values were (t1a) 34.6 ± 5, (t2a) 31.2 ± 5.1, (t1b) 31.3 ± 6, (t2b) 29.4 ± 5.1, (t1c) 38.2 ± 6.8, and (t2c) 37.3 ± 7.7. The difference between t1a and t2a (p= 0.004) was more significant than between t1b and t2b (P=0.028). The difference between t1c and t2c (P=0.363) was not statistically significant.
Conclusion: During sedation with propofol, cerebral perfusion decreases from oversedation.
Limitations: The small size.
Ethics committee approval: The institutional review board approved this prospective study.

Magnetic resonance (MR) in the identification of mural nodules of intraductal papillary mucinous neoplasms (IPMN) of the pancreas
G. Giannotti, A. Drudi, A. Lucarelli, A. Beleù, G. Rizzo, C. Longo, N. Cardobi, R. de Robertis Lombardi, M. D'onofrio; *Verona/IT (gabriele200590@gmail.com)*

Purpose: To evaluate the diagnostic accuracy of dynamic magnetic resonance (MR) with diffusion weighted imaging (DWI) in the identification of mural nodules of intraductal papillary mucinous neoplasms (IPMN) of the pancreas.
Methods and materials: 91 preoperative MRI scans with histopathological diagnosis of IPMN were reviewed by two radiologists. They evaluated the presence, number, and size of mural nodule, the SI of the nodule on T1-WI after i.v. contrast medium administration and on DWI, and the size of the cystic lesion and dilation of the main pancreatic duct. Two pathologists reviewed each case, evaluating the presence, number, and size of papillary structures, and the degree of epithelial dysplasia. Qualitative and quantitative analysis were performed. Interobserver agreement was calculated.
Results: Statistically significant differences were found for the following correlations: presence of nodules >5mm on MRI and confirmed by pathological review, size and number of mural nodule on pathological review and degree of dysplasia, size and number of mural nodule evaluated on MRI and tumoral dysplasia, presence of nodule >5mm with post-contrast enhancement and hyperintensity on DWI and degree of dysplasia, dilation of MPD and tumoral dysplasia. Interobserver agreement was moderate for the presence of mural nodule (K=0.56), the presence of high signal intensity on DWI (K=0.60), and enhancement of mural nodule (K= 0.58). Histogram analysis of ADC map showed a correlation between entropy of the entire cystic lesion and the degree of dysplasia.
Conclusion: Dynamic MRI with DW imaging has a good accuracy in the detection of IPMN mural nodule >5mm. DWI and T1-WI after contrast medium administration can be useful in the evaluation of malignancy of IPMN. Entropy could be used as a predictive parameter of malignancy of IPMN.

RPS 301a-2 14:06
Branch-duct intraductal papillary mucinous neoplasms of the pancreas: a 10 year follow-up of the safety of a surveillance MRI protocol
P. Boraschi, G. Tarantini, F. M. Donati, R. Cervelli, P. Scalise, D. Caramella; *Pisa/IT (p.boraschi@gmail.com)*

Purpose: To assess the safety of a surveillance MRI protocol through a 10 year follow-up of patients with branch-duct intraductal papillary mucinous neoplasms (BD-IPMNs) of the pancreas.
Methods and materials: All patients with “presumed” MR diagnosis of BD-IPMNs observed from 2008 to 2009 were retrospectively recruited from our radiological database. Only patients without worrisome features (WF) and/or high-risk stigmata (HRS) at diagnosis were enrolled. MRI protocol included axial T1w/T2w sequences, MRCP, and diffusion-weighted MRI with multiple b values. Contrast-enhanced T1-weighted sequences were obtained only at the baseline and if there was a suspicion of degeneration during the follow-up. The policy for follow-up consisted of abdominal MRI/MRCP every 6 months in the first 2 years from diagnosis and then each year in absence of clinical/radiological signs of progression. Cyst growth rate analysis and development of WF, HRS, and

pancreatic cancer (PC) during follow-up were evaluated. Patients with missing data and/or without 10 years follow-up were excluded from analysis.
Results: 69 patients fulfilling all the inclusion criteria represented our study group. During surveillance, five out of 69 patients (7%) underwent surgery (PC, n=2; IPMN with low grade dysplasia, n=3). WF and HRS developed in 10/69 (14,5%) and 3/69 (4%) cases, respectively. The cysts were dimensionally unchanged or slightly reduced in size in 18/69 (26%) and 3/69 (4,3%) patients, respectively. In the remaining 48/69 (69,5%) cases, cyst enlargement was appreciable with a median annual growth rate of 0,97±0,87 mm/yr (range: 0,13-5,0 mm).
Conclusion: In our series, pancreatic BD-IPMNs slowly grow over the time. Worrisome features, high-risk stigmata, and pancreatic cancer developed in a low percentage of patients, supporting the safety of our surveillance MRI protocol.
Limitations: Retrospective study.

Magnetic resonance morphologic features predict progression of incidental pancreatic cystic lesions during follow-up
S. Zhu, S.-X. Rao*; [1]Shanghai/CN (616209440@qq.com)*

Purpose: To evaluate which magnetic resonance (MR) morphologic features could predict the progression of pancreatic cystic lesions (PCLs) that were suitable for follow-up.
Methods and materials: A total of 2,176 MR images of PCLs were retrospectively reviewed between January 2009 and December 2016. The study population was composed of 223 patients. Clinical data and MR morphologic features of PCLs were recorded. We divided the individuals into two subgroups according to the final MR features. Univariable and multivariable regression analyses were performed to identify independent risk factors for progression of PCLs.
Results: 37.7% (84/223) PCLs progressed during follow-up, compared to 62.3% (139/223) PCLs that were stable. Age (odds ratio (OR) = 1.042; p = 0.017), number of lesions (OR = 0.491; p = 0.048), communication to pancreatic duct (PD) (OR = 2.425; p = 0.007), and the septa (OR = 6.105; p < 0.001) were significant independent factors for progression of PCLs. Among 84 lesions of progression, 27.4% (23/84) lesions increased to ≥ 30 mm or showed worrisome imaging features at the end of follow-up, which needs clinical interventions. The initial size and communication to PD were independent factors for progression of PCLs which needs clinical interventions (p < 0.001 and 0.011, respectively).
Conclusion: Age, number of the lesions, communication to PD, and the septa were independent risk factors for the progression of PCLs, and the initial size and communication to PD could potentially predict PCLs needing clinical interventions.
Limitations: We selected patients by reviewing the diagnostic reports. We did not collect the laboratory results. There is a difference in magnetic field strength.
Ethics committee approval: The Ethics Committee at Zhongshan Hospital of Fudan approved this retrospective research and waived the informed patient consent.
Funding: No funding was received for this work.

The value of diffusion-weighted imaging in the grading of pancreatic neuroendocrine neoplasms
W. Mingliang, Z. Mengsu*; Shanghai/CN (wang.mingliang@zs-hospital.sh.cn)*

Purpose: To evaluate the value of diffusion-weighted imaging (DWI) for the grading of pancreatic neuroendocrine neoplasms (pNEN).
Methods and materials: MR images and pathological data of 72 patients with pathologically confirmed pNEN were analysed retrospectively. PNEN was classified into pNETG1, pNETG2, pNETG3, and pNECG3 according to WHO's 2017 latest classification. ADC values of tumour and pancreas were measured.
Results: All 72 cases of pNEN were single lesion and the pathological grade was 18 cases of pNETG1, 36 cases of pNETG2, 13 cases of pNETG3, and 5 cases of pNECG3. ADC value of pNEN was negatively correlated with ki-67 (r=-0.845, P < 0.001). There were statistically significant differences in ADC values between pNETG1 and pNETG2, pNETG1 and pNETG3, pNETG1 and pNECG3, pNETG2 and pNETG3, and pNETG2 and pNECG3 groups (P < 0.001). There was no statistically significant difference in ADC values between pNETG3 and pNECG3 groups (P=0.233). The ADC value =1.596x10^{-3}mm^2/s was used as the cutoff value to distinguish the sensitivity and specificity of 97.22% and 83.33% of grade G1 and G2 pNEN, and the area under ROC curve was 0.941 (Z=13.340, P < 0.001). The ADC value =1.103x10^{-3}mm^2/s was used as the cutoff value to distinguish the sensitivity of 83.33% and specificity of 100% of G2 and G3 panNEN, and the area under ROC curve was 0.968 (Z=18.830, P < 0.001).
Conclusion: ADC values of tumours are helpful for the grading of pancreatic neuroendocrine neoplasms.
Limitations: The number of cases included in G3 (both pNETG3 and pNECG3) was small.
Ethics committee approval: The retrospective study was approved by the institutional review board of our hospital.
Funding: No funding was received for this work.

RPS 301a-5 14:24
The relationship between the portal radiomics score and G1/2 non-functional pancreatic neuroendocrine tumours
Y. Bian, H. Zhang, X. Fang, L. Wang, J. Lu, G. Jin*; Shanghai/CN (bianyun2012@foxmail.com)*

Purpose: To explore the exact relationship between the portal radiomics score (rad-score) and the grading in non-functional pancreatic neuroendocrine tumours (NF-pNETs), and evaluate the diagnostic performance of the rad-score.
Methods and materials: In this retrospective study, 102 patients with surgically resected, pathologically confirmed NF-pNETs underwent MSCT from January 2014 to December 2017. Radiomic features were extracted from portal venous CT scans. The least absolute shrinkage and selection operator method was used to select the features. Multivariate logistic regression models were utilised to analyse the association between the portal rad-score and grades of NF-pNETs. The portal rad-score performance was determined by its discrimination and clinical usefulness.
Results: The portal rad-score, which consisted of 4 selected features, was significantly associated with grades of NF-pNETs. High-risk patients had a 1.56-fold increased risk of G2 compared with low-risk patients. The portal rad-score was in its high accuracy (AUC=0.86 in all size, AUC=0.81 in size 2 cm). The best cut point based on maximising the sum of sensitivity and specificity was -0.134. The decision curves showed that if the threshold probability is above 0.02, using the rad-score in the current study to G1/2 NF-pNETs adds more benefit than the treat-all-patients scheme or the treat-none scheme.
Conclusion: The portal rad-score is a potentially valuable noninvasive tool for accurate preoperative prediction of grades for NF-pNETs.
Limitations: Firstly, this study was retrospective in nature. Secondly, we did not validate the rad-score with an external data cohort - this could form the topic of a future study.
Ethics committee approval: This retrospective single-center cross-sectional study was reviewed and approved by the Biomedical Research Ethics Committee of Changhai hospital.
Funding: National Science Foundation for Scientists of China (81871352, 81701689), Top Project of the Military Medical Science and Technology Youth Training Program (17QNP017).

RPS 301a-6 14:30
Diffusion-weighted imaging of autoimmune pancreatitis: how good is it as an imaging biomarker for disease activity?
L. Zhu[1], P. Asbach[2], T. Denecke[3], B. Hamm[2], Z. Jin*[1]; [1]Beijing/CN, [2]Berlin/DE, [3]Leipzig/DE*

Purpose: To evaluate diffusion-weighted imaging (DWI) features of autoimmune pancreatitis (AIP) at baseline, under treatment, and at relapse, and to compare with a disease-free pancreas.
Methods and materials: 62 patients with AIP (48 with initial attack and 14 with relapsed disease) underwent MRI with DWI (b =0 and 800sec/mm^2) at 3T. All patients received corticosteroid therapy (CST) with MR follow-up. 17 relapses were found during follow-up, whereas the remaining remained clinically stable. 40 gender-and age-matched patients without pancreatic disease served as control.

Results: The ADC value of AIP at baseline was significantly decreased compared to a disease-free pancreas (985.5±116.5 mm^2/s vs 1256.7±102.4 mm^2/s, p<0.001). During CST, the ADC value increased within 6 months, and further increased after 1 year (1174.8±122.1 mm^2/s and 1230.1±157.5 mm^2/s, respectively). At relapse, there was an relative decrease of ADC value (1104.8±200.5 mm^2/s), however, the value was significantly higher compared to the initial attack (p<0.001). Receiver-operating curve analysis yielded an area under the curve (AUC) of 0.876 for differentiating baseline AIP from a normal pancreas, an AUC of 0.701 for clinically active AIP (baseline + relapse) vs a normal pancreas, and an AUC of 0.544 for relapsed AIP vs a normal pancreas.
Conclusion: DWI might be useful in monitoring the dynamic change of AIP under CST. However, relapsed disease show less diffusion restriction than the initial attack and the absolute ADC value doesn't determine the disease activity of AIP.
Limitations: This was a retrospective study from a single institution and further multicenter validation studies are needed.
Ethics committee approval: The institutional review board approved this study and all patients gave written informed consent that their clinical and imaging data could be used for scientific purposes.
Funding: This study was founded by the national natural science foundation of China (81901716).

Differentiation of pancreatic adenocarcinoma from surrounding pancreatic tissue using the shortened MR protocol: histogram analysis of T2W signal intensity and ADC
D. T. Šarac, A. Djuric-Stefanovic*; Belgrade/RS (dimitrije.sarac89@gmail.com)*

Purpose: To evaluate whether pancreatic adenocarcinoma (PAC) could be accurately differentiated from the surrounding pancreatic tissue (PT) using the shortened MR scanning protocol by quantitative analysis of ADC and T2W signal intensity including the histogram-derived analysis.
Methods and materials: We retrospectively analysed 31 cases of PAC who underwent shortened 1.5T-MRI scanning protocol, which consisted of T2W FSSE and diffusion-weighted imaging (DWI) sequence with the apparent diffusion coefficient (ADC) by using two b values (0 and 800 mm^2/s). Tumour and surrounding pancreatic tissue were segmented on three consecutive the-largest-tumour-area sections in T2W series and the corresponding ADC map. Histogram analysis of T2W signal of PAC and PT was performed using MAZDA software. Mean values of ADC and T2W signal intensity and histogram-derived quantitative parameters (variance, skewness, kurtosis, minimum and maximum normalised values) of PAC and PT were compared using the paired-samples-t or Wilcoxon test depending on normality of parameter distribution, which was explored using the Shapiro-Wilk test.
Results: Mean ADC of PAC (1.537±0.221x10^{-3} mm^2/s) did not significantly differ from PT (1.555±0.196x10^{-3} mm^2/s) (p=0.644). Mean value of T2W signal intensity of PAC (median, 639.46) was non-significantly higher (p=0.410) than PT (589.76). Of histogram-derived parameters, variance of T2W signal intensity was significantly lower (p=0.030), kurtosis of histogram was higher (p=0.050), and minimum normalised signal intensity was significantly higher (p<0.001) in PAC than in PT.
Conclusion: Histogram-derived quantitative analysis of T2W signal intensity improves accuracy in differentiation of PAC from surrounding pancreatic tissue on shortened MRI scanning protocol.
Limitations: There were no obvious limitations.
Ethics committee approval: n/a
Funding: No funding was received for this work.

RPS 301a-8 14:42
Imaging-related delays in the diagnosis of pancreatic ductal adenocarcinoma: a multi-centered population-based observational study
J. Kang, S. Clarke, M. Abdolell, R. Ramjeesingh, J. I. Payne, A. Costa*; Halifax/CA (jessie-dain@Dal.Ca)*

Purpose: To determine the diagnostic interval of patients with pancreatic ductal adenocarcinoma (PDAC) in our region's population and which factors, including imaging-related delays, may impact survival.
Methods and materials: This study evaluated 257 patients (129 men, 128 women; mean 71.8 years) diagnosed with PDAC from 2014-2015. Patient data was retrieved from the Cancer Registry database, including demographics, stage, and dates of initial presentation/diagnosis and death.
The imaging archive was searched for US, CT, and MRI examinations performed during the diagnostic interval; these were independently rated by two radiologists according to the American College of Radiology RADPEER system. Univariate Kaplan-Meier analysis was performed for age (<65, 65-79, 80), sex, tumour location, stage, surgery, and RADPEER score. Multivariate Cox proportion hazards model was performed to assess for association between these covariates and survival.
Results: RADPEER 1-2 and 3 scores were assigned to 219 and 38 patients, respectively. The overall diagnostic interval was 77 days; this was much longer in the RADPEER 3 group (190 vs. 58 days, p=0.018). However, K-M analysis showed worse survival in the RADPEER 1-2 group (p=0.007).
Survival was also worse with distal PDAC (p=0.016), stage (p<0.0001), and no surgery (p<0.001). Survival was similar amongst the sexes (p=0.083). The Cox proportional hazards model showed better survival in women (p=0.008) and surgical patients (p<0.001), and worse survival in patients aged >80 years (p=0.016) and with stage IV disease (p=0.006).
Conclusion: Imaging-related delays are associated with much longer diagnostic intervals. However, this did not impact survival in our population.
Limitations: Retrospective study, registry data, other factors associated with survival: patient's comorbidities.
Ethics committee approval: Research ethics board approval and PHIA adherence.
Funding: No funding was received for this work.

RPS 301a-9 14:48
The prevalence and stability predictors of pancreatic lesions screened by non-contrast whole-body MRI
C. Xue[1], G. Lo[2], O. L. Wong[3], J. Yuan[3]; *[1]Hong Kong/HK, [2]Happy Valley/CN, [3]Hong Kong/HK (cindy.xue21@gmail.com)*

Purpose: To evaluate prevalence and stability predictors of pancreatic lesions (PLs) using non-contrast whole-body MRI (WBMRI) screening.
Methods and materials: 3236 consecutive healthy subjects (1765 male, 1471 female, mean: 55±13 years, range: 20-92 years) receiving non-contrast WBMRI using 1.5T or 3T MRI scanners covering brain, neck, thorax, abdomen, pelvis, and spine from 2008-2018 were retrospectively analysed. Abdomen protocol included T2w-TSE, T1w-FS, and DWI. Images were evaluated by radiologists (10+ years of experience). Subjects with PLs were identified and necessary follow-ups (interval: 1-9 years) were conducted to confirm the PLs' nature. Prevalence was counted as the proportion of PL reported to the total of WBMRI cases. PLs were divided into 2 groups (I: need treatment/close-monitor, II: simple/benign cysts). Pearson-correlation was conducted to evaluate the relationship between prevalence of PL and age. Chi-square and t-test were used to evaluate PL stability regarding sex and PL size.
Results: In this study, 74 (2.3%) subjects (40 males, 34 females) with PL were observed using WBMRI. Group I included 2 pancreatic carcinoma, 9 intraductal papillary mucinous neoplasms (IPMN), 1 serous cystadenoma, and 4 pancreatic cysts with changes in size/number/density. Group II consisted of 58 stable pancreatic cysts. PLs' size ranged from 0.1-4 cm (mean:0.6±0.6mm). Group I had significantly larger PLs (size:1±0.95mm) compared to group II (size:0.52±0.5mm)(p<0.05), with no significant difference in gender (p=0.066) or age (p=0.42) between groups.
Prevalence of PL was age-dependent (Pearson-coef.=0.35;p<0.005), with no pancreatic lesion found in subjects under 30 years old, and gender-independent (p=0.8;2.3%(male),2.3%(female)).
Conclusion: Prevalance of PL screened by WBMRI is 2.3%, and is age-dependent but gender-independent. PL size might be a potential predictor of whether further treatment/close-monitoring is needed.
Limitations: This is a retrospective study, hence, an inadvertent bias could not be excluded.
Ethics committee approval: Ethical approval has been obtained.
Funding: No funding was received for this work.

RPS 301a-10 14:54

Quantitative magnetic resonance imaging of the pancreas in patients with type-2 diabetes mellitus

T. H. Waddell, D. Halliday, A. Dennis, H. R. Wilman, R. Nicholls, M. Kelly, R. Banerjee*; Oxford/UK (tom.waddell@perspectum.com)*

Purpose: Traditional techniques for characterising pancreatic tissue such as endoscopy and computed tomography are invasive, limited by interobserver variability and lack sensitivity. Magnetic resonance imaging (MRI) successfully predicts liver outcomes, correlates with histology, and does not use ionizing radiation. MRI is emerging as a promising technique for monitoring the pancreas in patients with T2DM. Here we explore the utility of multiparametric MRI of the pancreas within a cohort of T2DM participants compared to healthy participants.
Methods and materials: 459 participants underwent a pancreatic MRI scan as part of the UK Biobank imaging study. 3 regions of interest (10mm) were placed on proton density fat fraction (PDFF) and T1 (a fibroinflammation biomarker) maps in the head, body, and tail of the pancreas. PDFF and T1 values were successfully acquired from 90.8% and 90.4% of scans, respectively. Participants were excluded if pancreatic T2* measured < 23.1 ms (high iron). Data from 126 participants (20 T2DM/106 healthy) were included for analysis.
Results: Two-sample Kolmogorov-Smirnov tests revealed T2DM participants had significantly greater PDFF than healthy participants (6.79% vs 3.09%, p < 0.0001), and there was a trend towards increased T1 in T2DM patients (639ms vs 603ms, p = 0.2). PDFF was not uniformly distributed within the pancreas with a trend towards increased fat in the body compared to the head and tail of the pancreas (T2DM: head 4.94%, body 7.06%, tail 4.57%; healthy: head 2.69%, body 3.28%, tail 3.07%). Data is presented as median.
Conclusion: Multi-parametric MRI had a high success rate for quantitative characterisation of pancreatic tissue, even in this high-throughput epidemiological study. Pancreatic PDFF, but not T1, was significantly higher in patients with T2DM vs heathy participants.
Limitations: Single analyst.

The relationship between pancreas divisum subtypes, bile duct variation, and portal vein variation

M. K. Şimşek, C. Altay, H. A. Özgül, I. Başara Akin, M. Seçil*; Izmir/TR (mkursatsimsek9@gmail.com)*

Purpose: To evaluate the incidence of the biliary duct (BD) and portal vein (PV) variations by magnetic resonance cholangiopancreatography (MRCP), contrast-enhanced computed tomography (CECT), and MR imaging (MRI) in patients with pancreatic divisum (PD) and control group patients.
Methods and materials: A retrospective study was performed from January 2010 to October 2018 in a single high-volume centre. Patients who had hepatobiliary surgery, malignancy, or pancreatitis were excluded. 199 patients with PD (age: 57.6±15,2 years, F=114, M=85), and 55 patients without any pancreatic variation (age: 61,1±14,3 years, F=28, M=27) who underwent MRCP, CECT, and/or MRI were enrolled. Two experienced radiologists assessed all the images for the variation of the BD and PV. The Chi-Square test was used with IBM SPSS 24.0 package program (SPSS Inc, Chicago, IL, USA).
Results: Of all 199 patients with PD, 57 patients (28,6%) were classified as PD type I, 48 (24,1%) were type II, and 94 (47,3%) were type III. BD and PV variations were found in 61.4% and 51.1% of the patients with PD, respectively. 11 patients without PD (20%) have BD variations, and 9 (16,3%) have PV variations. There were statistically significant differences between the control group and patients with PD, and PD subtypes and PV and BD variations ratio (P<0.05).
Conclusion: PD is the most common pancreatic variation. To have knowledge about pancreas divisum, bile duct and portal vein variations is essential in hepatobiliary surgery planning.
Limitations: The number of the patients was limited.

Camera-based respiratory triggering improves image quality of 3D magnetic resonance cholangiopancreatography

F. N. Harder, F. Lohöfer, G. Kaissis, C. Zöllner, O. Kamal, A. Hock, E. J. Rummeny, D. C. Karampinos, R. Braren*; Munich/DE (Felix.Harder@tum.de)*

Purpose: To evaluate the performance of a novel camera-based breathing navigation system in respiratory-triggered (CRT) 3D-magnetic resonance cholangiopancreatography (MRCP) at 3T MRI.
Methods and materials: Two compressed sensing (CS) accelerated 3D-MRCP data sets were acquired subsequently within one imaging session with traditional respiratory belt- (BRT) or camera- (CRT) based triggering in 28 patients. The CS factor was 15. Overall image quality, blurring, motion artifacts, and discernibility of the pancreaticobiliary tree (PBT) were scored on a 4-point scale retrospectively by two radiologists. The contrast ratio between the common bile duct and its adjacent tissue was measured by region-of-interest (ROI) analysis. Signal intensity increase at the boundaries of the ducts was quantified byline profilesto objectify blurring and motion artifacts. Furthermore, extracted respiratory signal curves were analysed for signal quality and trigger timing.
Results: Total scan time was 72s for both acquisitions. CRT yielded significantly better ratings in image quality, background suppression, blurring, and discernibility of PBT structures compared to BRT. Contrast ratios were significantly higher in CRT (0.94 ± 0.03) than in BRT (0.93±0.03) exams; paired t test P=0.0017. Line profileslopes through the common bile duct revealed significantly higher values in CRT (42.23 ± 8.74 % of maximum intensity/mm) compared to BRT (36.06 ± 8.96 % of maximum intensity/mm; paired t testP<0.0001). Camera-derived respiratory signal curves showed a higher SNR, lower standard deviation of the signal amplitude, and less incorrect triggering than the respiratory belt-derived respiratory signal curves.
Conclusion: Camera-based respiratory triggering significantly improves image quality of 3D-MRCP compared to conventional respiratory belt triggering.

Clinical feasibility of compress SENSE 3D MR cholangiopancreatography (CS-MRCP) with real-time tracking (vital eye) in pancreaticobiliary disorders: a preliminary study

M. He, J. Xu, X. Wang, J. Wang, H. Xue, Z. Jin*; Beijing/CN (377174431@qq.com)*

Purpose: To prospectively evaluate the clinical feasibility of a CS-MRCP using real-time tracking (vital eye) (CS-VE-MRCP) and to compare its performance with original navigator-triggered (NT) CS-MRCP and NT-MRCP.
Methods and materials: A total of 27 patients (11 males, 16 females, age range:15-60 years, mean age: 45.67±16.72 years) with suspected pancreaticobiliary pathologies were prospectively enrolled and completed the three MRCP protocols randomly. The acquisition time was recorded. The entire pancreaticobiliary system was divided into 12 segments and evaluated on a 5-point scale by 2 radiologists independently. The Friedman test with a post hoc test was performed to compare image acquisition time, the presence of artifacts, background suppression, overall image quality, and duct visualisation among the three protocols. The diagnosis performance of the three protocols was evaluated by AUC value and compared by McNemar's test. Interobserver agreement was evaluated by linearly weighted kappa coefficients.
Results: Compared to NT-MRCP, the acquisition time of CS-NT-MRCP and CS-VE-MRCP was significantly decreased (both P < 0.001). There is no significant difference in imaging quality (P> 0.05) between the NT-MRCP and CS-VE-MRCP protocols. NT-MRCP depicted pancreatic duct and intrahepatic duct better than CS-NT-MRCP (all P < 0.05) and was comparable with CS-VE-MRCP

(all P> 0.05). For detecting pancreatobiliary pathologies, both CS-VEMRCP and NT-MRCP had significantly better performance compared to CS-NT-MRCP (AUC was 0.955 (95%CI:0.918,1) for NT-MRCP, 0.677 (95%CI:0.573,0.781) for CS-NT-MRCP, and 0.903 (95%CI:0.839, 0.968) for CS-VE-MRCP, both P < 0.05). All evaluation reached good to excellent agreement (0.619-0.897).
Conclusion: Vital eye can feasibly improve imaging quality and diagnostic performance of CS-MRCP protocols.
Limitations: Small sample size and lack of histopathological results.
Ethics committee approval: Institutional review board approval and written informed consent was obtained.
Funding: No funding was received for this work.

Gadoxetic acid-enhanced MRI in primary sclerosing cholangitis: added value in liver function evaluation and monitoring of disease progression
A. Elkilany[1], T. Müller[1], A. Fischer[1], T. Denecke[2], D. Geisel[1]; [1]*Berlin/DE,* [2]*Leipzig/DE*

Purpose: To evaluate the added value of gadoxetic acid-enhanced magnetic resonance imaging (MRI) in the monitoring of disease progression and liver function in patients with primary sclerosing cholangitis (PSC).
Methods and materials: We retrospectively identified 120 patients (87 male, 33 female; mean age 42.58±12.3 years) with confirmed diagnosis of PSC who underwent 259 gadoxetic acid-enhanced MRI examinations between January 2008 and May 2019. Relative enhancement (RE) in hepatobiliary phase (HBP) was calculated in each Couinaud liver segment and in the whole liver and correlated with liver function tests (LFTs) and different prognostic clinical scoring systems, including model for end-stage liver disease (MELD) score, Mayo risk score, and Amsterdam-Oxford-PSC score. Furthermore, RE was correlated with qualitative MRI parameters including lobar atrophy, T2 hyperintensity, significant bile duct stenosis, and bile duct irregularities (pruning and beading).
Results: There was a significant negative correlation between RE in HBP and Mayo risk score (r = -0.716), MELD score (r = -0.554), Amsterdam-Oxford-PSC score (r = -0.465), LFTs including bilirubin (r=-0.521), aspartate aminotransferase (r=-0.449), alkaline phosphatase (r=-0.428), INR (r = -0.552), Alanine aminotransferase (r=-0.286) and Gamma-glutamyl transferase (r=-0.202) and a significant positive correlation with albumin (r=0.552). Furthermore, correlation between RE in HBP and qualitative MRI findings revealed a significant negative correlation with biliary duct dilatation (r=-0.286), significant bile duct stenosis (r=-0.204), lobar atrophy (r=-0.122), T2 hyperintensity (r=-0.096), and bile duct caliber irregularity (r=-0.112).
Conclusion: Gadoxetic acid-enhanced MRI can be used as a surrogate parameter for the evaluation of liver function and monitoring of disease progression in patients with PSC.
Limitations: No correlation with ERCP or clinical outcome.
Ethics committee approval: The study was approved by the institutional review board.
Funding: No funding was received for this work.

Hepatobiliary phase gadoxetic acid excretion in gadoxetic acid-enhanced MRI as a prognostic factor in patients with primary sclerosing cholangitis
A. Elkilany[1], T. Müller[1], A. Fischer[1], T. Denecke[2], D. Geisel[1]; [1]*Berlin/DE,* [2]*Leipzig/DE*

Purpose: To evaluate the utilisation of gadoxetic acid excretion in the hepatobiliary phase of gadoxetic acid-enhanced magnetic resonance imaging (MRI) as a prognostic parameter for disease progression and liver function in patients with primary sclerosing cholangitis (PSC).
Methods and materials: We retrospectively identified 120 patients (87 male, 33 female; mean age 42.58±12.3 years) with confirmed diagnosis of PSC who underwent 259 gadoxetic acid-enhanced MRI examinations between January 2008 and May 2019. Patients were divided into excreting (181 patients) and non-excreting (78 patients) groups depending on the presence or absence of gadoxetic acid excretion in the common bile duct (CBD) in hepatobiliary phase (HBP) respectively. Both groups were compared regarding relative liver enhancement (RE) in HBP, liver function tests (LFTs), and different prognostic clinical scoring systems including model for end-stage liver disease (MELD) score, Mayo risk score, and Amsterdam-Oxford-PSC score.
Results: Relative liver enhancement (RE) in HBP was significantly higher (P < 0.005) in the excreting group while clinical scoring systems (Mayo risk score, MELD score, and Amsterdam-Oxford-PSC score) were significantly higher (P < 0.005) in the non-excreting group. LFTs comparison between both groups demonstrated a significantly higher levels of bilirubin (P < 0.005), aspartate aminotransferase (P = 0.001), alkaline phosphatase (P < 0.005), and INR (P = 0.001) in the non-excreting group and a significantly higher level of serum albumin (P < 0.005) in the excreting group.
Conclusion: Gadoxetic acid excretion in the hepatobiliary phase of gadoxetic acid-enhanced MRI can be used as a prognostic parameter for monitoring of disease progression and evaluation of liver function in patients with PSC.
Limitations: No comparison regarding clinical outcomes or ERCP findings.
Ethics committee approval: The study was approved by the institutional review board.
Funding: No funding was received for this work.

Short MRI surveillance protocol for the detection of hepatocellular carcinoma: the SMS protocol
F. Willemssen, Q. G. de Lussanet de la Sablonière, R. S. Dwarkasing; *Rotterdam/NL (f.willemssen@erasmusmc.nl)*

Purpose: The purpose of this study was to explore if a short MRI surveillance protocol, the SMS protocol, can be used as surveillance examination for detection of hepatocellular carcinoma.
Methods and materials: Between 2010 and 2018, all patients who underwent yearly CE-MRI because of US screening failure as surveillance for HCC, with at least 2 examinations, were included. Second last negative MRI examination or MRI examination with HCC detected on full CE-MRI protocol, were selected. Axial T2 weighted images, axial DWI (b=600), and axial T1-in and opposed phase images were sent to a separated server. Three independent reviewers with 18, 13 and 5 years' experience in abdominal imaging evaluated these series. The presence of HCC was scored using a three-point scale as definitely HCC, uncertain, and no HCC. Reference standard was the full CE-MRI according to the international guidelines of the AASLD and EASL.
Results: 215 patients were included in our cohort follow-up study. 39 patients developed HCC (18,1%), of which 37 were detected (94,9%) by the SMS protocol. 2 HCCs were missed (0,9%). 31 patients (14,4%) had suspect lesions, which proved to be false positive. Interobserver agreement was high, the area under the curve was 0.909.
Conclusion: Surveillance of HCC using the SMS protocol has an excellent accuracy with high interobserver agreement. The SMS protocol might be a promising technique to replace US as screening tool for surveillance of HCC.
Limitations: Retrospective analysis. No direct comparison with US.
Ethics committee approval: Our local medical ethical committee granted permission for the study and informed consent was waived.
Funding: No funding was received for this work.

Diagnostic performance of an abbreviated non-contrast MRI for hepatocellular carcinoma surveillance

J. S. Kim, J. K. Lee, S. Y. Baek, S. Jang*; Seoul/KR (truth0508@nate.com)*

Purpose: To evaluate per-patient diagnostic performance of a minimised non-contrast MRI protocol for hepatocellular carcinoma (HCC) surveillance in cirrhotic liver, as well as factors affecting diagnostic sensitivity.
Methods and materials: A total of 226 patients who underwent MRI for HCC surveillance over an eight year period were included in this retrospective study. Set1 consisted of diffusion-weighted imaging and respiratory-triggered, fast-spin echo T2-weighted imaging with fat suppression. Set2 included T1-weighted in/opposed-phase images added to images from Set1. Image sets were scored as positive or negative for HCC according to predetermined criteria by two readers independently. The diagnostic performance of the two sets in conjunction with α-fetoprotein (AFP) was assessed and compared using the McNemar test.
Results: The sensitivity, specificity, and accuracy of Set1 of reader1/reader2 were 84.4%/87.3%, 86.8%/86.8%, and 85.0%/87.2%, respectively. Those for Set2 were 87.3%/89.6%, 81.1%/79.2%, and 85.8/87.2%, respectively. The sensitivities of the sets were not significantly different (p=0.063). Sensitivities of both sets in conjunction with AFP were higher than those of MRI alone without statistical significance (87.3%/89.6% and, p=0.063/>0.99; 89.6%/89.6%, p=0.125/>0.99). In very early stage HCC, the sensitivities of Set1 and Set2 were 73.1%/76.9% and 76.9%/82.7%, respectively.
Conclusion: An abbreviated non-contrast MRI protocol consisting of Fat-sat T2WI and DWI is highly sensitive and may be a viable method for HCC surveillance of the cirrhotic liver. The inclusion of T1-weighted in/opposed-phase and AFP may increase this sensitivity.
Limitations: This was a retrospective study.
Ethics committee approval: Our institutional review board approved this retrospective study; informed consent was waived.
Funding: No funding was received for this work.

Abbreviated magnetic resonance imaging (AMRI) for HCC detection: a five-year single-center experience

A. Pecorelli[1], P. M. Dautt Medina[1], N. Layyous[1], J. Y. An[1], A. Mamidipalli[1], R. L. Brunsing[2], M. T. Booker[1], C. B. Sirlin[1], K. J. Fowler[1]*; [1]San Diego, CA/US, [2]Stanford/US (pecorelli.anna@gmail.com)*

Purpose: Our center initiated in June 2014 hepatobiliary-phase AMRI for clinical HCC surveillance in patients with cirrhosis or chronic hepatitis B in whom ultrasound surveillance was compromised by obesity or other factors. The exam acquires 3 sequences (T1w fat-suppressed, T2w single shot fast spin echo, diffusion weighted) about 20 minutes after gadoxetate disodium (0.025 mmol/kg) administration with a total scanner time ≤ 15 minutes. The aim of the study is to describe the 5-year, single-center clinical experience of AMRI for HCC surveillance.
Methods and materials: Reports for AMRIs performed through May 2019 were retrospectively reviewed. Results were scored as negative (no or only definitely benign observations), subthreshold (observations < 10 mm), or positive (observations ≥ 10 mm). Each patient was categorised surveillance-negative, surveillance-subthreshold, or surveillance-positive according to their highest AMRI score. Outcomes were evaluated using all available clinical, imaging, and pathological data.
Results: 1160 AMRIs were performed in 561 patients between June 2014-May 2019. 185 (33%) patients were lost to follow-up. Of the remaining 376 patients, 295 (79%) were surveillance-negative, 23 (6%) surveillance-subthreshold, and 58 (15%) surveillance-positive. Based on the composite reference standard, 292/295 (99%) surveillance-negative and 20/23 (87%) surveillance-subthreshold patients were HCC-negative (true negatives); 29/58 (50%) of surveillance-positive patients were HCC-positive (true positives). Sensitivity, specificity, and accuracy of surveillance AMRI were 86%, 91%, and 90% respectively.
Conclusion: Hepatobiliary-phase AMRI surveillance is feasible clinically in patients in whom ultrasound surveillance is compromised. Our preliminary single-center experience suggests it provides higher sensitivity (86% vs 78%) and specificity (98% vs 89%) with lower loss to follow-up (33% vs 38%) than historically reported ultrasound surveillance.
Limitations: Retrospective study.
Ethics committee approval: IRB approval has been granted.

Radiomics model to predict hepatocellular carcinoma on liver MRI of high-risk patients in surveillance: a proof-of-concept study

M. P. A. Starmans, C. J. Els, F. Fiduzi, W. J. Niessen, S. Klein, R. S. Dwarkasing*; Rotterdam/NL (m.starmans@erasmusmc.nl)*

Purpose: Hepatocellular carcinoma (HCC) is the most common primary liver cancer. Many guidelines recommend surveillance with ultrasound twice per year for patients at risk (e.g. with hepatitis or cirrhosis). However, ultrasound has limited sensitivity for detecting early HCC. We present radiomics based on MRI of the liver parenchyma as an alternative.
Methods and materials: In our center, high risk patients deemed unsuitable for ultrasound surveillance for HCC had undergone yearly liver MRI. As a proof-of-concept, we aimed to distinguish two extrema: livers in which no HCC developed (i.e. HCC-naive livers) and livers with HCC at first detection. To this end, T2W and diffusion-weighted MRI (B-values: 0/50 and 600+) were collected from 154 patients (74 HCC, 80 HCC-naive). A clinician delineated the liver parenchyma, excluding HCC if present. Within the liver, 410 radiomics features, excluding shape and volume measures, were extracted per sequence. Three decision models, using 1) T2W; 2) DWI; and 3) T2W+DWI, were created through an automated search amongst a variety of machine learning algorithms to find the combination that maximises performance. Evaluation was implemented through a 100x random-split cross-validation, with 80% of the data used for training and model optimisation, and 20% for testing.
Results: The T2W+DWI radiomics model had a mean area under the curve (AUC) of 0.77. The models using only the T2W or DWI faired similar (AUC of 0.74 and 0.74, respectively).
Conclusion: Our radiomics approach showed that livers in which a HCC has developed differ in appearance from HCC-naive livers. Our next step includes the extension to longitudinal analysis of the liver to predict HCC development at an earlier stage.
Limitations: First step towards ultimate aim: prediction in longitudinal setting.

Combining CT-liver perfusion and MRI with hepatobiliary contrast agent to increase diagnostic accuracy in patients with suspected hepatocellular carcinoma

G. Kalarakis[1], E. Chryssou[2], K. Perisinakis[2], D. Samonakis[2], M. Koulentaki[2], I. Karageorgiou[2], E. Akoumianakis[2], A. A. Hatzidakis[3]*; [1]Stockholm/SE, [2]Heraklion/GR, [3]Thessaloniki/GR (kagiorgos@gmail.com)*

Purpose: We sought to compare the diagnostic accuracy of CT-liver perfusion (CTLP) plus MR imaging versus MR imaging alone for detection and characterisation of suspected HCC lesions.

Methods and materials: 33 patients (31 male, 25 cirrhotic) under HCC surveillance underwent Gadoxetic-Acid-Enhanced (GaE) MRI and CTLP in a 6-week interval. In total, 88 pairs of CTLP and GaE-MRI examinations were studied (17 pre-treatment, 67 post-TACE, 4 post-ablation). GaE-MRI was performed on a 1.5T-system (Siemens Vision-Hybrid). Lesions were characterised on MRI using established criteria. CTLP studies were performed on a 128-CT-system (GE Revolution HD) with 140mm z-axis coverage. Lesions with mean value greater than 1.4 HU/sec and 35 ml/100g/min on Mean-Slope-of-Increase and Hepatic-Arterial-Blood-Flow parametric maps respectively were considered as HCC on CTLP. Diagnoses based on GaE-MRI alone and GaE-MRI plus CTLP, were compared with DSA-angiography and 6-month follow-up as gold standard.
Results: Of the total identified 282 lesions (median diameter 15mm, range 5-110mm), 111 were considered as viable HCCs. GaE-MRI identified 98 true-positive, 157 true-negative lesions, and misdiagnosed 14 false-positive and 13 false-negative lesions, providing 88.3% sensitivity (95%CI; 80.8%-93.6%) and 91.8% specificity (95%CI; 86.6%-95.4%). The combination of GaE-MRI and CTLP identified 102 true-positive, 166 true-negative, 5 false-positive, and 9 false-negative lesions, increasing sensitivity and specificity to 91.9% (95%CI 85.1%-96.2%) and 97% (95%CI 93.3%-99%), respectively.
Conclusion: The combination of MRI and CTLP may increase accuracy of hepatic nodule characterisation, enabling more efficient patient selection for early and individualised loco-regional treatment.
Limitations: Use of single manufacturer's software platform and absence of histological verification can be considered the main limitations of this study.
Ethics committee approval: Institutional Ethics Committee approved the study. All patients provided informed consent.
Funding: No funding was received for this work.

Atypical enhancement pattern of hepatocellular carcinoma on multiphasic CT due to presence of portal vein thrombosis: a potential pitfall in imaging-based diagnosis

M. Rauf, C. Bai, S. Gul, B. Yawar Faiz*; Islamabad/PK (mari23392@gmail.com)*

Purpose: The American Association for Study of Liver Diseases diagnostic criteria allows non-invasive diagnosis of hepatocellular cancer (HCC) by imaging on basis of arterial phase enhancement followed by washout in portal venous phase. Portal vein thrombosis (PVT) is a common finding in the setting of cirrhosis where venous flow within the liver is altered. Also in our experience, presence of PVT leads to high incidence of atypical arterial enhancement, which may be secondary to compensatory increased arterial supply to the background liver. Our aim is to determine incidence of atypical enhancement pattern in HCCs with PVT as it remains a potential cause for delayed imaging diagnosis.
Methods and materials: 300 patients with HCC and portal vein thrombosis who underwent pretreatment multiphasic CT imaging were drawn retrospectively from our database. Arterial, portal venous, and delayed phase images were assessed qualitatively for lesion hypervascularity and washout by two independent consultant radiologists. Arterioportal shunting was also documented if present. Results were compiled using spss v21, results and p value determined.
Results: 201 lesions (66.8%) lacked typical arterial phase enhancement, however lesion washout was present, while 99 lesions (32.9%) showed typical arterial enhancement with washout (P< 0.001). Tumour thrombus was seen in 263 lesions (87.4%) while bland thrombus documented in 37 lesions (12.3%). Lesions with tumour thrombus showed high incidence of atypical lesion enhancement as compared to bland thrombus 76.4% (P< 0.001).
Arterioportal shunting was seen in 188 lesions (62.5%) (P< 0.001).
Conclusion: A large proportion of HCC with PVT lack characteristic arterial phase enhancement. This should be given a consideration when making imaging diagnosis of HCC.
Limitations: Relatively small sample size.
Ethics committee approval: Approved by institutional review board.
Funding: No funding was recieved for this work.

Radiomic analysis of contrast-enhanced CT predicts microvascular invasion and outcome in hepatocellular carcinoma

X. Xu, Y.-D. Zhang*; Nanjing/CN (xufast@hotmail.com)*

Purpose: To estimate whether radiomics can provide complementary value for predicting MVI risk in HCC patients.
Methods and materials: 495 patients with histologically confirmed HCC were retrospectively reviewed. All the patients have intact preoperative clinicoradiological records. 93 radiomic features were extracted from each patient and radiomics signatures were built by using the RFE-SVM method. Odds-ratio (OR) regression model was performed to determine risk factors of MVI and construct the predictive nomogram. A decision curve analysis was applied to test the incremental value of radiomics score (RS) to LI-score for predicting MVI.
Results: 9 radiomics features were selected to build a radiomics signature that was significantly associated with MVI ($p < 0.001$). An MVI risk estimation nomogram, which incorporated higher aspartate aminotransferase (AST), higher α-fetoprotein (AFP), non-smooth tumour margin, extrahepatic growth pattern, ill-defined pseudo-capsule, peritumoral arterial enhancement, positive radio-genomic venous invasion (RVI) score, and higher RS, was established with an area under curve (AUC) of 0.894 (95%CI, 0.864-0.920). Adding RS to LI-score scheme did not achieve significant improvement in predictive performance and did not add additional net benefits in a decision curve analysis.
Conclusion: Radiomics is still a complemental tool that offers limited additional benefit to the conventional radiologic method for predicting MVI risk of HCC.
Limitations: We restricted our study to the analysis of portal-phase CT images and cannot rule out the possibility that arterial phase CT are interrogating different tumour characteristics. The data was retrospectively evaluated. This study is a single-centre experience.
Ethics committee approval: Ethics committee approval was granted by local institutional ethics review board with a waiver of written informed consent.
Funding: No funding was received for this work.

RPS 301b-9 14:52

Radiological appearance of HCC recurrence after orthotopic liver transplantation (OLT) in adult patients: practical approach for an effective imaging follow-up

A. Pecorelli, M. Pace, P. A. Bonaffini, F. Sala, M. Lucà, S. Fagiuoli, S. Sironi*; Bergamo/IT (pecorelli.anna@gmail.com)*

Purpose: To describe the imaging pattern of hepatocellular carcinoma (HCC) recurrence after OLT in adult patients. To find recurrence predictors to improve follow-up strategies.
Methods and materials: We retrospectively reviewed 154 patients transplanted for HCC inside Milan criteria (MC) at a single transplant centre between 2001-2013. All the patients underwent a multiphasic liver CECT on a 256-row scanner for follow-up. Recurrence diagnosis was based on histology when available or imaging according to international guidelines. The following data was collected: sex, age, liver disease aetiology, radiological appearance at OLT, alfaphetoprotein (AFP) levels before and after OLT, histology, microvascular invasion, tumour grade, site, number, radiological appearance, and treatment of HCC recurrence.
Results: 31 (20.1%) patients developed HCC recurrence (median time 27 months; range 3-144). The most common site was liver allograft (61.3%) followed by lungs (35.6%), lymph nodes (12.9%), skin (9.7%), bones (9.7%), and brain (3.2%). In 10 (32.3%) cases, HCC recurred as diffuse metastatic disease (two/more sites) and in 21 cases (67.7%) as a single site (1-, 3- and 5-years disease-free survival (DFS) rates of 63.6%, 18.2%, 9.1% vs 90.0%, 50.0%, 35.0%; p=0.049). Twelve cases had typical CT pattern (hyper-vascularisation and wash-out), 7 atypical (2 hypervascular without washout, 5 hypodense in all phases). No correlation of imaging patterns was found with clinical characteristics of recurrence. DFS independent prognostic factors at the multivariate analysis were sex and AFP levels at OLT and at HCC recurrence.
Conclusion: Metastatic disease recurrence in OLT-HCC adult patient is not uncommon, with a trend toward a poor survival rates. No specific imaging predictors for recurrence are available. Six months CECT follow-up for the first year and once a year for the following 3 years might help to improve management strategies.
Limitations: Retrospective study.
Ethics committee approval: IRB approval was granted.
Funding: No funding was received for this work.

RPS 301b-10 14:58
Risk of liver cirrhosis and hepatocellular carcinoma after Fontan operation: a need for surveillance
D. H. Lee*; Seoul/KR (dhlee.rad@gmail.com)*

Purpose: The aims of this study were to investigate the cumulative incidence of cirrhosis and HCC and to identify specific features distinguishing HCC from benign arterial phase hyper-enhancing (APHE) nodules that developed after the Fontan operation.
Methods and materials: We retrospectively enrolled 313 post-Fontan patients who had been followed for more than 5 years and had undergone ultrasound or computed tomography (CT) of the liver between January 2000 and August 2018. Cirrhosis was diagnosed clinically.
Results: During the 5,882.7 person-years follow-up, the estimated cumulative incidence rates of cirrhosis at 5-, 10-, 20-, and 30-years after the Fontan operation were 1.3%, 9.2%, 56.6%, and 97.9%, respectively. On multiphasic CT, 18 patients had APHE nodules ≥1 cm showing washout in the portal venous phase (PVP)/delayed phase, which met current non-invasive HCC diagnosis criteria. Among them only 7 patients (38.9%, 7/18) were diagnosed with HCC. Thus, the annual incidence of HCC was 0.12% during 5,875.9 person-years of follow-up after the Fontan operation. After cirrhosis developed, the annual incidence of HCC was greater: 1.04% (7 HCCs per 672.7 person-years). The appearance of washout in the PVP (P=0.006), the long time elapsed since the initial Fontan operation (P=0.04), the large diameter of nodule (P=0.03), and elevated AFP level (P<0.001) were significantly more common in patients with HCC than those with a benign APHE nodule.
Conclusion: In post-Fontan patients, cirrhosis is a frequent late complication, especially after 10 years, and HCC is not a rare complication after cirrhosis development. Diagnosis of HCC should not be based solely on the current imaging criteria.
Limitations: Retrospective design with potential selection bias.
Ethics committee approval: This study was approved by the Institutional Review Board of Seoul National University Hospital (IRB No. 1812-158-998).
Funding: No funding was received for this work.

Hepatocellular carcinoma: MRI texture analysis as a predictive biomarker of survival after Yttrium-90 radioembolisation
S. Liu, M. King, C. Zhan, A. Tong, B. Dane, C. Huang, K. Shanbhogue*; New York, NY/US (Shu.Liu@nyumc.org)*

Purpose: To assess the utility of pretreatment MRI texture analysis (TA) in predicting tumour free survival (TFS) and overall survival (OS) in patients with hepatocellular carcinoma (HCC) treated with Yttrium-90 radioembolisation (Y-90).
Methods and materials: This retrospective study included 52 treatment naïve patients with 70 HCC lesions treated with Y-90. TA was performed on MRI obtained within one month prior to Y-90 on T2-weighted, diffusion, and hepatic arterial (HAP) and portal venous phase (PVP) post-contrast images. The texture features, mean, kurtosis, skewness, and entropy were correlated with qEASL score on 2 post-Y-90 MRIs. Receiver operator characteristic (ROC) curves were calculated for predicting treatment response. The association of texture features with TFS and OS after adjusting for significant clinical factors was assessed with Cox proportional hazard regression.
Results: The median TFS and OS were 386 and 450 days, respectively. 26 patients demonstrated residual disease or progression and 5 patients died with median survival of 476 days. Entropy was lower in patients with complete response than with stable or progressive disease on HAP and PVP of both follow-up MRI (p=0.007-0.043). Average entropy on PVP was a predictor for residual disease or progression (p=0.05, AUC 0.66, at cutoff 2.7, specificity=92%, sensitivity=54%). Maximum skewness on diffusion was the most accurate predictor for complete response on first follow-up MRI (AUC 0.73, p=0.01). After adjusting for significant clinical predictors, minimal kurtosis on HAP was found to be a predictor of OS (p=0.028, HR=0.025).
Conclusion: Pretreatment texture features can be valuable predictive biomarkers for treatment response and overall survival.
Limitations: This study is limited by the retrospective nature, performance of TA by a single operator, and inherent sensitivity of TA to imaging artifact.
Ethics committee approval: IRB approved.
Funding: No funding was received for this work.

RPS 301b-12 15:10
Predicting the therapeutic response of hepatocellular carcinoma to transcatheter arterial chemoembolisation based on CT texture analysis: evaluation of a multiparametric prediction model
J. Vosshenrich, C. J. Zech, T. Boldanova, M. Heim, D. Boll*; Basel/CH (jan.vosshenrich@usb.ch)*

Purpose: To investigate the value of texture analysis of pretherapeutic dynamic CT for prediction of therapeutic response of hepatocellular carcinoma (HCC) to transcatheter arterial chemoembolisation (TACE) according to mRECIST.
Methods and materials: Pre- and post-therapeutic 4-phase CT scans of 92 biopsy proven HCCs in 37 patients treated with TACE were retrospectively analysed. Patients with and without liver cirrhosis were included. Pretherapeutic CT was performed directly prior to TACE, initial post-therapeutic imaging four weeks after TACE, and subsequently at 3-month intervals. Each HCC was manually segmented according to mRECIST criteria. Measurements and quantitative texture parameters were extracted and included area, long axis, mean of positive pixels (MPP), and uniformity of positive pixel distribution (UPP). Lesions were grouped into virgin lesions (primary TACE) and lesions undergoing re-TACE. Prediction models were calculated and visualised as decision trees.
Results: Texture parameters from pretherapeutic CT imaging are good discriminators when aiming to predict complete response (CR) or progressive disease (PD) in virgin lesions as well as lesions undergoing repeated TACE.
ROC curve analysis showed excellent results for the prediction of CR in virgin lesions with an AUC of 0.964 (positive predictive value: 96.9%, negative predictive value: 82.5%, accuracy: 88.9%).
Performance of our model to predict PD in virgin lesions was just slightly inferior with an AUC of 0.883 (accuracy: 80.1%) as well as for CR in re-TACE lesions (AUC: 0.833, accuracy: 75%) and PD in re-TACE lesions (AUC: 0.859, accuracy: 80%).
Conclusion: A multiparametric model based on texture analysis of pretherapeutic CT-imaging may predict response of HCCs to subsequent TACE treatment. This could serve as a valuable tool for radiologists and clinicians when triaging patients to TACE.

RPS 301b-13 15:16
Impact of skeletal muscle mass loss and sarcopenia on cumulative survival and procedure success in hepatocellular carcinoma (HCC) patients who have undergone transarterial chemoembolisation (TACE)
L. Allois, A. Depaoli, E. Mosso, S. Gaia, A. Ferraris, P. Carucci, C. Guarnaccia, E. Rolle, P. Fonio*; Turin/IT*

Purpose: This study aimed to evaluate the impact of sarcopenia and skeletal muscle mass loss in the first year after TACE on complete response (CR) and overall survival (OS) in cirrhotic patients with HCC.
Methods and materials: In a retrospective trial conforming to the Helsinki Declaration, we selected 44 cirrhotic patients treated with TACE between 2014 to 2018 as first therapy for early or intermediate HCC. We divided patients in two groups on the basis of complete or no complete response to treatment (CR/NCR, mRECIST Criteria). We calculated L3-Skeletal Muscle Index (L3SMI) on two CT examinations (before treatment (pre-L3SMI) and after 12 months) and its variation in this period (ΔL3SMI). We also compared OS in patient with ΔL3SMI<0 and ΔL3SMI≥0 and the CR rate between sarcopenic (L3SMI<39 cm^2/m^2 for female, <50 cm^2/m^2 for male) and no sarcopenic patients.

Results: The two groups were homogeneous in terms of sex, age, BMI, smoke and alcohol habits, Child-Pugh Score, and radiologic appearance lesion (nodular, non-nodular, infiltrative). Univariate analysis demonstrated no significant differences in pre-L3SMI in the two groups (52.8 cm^2/m^2 vs 52.2 cm^2/m^2; p=0,82) and in ΔL3SMI (-3,57% NCR vs -1,33% CR; p=0,62). Patients with ΔL3SMI<0 and ≥0 had a comparable OS (OS 3-year 13% vs 90%; p=0,17). No differences were highlighted between sarcopenic patients (n=13) and no sarcopenic patients in terms of CR rate (30% vs 58%; p=0,18).
Conclusion: We observed a lower reduction of muscle mass in patients with CR, a better survival of patients with increased or stable muscle mass, and a higher response rate in no-sarcopenic patients, but without reaching statistical significance. For these reasons, we need further studies.
Limitations: The cohort was small.

Clinical applications of partial splenic artery embolisation
A. M. Teama; *Kafrelsheikh/EG (amr.teama@hotmail.com)*

Purpose: Partial splenic embolisation is a safe and effective method in the management of certain clinical conditions related to splenic pathologies.
Methods and materials: During the period from April 2016 to November 2016, the present study included 20 patients 11 males, 9 females, with different splenic pathologies candidate to splenic artery embolisation. Their ages ranged between 37- 72 years with a mean age of 55 years old. Patient inclusion criteria include adult males and females, patients candidate to the procedures, patients haemodynamically stable for procedure and patients with signs and symptoms of thrombocytopenia. Patients with hypersensitivity of contrast materials and haemodynamically unstable for procedure and pregnant females were excluded from the study.
Results: The technical success reflects in the success of all procedures in all cases. The technical complications occurred are puncture site haematoma, 4 cases developed haematoma at the puncture site and were resolved conservative. There is high significant increase in platelet count one month after PSE in all patients presented by hypersplenism. Before PSE platelet count means was 59.6±29.83 K/UL and increased to mean of 72.3±38.9 K/UL after one month of the procedure.
Conclusion: PSE is effective in improving thrombocytopenia due to hypersplenism with a statistically significant mean improvement of platelet counts. PSE is an alternative endovascular procedure for patients with portal hypertension complications. Splenic embolisation proved to be a lifesaving treatment in autoimmune haemolytic anaemia resistant to immunosuppressive and biological therapies, not eligible for surgical intervention because of critical condition.
Limitations: Patients presented with hypersensitivity of contrast materials, who were haemodynamically unstable for procedure and renal impairment.
Ethics committee approval: A written informed consent was done for all patients.
Funding: No funding was rcieved for this work.

Endovascular management of cerebral arteriovenous malformations
M. T. N. Mekhail[1], A. Bessar[1], T. Elserafy[1], M. Teaema[1], F. Youssef[2]; *[1]Zagazig/EG, [2]Cairo/EG*

Purpose: Endovascular management is effective and safe in management of cerebral AVMs to improve the outcome of patients with cerebral AVMs.
Methods and materials: 25 patients with cerebral AVMs are subjected to CT, MRI, MRA, CT angiography and four-vessel angiography for detection of angioarchitexture of cerebral AVMs locations and grading.
Results: 25 patients with cerebral AVMs, one patient (4%) with a family history of cerebral AVMs. 10 patients (40%) were presented with intracranial haemorrhage, 7 patients (28%) with epilepsy, 6 patients (24%) with headache and 2 patients with weakness due to AVM itself (8%). The cerebral AVMs were present in the eloquent area in 11 patients (44%) and 14 patients (56%) in non-eloquent area. The Spetzler grading was grade II) in 3 patients (12%), grade III in 15 patients (60%), grade IV in 5 patients (20%) and G V in 2 patients (8%). 10 patients (40%) showed complete occlusion of the nidus and 15 patients (60%) had a partial reduction of the nidus and were candidates for radiosurgery (48%) and surgery (12%). The periprocedural problems were vaospasm in 2 patients (8%), one patient (4%) with microcatheter stuck in the 2 cm Onyx plug and broke during the removal attempt, temporary deficit in 2 patients (8%) due to Onyx reflux and extravasation of Onyx so we recommend uses of pressure cooker technique. Regarding outcome of epilepsy after 6 months we found that 5 of the 7 patients (71.4%) were well controlled while in other 2 patients (28.6%), the fits became infrequent.
Conclusion: Endovascular management of cerebral AVMs is a valid, effective and safe approach for AVM treatment with high rates of total and near-total occlusion with acceptable complications.
Limitations: There are no limitations to this study.

Evaluating the vessel wall permeability of abdominal aortic aneurysm using 3D dynamic contrast-enhanced MRI
B. Tian, X. Tian, Z. Shi, J. Lu; *Shanghai/CN (bing.tian@hotmail.com)*

Purpose: This study aims to 1) investigate the feasibility of 3D dynamic contrast-enhanced (DCE) MRI to evaluate the vessel wall permeability of abdominal aortic aneurysm(AAA), and 2) assess the relationship between Ktrans and AAA diameter/intraluminal thrombus (ILT).
Methods and materials: 13 patients with AAAs were scanned on a 3T Siemens Skyra scanner. MRI was acquired using 1) a 3D T1-weighted black blood FSE sequence and 2) a 3D DCE sequence using fast gradient-echo. AAA diameter and ILT thickness were measured. Based on the volume distribution of ILT on the black blood MRI, patients were divided into two types: Type 1: Fresh ILT was present; Type 2: Without fresh ILT. 3D DCE MRI images were analysed. ROIs were carefully drawn on aneurysm wall and ILT (if available) and Ktrans was obtained for both aneurysm wall and ILT. Spearman's r was used to evaluate the correlation of DCE Ktrans with AAA diameter and ILT thickness. Mann-Whitney test was used to compare DCE Ktrans between the aneurysm wall and ILT. DCE Ktrans differences were also investigated as a function of ILT types.
Results: 11/13 patients were found to have ILT and 3/13 patients' AAA diameter was ≥5.5cm. There was a positive correlation between Ktrans and AAA diameter (r=-0.57; P=0.01). A relatively weak, non-significant negative correlation was found between Ktrans and ILT thickness (r=-0.32; P=0.34). DCE Ktrans of aneurysm wall was significantly higher than that of ILT(P=0.01). There was no significant difference in DCE Ktrans between different types of ILT.
Conclusion: 3D DCE MRI can be used to evaluate the vessel wall permeability of AAA with high temporal and spatial resolution.
Limitations: Small patients number, and further larger scale study is needed.
Ethics committee approval: n/a

Evaluation of different keV-settings in dual-energy CT angiography of the siphon of internal carotid artery using noise-optimised virtual monoenergetic imaging

J. Fu, Y. Zeng, J. Zhang; *Shanghai/CN (kdidjs_fu@163.com)*

Purpose: The aim of this study was to perform an objective image analysis of traditional and noise-optimised virtual monoenergetic imaging (VMI & VMI+) algorithms in third generation dual-source dual-energy computed tomography angiography (DE-CTA), for showing the siphon of internal carotid artery more clearly.
Methods and materials: Twenty-eight patients who underwent DE-CTA of brain were evaluated in this retrospective study. On the VMI and VMI+, images were reconstructed from 40-keV to 190-keV. Then, attenuation and noise were measured in the siphon of bilateral internal carotid artery, and muscle and fat in the back of the neck. The signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) were calculated.
Results: Attenuation values were highest both on 40-keV VMI and VMI+ (745.55±184.87 vs 721.38±174.89, p=0.409). Although noise values were also greatest at 40-keV in the two reconstructions (117.40±39.97 vs 75.18±28.66, p<0.001), the values on 40-keV VMI+ were significantly lower compared to the VMI. SNR was the highest in 75-keV VMI and 84-keV VMI+, and there was no significant difference between the two datasets (11.39±2.72 vs 11.62±3.27, p=0.572). CNR was the greatest in 64-keV VMI and 40-keV VMI+ respectively (15.87±6.02 vs 29.95±10.94, p＜0.001), and it was were higher in 40-keV VMI+.
Conclusion: The 40-keV VMI+ reconstruction was recommended for showing the siphon of internal carotid artery more clearly in third generation dual-source DE-CTA of brain.
Limitations: This study only involved objective evaluation and did not mention subjective evaluation.
Ethics committee approval: This retrospective study was approved by the institutional review board of our hospital.
Funding: This study was supported by the National Key Research and Development Program of China.

The use of near-infrared spectroscopy (NIRS) to measure vascular haemodynamics within bone tissue in vivo

R. Meertens, K. Knapp, F. Casanova, W. D. Strain; *Exeter/UK (r.m.meertens@exeter.ac.uk)*

Purpose: Measuring vascular haemodynamics within bone tissue is difficult with existing imaging modalities due to bone's high density and mineral content. Near-infrared spectroscopy (NIRS) has the potential to safely measure markers of blood oxygenation and vascular responsiveness. The aim of this PhD project was to explore if NIRS could be an accurate, reliable and precise diagnostic tool for measuring markers of bone haemodynamics in vivo.
Methods and materials: A systematic review was undertaken, establishing existing evidence around the use of NIRS for measuring in vivo haemodynamics in bone tissue. Arterial occlusion protocols were developed to measure haemodynamics at the tibia using NIRS. Thirty-six participants were recruited to assess if NIRS could obtain reproducible measurements which correlate with other markers of bone health, including dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI), bone mineral densitometry, trabecular bone scoring, and blood markers of bone metabolism.
Results: Markers of NIRS at the tibia were identified with within-subject coefficients of variation ranging from 3.0% to 27.7%. These markers demonstrated statistically significant associations with bone density and relatable DCE-MRI haemodynamic markers at the tibia.
Conclusion: NIRS can produce reproducible markers of oxygen extraction and microvascular reactivity at the tibia. NIRS markers show promising associations with other markers of bone health which may facilitate future research into the vascular role of common bone pathologies such as osteoporosis.
Limitations: This PhD project explored a relatively small participant sample at one testing site. However, the study has demonstrated promise worthy of further investigations in wider populations using different commercially available NIRS systems.
Ethics committee approval: Reseach involving human participants was undertaken with ethical approval from the NHS Health Research Authority (16/SW/0254).
Funding: Funding for this PhD projet was gratefully received via the College of Radiographers Doctoral Fellowship Grant.

How we see congenital portosystemic shunts through CT-angiography

M. Akyüz[1], I. Akdulum[1], M. Öztürk[2], Ö. L. Boyunağa[1], A. Sigirci[3]; *[1]Ankara/TR, [2]Aksaray/TR, [3]Malatya/TR (melih.akyuz.md@gmail.com)*

Purpose: Portosystemic shunts(PSS) are rarely-observed anomalies. Depending on the shunt localisation, there are two types extrahepatic and intrahepatic. There are few studies related to paediatric age group in the literature. The aim of the study is to evaluate the computerised tomography angiography (CTA) findings according to PSS types.
Methods and materials: The study included US and CTA exams of 8 patients (7 m-16 yr). US and CTA findings were recorded and classified by Blanc et al anatomical classification.
Results: 2 patients were female and the remaining 6 were male. 5 out of 8 patients had extrahepatic PSS - 3 children had type 1 and the remaining 2 had type 2 - 3 patients had type 3 intrahepatic PSS. One patient was tested with a pulmonary artery-vein shunt suspicion. Additionally, in that case, the pathologic signal was visualised in globus pallidus suggesting hepatic encephalopathy. Abdomen CT - Angiography imaging showed large shunt between the portal vein and the vena cava inferior (VCI). Another patient was tested due to primary pulmonary hypertension. In partially included abdominal sections, coincidentally detected a shunt between the portal vein and the VCI. No follow-up examination was performed in five patients. Two extrahepatic PSS patients were treated with coil occlusion by interventional radiologists. During the angiographic examination of one patient portal vein could not be visualised therefore could not be treated.
Conclusion: Small shunts may not be visualised via US. To demonstrate PSS, CTA might be necessary. In addition, CTA findings in the PSS could be a guide for tailoring clinical management and planning treatment by interventional radiologist or surgeons prior to the procedure.
Limitations: The study was limited by a few patient number and no follow-up with five patients.

Resting-state functional connectivity in patients with asymptomatic stenoses of the internal carotid arteries

A. Lepekhina; *St. Petersburg/RU (anna20.04.1994@yandex.ru)*

Purpose: To determine changes in the functional connectivity of the brain in patients with asymptomatic atherosclerotic stenoses of internal carotid arteries (ICA) arteries by performing resting-state functional magnetic resonance imaging (fMRI).
Methods and materials: Resting-state fMRI was performed to 23 patients with asymptomatic atherosclerotic stenosis of one or several ICA to 60-75% (14 women, 9 men, 55 to 81 y.o., mean age 69 ± 5.4 y.o.) and healthy controls (13 women, 10 men) on 3.0T MR-scanner. All patients from the study group suffered from arterial hypertension. Carotids stenting was performed to 4 patients. We used CONN v.18 software package for statistical processing and result evaluation (rfMRI).
Results: Intergroup statistical analysis (ROI-ROI, Seed-to-Voxel) showed differences in functional connectivity in 19 patients (p <0.001). Right hemisphere: a significant increase in negative functional connections (FC) of the medial prefrontal cortex (MPFC) with the insula and the marginal gyrus was determined; decrease of positive FC of MPFC with the anterior and posterior part of the parahippocampal, middle and inferior temporal gyri. Left hemisphere: decrease of the positive functional connectivity of MPFC with the middle temporal gyrus and hippocampus (3.54 ≥ T ≥ 3.09). In 4 patients who underwent ICA stenting, there were no changes in the functional connections, compared to the control group.

Conclusion: Our findings confirm that brain connectome (and DMN in particular) alterations are most likely caused by contributions made by presence of asymptomatic atherosclerotic stenoses of the ICA.
Limitations: Our study had limitation as the sample size was relatively small. Limitations include evaluating only diseases mediated through BP and aCAS.
Ethics committee approval: n/a
Funding: No funding was received for this work.

Angiographic analysis on posterior fossa haemorrhages and vascular malformations using computed tomographic angiography and digital subtraction angiography

V. Selvamurugan, V. Singh, R. V. Phadke, Z. Neyaz*; Lucknow/IN (vigneshmdrd@gmail.com)*

Purpose: The purpose of this study is to analyse the various causes of posterior fossa haemorrhages and to compare the diagnostic accuracy of computed tomography angiography (CTA) with digital subtraction angiography (DSA) in detecting various posterior fossa vascular pathologies.
Methods and materials: From January 2017 – October 2018, 80 patients (49 males, 31 females) were included who had symptoms of non-traumatic posterior fossa haemorrhage or vascular pathologies. The mean age of the patients was 43.59 ± 1.58 years. Among 80 patients, 31 patients underwent both CTA and DSA with a mean interval of 6.2 ± 1.1 days.
Results: Out of 80 patients, 47 (58.8%) had aneurysms, 29 (36.3%) had arteriovenous malformations (AVMs), one patient had developmental venous anomaly (DVA) and one patient had brainstem cavernoma. No cause could be detected in two patients. There was a statistically significant difference in the age groups of patients with aneurysms (46.96 ± 1.88 years) and AVMs (36.24 ± 2.56 years) ($p<0.05$). The correct diagnosis was made with CTA in 24 out of 25 aneurysms and 2 of the 4 AVMs. The cause of haemorrhage was found to be aneurysms in two missed cases of AVMs. The sensitivity and specificity of CTA in detecting aneurysms was 95.7 and 100% respectively, and in diagnosing AVM was 66.7 and 100% respectively. The overall sensitivity, specificity and diagnostic accuracy of CTA as compared to DSA were 96.6, 100 and 97% respectively.
Conclusion: CTA is a simple, fast and non-invasive imaging modality that can be used to detect and characterise the vascular pathologies in posterior fossa.
Limitations: The main limitations in our study was the unavoidable selection bias and smaller sample size.

A multidisciplinary approach to the diagnosis and treatment of kaposiform hemangioendothelioma in newborn children

S. Riebienkov, I. Benzar*; Kiev/UA (rebenkov@gmail.com)*

Purpose: The aim of the study is the determination of the clinical course, the choice of the diagnostic and treatment methods and evaluating the effectiveness of treatment in newborn children with Kaposiform hemangioendothelioma (KHE) and Kasabach-Merritt phenomenon.
Methods and materials: The study enrolled 6 newborn patients with Kaposiform hemangioendothelioma (KHE) and Kasabach-Merritt phenomenon within a period from 2013 - 2018. US, MRI (CT) performed for a primary diagnosis, and MRI follow-up investigations to evaluate treatment effectiveness.
Results: An infiltrative hypervascular lesion with the involvement of muscles, fat spaces and reticular lymphedema was observed. Possible involvement of bones, skin. Thrombocytopenia 8-20 x 10 9 /l was diagnosed in all patients. Corticosteroids treatment lead to platelet count normalization in 7-15 days, but minimal decreasing of tumour size. A sustained clinical and laboratory remission was achieved in 2 patients after propranolol monotherapy in daily dose 2,5 mg/kg. In other 3 patients vincristine was prescribed in a dosage of 1,5 mg/m 2 once a week with following positive clinical outcome. Vincristine treatment duration was 6 - 12 months. An outcome was considered to be good in 5 patients and as satisfactory in 1. No excellent outcome was observed as in all patients MRI showed a residual tumor mass in 6 months after treatment termination.
Conclusion: The diagnosis of kaposhiform hemangioendothelioma can be made without invasive procedures, based on data from radiological studies and laboratory parameters (Kasabach-Merritt phenomenon). Short courses of corticosteroids are effective for thrombocytopenia relief in KHE patients. The sustained remission was achieved with treatment by propranolol (n=2), vincristine (n=1), and propranolol+vincristine combination (n=3). The course of chemotherapy can be cancelled after stabilization of the size of the residual tumour.

Diagnostic yield of CT angiography in penetrating lower extremity trauma

A. P. Le Roux, A.-M. Du Plessis, R. D. Pitcher*; Cape Town/ZA (alwynleroux@gmail.com)*

Purpose: Injury is a major public health challenge, placing a significant demand on hospital resources, particularly in resource-limited settings. With the rise of interpersonal and gang violence, there has been an increase in penetrating injuries to the lower extremities, and the use of CT angiography (CTA) for suspected arterial injuries. Over-utilization of expensive imaging - with a relatively low yield - significantly increases healthcare costs. The implementation of value-based care is paramount in a resource-limited setting. The aim is to determine the value of CTA in penetrating lower extremity injuries in a resource-limited setting.
Methods and materials: This retrospective descriptive study from 1 July 2013 – 31 June 2018 included all Tygerberg Hospital patients undergoing penetrating trauma-related emergency lower extremity CTA for suspected arterial injury. The yield of clinically significant injuries and the positive predictive value of specific clinical signs were calculated.
Results: 982 patients (median age 27 years, 91% male) were included. 90% (885/982) had gunshots, 9% (89/982) stabs and 0.5% (5/982) other injuries. 33% (23/68) of patients with hard signs of vascular injury and 7.9% (73/914) with soft signs/no indication for imaging had clinically significant injuries. Significant ($p<0.05$) correlations were a rapidly expanding haematoma (PPV 40%), an absent pulse (PPV 39%), and a diminished pulse (PPV 18%). There was a year-on-year rise in the number of studies, but no significant difference in injury yield.
Conclusion: The current utilisation of CTA has a low yield in detecting clinically significant vascular injuries in penetrating lower extremity trauma. There is a poor correlation between the clinical indication provided and imaging findings.
Limitations: Retrospective study design.
Ethics committee approval: Stellenbosch University ethics approval (S18/10/219).

Optimisation of window settings on traditional and noise-optimised virtual monoenergetic imaging for displaying intracranial arterial aneurysm in dual-energy CT angiography

Y. Zeng, X. Cao, H. Li, J. Fu, J. Zhang*; Shanghai/CN (18211220088@fudan.edu.cn)*

Purpose: To determine the optimal window settings for displaying intracranial aneurysm more clearly on virtual monoenergetic imaging (VMI) reconstructions of third generation dual-source, dual-energy CT angiography (DE-CTA).
Methods and materials: A total of 28 intracranial aneurysms were retrospectively evaluated in 26 patients who underwent cerebral angiography in third-generation dual-source dual-energy CT (DECT). Images were reconstructed with traditional VMI and noise-optimised VMI reconstructions at 1-keV intervals from 40-keV to 190-keV. Attenuation and noise were measured in the intracranial aneurysm, brain tissue around the aneurysm, fat in the posterior neck, and internal carotid arteries. A contrast-to-noise (CNR) was calculated. At the energy level where the dataset had highest CNR respectively on the traditional and noise-optimised VMI reconstructions, the subjectively best window setting (width and level, B-W/L) was independently determined by two observers and subsequently related with internal carotid arteries attenuation to calculate separate optimised values (O-W/L) using linear regression.
Results: The CNR was highest at 64-keV (M64) and 40-keV (M40+) respectively on the traditional and noise-optimised VMI reconstructions (21.29±8.51 vs 34.34±11.41, $p<0.001$). The B-W/L for M64 and M40+ was 690/190 and 1570/450, respectively. Results from regression analysis inferred an O-W/L of 650/180 for M64 and 1480/420 for M40+.
Conclusion: In order to display aneurysms more clearly on third-generation dual-source DE-CTA, we recommended 64-keV and 40-keV as the energy level on traditional and noise-optimised VMI reconstructions, respectively. And the W/L settings of 650/180 for M64 and 1480/420 for M40+ were suggested.

Limitations: There was no comparison between traditional and noise-optimised VMI in intracranial aneurysm visualisation.
Ethics committee approval: This study was approved by ethics committee of our hospital.
Funding: This study was supported by the National Key Research and Development Program of China.

Comparison of moving bed contrast-enhanced MR angiography vs digital subtraction angiography in peripheral arterial disease
E. Ozgul*; Afyonkarahisar/TR (dresrayam@gmail.com)*

Purpose: Peripheral arterial disease is partial or total occlusion of one or more peripheral arteries due to atherosclerosis. The aim of this study is to evaluate the accuracy of contrast-enhanced moving bed MRA for significant stenosis and occlusions vs DSA serving as the gold standard.
Methods and materials: We have evaluated retrospectively 1118 arterial segments of 43 patients with a known or suspicious PAD who underwent DSA after MRA within 30 days. DSA was accepted as the gold standard and the sensitivity, specificity and accuracy of MRA were determined. MRA and DSA images were examined by two different radiologists as a double-blind study. McNemar test was used to evaluate the significant difference in diagnostic aspect between DSA and MRA. Specificity, sensitivity, positive and negative estimated values, diagnostic accuracy rate were calculated. Kappa coefficient (κ) was calculated to determine the significance of diagnostic compliance between DSA and MRA. Results for $p<0.05$ were accepted statistically significant.
Results: The overall sensitivity and specificity values of contrast-enhanced moving bed MRA for significant (>70%) stenosis were 91% and 97.3%; for total occlusion, sensitivity and specificity values were 90% and 99.3% respectively. For both of them, the accuracy was 96%. No significant difference is found between contrast-enhanced moving bed MRA and DSA for the diagnosis of peripheral arterial disease ($p>0.05$).
Conclusion: Contrast-enhanced moving bed MRA is a reliable, fast, noninvasive imaging modality in the diagnosis of patients, in planning of interventional procedures and follow-up of the patients with peripheral arterial disease.
Limitations: 14 segments in 5 patients were excluded because of metallic artefact due to iliac stents. Lower sensitivity ratios were calculated from iliac arteries. It was due to a decrease in the number of iliac segments.

Quality control studies of dynamic contrast-enhanced 3-dimensional magnetic resonance angiography for spinal vascular
J. Cao, L.-L. Cui*; Shenyang/CN (cmucao@163.com)*

Purpose: A spinal vascular malformation is rare in clinics, with a high disabling rate. Dynamic contrast-enhanced 3-dimensional magnetic resonance angiography（DCE-3D-MRA) for spinal vascular play an important role in the diagnosis and treatment of spinal vascular malformations and postoperative follow-up. In this study, we investigated the protocol for scanning spinal vascular to improve the success rate of DCE-3D-MRA for spinal vascular.
Methods and materials: We developed a protocol for assessment of anterior spinal artery based on anatomic, morphologic of anterior spinal artery in 24 research participants using DCE-3D-MRA in the area between T8 and L5. Real-time sequence was used to monitor the time of administration. The contrast agent was injected through antecubital veins with high pressure syringe at a rate of 3ml/s in 16 research participants and 2ml/s in 17 research participants.
Results: Although the average enhanced scan time we detected was 16s, individualised scanning was essential. Then we can get a better image quality by the dosing speed of 3ml/s.
Conclusion: The quality of images of DCE-3D-MRA for spinal vascular can be improved by using optimal scanning protocol.
Limitations: The study is limited by the small sample.

Contrast-enhanced perfusion patterns and serum lipid signatures specific of vulnerable plaque in predicting stroke: a cohort study of carotid stenosis in Chinese patients
H. Yunqian, W. Zhu, M. Chen*; Shanghai/CN (18721619656@163.com)*

Purpose: To investigate the correlation between contrast-enhanced ultrasound (CEUS) perfusion patterns and serum lipid signatures specific of carotid artery vulnerable plaque with the degree of carotid stenosis, which provide the basis for early diagnosis of cerebral ischaemic stroke.
Methods and materials: From March 2018 to June 2018, 202 patients with carotid plaque who underwent CEUS were enrolled in this study. The patients who did not undergo CTA or DSA examination within 1 week after CEUS examination were excluded. 80 patients were analysed. All subjects underwent a contrast-enhanced ultrasound, CTA or DSA, and serum lipid testing. In face-to-face interviews with participants, trained investigators used questionnaires to get information about their routine cardiovascular and cerebrovascular risk factors, demographic characteristics, smoking history, lifestyle, atrial fibrillation history and other disease histories.
Results: Serum-free fatty acid was significantly associated with CVA events ($P<0.05$). Serum-free fatty acid was significantly associated with the different contrast agent enhancement level and difference contrast-enhanced perfusion patterns ($P<0.05$).
Conclusion: The enhancement levels and the CEUS perfusion patterns with microbubbles are infused from the surface to the interior of the plaque was increased with the degree of carotid stenosis, the CEUS perfusion pattern of moderate or higher carotid stenosis plaques is mainly infused from the surface to the interior of the plaque, serum-free fatty acid was increased with the enhancement levels of the plaques. These may evidence that the plaque begins to become vulnerable.
Limitations: This is an observational study. We did not analyse the morphology and properties of plaques in this study.
Ethics committee approval: n/a

Non-contrast MR venography in the diagnosis of post-thrombotic iliac vein obstruction and extravascular compression
V. Shebryakov, O. Karpov, Y. Stoyko, O. Bronov, M. Yashkin, D. Lutarevich*; Moscow/RU (VSHEBRYAKOV@MAIL.RU)*

Purpose: Evaluate value of non-contrast MRI in the diagnosis of post-thrombotic iliac vein obstruction and extravascular compression.
Methods and materials: The study included 228 patients with CVD (clinical class C3-C6 according to the CEAP classification), including 110 males and 118 females. The average age of the patients was 43.6±11.6 years. All patients underwent ultrasound angioscanning veins of the lower extremities and MRI of the iliac veins and inferior vena cava. Studies were performed on MRI using a special protocol non-contrast sequences: 1. BH TRUFI/FIESTA 3D using Valsalva manoeuvre; 2. INHANCE 3D using the free-breathing technique, with subsequent 3D reconstruction.
Results: 107 patients have been diagnosed with stenosis of the left common iliac vein due to compression of the right common iliac artery (May-Thurner syndrome). 65 patients underwent stenting of left common iliac vein with the May-Turner syndrome. Two patients underwent stenting of the left external and common iliac veins with post-thrombotic obstruction. 50 post-thrombotic deep vein changes have been revealed.
Conclusion: MR-venography is the most optimal method in the diagnosis of the causes of extra and intravenous pathology of the IVC and its basin. There is no radiation exposure, no use of contrast agent and short time relation. 3D-reconstruction of the IVC and iliac veins can be used for planning corrective treatment and reconstructive operations. MR-venography is equal to contrast angiographic methods in detecting extravasal compression and is recommended in the initial evaluation of suspected May-Thurner syndrome and post-thrombotic iliac vein obstructions.

Carotid stenosis evaluation by 128-slice CT: comparison of NASCET, ECST and CC grading methods, and comparison with colour-Doppler ultrasonography

F. M. H. Rijnberg, A. Lammertink*; Groningen/NL (frankrijnberg@hotmail.nl)*

Purpose: Purpose is to evaluate the intra- and interobserver variability of the North American Symptomatic Carotid Endarterectomy Trial (NASCET), European Carotid Surgery Trial (ECST), and Common Carotid (CC) methods, which are used to measure the degree of carotid stenosis, using 128-slice CT and to compare the measurements made by these three methods, and to compare those methods with the gold standard, ultrasound.
Methods and materials: Of the initial 25 included patients, five patients were excluded during the study because the percentage of stenosis of these five patients could not be determined using the NASCET, ECST and/or CC method. CT-Angiography (CTA) examination was performed by a 128-slice scanner (Siemens SOMATOM Definition AS 128). Retrospective data from the CT scan and the ultrasound examination were used. In addition, prospective data has been collected. Two neuroradiologists measured the degree of carotid stenosis by using the NASCET-, ECST-, and CC-method. Intra-observeragreement and inter-observeragreement were determined by intraclass correlation coefficient (ICC).
Results: The similarity between neuroradiologists and ultrasound examination was highest in the ECST and CC method (85%). The similarity between neuroradiologists themselves was highest with the use of the ECST and CC method (95%). The inter-observer agreement is highest with the ECST method (0.672), followed by the NASCET method (0.667) and the CC method (0.532). The intra-observer agreement within the NASCET method is “moderate" while within the ECST and CC methods it was "fair".
Conclusion: The ECST method is the most reliable way to determine the extent of carotid stenosis based on the high similarity with the golden method, the high similarity between neuroradiologists and the high inter-observer agreement compared to the NASCET and CC method.

Prediction of early haematoma expansion in cerebral haemorrhage based on non-contrast CT

L. Song[1], T. Guo[1], J. Wang[2], H. Ren[1]*; [1]Xiangyang/CN, [2]Xiang/CN (song580lei@163.com)*

Purpose: Patients with intracerebral haemorrhage (ICH) were divided into haematoma expansion group and non-haematoma expansion group. The clinical features of the two groups of patients and the imaging features of non-contrast CT were analysed to explore the relationship between the two groups and the early haematoma expansion.
Methods and materials: Consecutive adult patients with spontaneous ICH who had undergone baseline CT within 6 hours after ICH symptom onset were screened for inclusion. A follow-up CT scan was performed within 24 hours after the initial CT scan. Baseline clinical data, including age, sex, diabetes mellitus, coronary heart disease, past stroke history, onset to CT scan time, and CT features (haematoma volume, haematoma morphology, haematoma site, delayed intraventricular haemorrhage and island sign), were prospectively collected and recorded in our ICH research database. We also prospectively recorded admission blood pressure, admission Glasgow Coma Scale (GCS) score.
Results: 140 patients with haematoma expansion group (37.8%) and 230 patients with non-haematoma expansion group (62.2%) were enrolled. Multivariate logistic regression analysis showed irregular haematoma shape (OR=2.289, 95% CI=1.131-4.631, P=0.021), island sign (OR=2.327, 95% CI=1.139-4.751, P=0.020) and delayed intraventricular haemorrhage (OR=4.979, 95% CI=1.423-17.429, P=0.012) are the independent predictor of early haematoma expansion. The predicted sensitivity and specificity were 71.45% and 54.78%, 51.4% and 81.7%, 23.07% and 71.3%, respectively.
Conclusion: Irregular haematoma shape, island sign and delayed intraventricular haemorrhage expansion based on non-contrast CT are the independent predictors of early haematoma expansion. Irregular haematoma shape has the higher sensitivity and island sign has the highest specificity.
Limitations: This study is based on a single centre retrospective study.

Application of FLAIR vascular hyperintensity-DWI mismatch in ischaemic stroke, depending on semi-quantitative DWI-Alberta stroke programme early CT score

L. Song[1], J. Wang[2]*; [1]Xiangyang/CN, [2]Xiang/CN (song580lei@163.com)*

Purpose: Our aim is to determine whether there is a relationship between (DWI)-Alberta Stroke Programme Early CT Score (ASPECTS) and fluid-attenuated inversion recovery (FLAIR) vascular hyperintensity (FVH)-DWI mismatch and to better quantify FVH-DWI mismatch to assess the prognosis of cerebral infarction.
Methods and materials: A retrospective analysis of 109 patients with MCA stenosis or occlusion with cerebral infarction was performed by dividing this cohort into FVH-DWI match group and FVH-DWI mismatch group based on FVH and DWI results. The clinical and imaging data of these two groups of patients were reviewed and analysed to identify associations between FVH-DWI mismatch and prognosis of patients for the preservation of neurological function. Correlation between DWI-ASPECTS and FVH-DWI mismatch was also performed.
Results: FVH-DWI mismatch was present in 66/109 (60.55%) patients, and FVH-DWI match was present in 43/109 (39.45%). Patients with FVH-DWI mismatch had higher DWI-ASPECTS (7.0 vs 4.0, P < 0.001) and lower mRS at 3 months (3.0 vs 4.0, P <0.001) than patients without FVH-DWI mismatch. Multiple regression analysis suggested that DWI-ASPECTS (OR = 4.7, 95% CI = 2.5–9.2, P < 0.001) remained significantly associated with FVH-DWI mismatch. Two threshold points for DWI-ASPECTS of 3 and 8 can be used to distinguish whether there is a mismatch in FVH-DWI by smooth curve fitting.
Conclusion: The DWI-ASPECTS score was an independent predictor of FVH-DWI mismatch. At DWI-ASPECTS ≤ 3, the FVH-DWI mismatch offers no prognostic value; whereas, at DWI ASPECTS ≥ 8, the FVH-DWI mismatch had the highest prognostic value. DWI-ASPECTS can roughly determine whether there is a FVH-DWI mismatch in order to select optimal clinical treatment and accurately assess prognosis.
Limitations: This study is based on a single centre retrospective study.

Factors resulting in the increase of the total dose received by the patient during endovascular procedures performed within the region of the central nervous system

S. Modlińska[1], M. M. Cebula[1], J. Komenda[2], J. Baron[1]*; [1]Katowice/PL, [2]Czeladź/PL*

Purpose: The aim of the study was to analyse factors influencing the total radiation dose during diagnostic and therapeutic procedures in the field of neuroradiology, obtained by a patient with suspicion of intracranial pathology.
Methods and materials: The retrospective analysis involved 419 procedures. The following group can be divided into 321 panangiography and 98 embolisations preceded by panangiography procedures. For each of the procedures the total dose absorbed by the patient was calculated on the basis of the "cumulative air kerma" parameter. In the analysed group aneurysms were found in 318 patients, arteriovenous malformations in 46 patients, and in 54 cases no pathology was revealed. The collected data was subjected to statistical

analysis. The relationship between the total dose received by the patient during procedures and the location of the pathology, the type of surgery, the type of embolisation material used, the presence of subarachnoid haemorrhage (SAH) and the type of embolisation were analysed.
Results: There was a statistically significant correlation between the total radiation dose absorbed by the patient and the type of procedure (p <0.000), the amount of embolisation material used (p <0.05) and the presence of SAH (p <0.000). There was no significant effect of the type of pathology and pathology location on the total dose received by the patient during the procedure.
Conclusion: The total dose received by the patient during neuroradiology procedures depends on the type of intervention, the type of material used during embolisation and the presence of SAH.

Non-contrast magnetic resonance angiography in renal artery assessment
S. Sethu Madhavan[1], V. Bhat[2], K. Ga[2]; [1]*Kannur/IN,* [2]*Bengaluru/IN*
(sreesm7@gmail.com)

Purpose: To evaluate renal artery anatomy in cases of suspected renovascular hypertension using INHANCE non-contrast MR angiography and determine its significance in diagnosing renal artery stenosis.
Methods and materials: Non-contrast MR angiography using INHANCE was performed on a 1.5T MRI system for assessing renal arteries in 114 patients referred with clinically suspected renovascular hypertension for a period of three years (June 2014 to May 2017). Out of this, 10 patients further underwent Contrast enhanced-MR Angiography, 7 underwent CT-angiography and one patient underwent both contrast-enhanced MR angiography and CT angiography.
Results: We evaluated the findings on non-contrast INHANCE MR angiography in suspected cases of renal artery hypertension in 114 subjects. Its validity was calculated in comparison with contrast-enhanced MR angiography and/or CT Angiography in 18 patients. In our study, renal artery stenosis was found in 21.2% arteries out of the 214 arteries examined. Also, there was noted a significant association between renal artery stenosis identified on non-contrast INHANCE MR angiography and that on contrast-enhanced MR angiography and CT angiography (p<0.001).
Conclusion: Non-contrast INHANCE MR angiography can be used as a significant and valuable screening investigation for renal artery assessment especially in patients with impaired renal functions where contrast-based investigations carry a high risk.
Limitations: No comparisons are available with the gold standard, digital subtraction angiography. INHANCE NC-MRA sequence was done in the axial plane and other planes could not be evaluated. Our study population may not be a true representation of all clinically suspicious cases of renovascular hypertension hence derived values may not be truly representative.

Long term neurodevelopmental outcomes of children with foetal isolated vermian anomaly
L. Ben-Sira, R. Shperling, L.-T. Pratt, *Tel-Aviv/IL*
(bensiraliat@gmail.com)

Purpose: To evaluate the neurodevelopmental performance of children with abnormal isolated vermian during foetal life.
Methods and materials: A historical cohort study (2000-2017) of women referred due to suspected central nervous system abnormalities. Of 447 fetuses suspected with anomalies of the PF, 79 were considered as an isolated vermian abnormality; of these, 15 cases were lost to follow-up and 26 underwent termination of pregnancy (TOP). The remaining 38 composed the study and control groups; 3 foetuses were excluded since they were diagnosed postpartum with genetic syndromes. 9 had an isolated vermian anomaly (IVA) (study group). 26 of these foetuses were diagnosed as having Blakes' pouch cyst (BPC) or arachnoid cyst. The structures of the PF were assessed quantitatively by measuring vermian length, width, pons diameter, transverse cerebellar diameter (TCD), and additional biometry. The neurodevelopmental performance was assessed using the Vineland adaptive behaviour scale II (VABS-II) questionnaire (parental interview).
Results: Children with IVA showed significantly lower scores on the VABS-II and in its subdomains. This group presented with developmental difficulties and attention deficits when compared to foetuses with BPC.
Conclusion: IVA, when diagnosed prenatally, is a significant risk factor for later neurodevelopmental performance in contrast with other posterior fossa cysts (PFC).
This study highlights the importance of a correct classification and prenatal diagnosis of “true IVA”, which enables accurate neurodevelopmental prognostication.
Limitations: The study had a wide-ranging age groups; the median age in the control group was 3.85 years-old and in the study group II 9.3 years-old. The developmental milestones are very different.
The small sample size limits our ability to conclude unequivocally whether IVA is associated with genetic syndromes.
Ethics committee approval: The study was approved by the Helsinki committee at our medical centre. Approval number: 0419-17-TLV.
Funding: No funding was received for this work.

Imaging the foetal brainstem: an in vivo MRI study
G. O. Dovjak, P. Brugger, G. M. Gruber, D. Prayer, G. Kasprian; *Vienna/AT*
(gregor.dovjak@meduniwien.ac.at)

Purpose: The brainstem is involved in different types of hindbrain anomalies, which are nowadays increasingly detected by prenatal sonography. However, little is known about the proportions of different foetal brainstem segments and their evolution throughout pregnancy. This study aimed to assess the midsagittal two-dimensional area of brainstem substructures with foetal MRI.
Methods and materials: Prenatal cases with normal brain development were retrospectively assessed. The midbrain, pons, and medulla oblongata were segmented using a T2-weighted median sagittal slice and ITK snap. The ratios of the brainstem substructures were calculated and correlated to gestational age.
Results: 148 brain-normal foetal MRI with a mean age of 25.26±4.12 gestational weeks (GW) showed a sufficient image quality to be assessed. The ratio midbrain:pons significantly decreased (p<0.01) from 0.6 to 0.5 between 18 and 40 GW, whereas the ratio pons:medulla oblongata increased significantly (p<0.01) from 1.5 to 1.8. The ratio midbrain:medulla oblongata remained 0.9 throughout gestation (p=0.91).

Conclusion: Two-dimensional segmentation of brainstem substructures revealed that there was an increase in the size of pons compared to midbrain and medulla oblongata during the 2nd and 3rd trimester. Brainstem proportions at the early second trimester (midbrain:pons:medulla=3:4:3) differ from those postnatally (1:2:1), which has to be acknowledged when assessing the brainstem in foetal hindbrain malformations.
Limitations: An inherently limiting factor of foetal imaging is the small size of the posterior fossa. The size and limited resolution make segmentation prone to partial volume effects. Although movement artefacts can be a limiting factor, we were able to bypass them by repeating the desired image plane.
Ethics committee approval: Ethics committee approval and written informed consent were obtained.

An apparent diffusion coefficient of different areas of the brain in growth-restricted foetuses

B. Moradi[1], Z. Alibeigi Nezhad[2], N. Seyed Saadat[1], M. A. Kazemi[1], M. Shirazi[1], A. Borhani[1]; [1]*Tehran/IR,* [2]*Alibeigi Nezhad/IR (Aliborhani@gmail.com)*

Purpose: To compare the apparent diffusion coefficient (ADC) values of different areas of the brain in foetuses with intrauterine growth restriction (IUGR) and control cases.
Methods and materials: A total of 38 foetuses with IUGR and 18 control foetuses with similar gestational age were compared using a 3T magnetic resonance scanner. IUGR cases included 23 foetuses with clinical severity signs (group A) and 15 foetuses without these signs (group B). ADC values were measured in different brain regions and compared among the groups. Foetuses with brain structural abnormalities were excluded.
Results: Foetal brain signal and anatomy were normal in all foetuses. Head circumference <5% was more common in IUGR compared to IUGR B (56.5% vs 13.3%, p<0.0001). In comparison to the normal group, the ADC values in IUGR foetuses were significantly lower in the cerebellar hemisphere (CH) (1.239 vs 1.280.5 x10-3 mm2/sec, p=0.045), thalami (1.205 vs 1.285 x10-3 mm2/sec, p=0.031), and caudate nucleus (CN) (1.319 vs 1.394 x10-3 mm2/sec, p=0.04). However, ADC values were not significantly different between IUGR subtypes. Pons had the lowest ADC values among all brain regions.
Conclusion: In a comparison with a control group, ADC values of some brain areas (thalami, CN, and CH) were found to be significantly lower in IUGR foetuses, though there were not any significant differences in IUGR subtypes.
Limitations: The specificity and sensitivity might be overestimated because the ADC value cut-off was calculated from our own cases.
Ethics committee approval: Institutional review board approval and parents' informed consent were obtained.

Widespread cortical dyslamination in epilepsy patients with periventricular heterotopia and focal cortical dysplasia

E. Lotan[1], O. Tomer[2], I. Tavor[2], I. Blatt[1], H. Goldberg-Stern[3], C. Hoffmann[1], G. Tsarfaty[1], D. Tanne[2], Y. Assaf[2]; [1]*Tel Hashomer/IL,* [2]*Tel Aviv/IL,* [3]*Petah Tikva/IL*

Purpose: Emerging research confirms our understanding of epilepsy as a network disorder that involves more widespread cortical compromise than previously assumed. However, little is known about the developed laminar-specific cortical disruption. We aimed to investigate the cortical laminar architecture of the neocortex beyond the measurement of cortical thickness using clinically feasible structural MRI.
Methods and materials: Epilepsy patients with focal cortical dysplasia (FCD; n=9), periventricular nodular heterotopia (PVH; n=9), and age-matched healthy controls (HC; n=9) underwent T1 relaxation 3T-MRI, of which component probability T1-maps were utilised to extract a sub-voxel composition of 6 T1 cortical layers. 78 cortical areas of the automated anatomical labelling (AAL) atlas were divided into 1,000 equal-volume sub-areas and logistic regressions were performed to compare FCD/PNH patients to HC, with the T1-layers composing each sub-area as regressors. The significance maps were projected on MNI brain templates.
Results: Widespread cortical dyslamination was observed in the patient groups compared to the HC. Out of 1,000 sub-areas, 291 bilateral hemispheric cortical sub-areas were found to predict FCD and 256 to predict PNH. For each of these sub-areas, we were able to identify the T1-layer, which contributed the most to the prediction.
Conclusion: Our results reveal similar widespread cortical dyslamination in epilepsy patients with FCD and PNH, which supports the concept of epilepsy as a network disease, although intrinsic abnormalities of neuronal development may be a contributory factor. As the ability to assess structural and functional connections in the human brain increases through both diffusion tensor imaging and functional MRI, using qualitative and quantitative information of cortical laminar patterns in epilepsy patients as a sensitive imaging biomarker could potentially elucidate pathophysiologic mechanisms and facilitate patient management towards developing individually tailored treatment.

Isolated and subtle abnormality of the corpus callosum: correlation with postnatal clinical outcome

L. Ben-Sira[1], N. Feldman[1], L.-T. Pratt[1], K. Kradjen[1], G. Malinger[2]; [1]*Tel-Aviv/IL,* [2]*Holon/IL (bensiraliat@gmail.com)*

Purpose: To examine the correlation between isolated and subtle abnormality of the CC with postnatal clinical outcomes.
Methods and materials: This retrospective study included all women referred for foetal neurosonogram and foetal MRI in Tel Aviv Sourasky medical centre from 2006-2017 due to suspected CC abnormality. Classification of the cases to anomaly subtypes was made by two independent observers according to CC integrity, width, length, shape, and additional brain findings. 44 isolated cases excluding complete CC agenesis and 44 control cases paired by age and gender to the study group who performed foetal MRI and were normal were included in the study. The clinical outcome was assessed by the adaptive behaviour assessment scale (ABAS-II) and by medical review questionnaires.
Results: The study group scored lower in all of the ABAS-II sub-domains and a significant difference between the study and control groups was found in the conceptual, practical, and general domains (p=0.005, 0.009, and 0.006). Special education placement was reported only in the study group (in 3 children) and the children in this group received neurodevelopmental interventions more often than the control group. In addition, individual comparisons were made for each CC anomaly subtype which included short, thick, thin, and dysmorphic CC. A similar trend of impaired functional abilities was evident in both short and thick CC subgroups.
Conclusion: This study sheds light on the unresolved question regarding the clinical outcome of isolated subtle anomalies in the CC during pregnancy. Subtle CC anomaly, especially short and thick, manifest mild functional difficulties. No major handicaps were found in our study group.
Limitations: Larger studies on this subject matter are still required.
Ethics committee approval: Ethics committee approval obtained.
Funding: No funding was received for this work.

Differentiation of genetic subtypes of medulloblastomas using qualitative and quantitative (ADC) MRI features

J. Reis, H. Zimmermann, V. Ruf, N. Thon, T. Liebig, R. Forbrig; *Munich/DE*

Purpose: According to the updated WHO 2016 classification of CNS tumours, diagnosis of a medulloblastoma now demands genetic subgroup information (in addition to histopathology), defining the tumour biology, therapy and prognosis more precisely. The aim of this study was to assess potential correlations of

qualitative and quantitative MRI features for differentiation of genetic subtypes of medulloblastomas.
Methods and materials: A retrospective single-centre analysis of all patients with medulloblastomas from 2015-2019 with available genetic subgroup information (WNT, SHH, and non-WNT/non-SHH) was conducted. Regarding qualitative MRI analysis, tumour location as well as presence/absence of contrast-enhancement, oedema, cysts, and signs of metastatic disease were evaluated. Quantitative MRI analysis consisted of manual region-of-interest (ROI) based on ADC_{mean} calculation within the solid tumour. Statistical analysis included a comparison of ADC_{mean} between the genetic subgroups and a correlation with histopathological and imaging features.
Results: 30 patients (8 female, mean age=12 years) were included. 3/30 tumours were WNT-activated (10%), 11/30 (37%) SHH-activated, and 16/30 (53%) were classified as non-WNT/non-SHH. The tumour was located centrally in 19/30 (63%) and laterally in 7/30 (23%) patients. Distinct contrast enhancement was present in 3/30 (10%), oedema in 6/30 (20%; exclusively SHH subtypes), cysts in 25/30 (83%), and signs of metastatic disease in 13/30 (43%) patients. ADC_{mean} [$10^{-6}mm^2/s$] was 484 for WNT, 566 for SHH, and 624 for non-WNT/non-SHH subtypes ($p>0.05$). We found a significant negative correlation between ADC_{mean} and the proliferation parameter ki67 ($r=-0.469$, $p=0.009$, $n=30$).
Conclusion: In our study, peritumoral oedema was only present in SHH subtypes. Quantitative DWI analysis alone was not sufficient for the differentiation of genetic subtypes. However, a comparably lower ADC value was associated with a higher proliferation rate.

Imaging in neonatal encephalitis due to Chikungunya vertical transmission

N. Sachdev, S. Sana, A. Prasad, Y. Singh*; New Delhi/IN (namritasach@rediffmail.com)*

Purpose: Imaging modalities like neurosonogram and CT have a limited role in evaluation. MRI with diffusion-weighted imaging shows features of viral encephalitis involving frontoparietal subcortical and deep white matter and corpus callosum.
Methods and materials: 10 neonates of Chikungunya encephalitis born of mothers with Chikungunya in the last 2 weeks prior to delivery underwent MRI evaluation included T1, T2, FLAIR diffusion-weighted, gradient echo, and post-contrast images. A neurosonogram was done in one child and a CT scan in another. Follow-up MRI was done at 1 month or 3 months, depending on the clinical evaluation of the neurodevelopmental delay.
Results: 2/10 neonates showed normal MRIs. All the cases showed bilateral involvement affecting frontal, parietal, and occipital lobes. The infratentorial compartment with the cerebellum and brain stem were not involved. T2 and FLAIR hyperintensities diffuse as well as discrete in appearance were seen in the subcortical and deep white matter periventricular location with sparing of the U fibres. Follow-up MRIs showed a significant reversal in diffusion restriction in the 1-month scan. Cystic encephalomalacia with ventricular dilatation was seen with a reduction in white matter volume in the 3-month follow-up scan in 2 cases.
Conclusion: Encephalitis is the most common neurological presentation in the Chikungunya infected neonates after mother-to-child transmission. Neuro imaging is essential with MRI, with diffusion-weighted imaging being the primary imaging modality. DWI images may show changes prior to signal intensity changes on T2 images. DWI can also demonstrate progress as well as as prognosticate. Long-term MRI imaging is important in neonates who have neurodevelopmental delays.

Orbito-facial dysmorphology in patients with different degrees of trigonocephaly severity: quantitative morpho-volumetric analysis in infants with non-syndromic metopic craniosynostosis

A. Marrazzo[1], R. Calandrelli[2], M. Panfili[2], F. Pilato[2], L. Massimi[2], C. Colosimo[2]; *[1]Taranto/IT, [2]Rome/IT (arm.marrazzo@gmail.com)*

Purpose: Craniofacial dysmorphology varies significantly along a wide spectrum of severity in metopic cranial synostosis (MCS). This study aimed to quantify craniofacial changes to investigate their relationships with the severity of trigonocephaly.
Methods and materials: Among 59 infants with MCS, we identified 3 groups according to the severity of trigonocephaly combining the metopic ridge and interfrontal angles (mild, moderate, and severe). We performed a quantitative analysis using high-resolution CT images evaluating: 1) cranial fossae dimensions; 2) vault indices and ratios: interparietal/intercoronal (IPD/ICD ratio), interparietal/intertemporal (IPD/ITD), cephalic index, vertico-longitudinal index; 3) orbito-facial distances (midfacial depth, maxillary height, upper facial index, orbital distances, globe protrusions), maxilla and orbital volumes; 4) supratentorial (ICV) and infratentorial (PCFV) cranial volume, supratentorial (WBV) and infratentorial (PCFBV) brain volume.
Results: In all groups, middle skull base lengths and upper midface indexes (n-pr/af-af) were increased.
In moderate and severe groups, anterior hemifossae lengths were reduced, IPD/ICD and vertico-longitudinal index were changed, interzygomatic buttre distance, midfacial depth (af-ans), anterior, and mild and lateral interorbital distances were reduced and globe protrusions were increased.
The comparison between moderate and severe groups showed a worsening of globe protrusions and IPD/ICD in the severe group and only in the severe group were ICV and WBV resulted reduced.
Conclusion: This morpho-volumetric study provides new insights in understanding the craniofacial changes occurring in infants at different severities of trigonocephaly. The increase of globe protrusions and the reduction of sovratentorial volumes found in the severe group reflect the severity of trigonocephaly; these patients might require early surgical cranial expansion.
Limitations: A retrospective study

Dural venous sinuses and subarachnoid spaces in foetuses with MMC correlate with sac morphology: implications for the pathophysiology of abnormal brain development

I. Shelef[1], N. Boniel[2], L. L Tene[1], R. Goldstein[3], N. Gupta[3], O. Glenn[3]; *[1]Beer Sheva/IL, [2]Winnipeg, MB/CA, [3]San Francisco, CA/US (shelef@bgu.ac.il)*

Purpose: We hypothesise a significant size difference exists in the subarachnoid spaces (SAS) and dural venous sinuses (DVS) of myelomeningocele (MMC) infants in utero and that these differences vary depending on the morphology of the MMC sac.
Methods and materials: 76 foetuses with MMC underwent MRI prior to foetal surgery (mean gestational age 23.55+/-2.85 weeks) and repeat MRI postnatally (mean age at MRI 24.07+/-85.37 weeks). Head MRIs of 74 gestational-age matched normal foetuses were used for comparison. The MMC prenatal group was subdivided based on the presence or absence of a spinal sac. SAS depth and DVS diameters were compared between all groups.
Results: All parameters were significantly different between prenatal MMC group and normal foetus group ($p<0.001$). All SAS measurements were significantly smaller in the prenatal MMC group compared to the normal foetus group ($p<0.001$). SAS in the subgroup of MMC with an absent or flaccid sac was significantly less than those with an apparently tense sac. All DVS were found to be significantly narrower in the prenatal MMC group compared to the normal foetus group ($p<0.001$). The superior sagittal sinus was narrower in the subgroup of MMC with an absent sac versus those with an apparently tense sac.
Conclusion: This is the first report of mismatch between DVS and SAS diameters in foetuses with MMC and normal foetuses. Preliminary results suggest a contradiction in DVS size; when no sac (or a flaccid sac) is present, the veins are significantly narrowed and vice versa. We postulate that in the presence of a sac, there is less leakage of cerebrospinal fluid and the vein morphology is closer to normal.
Limitations: The potential sources of bias and small study group.

MRI anatomical variants of the head of the hippocampus
E. Piccirilli, L. Gentile, V. Panara, V. Maruotti, P. A. Mattei, M. Caulo*; Chieti/IT (ele.piccirilli@gmail.com)*

Purpose: The head of the hippocampus (H) is classically described as having 2 -4 digitations both in ex-vivo specimens and in-vivo coronal MRI. Our aim was to develop a new MR-based classification of the anatomical variants of H in a large sample population of healthy subjects
Methods and materials: Brain MRIs of 247 young healthy subjects (138 M, age 18-39) were analysed. The H was identified on coronal reformatted 3D T1-w MRI. The H of a subset of 100 subjects were analysed and classified according to number of sulci and number and size of digitations. This classification was used to assess the frequencies of anatomical variants in a larger subset of 247 subjects for hemisphere and sex. Statistically significant differences were assessed by Chi-Square or marginal homogeneity tests (level of significance ρ<0.05)
Results: 8 variants of the H were described. Class 0 (11.3%) describes a total lack of sulci and is subdivided in 0A (one digitation, 10.1%) and 0B (no digitations or "null variant", 1.1%). Class 1 (25.6%, one single sulcus) is subdivided into 4 types according to location and width of the sulcus [1A (8.8%), 1B (12.8%), 1C (1.3%), and 1D (2.7%)]. Class 2 ("classical variant", 2 symmetrical sulci and 3 digitations equal in size) is the most frequent overall (63.0%). A statistically significant difference between the H classification of the two hemispheres was observed only in women (ρ=0.035) and overall (ρ=0.047). Variants prevalence did not differ between genders.
Conclusion: We described a new morphologic classification of the H which should allow minimisation of the risk of misinterpreting anatomical variants as pathologic conditions.
Limitations: Only T1w coronal images were assessed, not T2w.

Age-related differences in subfields and subregions of the hippocampus in normal volunteers
N. Ananyeva, E. Andreev, R. Ezhova, T. Salomatina, L. Akhmerova*; St. Petersburg/RU (ananieva_n@mail.ru)*

Purpose: To define the changes in subfields and subregions of the hippocampus in normal ageing.
Methods and materials: We examined 83 normal volunteers without neurological or psychiatric disorders divided into groups: 15-19, 20-24, 25-29, 30-39, 40-49, 50-59, 60-69 years old, and older than 70.
MR VBM was performed using 3D MPRAGE on MRI 1.5T XGV (Canon, Japan) with Freesurfer 6.0.
Results: A comparative analysis using the Mann-Whitney criteria defined the increase of the whole hippocampal volume until the age of 29. Then until 39, there was no difference. After that first slow (until 69) and after 70, a quick decrease of 17% of a significance level, p≤0.05.
The most significant difference occurred in the CA3 Broadmann area increasing until 24 years old, 12% of a significance level, p≤0.05. Until 49, there was no difference. There was a decrease of 7% until 70 years, and after 70 years, a decrease of 19% of a significance level, p≤0,01. The same results we found in the CA1 Brodmann area: increasing until age 29 years then a slow decreasing. After 70 years, a decrease of 18% of a significance level, p≤0,05, was seen. A significant difference was found in the hippocampal sulcus of 20% of a significance level, p≤0.05.
In old age, a significance level, p≤0.05, was found in the decrease in the volume of the hippocampal tail of 23%, molecular layer of hippocampus (14%), and of the dentate gyrus (19%), fimbria (37%), and subiculum (16%).
Conclusion: In our research, we found significant dynamics of differences in the whole volume of the hippocampus. The most significant changes were found in the CA1 and CA3 Broadmann areas, hippocampal sulcus, fimbria, hippocampal tail, subiculum, molecular layer of hippocampus, and dentate gyrus.

The measurement of hippocampal dimensions versus hippocampal volumetry via the automated segmentation on MRI for the validation of hippocampal sclerosis
X. C. Liew[1], K. Rahmat[2], N. Ramli[2], F. B. Fadzli[2], K. S. Lim[2]; [1]*Lembah Pantai/MY,* [2]*Kuala Lumpur/MY (katt_xr2000@yahoo.com)*

Purpose: To develop a simple quantitative technique for hippocampal atrophy which is comparable to hippocampal volumetry on MRI and to specifically delineate and obtain the cut-off value for normal and abnormal hippocampal volume, height, and width.
Methods and materials: A cross-sectional MRI study of 43 temporal lobe epilepsy and 49 control subjects was conducted. MRI brain assessment by two readers was based on standard visual diagnostic criteria by identifying hippocampal atrophy and hyperintensity on axial T2 FSE/coronal FLAIR CUBE sequences. The mean manual measurement of the hippocampal head height and width were performed using MANGO (multi-image analysis GUI) software by two readers. The hippocampal volume was measured by Free Surfer automated segmentation.
Results: A moderate positive correlation between the hippocampal volume and height/width bilaterally (p <0.001) was seen. Wilcoxon rank tests demonstrated a significant difference between bilateral hippocampal volume and width. A Mann-Whitney test showed that hippocampal volume, height, and width in the control group were significantly higher than the patient group (p<0.001).
The optimal cut-point value by (ROC) curve and Youden index for the left hippocampal volume was 3257 mm³ (sensitivity: 91.3%, specificity:88.4%, PPV:72.4%, and NPV:96.8%), left hippocampal height was 7 mm (sensitivity: 84.6%, specificity: 89.4%, PPV:75.9%, and NPV:93.7%), and left hippocampal width was 15 mm (sensitivity: 61.3%, specificity: 83.6%, PPV: 65.5%, and NPV: 81.0%). The optimal cut-point value for the right hippocampal volume was 3761 mm³ (sensitivity: 87.5%, specificity: 97.1%, PPV: 91.3%, and NPV: 95.7%), right hippocampal height was 7 mm (sensitivity: 88.2%, specificity: 89.3%, PPV: 65.2%, and NPV: 97.1%), and right hippocampal width was 17 mm (sensitivity: 61.5%, specificity: 89.4%, PPV: 69.6%, and NPV: 85.5%).
Conclusion: Manual measurement of hippocampal dimension is simple and reliable with a strong positive correlation between the hippocampal volume, height, and width in combination with semiology and MRI visual assessment.
Limitations: n/a
Ethics committee approval: Approval by the institutional ethics board.

Brain size matters: a comparative study between Indian and caucasian brains and intracranial volumes
J. Desai[1], A. Joshi[1], R. Kulkarni[1], L. Poonamallee[2], A. Sakegaonkar[1]; [1]*Pune/IN,* [2]*New York/US (juhi.desai@in-medprognostics.com)*

Purpose: Quantitative MRI has been proven to aid in identifying subtle volumetric changes in the brain. Studies have stated regional and global differences in shape, size, and volume between the caucasian and eastern populations. Chinese, Korean, and Japanese populations have also shown significant differences in brain shape and size between the western and eastern population. Our objective was to study the differences between the Indian and caucasian populations.

Methods and materials: 100 healthy control T1 3d MRIs of brains were collected from Indian and caucasian (XNAT database) populations, cross-matched between the ages of 20-85 years. A semi-automated clustering segmentation technique of ITK-SNAP was used to segment brain volumes. MRIs with motion artefacts were rejected to reduce error.
Results: Data had a normal distribution between ages, with a skewness coefficient of 0.05. The age and gender-matched comparison of Indian (group 1) and caucasian (group 2) brains and intracranial volumes (ICV) showed significant differences. The average volumes for Indians were 1,122.48 ml (whole-brain) and 1,339.75 ml (ICV) as compared to 1,222.68 ml (whole-brain) and 1,482.87 ml (ICV) in caucasians. One way anova for brain and ICV were found significant at $p<0.5$.
Conclusion: To our knowledge, this is the first large-scale study examining the differences in the volumes of brains and intracranial volumes between Indians and caucasians. The statistical analysis confirms the vast differences in the volumes of the brain in the two population. For the use of the quantitative analysis based on MRI to be clinically relevant, new references need to be build based on the type of population.
Limitations: The relationship between brain volumes and ICV described here are based on cross-sectional data and await refinement in future analyses.

Applying clinical 7 Tesla MRI scanners for postmortem examinations in forensic medicine

D. Gascho, E. Deininger-Czermak, N. Zoelch, M. Thali*; Zurich/CH (dominic.gascho@irm.uzh.ch)*

Purpose: The role of postmortem magnetic resonance imaging (MRI) is becoming more important in forensic medicine. The purpose of this study was to assess the potential advantages in using 7 Tesla MRI versus 3 Tesla MRI in forensic medicine for the assessment of cerebral haemorrhages.
Methods and materials: Decedents with cerebral haemorrhages (n=10) after blunt trauma or in accordance with a natural cause of death underwent head examinations using a 3 Tesla MRI unit and using a 7 Tesla MRI unit. The case selection was based on the detection of a cerebral haemorrhage on a previously performed computed tomography scan. The MRI protocol included 3D T2, T1, and susceptibility-weighted sequences. Additionally, high-resolution 3D in-phase gradient-echo sequences were performed for the visualisation of the bones. The images were visually compared by two radiologists.
Results: 7 Tesla MRI was superior to 3 Tesla MRI with regard to the detailed visualisation of anatomical structures due to the high contrast and high spatial resolution of the 7 Tesla MRI. Additionally, microhaemorrhages could be visualised on 7 Tesla MRI due to an increased susceptibility compared to 3 Tesla MRI. Overall, 7 Tesla MRI allowed for a more precise assessment of cerebral bleeding. A drawback of 7 Tesla MRI was the increased B1 inhomogeneities compared to 3 Tesla MRI, which caused signal differences across the brain. Small osseous fractures could be visualised on both MRI units, albeit 7 Tesla MRI presented a higher spatial resolution.
Conclusion: 7 Tesla MRI enables a more precise examination of cerebral haemorrhages, which may provide new opportunities for their radiological assessment in forensic as well as in clinical radiology.
Limitations: A small number of cases.

TI optimisation for postmortem FLAIR MRI: a pilot study

C. Bruguier, J.-F. Knebel, V. Magnin, P. Genet, V. Dunet*; Lausanne/CH (christine.bruguier@chuv.ch)*

Purpose: During the radiological evaluation of the FLAIR sequence for postmortem cases, a wide variety of image contrast is observed, different from that encountered in living patients. We aimed at evaluating the impact of two variables (temperature and delay from death) suspected of having an influence on the optimal inversion time (TI) value, which allows obtaining the living patient-like image contrast.
Methods and materials: In 24 postmortem cases, brain MRIs were performed and 3D FLAIR sequences with TI varying from 1,660 ms-900 ms, every 110 ms, were acquired. Two radiologists independently evaluated the images and were asked to choose which TI corresponded to the image of a standard patient-like FLAIR contrast. Rectal temperature and delay between the death of the cases and MRI were recorded. Pearson's correlation tests between the mean TI value, temperature, and delay were performed, as well as an evaluation of interobserver reliability with the prevalence-adjusted and bias-adjusted Kappa (PABAK).
Results: The temperature ranged from 5.7°-29.7°, while the death-MRI delay ranged from 12.3h to 74.4h. The optimal TI value ranged from 1,330 ms-1,100 ms, with moderate interobserver reliability (PABAK=0.56, 95%CI [0.28-0.84]). The optimal TI value was significantly correlated with the temperature (Pearson R=0.70; p=0.0014) and the delay from death (Pearson R=-0.67; p=0.00027). Rectal temperature was inversely correlated with the delay from death (Pearson R=-0.79; p<0.00001).
Conclusion: Postmortem brain FLAIR imaging contrast is significantly related to body temperature and delay from death. The TI value should be adapted to obtain living patient-like image contrast. A larger study cohort is needed to confirm these preliminary results and to evaluate whether the TI value could be used as an additional tool for dating the postmortem interval.
Limitations: The size sample.

Diffusion-weighted magnetic resonance imaging of the normal bone marrow in children and the effects of local and systemic cancer therapies

E. Pace, E. Clarke, A. Mackinnon, H. Mandeville, S. Vaidya, N. Desouza;
London/UK (ERIKA.PACE@RMH.NHS.UK)

Purpose:
To establish apparent diffusion coefficient (ADC) values for normal paediatric clival marrow and variation with age, gender, and puberty. To compare post-photon and proton-therapy clival ADC changes. To examine chemotherapy effects on ADC in the spine. To develop a longitudinal study to assess post-transplant bone marrow changes.
Methods and materials: Inclusion criteria: 5-17 years old, iso-DW-MRI ISO, non-oncological population (aim 1). Exclusion criteria: drugs (aim 1), dental brace, DW-MRI artefacts. Image acquisition/analysis: 1.5 T scanner. DWI with b = 0 and 1000 s/mm2. A 4-6 mm region-of-interest drawn within the clivus (Adept®, The Institute of Cancer Research) and at L3-S1. ADC calculated on a voxel-by-voxel basis through a monoexponential fit of the data yielded mean, median, 10th, 25th, 75th, and 90th centile ADC values.
Results: With chemotherapy, a reduction in vertebral ADC at 3 months was stabilised or decreased by 6 months. Although no oedematous response developed, fat replacement of haematopoetic tissue still resulted.
Conclusion: As paediatric prospective studies to investigate normal bone marrow are ethically difficult, the work in this thesis was largely retrospective. A first innovative attempt to establish the influence of age, gender and puberty on ADC values of clival marrow in cancer-free children alongside an assessment of oncological local and systemic treatment-related effects have been made.
Limitations: Unnumerous cohorts. Non-standardised acquisition timing of the follow-up scans; different tumour types, photon/proton dose, and chemotherapy. PUMA (Paediatric osseoUs Marrow Assessment) trial recruitment still in progress.
Ethics committee approval: Service Evaluations (562 and 756) approved by The Marsden. Approval from the Joint Research Committee to import MR scans performed at St George's Hospital. PUMA trial approved by the Health Research Authority.
Funding: Cancer Research United Kingdom grant (2013-2018).

Application of "Trigger Drop" in patients enrolled for percutaneous treatment of symptomatic discal hernia: preliminary results

A. Paladini[1], I. Percivale[1], A. Carriero[1], M. Spinetta[1], G. Guzzardi[1], Z. Falaschi[1], M. Cernigliaro[1], S. Bor[2], D. Zagaria[1]; [1]*Novara/IT,* [2]*Santhià/IT*
(andreapaladini1988@gmail.com)

Purpose: Trigger drop® is a muscle mediator that reduces the pain due to articular and muscular etiology. The device acts on crossed muscular chains and on neuro-lymphatic points with antalgic effect. We performed "dropping technique" applying inherit devices with different shapes in different positions on the body surface.
Methods and materials: From January to June 2019, 19 symptomatic patients have been enrolled. All patients were candidates to either cervical (5 patients) or lumbar (14 patients) disc treatment. Primary and secondary endpoints have been evaluated: efficacy of Trigger-Drop® has been evaluated in stopping analgesic drugs assumption and reducing back-pain through the visual analogic scale (VAS) evaluated before and soon after the device positioning. We performed a clinical follow-up three weeks after Trigger-drop positioning.
Results: In 89,5% (17 Patients) the device had immediate pain relief with a VAS reduction >4 compared to the initial value. 87.5% of patients stopped painkillers therapy after the application of Trigger-Drop®. Only one minor side effect was reported (localised cutaneous erythema), which disappeared by itself.
Conclusion: In our experience the positioning of Trigger-drop®, in patients waiting for percutaneous disc treatment, has been effective and safe in relieving back pain for a short period (three weeks), improving the overall quality of life of patients. Trigger-Drop® therapy allowed the pharmacologic therapy suspension for pain management.
Limitations: Not a large cohort of patients included.

Staging of osteochondral lesions of the talus: comparison of cone-beam CT arthrography with MR imaging

J. Desimpel[1], F. M. H. M. Vanhoenacker[2]; [1]*Antwerp/BE,* [2]*Duffel/BE*
(julie_desimpel@hotmail.com)

Purpose: An osteochondral lesion (OCL) is defined as damage involving both articular cartilage and subchondral bone. OCL of the talus is frequently detected by routine MRI by identification of bone marrow oedema as an indirect marker of overlying cartilage lesion. The articular cartilage of the talus and the distal tibia is thin compared to the knee joint hampering precise staging of osteochondral lesions of the talus on MRI. CBCT-arthrography has a better spatial resolution than MRI and visualises the articular cartilage more in detail. The purpose of this study was to compare the value of CBCT-arthrography as staging method of talar OCL.
Methods and materials: 35 patients with a talar OCL underwent both MR imaging (1.5T) and CBCT-arthrography within a time frame of maximum 1 month to avoid significant lesion progression between both examinations. The following parameters were scored individually by two radiologists: depth of the cartilage lesion, degree of detachment (no, partial or complete), size and the presence of subchondral bone changes.
Results: CBCT-arthrography led to an upstaging of the OCL in 28 cases. 13 patients subsequently underwent surgery of which 6 patients had an upstaging of the degree of detachment on CBCT-arthrography (upstaging to partial detachment in 2 cases and to complete detachment in 4 cases). Surgery was recommended in 3 cases of which 2 patients had an upstaging of the degree of detachment on CBCT-arthrography (1 patient with partial and 2 patients with complete detachment).
Conclusion: CBCT-arthrography is a very promising technique for staging of cartilage lesions of the ankle. Improved staging is very useful in those clinical scenarios where arthroscopic treatment of the lesion is considered.
Limitations: This stud is limited by the number of patients.

Diagnostic accuracy of dual-energy CT in assessment of traumatic bone marrow oedema of lower limb and its correlation with MRI

H. Yadav[1], S. Khanduri[2], P. Yadav[2]; [1]*New Delhi/IN,* [2]*Lucknow/IN*
(harshyadav.kgmc@gmail.com)

Purpose: To assess the diagnostic accuracy of dual-energy CT in detecting bone marrow oedema in patients of trauma of lower limb and correlate it with MRI.
Methods and materials: The study included 40 patients aged between 15–70 years of either sex. All the patients of lower extremity trauma after clinical evaluation underwent DECT and MRI evaluation. All the images were postprocessed on a work station and were further evaluated by a radiologist.
Results: Mean attenuation at fractured site observed by dual-energy CT was found to be significantly higher as compared to that at the adjacent site (170.75±33.99 vs 19.73±22.50 HU). Sensitivity, the specificity of dual-energy CT as compared to MRI in detecting bone marrow oedema were 94.1%, 91.3% respectively. Out of 40 cases enrolled in the study, agreement of MRI and dual-energy CT was observed in 37 (92.5%).

Conclusion: Dual-energy CT can be an effective alternative to MRI in detection of bone marrow oedema in patients of lower limb trauma. Dual-energy CT can also be used in patients in whom MRI is contraindicated.
Limitations: Not applicable.
Ethics committee approval: Not applicable.
Funding: No funding was received for this work.

The role of bone marrow lesions in acute joint injury
L. Selvarajah[1], A. Curtis[2], O. Kennedy[2]; [1]*Limerick/IE,* [2]*Dublin/IE (logesselva@gmail.com)*

Purpose: Post-traumatic osteoarthritis (PTOA) mainly affects a younger population cohort and poses significant costs to healthcare systems. Recent developments have identified that joint injury is initiated in the sub-chondral region of the joint despite the initial intra-articular cartilage injury. Of particular interest is bone marrow oedema or lesions (BMLs) that appear in the sub-chondral region almost immediately after initial joint injury.
Methods and materials: A review is undertaken on what is known about these phenomena (microcracks and BMLs) in the literature and discuss potential mechanisms by which they may be linked. Papers published in the last 10 years relating to bone remodeling in joint injury, subchondral microdamage, BMLs, bone-cartilage crosstalk and novel imaging models demonstrating acute knee injury were reviewed.
Results: The recent findings in this field have shown that microcracks in bone initiate targeted remodelling via RANKL expression in osteocytes. Other work has shown that subchondral microcracks co-localise with BMLs as viewed by MRI. Finally, BMLs are associated with and predict subsequent pain and structural joint degeneration.
Conclusion: This paper demonstrates that subchondral microcracks likely occur during acute joint injury, and are closely linked to BML that are seen by clinical MRI and thus are potentially involved in the subsequent joint degeneration that occurs after injury. BMLs could serve as a potential site of radiological monitoring and therapeutic intervention to better tailor patient management.
Limitations:
The precise way in which subchondral activities are linked with those in the articular compartment is not yet known but defining these events using additional imaging sequences (DWI-ADC/T1rho) will be an important next step in this field.

T2-mapping evaluation of long-term cartilage alteration of humeral head for arthroscopic Bankart repair with or without remplissmage
Y. Xie, S. Chen*; Shanghai/CN (xieyuxue1994@gmail.com)*

Purpose: To quantitatively evaluate the cartilage alteration of humeral head after Bankart repair with or without remplissmage using T2-mapping.
Methods and materials: Fifty-six patients, including 28 with isolated Bankart repair surgery (group A) and 28 with combined remplissmage (group B), and 20 healthy subjects (control group) were recruited. All participants underwent T2-mapping scan and were evaluated with American Shoulder and Elbow Surgeon scores（ASES）and range of motion (ROM) at a minimal of 2 years' follow-up (average, 8.9 years). The total humeral head cartilage was segmented into six compartments (I-VI) along the coronal oblique plane.
Results: Of the 56 patients, 3 (5.4%) had recurrent dislocation during daily activities. There was no significant difference in preoperative and postoperative ASES between group A and group B (P=0.82). The mean external rotator loss was 6.3 degrees for group A and 9.8 degrees for group B (P=0.12). The T2 values in the middle-to-inferior subregions were significantly higher than those in the superior subregions (P<0.05). The total and all the compartments of T2 values in the patient groups were higher than those in the control group (P<0.05). For the two patient groups, there was no significant difference of T2 values between all regions (P>0.05). Moreover, the T2 values in both patient groups were negatively correlated with ASES scores, especially for the middle-to-inferior compartments (r= –0.52 to -0.6, P < 0.05).
Conclusion: Shoulder instability after repair showed increasing cartilage T2 values in humeral head, mainly involving middle-to-inferior compartments, which could be the main cartilage compartment that may affect the patient's clinical symptoms.
Limitations: The cohort of patient was small.
Ethics committee approval: This study was approved by the Health Sciences Institutional Review Board of our hospital (2015M-010).
Funding: Grant support was received from the National Natural Science Foundation, China (No. 81671652).

MRI evaluation to predict tendon size for knee ligament reconstruction
G. Di Nino, E. Grassedonio, P. Toia, L. La Grutta, M. Nobile, T. Smeraldi, F. Midiri, M. Galia, M. Midiri*; Palermo/IT*

Purpose: The aim of this study is to evaluate a possible correlation between anthropometric parameters and sizes of knee tendons used for ACL reconstruction. We hypothesised that specific clinical and radiological knee measurements could be better tendon sizes predictors than anthropometric parameters.
Methods and materials: 110 patients were enrolled and 80 patients met the inclusion criteria of the study. All patients underwent an MRI of the knee with a 1.5 T MRI. For each patient, anthropometric data such as gender, height, weight, body mass index (BMI) and knee circumference were recorded. MRI knee measurements were performed on each study: patellar tendon (PT) thickness and length, quadriceps tendon (QT) thickness, semitendinosus tendon (ST), gracilis tendon (GR) diameter, the largest patella and intercondylar width.
Results: The ST, QT and PT thickness were higher in males than in females and no significant GT and knee circumference differences were. Significant, but weak correlations were found between patient anthropometric data and hamstrings diameter, PT length, and QT and PT thickness. Intercondylar and patellar width present a moderate correlation between PT thickness, PT length and ST diameter.
Conclusion: The intercondylar and patellar width presented a moderate correlation with PT thickness, PT length and ST diameter. Further, weak correlations were found between patient anthropometric data (gender, weight, height, BMI) and GR and ST diameter, PT length, and QT and PT thickness. This results may help surgeons during preoperative planning, specifically regarding graft choice and size.
Limitations: The study is preformed as a single centre study.
Ethics committee approval: n/a

Hand extensor compartments: how to study them and is it always their fault?
C. A. B. Oliveira[1], F. M. F. Gomes[2], F. Vieira[1], V. Mendes[1]; [1]*Braga/PT,* [2]*Vila Nova de Sande/RO (carlosaboliveira2014@gmail.com)*

Purpose: To evaluate 100 patients with pain referred to the dorsal compartment, by grading the lesions in a three-way system (mild, moderate and high) and to examine the correlation between the physical exam and the ultrasound findings.
Methods and materials: Hand ultrasound was done to 100 patients with evaluation of the dorsal and volar hand. A review of the literature was made.
Results: In 72% of cases, pathology was found in the dorsal hand: 48% tendinitis of the I compartment, 22% tendinitis of the III compartment and the rest of the patients with multicompartment extensor pathology. 28% of cases with tenosynovitis of the flexor compartment lesion - 75% of cases; median nerve compression - 15% of cases and other pathology. Physical exam was according in 80 % of cases and pain referred to the lateral compartment was found in 68 %.

Conclusion: Hand pathology is complex and demands a correct grading and evaluation by the radiologist.
Limitations: This study is limited by its sample and a one radiologist reader.
Ethics committee approval: N/A

Diffusion tensor imaging of annulus fibrosus in subjects with discogenic low back pain
S. Tian, H. Yuan*; Beijing/CN (ts@bjmu.edu.cn)*

Purpose: Observe the morphology and integrity of annulus fibrosus by diffusion tensor imaging (DTI), and quantitatively analyse the annulus fibrosus by measuring the apparent diffusion coefficient (ADC) and fractional anisotropy (FA) in subjects with discogenic low-back pain (DLBP).
Methods and materials: Subjects with DLBP confirmed by discography were selected as the DLBP group and healthy volunteers as the healthy control (HC) group. The ADC, FA and λ1, λ2, λ3 values were measured by axial DTI of L3-S1 levels. The differences of ADC, FA and λ1, λ2, λ3 values between two groups were compared. The data conforming to normal distribution were tested by t-test, while the data not conforming to normal distribution were tested by nonparametric test.
Results: 30 subjects in the DLBP group and 24 subjects in the HC group were included in the study. The ADC value of ROI in the DLBP group was significantly lower than that in the HC group (6.10 ± 3.17 vs 9.84 ± 4.01, P = 0.0002), and the FA value was significantly higher than that in the HC group (0.341 ± 0.201 vs 0.231 ± 0.150, P = 0.007). Compared with the HC group, the DLBP group showed significantly lower λ1 (4.44 ± 0.36 vs 4.75 ± 0.35), λ2 (4.19 ± 0.34 vs 4.50 ± 0.36), and λ3 values (3.97 ± 0.34 vs 4.27 ± 0.38; all P < 0.05).
Conclusion: Diffusion tensor imaging has guiding significance in the clinical diagnosis of DLBP and preoperative localisation of the responsible segment.
Limitations: Retrospective design and the small sample sizes.
Ethics committee approval: Peking University Third Hospital Medical Science Research Ethics Committee approved this study (16-45-QX-TTK).

MyT3 5-10 09:06
Accuracy of volumetric trabecular bone mineral density assessment using dual-source dual-energy CT: a prospective phantom study and comparison with quantitative CT
C. Booz[1], I. Yel[1], N. Grosse Hokamp[2], J. Borggrefe[2], L. Lenga[1], S. S. Martin[1], J. L. Wichmann[1], T. J. Vogl[1], M. H. Albrecht[1]; [1]*Frankfurt am Main/DE,* [2]*Cologne/DE (boozchristian@gmail.com)*

Purpose: To assess the accuracy of phantomless volumetric bone mineral density (BMD) assessment of trabecular bone using dual-source dual-energy computed tomography (DECT) in comparison to quantitative CT (QCT).
Methods and materials: Data from a validated anthromorphic spine phantom consisting of three lumbar vertebra equivalents containing 50, 100 and 200 mg/cm³ calcium hydroxyapatite (HA) concentrations which had been scanned using third-generation dual-source DECT, QCT and dual x-ray absorptiometry (DXA) was analyzed. For volumetric BMD assessment based on DECT, dedicated postprocessing software using material decomposition was applied, which enables phantomless BMD assessment of the trabecular bone through semi-manual definition of the volume of interest (VOI). Scans of all modalities were repeated three times and measurements per vertebrae were also repeated three times, and averaged values were recorded. The accuracy of DECT and QCT for BMD assessment was compared; additionally, calculated BMD values were correlated with DXA, the standard of reference for BMD assessment according to the WHO.
Results: Significantly higher correlations between actual and measured HA concentrations were found for DECT (r=0.98) compared to QCT (r=0.93, P<.001). Mean error for all measurements was -2.8 ± 3.3 mg/cm³ (DECT) and –8.3 ± 9.5 mg/cm³ (QCT) (P<.001). There was significantly higher correlation between BMD values of DECT and DXA (r=0.99) compared to BMD values of QCT and DXA (r=0.96, P<.001).
Conclusion: Phantomless volumetric BMD assessment of trabecular bone using dedicated DECT material decomposition achieves substantially improved accuracy and significantly higher correlation with DXA in comparison to QCT.
Limitations: Small number of BMD measurements in this phantom study.
Ethics committee approval: This study was approved by the local IRB. Written informed consent was waived.

Complex radiological diagnosis of osteonecrosis in desomorphine dependence patients on the pre-operative stage of treatment
A. Babkova, N. S. Serova, S. P. Pasha, S. K. Ternovoy*; Moscow/RU (an4i1@ya.ru)*

Purpose: To determine the diagnostic efficiency of methods of complex radiological diagnosis (ortopantomography, conventional radiography, MSCT, CBCT) in the evaluation of osteonecrosis in patients on the preoperative stage.
Methods and materials: In the period from 2014 to 2018, a total of 108 drug addicts with a history of abuse desomorphine were evaluated at the clinics of the Sechenov University. The age of patients varied from 18 to 48 years. The median age was 28 years. Among the patients, the number of women was 11 (10,1%), men – 97 (89,9%). The duration of administration of desomorphine in this group of patients ranged from 2 months to 10 years. Orthopantomography, radiography of the skull, MSCT and CBCT were performed on 108 patients (100%) in the preoperative stage. Also 25 patients (21%) underwent radionuclide diagnostics: planar bone scan, SPECT.
Results: The application of complex highly informative radiological methods (MSCT, CBCT, radionuclide diagnostics) in desomorphine dependence patients at the preoperative stage of treatment enables full investigation of character and the prevalence of the pathological process, to plan further tactics of surgical treatment.
Conclusion: The diagnostic efficiency parameters at the preoperative stage for MSCT were: the sensitivity – 98,1%, the specificity – 99,6%, the accuracy – 98,8%, for CBCT were: the sensitivity – 97,3%, the specificity – 99,1%, the accuracy – 98,4%, for orthopantomography: the sensitivity – 78,6%, the specificity – 76,3%, the accuracy – 77,4%, for skull xray: the sensitivity – 61,1%, the specificity – 59,2%, the accuracy – 60,2%.
Limitations: No limitations.

Long-term comparison between blind and ultrasound-guided injection in Morton neuroma
F. Ruiz Santiago, N. Prados Olleta, P. Tomás Muñoz, A. J. Láinez Ramos-Bossini*; Granada/ES (ferusan12@gmail.com)*

Purpose: This study aims to compare the effectiveness of blind vs ultrasound-guided injections in Morton neuroma until one year of follow-up.
Methods and materials: This is an evaluator blinded randomised trial. 31 patients with Morton neuroma were injected based on anatomic landmarks and 33 patients under ultrasound guidance. Patients were clinically assessed by the VAS score (0-10), and by the Manchester Foot Pain and Disability Index (MFPDI) –17 items; total score: 17 (best state) - 51 (worst state). Injections containing 1 ml of 2% mepivacaine and 40 mg triamcinolone were administered in the web space. Follow-up was performed at 15 days, 1 month, 45 days, 2 months, 3 months, 6 months and 1 year.
Results: Improvement in the VAS score was superior in the ultrasound group at all points of follow-up (p<0.05) except at 1 year when differences did not reach statistical significance (VAS: 4.6 ± 0.6 vs 5.9 ± 0.6, p=0.16). The improvement according to the MFDI was superior in the ultrasound group from 45 days to one-year follow-up (31.4± 1.7 vs 36.8± 1.9, p<0.05).

Conclusion: Ultrasound-guided injections in Morton neuroma led to greater long-term clinical improvement than blind injections. Although differences in pain tend to disappear at one-year follow-up, the disability index remains statistically improved in the ultrasound-guided group in comparison with the blind group.
Limitations: MN was not confirmed by histological examination in all our patients, but the overall accuracy of clinical and imaging diagnosis altogether has been reported to be very high, over 95%. Another limitation of the study is the sample size, which may have prevented differences from reaching stronger statistical significance.
Ethics committee approval: The study was approved by the local ethics committee (code: 0565-N-16).
Funding: No funding was received for this work.

Shoulder stability: where does it fail?
C. A. B. Oliveira, F. D. S. Costeira, V. Mendes, F. Vieira*; Braga/PT (carlosaboliveira2014@gmail.com)*

Purpose: To evaluate the stability of the upper limb when pathology is present. Shoulder findings when there's elbow pathology and vice-versa. Grading of interstitial oedema in muscle for compensations/stability.
Methods and materials: 80 patients with elbow or shoulder pathology confirmed with ultrasound. When elbow pathology was found the integrity of the biceps anchor, conjoined tendon and pectoral major were evaluated with a 3 stage system (mild, moderate and high-grade oedema). When shoulder pathology was found, common insertion of the biceps, distal coracobrachial insertion and triceps distal insertion were evaluated with a 3 grade system (mild, moderate and high-grade oedema).
Results: Shoulder pathology was documented in 40 cases: Common insertion of the biceps- stage II oedema in 85% of cases, distal coracobrachial insertion- stage II oedema in 70% of cases, and triceps distal insertion- stage II oedema in 50% of cases. Elbow pathology was documented in 40 cases: biceps anchor- stage II oedema in 90% of cases, conjoined tendon- stage II oedema in 81% of cases, and pectoral major - stage II oedema in 72 % of cases. Complete tear of the tendon was found in 6 cases involving the biceps anchor and common insertion. Shoulder assimetry was found in 75% of cases. In 54% of cases cervical and dorsal spine x-ray was done with scoliosis found in only 10 %.
Conclusion: Upper limb stability is a hard problem with compensations consituting a common difficulty.
Limitations: This study is limited by its sample and one radiologist bias.

Pitfalls in imaging of TFCC
O. Balazs*; Timisoara/RO (oanabalazs@yahoo.com)*

Purpose: The triangular fibrocartilage complex plays an important role in wrist biomechanics and is prone to traumatic and degenerative injury, making it a common source of ulnar-sided wrist pain. Diagnosis of injuries to the ligamentous structures of the wrist can be a challenge, particularly when there is involvement of the small, complex structures of the proximal wrist. A detailed understanding of the triangular fibrocartilage complex anatomy and injury patterns is critical in generating an accurate report to help guide treatment.
Methods and materials: A retrospective review of MR wrists done in our institution over a two-year period was performed and illustrative cases were selected. A review of the normal anatomy of TFCC, imaging technique, normal MR appearance, Palmer classification, variant anatomy that mimic TFCC disease and spectrum of imaging findings in TFCC injury are discussed in the study.
Results: Advances in magnetic resonance imaging have facilitated a better visualisation of the triangular fibrocartilage complex structures. However, there are a number of pitfalls that may cause difficulty in diagnosis of injuries to the triangular fibrocartilage complex, lunotriquetral ligament, and scapholunate ligament. The accuracy of diagnosis of injuries to the TFCC and wrist ligaments may decrease due to use of inappropriate MR imaging sequences or MR imaging artifacts, whereas variant anatomy of the proximal wrist structures may mimic disease of the TFCC and wrist ligaments.
Conclusion: Knowledge of the detailed anatomy of the wrist, as well as variant patterns of structure morphology and signal intensity, can help differentiate actual disease from normal or variant appearances at the assessment with MR imaging.
Limitations: None.

Sarcopenia in total hip replacement and its effects on complications
M. Ay, H. Çetin, N. Çay*; Ankara/TR (mesutay0929@yandex.com)*

Purpose: The aim of this study was to evaluate the psoas muscle and paravertebral muscle in terms of sarcopenia in patients with total hip replacement and to investigate the effect of sarcopenia on prosthetic complications.
Methods and materials: The area of the bilateral paravertebral and psoas muscles and the density of the software-selected area were independently calculated by the prosthesis of the patients. In addition, normal or possible complications of the final prosthesis were noted in each patient. While evaluating the images, paravertebral and psoas muscle boundaries were drawn at level of the L3 or L4 vertebrae in accordance with the previously accepted studies and maximum area measurement was performed.
Results: Although there was no significant difference in bilateral paravertebral muscle areas, there was a decrease in muscle density when hip prosthesis patients were compared with normal group regardless of side. There was a statistically significant decrease in left psoas muscle area and density in patients with left hip replacement compared to normal group. There was a statistically significant decrease in the right psoas muscle area and density in patients with right hip replacement compared to the normal group. Although there was no significant difference in the right psoas muscle area, there was a decrease in the psoas muscle density complications in patients with the right hip prosthesis. Although there was no significant difference in the right psoas muscle area in patients with left hip prosthesis compared to patients with prosthesis complications and healthy prosthesis, there was a decrease in the psoas muscle density complications.
Conclusion: We concluded that the prevalence of sarcopenia is higher in patients with prosthesis compared to the normal population and that sarcopania may be one of the reasons that increase at the prosthesis complications.
Limitations: No limitations.

MRI findings and their correlations in patients with symptomatic subtle cavovarus hindfoot deformity
I. Menkova*; St. Petersburg/RU (irina.s.menkova@gmail.com)*

Purpose: To find significant associations of ligamentous, tendon, osseous abnormalities in patients with symptomatic subtle cavovarus hindfoot deformity.
Methods and materials: Ankle MRI of 35 patients (18 male; mean age 52±5,6) with clinical and radiographic evidence of subtle cavovarus hindfoot deformity was assessed by 2 musculoskeletal radiologists. Pearson's, Spearman's Rank correlation coefficients were used for analysing.
Results: All patients with cavovarus hindfoot deformity underwent weight-bearing radiographic measurement of Cobey angle, a measurement of the modified Cobey angle on MRI. All patients were divided into the groups according to Cobey angle range. Group I: 19 patients with Cobey angle of 1-4°, group II: 10 patients - 5-9°, group III - 6 patients – >9°. Signs of peroneal tendinopathy were found in all patients. The severity of the peroneal tendons tears (according to Sobel classification) correlated with the hindfoot varus severity. III-IV grade of the peroneal tendons tears was observed more often in patients of II-III groups (p=0.0065). Hypertrophy and degenerative changes of the peroneal tubercle were revealed in 18 patients (fig.1). Oedematous changes of the peroneal tubercle were found mostly in the patients with the highest rates of calcaneus deviation (group III) (p=0.0016). In all the patients with symptomatic idiopathic cavovarus hindfoot, chronic lateral ligaments tears were found. Other pathologic conditions of ankle structures in these patients had no significant associations between them and hindfoot varus severity (p>0.05).

Conclusion: Painful peroneal tubercle hypertrophy associated with peroneal tendinopathy is evident in patients with more pronounced cavovarus hindfoot deformity. The grade of peroneal tendons tears also increases with an increasing of hindfoot varus severity. Such pathologic conditions exacerbate chronic pain and the degree of ankle lateral instability and often require surgical correction.

The role of diffusion-weighted MRI in the assessment of treatment response to chemotherapy in osteosarcoma
R. Kaddah[1], T. Raafat[1], L. M. E.-M. S. A. Bokhary[2]; [1]Cairo/EG, [2]Giza/EG *(dr-lobna2011@hotmail.com)*

Purpose: To investigate whether DWI is useful for monitoring the therapeutic response after chemotherapy in osteosarcoma by comparing the ADC values pre and post-treatment. And to determine if osteosarcomas change their water diffusion during preoperative chemotherapy in relation to the amount of tumour necrosis.
Methods and materials: Inclusion criteria: osteosarcoma patients coming to the National Cancer Institue (NCI). Exclusion criteria: patients who have implanted electric and electronic devices and those who are intolerant to contrast administration. MRI techniques: conventional MRI, DWI and postgadolinium DTPA MR imaging initially and 3-6 months after chemotherapy administration. DWI analysis: qualitative analysis was done by studying the signal intensity of different lesions on both the DWIs (at the highest b value i.e. at 800sec/mm2) and the ADC map. Quantitative analysis: ADC calculation by using the electronic cursor on the ADC map in 3 different ROI of the lesion which was placed on the solid and preferably enhancing parts of the lesion excluding necrotic, fibrotic and haemorrhagic areas as well as adjacent fat, normal tissue and bone.
Results: The study showed 17 patients with regressive response, 7 with a progressive response and only one case remained stationary. Follow-up MR after treatment showed increased intra-tumoural breaking down in (52%) of patients.
Conclusion: DWI and ADC value in following-up the treatment of osteosarcoma revealed to increase the mean ADC value in regressive cases and vice versa in progressive cases. Following-up by MRI revealed increased in tumour breaking down in post-therapeutic conventional MRI.
Limitations: None.
Ethics committee approval: Informed written consent was obtained from the patients after explanation of the procedure.
Funding: No funding was received for this work.

Immediate morphological spine modification after positioning of removable interspinous spacer for unifocal lumbar canal stenosis
L. J. Pavan[1], F. Torre[1], J. Yazbek[2], A. Prestat[1], S. Guinebert[3], D. S. Palominos Pose[4], N. Stacoffe[5], N. Amoretti[1]; [1]Nice/FR, [2]Bordeaux/FR, [3]Paris/FR, [4]Santiago/CL, [5]Lyons/FR

Purpose: To evaluate the immediate morphological modifications on pre and post-procedural CT scan after percutaneous positioning of a removable interspinous spacer (ISS) for unifocal lumbar canal stenosis under fluoroscopic and CT guidance.
Methods and materials: Patients treated in our centre between 12/2018 and 09/2019 with a percutaneous removable interspinous spacer (LobsterProject®, Techlamed®) for symptomatic unifocal lumbar stenosis were retrospectively selected. After general or epidural anaesthesia, under fluoroscopic and CT guidance, the ISS was percutaneously placed by two interventional radiologists in the central part of the interspinous ligament with lateral access. For each patient interspinous space, intradiscal space, intra-articular space and foraminal area (based on bone cortical on sagittal imaging) were measured on pre- and post-procedural low dose CT by two operators (OP1-OP2).
Results: Nine patients were selected with a mean age of 80,1[68-92] years. Interspinous space significantly increased (-OP1:3.3 vs 8.8mm, p<0.01 -OP2:3.4 vs 9.7mm, p<0.01) as well as foraminal area (-OP1:132 vs 155mm2, p<0.01 -OP2:132 vs 163mm2, p<0.01), according to both operators. Intradiscal space (-OP1:6.2 vs 6.8mm, p=0.069 -OP2:6.3vs6.9mm, p=0.021) and intra-articular space (OP1:2.1 vs 2.9mm, p=0.076 -OP2:2.1 vs 3.3mm, p=0.011) increased too (statistically significant according to one operator). Mean operative time was 44 minutes. Technical positioning was satisfying in 8/9 cases.
Conclusion: Interspinous spacer has immediate significant effects on lumbar morphology, significantly increasing interspinous space, foraminal area, intradiscal space and intra-articular space. The reduced invasiveness of the procedure and the possibility of percutaneous removal allows to avoid a major surgery, even if the ISS is not tolerated.
Limitations: Limits of the study are the analysis on low-dose CT and lack of a long term clinical follow-up.

Use of DISCOGEL® to treat cervical and lumbar discal bulging: results and consideration in our monocentric experience
A. Paladini[1], G. Guzzardi[1], M. Spinetta[1], A. Galbiati[1], M. Cernigliaro[1], D. Negroni[1], I. Percivale[1], Z. Falaschi[1], G. F. Buoni[2]; [1]Novara/IT, [2]Turin/IT *(20027467@studenti.uniupo.it)*

Purpose: Intervertebral disc bulging is a radiologic sign due to the weakness of annulus fibrosus that causes compression on the inter-vertebral foramina with a symptoms characterized by back pain with or without limbs irradiation and functional limitation
Methods and materials: We retrospectively evaluated our monocentric experience in 78 Patients affected by cervical and lumbar disc bulging treated with DISCOGEL®. Inclusion criteria were: at least 6 weeks failure of medical therapy and disc degeneration classified as Pfirmann grade 1-3. Patients selection was based on the evaluation of a spine MRI and clinical symptoms
Results: We performed all the procedures in angiographic suite, with prone (lumbar treatment) or supine (cervical) position and in all of cases we injected 0,8 ml DISCOGEL® for every disc treated. No major adverse events have been reported. According to MacNab scale, in our experience, clinical success was achieved in the 75,7 % of cases (59/78 Patients). In the 24,3% of cases (19/78 Patients) the treatment was not efficient
Conclusion: Our study demonstrates that DISCOGEL® is safe and efficient in the treatment of cervical and lumbar disc bulging, with a good clinical success and a low adverse events rate.
Limitations: no randomization of our cohort of patients

Discordant and false-negative screen-detected cancers at independent double reading: a comparison of digital mammography and digital breast tomosynthesis in a population-based screening program

P. Skaane, S. Y. Yanakiev, T. Lie, E. E. Eben, R. Gullien, S. B. Brandal; *Oslo/NO (PERSKA@ous-hf.no)*

Purpose: To review screening-detected cancers (SDC) missed by one or both readers at independent double reading comparing digital mammography (DM) and digital breast tomosynthesis (DM+DBT) in population-based screening.
Methods and materials: A prospective study comparing DM and 2D+DBT included 24,301 women aged 50-69. A paired design with independent double reading for 2D and for 2D+DBT. Four readers interpreted each examination using a breast-based 5-point rating scale. SDC with at least one false-negative score were retrospectively reviewed by four radiologists using the same 5-point scale, giving an individual score for each breast, for CC- and MLO-view, and for DM and DBT. A consensus meeting categorised the findings as normal, nonspecific, or significant minimal signs, and false-negative ("miss"). Mammographic findings were grouped as circumscribed mass, spiculated mass, architectural distortion, asymmetry, and calcifications.
Results: 230 SDC (4 bilateral) were found, 175 at DM and 227 at DM+DBT. Prospective interpretation had a positive score in all arms for 100 SDC, but a normal score in at least one arm for 130 SDC. Normal score, discordant positive, and concordant positive for the 130 SDC (134 breasts) were for 2D 57, 53, 24, and for 2D+DBT 3, 75, and 56, respectively. Mammographic features in these 130 SDC revealed 89 spiculated masses, 23 calcifications, and 11 distortions. SDC presenting as spiculated mass and visible in retrospect had improved conspicuity on CC-views as compared with MLO-views at DBT.
Conclusion: Spiculated mass was the most common feature of missed SDC with a high interobserver variability in DBT-screening, probably caused by perception errors. Missed SDC presenting as calcifications might more often represent classification errors.
Limitations: The screening examinations including DM and DBT were interpreted sequentially in one reading session, the 2D images first and then immediately after the 3D (DBT) images.

Delayed breast cancer diagnosis after repeated recall at biennial screening mammography: an observational follow-up study from the Netherlands

J. L. R. Lameijer[1], A. C. Voogd[2], R. M. Pijnappel[3], W. Setz[1], M. Broeders[4], V. C. G. Tjan-Heijnen[2], L. Duijm[4]; *[1]Eindhoven/NL, [2]Maastricht/NL, [3]Utrecht/NL, [4]Nijmegen/NL (joostlameijer@gmail.com)*

Purpose: To investigate delayed breast cancer diagnosis after repeated recall for the same screening mammographic abnormality.
Methods and materials: This was a retroprospective observational study performed in a cohort of women enrolled in a mammography screening programme in the Netherlands. All women aged 50-75 who underwent biennial screening mammography in the south of the Netherlands between January 1, 2007, and December 31, 2016, were included. Follow-up of recalled women was at least 2 years.
Results: A delayed diagnosis of breast cancer was seen in 2.8% of all recalled women with breast cancer. Most delays were caused by incorrect BI-RADS classifications after recall (74.2%). Tumour characteristics of breast cancers with a diagnostic delay were comparable to those of cancers without delay, except for proportions of DCIS and tumour histology. The delayed confirmation of breast cancer significantly increased the mean tumour size (P<0.001). The proportion of women who experienced a diagnostic delay in the confirmation of their breast cancer significantly varied among hospitals (P=0.027).
Conclusion: We found that the proportion of women with a long delay of their breast cancer confirmation following recall did not decrease during 20 years of screening. These delays worsen the tumour size and may negatively influence prognosis of survival. We suggest that quality assurance not only covers the screening programmes, but also the hospitals handling recall.
Limitations: Screening mammography programmes are constantly subject to changes. These parameters influence accuracy and may limit extrapolation of our findings to other programmes.
Ethics committee approval: Ethical approval was not required for this observational follow-up study. The screening programme requires women to 'opt-out' of mammography screening. Three recalled women refused and were excluded.
Funding: No funding was received for this work.

RPS 502-3 08:52

Predicting the long-term impact of breast tomosynthesis on the cancer detection rate in a screening programme

F. Caumo[1], G. Gennaro[1], A. Pittaro[1], G. Romanucci[2], C. Fedato[3], S. A. Montemezzi[2]; *[1]Padua/IT, [2]Verona/IT, [3]Treviso/IT (francesca.caumo@iov.veneto.it)*

Purpose: To evaluate the long-term impact on cancer detection rate (CDR) of breast tomosynthesis (DBT) used as screening test.
Methods and materials: From April 2015 to March 2017, 34,688 women were enrolled in a screening programme where digital mammography (FFDM) was replaced by DBT combined with synthetic mammography (SM). The rescreening round was split in two: about half the population was rescreened by DBT+SM and the second half by FFDM. CDR was calculated for the first screening round dividing between prevalent and incident cancers and compared with CDRs obtained by FFDM before using DBT. $CDR_{prevalent}$ found in the second round by DBT+SM and by FFDM respectively were compared with values found in the first round and with those associated with former FFDM screening. CDR differences were tested by the Chi-square test.
Results: In the first DBT round, cancer detection of prevalent and incident cancers was respectively 11.8/1000 and 8.6/1000. Both values were significantly higher than CDRs found in the former FFDM screening ($CDR_{prevalent}$ = 8.4/1000; $CDR_{incident}$ = 5.7/1000; p<0.0001). At the rescreening with DBT+SM, $CDR_{incident}$ decreased at 8.1/1000 but the difference with the first round was not significant; a significant decrease was found at the rescreening by FFDM, with a $CDR_{incident}$=3.5. The difference between incident CDRs by FFDM before and after the introduction of DBT was also significant (5.7/1000 vs. 3.5/1000, p<0.0001).
Conclusion: Rescreening with DBT detected more cancers than FFDM, anticipating cancers which might have been detected in the following rounds. The decrease in CDR of rescreening by FFDM after DBT compared to FFDM CDR before DBT shows that DBT also found cancers which might have shown up within two years.
Limitations: Case-control study.
Ethics committee approval: Approved by the IRB. Patient informed consents collected.

RPS 502-4 08:58

The early effects of a mammography screening program on advanced breast cancer incidence in the Friuli Venezia Giulia Italian region

F. Giudici[1], M. Tonutti[1], M. Bortul[1], F. Zanconati[1], A. Zucchetto[2], A. Franzo[3], M. Gobbato[3], M. A. Cova[1], L. Bucchi[4]; *[1]Trieste/IT, [2]Cro-Aviano/IT, [3]Udine/IT, [4]Forli'-Meldola/IT (giudici.ctf@gmail.com)*

Purpose: Breast cancer (BC) screening aims to reduce BC mortality. Effects on mortality require more time to become evident making an evaluation of its effectiveness difficult. This study assessed incidence rates of advanced breast cancer (ABC) and a surrogate measure of mortality reduction based on the attendance to Friuli-Venezia Giulia (FVG) region mammography screening programme (MSP). It has been the first to evaluate, on a regional basis, the effectiveness of MPS implemented in Italy in 2000.
Methods and materials: Administrative databases were record-linked with the FVG cancer registry. The cohort included women aged 50-69 years invited to the first screening round. Attenders were women who responded to at least one of the first two screening rounds (2006-2007 and 2008-2009) and non-attenders who responded to neither of them. ABC was defined as tumour ≥ 2 cm (T2+), lymph-node-positive (N+), or TNM Stage greater than II (stage II+). Age-standardised incidence rate ratios (IRR) of attenders versus non-attenders, with

95% confidence intervals (95%CI), were calculated. IRRs were adjusted for age and socio-economic status by fitting a Poisson regression.
Results: The cohort included 104,488 attenders and 49,839 non-attenders (154,327 women). During the follow-up period (median 7.02 years), 3,866 invasive BC were diagnosed (2,717 and 1,149 among attender and non-attenders respectively). Attenders had lower rates of T2+ BC (IRR=0.64; 95% CI: 0.56-0.72), N+ BC (IRR=0.87; 95% CI: 0.78-0.98), and Stage II+ BC (IRR=0.78; 95% CI: 0.70-0.87). The self-selection bias was limited.
Conclusion: The attendance to the FVG MPS was associated to a significant decrease in the risk of advanced BC that was independent of self-selection biases. This early effect is suggestive of a future impact of the screening programme on BC mortality.
Limitations: Short follow-up.

Unenhanced MRI combined with digital breast tomosynthesis: diagnostic accuracy for breast cancer detection of a double-reading strategy

V. Marconi, R. Girometti, A. Linda, L. Di Mico, F. Bondini, C. Zuiani*; Udine/IT (rgirometti@sirm.org)*

Purpose: To evaluate the accuracy for breast cancer (BC) detection of a double-reading approach involving combined unenhanced breast magnetic resonance imaging and digital breast tomosynthesis (UMRI-DBT).
Methods and materials: We retrospectively included 93 patients (mean age 57.5±10.4 years) who underwent both 1.5T magnetic resonance imaging and DBT from January 2016 to December 2017. Three readers (R1, R2, and R3), ranging from 3 to 10 years experience, blinded to clinical information and histology, independently evaluated a combination of UMRI (transverse T1-weighted imaging and diffusion-weighted imaging [DWI]) and DBT, using a Likert-score and the BI-RADS scale to provide final a categorisation of observations. Using postoperative pathology and a ≥2-years follow-up as the standard of reference, we calculated per-lesion sensitivity and positive predictive value (PPV) for BC of individual readings (R1, R2, and R3), as well as combined pairwise readings (R1+R2, R1+R3, R2+R3), assuming as positive a finding with a score ≥4 for at least one reader. The McNemar test was used for comparisons.
Results: A total of 105 findings were operated or referred to follow-up, including 65/105 (61.9%) cancers and 40/105 (38.1%) benign findings. On a single-reader basis, sensitivity and PPV ranged 73.8-80% and 83.9-87.9%, respectively. Double-reading significantly increased the sensitivity in the case of R1+R2 (83.1%) versus R2 (73.8%) (p=0.0001), and R1+R3 (86.2%) versus R3 (78.5%) (p=0.0005). After double-reading, there was a slight decrease in PPV (ranging 81.8-87.7%).
Conclusion: Combined UMRI and DBT showed acceptable accuracy for detecting BC. A double-reading strategy has the potential to increase the sensitivity, at the cost of a slight decrease in PPV.
Limitations: Monocentric retrospective study on relatively small population.
Ethics committee approval: Approved by our IRB. Informed consent acquisition was waived due to the retrospective design.
Funding: No funding was received for this work.

RPS 502-6 09:10

Delayed breast cancer diagnoses in women recalled at screening mammography: trends in the proportions and lengths of delay over two decades of screening

L. Duijm[1], J. L. R. Lameijer[2], M. Broeders[1], R. M. Pijnappel[3], L. J. A. Strobbe[1], V. C. G. Tjan-Heijnen[4], A. C. Voogd[4]; [1]*Nijmegen/NL,* [2]*Eindhoven/NL,* [3]*Utrecht/NL,* [4]*Maastricht/NL (lemduijm@hotmail.com)*

Purpose: To determine trends in the frequency and length of delay in breast cancer diagnosis in women recalled at screening mammography.
Methods and materials: We included a consecutive series of 817,656 screens of women who received biennial screening mammography between January 1, 1997, and December 31, 2016. During at least 2.5 year follow-up, radiological reports and biopsy reports were collected of all recalled women. The 20 year inclusion period was divided into 4 cohorts of 5 years each (1997-2001, 2002-2006, 2007-2011, 2012-2016). For each cohort, we determined the number and tumour characteristics of screen detected cancers and assessed the proportion of recalled women who experienced a diagnostic delay of at least four months in breast cancer confirmation.
Results: The proportion of recalled women who experienced a diagnostic delay of at least four months decreased from 7.5% in 1997-2001 (47/623) to 3.0% in 2012-2016 (67/2223, P<0.001). Among all delays, the proportion of women with a delay of at least two years increased from 27.7% (13/47) in 1997-2001 to 74.6% (50/67) in 2012-2016 (P<0.001), that is of all recalled women 2.1% (13/623) and 2.5% (50/2223), respectively. Most of these were only detected and re-recalled at the following screening round. Cancers with a diagnostic delay >2 years were more frequently invasive (P=0.009) and showed a less favourable B&R grading (P<0.001) than cancers with a diagnostic delay of 4-24 months.
Conclusion: The proportion of recalled women with a diagnostic delay in confirmation of breast cancer has more than halved during two decades of screening mammography. Unfortunately, long delays now constitute the majority of women who face a delay, which may worsen breast cancer survival.
Limitations: n/a
Ethics committee approval: n/a

RPS 502-7 09:16

Classification of interval cancers on digital breast tomosynthesis compared to digital mammography in the Malmö breast tomosynthesis screening trial

K. Johnson[1], K. Lang[2], I. Andersson[2], D. M. Ikeda[3], S. Zackrisson[2]; [1]*Lund/SE,* [2]*Malmö/SE,* [3]*Stanford/US (kristin.johnson@med.lu.se)*

Purpose: To evaluate cancer visibility with digital breast tomosynthesis (DBT) in screening, we classified interval cancers (ICs) on DBT versus digital mammography (DM) in the Malmö breast tomosynthesis screening trial (MBTST).
Methods and materials: The MBTST is a prospective, paired, population-based one-arm screening trial comparing one-view DBT with two-view DM. 14,848 women were enrolled from January 2010 to February 2015. ICs were identified in the Swedish Cancer Registry. The DM and DBT images were reviewed retrospectively, side-by-side, in consensus by two experienced breast radiologists who classified the types of ICs as true negative, minimal sign, or false negative. The distribution of IC types for the two modalities was assessed. Breast density was classified into fatty or dense.
Results: There were 22 ICs following the MBTST. The distribution of IC types on prior DBT was 46% (10/22) true negatives, 18% (4/22) minimal signs, and 36% (8/22) false negatives. As judged on prior DM, the same ICs were 46% (10/22) true negatives, 9% (2/22) minimal signs, and 46% (10/22) false negatives. 13 (59%) women had dense breasts.
Conclusion: The majority of the ICs were true negative on both DBT and DM. A slight shift was noted from false negative ICs on prior DM to ICs with a minimal sign on prior DBT, which suggests a challenge of increased retrospective cancer visibility when introducing a more sensitive screening method. The numbers are, however, small and the result needs to be confirmed in larger samples.
Limitations: Single-centre trial. Few interval cancers
Ethics committee approval: Lund University Ethics Committee approval. Written informed consent.

First Australian pilot trial of digital breast tomosynthesis (3D-mammography) population-based screening in BreastScreen Victoria

D. J. Lockie[1], N. Houssami[2], M. E. Clemson[3]; [1]Southbank/AU, [2]Sydney/AU, [3]Ringwood East, Vl/AU (lockie.darren@gmail.com)

Purpose: To assess cancer detection rates, recall rates, and reading time, as well as the feasibility of population-based tomosynthesis screening, in BreastScreen Victoria, Australia.
Methods and materials: Women ≥40 years presenting for routine screening (August 2017–November 2018) to Maroondah BreastScreen were prospectively recruited and received tomosynthesis (with synthesised 2D-images) or standard 2D mammography for routine screening.
Reading outcome (clear or recall), final screening outcome for 3D and 2D cohorts, and screen reading times were obtained from the client information system (CIS).
Results: Amongst 5,018 tomosynthesis screens, 49 cancers (40 invasive, 9 in situ) were detected representing a CDR of 9.77/1,000 (95%CI 7.23–12.89/1,000). Amongst 5,166 2D-mammography screens, 34 cancers were detected (30 invasive, 4 in situ), a CDR of 6.58/1,000 (4.56–9.18/1,000). The difference in CDR was 3.18/1,000 (-0.32–6.84); the difference in CDR between screening modalities was shown for repeat screening rounds (3.47/1,000; -0.26–7.52) and was evident in women ≥ 60 years (6.96/1,000; 1.05–13.91) in stratified analyses.
Tomosynthesis screening had higher recall (4.18%; 3.65–4.78%) than mammography (3.00%; 2.55–3.50%); the difference in recall was 1.18% (0.46–1.92%).
Screen-reading time for tomosynthesis was approximately 3 times that of mammography.
Approximately 5% of women opted out of tomosynthesis screening.
Conclusion: Tomosynthesis screening seems feasible (given adequate infrastructure and service preparation). Tomosynthesis increased breast cancer detection, recall to assessment, and screen-reading time compared to mammography.
Our findings can underpin large-scale evaluation of tomosynthesis in Australia's BreastScreen program that examines longer-term end-points.
Limitations: Study design was intentionally not a RCT.
Ethics committee approval: Trial Registration: ACTRN-12617000947303.
Funding: This study was funded by a National Breast Cancer Foundation (NBCF) Australia pilot study grant.

RPS 502-9 09:28

Breast cancer detection rate of screening digital breast tomosynthesis versus 2D mammography: a meta-analysis

A. Wadera[1], M. Alabousi[2], D. N. Zha[2], J.-P. Salameh[3], L. Samoilov[4], A. Dehmoobad Sharifabadi[3], A. Pozdynakov[2], B. Sadeghirad[2], A. Alabousi[2]; [1]Valhalla, NY/US, [2]Hamilton, ON/CA, [3]Ottawa/CA, [4]London/CA (akshay_wadera@student.nymc.edu)

Purpose: To perform a systematic review and meta-analysis comparing the breast cancer detection rate (CDR) and positive predictive value (PPV) of digital breast tomosynthesis (DBT), combined DBT, and 2-D mammography (2-D MMG), and 2-D MMG alone in screening populations.
Methods and materials: MEDLINE and Embase were searched to identify studies reporting patients undergoing 2-D MMG alone and DBT with or without 2-D MMG for breast cancer screening. CDR and PPV were pooled using a random-effects model meta-analysis of proportions. Heterogeneity was assessed based on visual inspection of individual forest plots.
Results: A total of 24 studies were included, reporting on 215,225 patients for DBT (1,313 with breast cancer), 385,200 for combined DBT and 2-D MMG (2,683 with breast cancer), and 764,166 for 2-D MMG alone (3,443 with breast cancer). The CDR of DBT (6.0 per 1,000, 95% confidence interval [CI] 4.7-7.4) demonstrated no statistically significant difference compared to combined DBT and 2-D MMG (7.5 per 1,000, CI 6.5-8.6), or 2-D MMG alone (4.6 per 1,000, CI3.6-5.7). Combined DBT and 2-D MMG showed a statistically significant higher CDR compared to 2-D MMG alone. No difference was identified in the PPV between DBT (15%, CI 9-23), combined DBT and 2-D MMG (15%, CI 10-20), and 2-D MMG alone (9%, CI 6-12).
Conclusion: Combined DBT and 2-D MMG detect more cases of breast cancer than 2-D MMG alone. DBT was no different than 2-D MMG alone, which may be related to the study heterogeneity. The study's results support the implementation of combined DBT and 2-D MMG in screening practice.
Limitations: This study was limited by mild to moderate study heterogeneity.

A survey of technical repeats and recalls in the UK Breast Screening Service

M. L. Hill[1], M. Halling-Brown[2], P. Whelehan[3], R. Highnam[4]; [1]Issy-Les-Moulineaux/FR, [2]Guildford/UK, [3]Dundee/UK, [4]Wellington/NZ (melissa.hill@volparasolutions.com)

Purpose: This study surveyed reasons for repeat examinations (TR) due to clinical image quality (IQ) deficiencies within the United Kingdom National Health Service Breast Screening Programme (NHSBSP). Understanding TR is a first step towards improving IQ, the patient experience, and reducing inefficiencies.
Methods and materials: TR exams include technical repeats (TP), where additional views are acquired during screening, and technical recalls (TC), where women are invited to a second appointment to repeat views. Study cases coded with a repeat reason were obtained from the OPTIMAM image database among women with normal four-view screening exams acquired between 2011 and 2018. Distributions of repeats according to reason and breast laterality were analysed with repeat codes grouped into inadequate positioning (IP), image blurring (IB), and other factors (OF) categories.
Results: In total, 3,821 cases were included, with 3,846 TR split between 3,228 TP and 618 TC. Of the TR, 2,053 and 1,438 were unilateral for right or left breast repeated views, respectively. The remaining 355 TR were for the same repeat reason bilaterally. Comparing repeat classifications by proportions of TP, TC, and total TR, IP accounted for 90%, 31%, and 80%, respectively, IB represented 8%, 66%, and 17%, respectively, and OF was consistently around 3%.
Conclusion: The majority of TR were related to IP, but among TC, IB was the predominant repeat reason. A focused effort to reduce both IP and IB at the time of the screening exam has the potential to improve IQ and substantially reduce the number of TC in the NHSBSP.
Limitations: Potential for population and practice bias due to case collection from two screening centres, predominantly using Hologic equipment.
Ethics committee approval: Source database REC approval: 19/SC/0284.

A multicentre, retrospective analysis of interval cancers to determine clinicopathological factors that correlate with increased growth rates

N. Sharma[1], S. Duffy[2], M. G. Wallis[3], L. S. Wilkinson[4], K. Satchithananda[2], R. Rahim[2], A. Turnbull[5], E. G. E. Macinnes[6], J. Simpson[1]; [1]Leeds/UK, [2]London/UK, [3]Cambridge/UK, [4]Oxford/UK, [5]Derby/UK, [6]York/UK (Nisha.sharma2@nhs.net)

Purpose: This multicentre, retrospective review of intervals cancers aimed to identify clinicopathological factors that correlate with increased tumour volume doubling times. The potential impact of delayed diagnosis was also explored.
Methods and materials: Data from interval cancer diagnoses with retrospective screening mammographic changes classified as either uncertain or suspicious were collated from five English breast screening units. Tumour volume doubling time was calculated based on the time from screening to diagnosis and the observed size difference. Demographic data and pathology and radiological details were noted, including mammographic density, grade, and nodal and hormone receptor status.
Results: Data was available for 306 patients with interval cancers. 81% were diagnosed at least 12 months after screening with 19% presenting within the first year. Average time to diagnosis was 644 days (SD 276 days). Average tumour volume doubling time, based on the difference in radiological sizes and assuming volume and size proportionality, was 167 days (95% CI 151-186). Age (p=0.01), grade (p<0.001), and ER status (p<0.001) correlated with TVDTs, with women under 60, grade 3 cancers, and ER negative cancers having significantly shorter doubling times. HER2 positive tumours had shorter doubling times than

the negative, but this difference was not statistically significant. There was no correlation between breast density and tumour growth rate.
Conclusion: Cancers diagnosed in women under the age of 60, Grade 3 and hormone receptor negative cancers were found to have shorter tumour volume doubling times. BIRADS breast density did not correlate with tumour growth rates. Delay in diagnosis in this group of screening patients is likely to result in a modest increase in breast cancer mortality.
Limitations: Small numbers.

An analysis of screen-detected invasive cancers by grade in the English breast cancer screening programme: are we failing to detect enough small grade 3 cancers?
R. G. Blanks[1], M. G. Wallis[2], R. Alison[1], R. Given-Wilson[3]; [1]*Oxford/UK,* [2]*Cambridge/UK,* [3]*London/UK (matthewwallis492@btinternet.com)*

Purpose: Detection of small high grade invasive cancers contributes disproportionately to mortality reduction from mammographic screening. We have studied the relative sensitivity of detection of invasive cancers by grade in the English breast screening programme (NHSBSP).
Methods and materials: This study examined data from national returns from the NHSBSP for 7 years, 2009/2010 to 2015/2016. Information on size and grade of invasive cancers was collected for first/prevalent (age 45-52) and routine repeat/incident (age 53-70) screens.
Results: Data was analysed from 11.3 million screens when 67,681 invasive cancers were diagnosed. 29% of prevalent cancers were grade 1, 52% grade 2, and 18% grade 3. At all screens, the rate of detection of small (<15mm) grade 3 cancers and large (15mm) grade 1 cancers was disproportionately low. We estimate a relative sensitivity of mammography for grade 3 detection of 52% and grade 2 detection of 62% relative to the sensitivity for grade 1 cancers.
Conclusion: Published data shows the majority of the mortality reduction from screening is attributable to the detection of grade 3 invasive cancers, and these are over-represented in interval cancers. In our study, the sensitivity of the NHSBSP for small high grade cancers appears similar to that reported from the Swedish Two Counties study. It has not been improved by the introduction of digital mammography. Technological advances should focus on improving high-grade cancer detection.
Limitations: Retrospective data from a 3-year programme but prevalent/first screen is independent of screening interval.
Ethics committee approval: The study has no patient contact, intervention, or use of identifiable patient data, and is therefore exempted from ethical review in the UK.
Funding: Roger Blanks and Rupert Alison received funding from Public Health England to perform this work.

Trends in recall and outcome of screen-detected microcalcifications during two decades of screening mammography in the Netherlands
L. Duijm[1], J. Luiten[2], E. Luiten[3], M. Broeders[1], K. Roes[1], V. C. G. Tjan-Heijnen[4], A. Voogd[4]; [1]*Nijmegen/NL,* [2]*Tilburg/NL,* [3]*Breda/NL,* [4]*Maastricht/NL (lemduijm@hotmail.com)*

Purpose: To determine trends in recall and outcome of screen-detected microcalcifications during 20 years of screening mammography.
Methods and materials: We included a consecutive series of 817,656 screens obtained in a Dutch breast cancer screening region between January 1997 and January 2017. In 2009/2010 (transition period) screen-film mammography (SFM) was gradually replaced by full-field digital mammography (FFDM). We focused on the recall of suspicious microcalcifications and obtained all radiology reports and pathology outcomes of recalled women, with a 2-year follow-up. Screening outcomes during the period of SFM (1997-2010) and FFDM (2009-2016) were compared.
Results: A total of 18,565 women were recalled, of whom 3,556 had suspicious microcalcifications. The recall rate for microcalcifications per 1,000 screens increased from 1.0 in 1997-1998 to 7.2 during the transition (p<0.001) and afterwards gradually decreased to 5.2 at the latest digital screening period (p<0.001). The recalls yielding DCIS increased from 0.3 per 1,000 screens to 1.1 per 1,000 screens, respectively. More than half of the DCIS lesions were high grade (393/747, 52.6%). The distribution in DCIS grading was stable during the 20-year screening period (p= 0.362).
Conclusion: The recall rate for suspicious microcalcifications at mammographic screening significantly increased over the past two decades, while the DCIS detection rate increased less rapidly, resulting in a lower positive predictive value of recall. Since it is not yet clear to which degree histological features of DCIS can be estimated by the patterns of microcalcifications alone, a stereotactic core-needle biopsy is currently still mandatory in the workup of these lesions.

Accuracy of ultrasound in the characterisation of superficial soft tissue tumours: a prospective study
S. W. Y. Yip[1], J. F. F. Griffith[1], E. H. Hung[2], W. H. A. Ng[2], C. S. Tong[3], K. L. L. Lee[3]; [1]*Shatin/HK,* [2]*Hong Kong/CN,* [3]*Hong Kong/HK (stefaniewyip@gmail.com)*

Purpose: To prospectively evaluate the accuracy of ultrasound in characterising superficial soft tissue tumours.
Methods and materials: 830 superficial soft tissue tumours were prospectively evaluated with ultrasound by 5 experienced musculoskeletal radiologists. The radiologist at the time of examination provided 1-3 specific differential diagnoses and the perceived level of confidence with regard to each diagnosis. The clinical diagnosis was recorded. Ultrasound and clinical diagnoses were compared with the histological diagnosis to determine the accuracy. Tumour malignancy was determined by histology or clinical follow-up.
Results: 234 (28.2%) of 830 tumours had a subsequent histological correlation. Compared with histology, the accuracy of clinical and ultrasound examination for determining the specific tumour type was 32.9% and 82.1%, respectively, considering all differential diagnoses provided. Radiologists were “fully confident” about the ultrasound diagnoses in 136 (58.1%) of 234 superficial soft tissue tumours and, in this setting, the diagnostic accuracy of ultrasound was 95.6%. When the radiologist was “not fully confident”, accuracy was 45.9% for the first ultrasound differential diagnosis and 63.2% for all differential diagnoses. Sensitivity, specificity, positive predictive value, and negative predictive value of ultrasound for identifying malignant soft tissue tumours was 91.7%, 94.1%, 45.8%, and 99.5%, respectively.
Conclusion: Based on the ultrasound appearances alone, the radiologist can be ‘fully confident’ with providing a specific diagnosis in over half of the cases and, in this setting, diagnostic accuracy is very high. Ultrasound is also highly accurate at discriminating benign from malignant superficial soft tissue tumours.

Limitations: Only one-quarter of tumours examined had a final histological diagnosis as it is common for soft tissue tumours with a clear diagnosis to forgo excision.
Moreover, a referral bias may have existed with more clinically atypical tumours referred for an ultrasound examination.
Ethics committee approval: This study was approved by the institutional review board.
Funding: No funding was received for this work.

Quantitative evaluation of muscle stiffness with shear-wave elastography in children with cerebral palsy after a botulinum toxin A injection

N. Dağ, M. N. Cerit, B. N. Muşmal, M. Zinnuroğlu, S. Ozhan Oktar*; Ankara/TR (drndag@icloud.com)*

Purpose: To evaluate the changes in medial gastrocnemius muscle (GCM) stiffness after a botulinum toxin A (BTA) injection in children with cerebral palsy (CP) by using shear-wave elastography (SWE) and to investigate the usability of this technique in the evaluation of treatment efficacy and correlation with clinical measurements. SWE is used to assess whether treatment for GCM spasticity causes an alteration in the stiffness of the anterior tibial (TA) muscle, which is its antagonist.
Methods and materials: 43 spastic lower extremities of 24 children with CP were evaluated. BTA injection treatment was applied to the medial GCM. Muscle stiffness was measured with the SWE technique before the procedure and one month after the procedure. The patients were evaluated with the modified Ashworth scale (MAS) and modified Tardieu scale (MTS) in the physiotherapy department at about the same time.
Results: Mean SWE values of GCM muscle were measured as 45.9±6.5 kPa before BTA and 25.0±5.7 kPa after BTA, and the difference between them was statistically significant ($p<0.01$). A statistically significant difference was found between MAS and MTS results. There was a statistically significant high correlation between SWE values and MAS scores (rho: 0.77; $p<0.01$). A statistically significant correlation was found between SWE values and MTS parameters. Mean SWE values of TA muscle were measured as 36.9±7.9 kPa before BTA and 28.4±5.2 kPa after BTA, and the difference between them was statistically significant ($p<0.01$).
Conclusion: Quantitative measurement of muscle stiffness with SWE might provide important information for evaluating spasticity and treatment efficacy in children with CP.
Limitations: A small number of patients.
Ethics committee approval: The study was approved by the institutional ethics committee.

The role of ultrasound and Doppler in callus formation in diaphyseal fractures of long bones treated by internal fixation

C. Mehta, U. Gohil, K. K. Kartik*; Vadodara/IN (drchetan_mehta@yahoo.com)*

Purpose: To evaluate callus formation and the role of Doppler in diaphyseal fractures of long bones treated by internal fixation.
Methods and materials: 100 patients with a diaphyseal fracture of long bones treated with internal fixation underwent ultrasonography of the fractured site at 6 weeks, 12 weeks, 18 weeks, and 24 weeks. The presence of callus and its echogenicity were evaluated. Doppler was applied to evaluate the vascularity within callus and spectral trace for the resistance index. Radiographs were obtained in AP and lateral views.
Results: Out of the 100 patients evaluated, 87% progressed to union and 13% progressed to non-union of the fracture.
At 6 weeks, hypoechoic callus was seen in 83 patients progressing to union and 9 patients progressing to non-union. Callus formation on ultrasound at 6 weeks yielded a sensitivity and specificity of 95.4% and 69.2%, respectively. Callus on x-ray at 6 weeks yielded a sensitivity and specificity of 80.6% and 92.3%, respectively.
At 12 weeks, 100% of fractures demonstrated a hypoechoic callus with the presence of vascularity on the application of Doppler in 82% of uniting fractures and 84% of non-uniting fractures. The resistance index ranged from 0.56-0.89 in uniting fractures and 0.73-1.57 in non-uniting fractures, with cut-off below <0.88 yielding a sensitivity of 98% and specificity of 90%for uniting fractures.
At 18 weeks, 85% of patients progressing to union had a hyperechoic callus and 100% had a hyperechoic callus at 24 weeks.
Conclusion: Ultrasound proved to be more sensitive for detecting the presence of early callus than radiographs. Colour Doppler and spectral trace add additional functional data on bone callus and neovascularisation with low resistive index in callus of uniting fractures.
Limitations: Orthopaedic implants can limit the evaluation.
Ethics committee approval: Ethics committee approval obtained.
Funding: No funding was received for this work.

Detection of intra-articular urate deposition in gout: an ultrasound and dual-energy CT study

J. Legrand[1], F. Becce[2], C. Marzin[1], L. Norberciak[1], J.-F. Budzik[1], T. Pascart[1]; *[1]Lille/FR, [2]Lausanne/CH*

Purpose: To determine if dual-energy computerised tomography (DECT) was able to detect intra-articular monosodium urate (MSU) deposits, identified with ultrasonography (US), in patients with gout.
Methods and materials: Knees of patients with a diagnosis of gout via US and DECT scans were prospectively assigned to DC+ or DC- groups depending on the presence or absence of the US double-contour sign (DC).
Standardised regions of interest were drawn in the patellofemoral joint space, the menisci, and the femorotibial cartilage. 5 DECT parameters were obtained: CT numbers in Hounsfield Unit (HU) at 80 and 140 kV, effective atomic number (Z_{eff}), electron density (ρ_e), and the dual-energy index (DEI). Zones were compared between the two groups using linear mixed models.
In a preliminary study, we used a phantom constituted of 3 rods of MSU (0, 200, and 600mg/ml) which were scanned to determine the in vitro DECT parameters of different concentrations of MSU.
Results: 115 patients were included. The mean gout duration was 9.0±9.8 years, mean serum urate level was 7.3±2.3 mg/dL, and mean DECT volume of urate deposition was 1.2cm^3±3.8. 225 knees were analysed. 36 knees were assigned to the DC+ group.
No significant differences were found between DC+ and DC- knees for Zeff, ρe, and DEI in menisci ($p=0.94$, 0.72, and 0.97, respectively), femorotibial cartilage ($p=0.94$, 0.89, and 0.97, respectively), or patellofemoral joint space ($p= 0.48$, 0.89, and 0.54, respectively).
Phantoms exhibited increasing values in ρ_e ($p=0.03$) with growing MSU concentrations.
Conclusion: This study shows that, in vivo, DECT is not able to identify intra-articular MSU deposition in patients with gout, although it has the ability to detect in vitro growing concentrations of MSU.
Limitations: n/a
Ethics committee approval: n/a

Quantitative evaluation of image quality of reduced-dose cone-beam CT images using an adaptive image noise optimiser

R. H. H. Wellenberg, G. J. Streekstra, M. Maas*; Amsterdam/NL (r.h.wellenberg@amc.uva.nl)*

Purpose: To quantitatively assess the image quality of reduced-dose CBCT images, reconstructed with different levels of adaptive image noise optimiser (AINO).
Methods and materials: A fresh frozen cadaver lower leg was scanned on a Planmed verity cone-beam CT-scanner using ultra-low-dose parameters of 0.4 mm resolution, 300 projections, 15 ms pulse length, and a sharp reconstruction kernel. The kV was varied between 96–80 and mA was reduced from 6.3 to 4, 2, and 1 mA. Acquisitions were reconstructed without AINO and with AINO (levels light/medium/strong), which resulted in a total of 80 reconstructions. CT-numbers, standard deviations as a noise estimate, and contrast-to-noise-ratios (CNR) were quantitatively assessed in regions-of-interest placed in the bone and

soft tissue. Quantitative results of standard protocol images using 96kV and 6.3mA, without AINO, served as a reference.
Results: $CTDI_{vol}$ reduced 92%, from 2.74 mGy in 96kV/6.3mA acquisitions to 0.21 mGy in 80kV/1mA acquisitions. Standard deviations and CNR decreased while CT-numbers remained constant in reduced-dose results. AINO reduced standard deviations of noise, and increased CNR, while CT numbers remained constant. Increasing levels of AINO results in higher CNR (p<0.001). Based on the quantitative analysis on CNR, AINO potentially enables a radiation dose reduction of 15-85%, depending on the level of AINO, kV, and mA. Photon-starvation artefacts appear at low kV and mA.
Conclusion: Based on the quantitative analysis on CNR, AINO potentially enables a radiation dose reduction of 15-85%, depending on the level of AINO, kV, and mA. However, AINO is incapable of eliminating photon-starvation artefacts and images appear smoother due to noise reduction.
Limitations: The sample size and quantitative assessment of image quality only.
Ethics committee approval: n/a
Funding: No funding was received for this work.

Prognostic prediction in initially diagnosed multiple myeloma patients using IVIM-DWI and multi-echo Dixon MR imaging
A. Jo, J.-Y. Jung, S. E. Lee, S.-Y. Lee, S.-E. Lee*; Seoul/KR (JARSW2011@gmail.com)*

Purpose: To evaluate the feasibility of the multi-parametric MRI including intravoxel incoherent motion-diffusion-weighted imaging (IVIM-DWI) and multi-echo Dixon on a prediction of the prognosis in initially diagnosed multiple myeloma (MM)
Methods and materials: This retrospective study included 78 patients who were initially diagnosed with MM. All patients received MRIs of lumbar and/or thoracic spines, including IVIM-DWI and multi-echo Dixon prior to initiation of the therapy. The freehand region of interest was drawn within the marrow space of the vertebral body: pure diffusion coefficient (Dslow), pseudo-diffusion coefficient (Dfast), and perfusion fraction (Pf) maps from IVIM-DWI, and proton-density fat-fraction (PDFF) maps from multi-echo Dixon MR imaging. All patients were classified into 3 groups according to the international staging system (ISS) and compared using ANOVA with a Scheffe test. A logistic regression model was built to predict the prognosis between the two groups (early stage-ISS I vs advanced stage-ISS II and III).
Results: 38 patients were ISS-1, 22 ISS-II, 18 ISS-III. The higher grade of ISS demonstrated significantly lower PDFF and higher Dslow (Dslow: 355.6±19 vs 408.1±19 vs 579.8±17 $\mu m^2/s$, P<0.001/PDFF: 46% vs 30% vs 15%, p<0.001). In the prediction model using logistic regression by stepwise selection, PDFF was the single most significant factor to differentiate early and advanced stages of MM with an accuracy of 76% and AUC of 0.83.
Conclusion: Dslow from IVIM-DWI and PDFF from multi-echo Dixon were significantly associated with prognosis in initially diagnosed MM.
Multi-parametric bone marrow imaging with IVIM-DWI and multi-echo Dixon could be used to predict the prognosis in initially diagnosed MM.
Limitations: A retrospective study with a limited number of patients. Our MR imaging examinations were limited to the lumbosacral and thoracic spine.
Ethics committee approval: n/a

RPS 610-8 12:01
Change of apparent diffusion coefficient during CT-guided periradicular infiltration as an indicator of therapy success
S. Talarczyk[1], D. F. P. Uhlenbrock[1], P. Haage[2], C. A. Stückle[3]; *[1]Dortmund/DE, [2]Wuppertal/DE, [3]Witten/DE*

Purpose: To analyse changes in the apparent diffusion coefficient in patients with specific low back pain following CT-guided interventional therapy.
Methods and materials: From 11/2017-2/2018, 14 MRI examinations in 7 patients suffering from low back pain were compared before and after CT-guided periradicular infiltration therapy in respect to the ADC value of the affected and treated nerve root. Two radiologists independently measured the ADC value of the affected nerve twice and the mean value was calculated. Before and, in average, 11 days after CT-guided treatment where a glucocorticoid, a local anaesthetic, and a contrast agent were injected close to the affected nerve root, the same nerve root was measured. The affected nerve root was compared by the same procedure to a non-affected nerve root. We asked the patients before each intervention to point out their actual pain on an analogue pain score ranging from 0-10. We calculated the correlation between the change in ADC value and the development of the pain score as a one-sided Pearson correlation.
Results: There is a strong negative correlation of -0.698 (p=0.017) between the change of ADC value and the improvement of the pain score under therapy. For the reference nerve, no significant change of ADC over time was shown.
Conclusion: Effective periradicular CT-guided infiltration leads to a significant ADC increase of the affected nerve.
Limitations: The small number of patients.
Ethics committee approval: The presented study was approved by the local ethic committee.
Funding: No funding was received for this work.

RPS 610-9 12:07
Chondroblastoma treatment by radiofrequency thermal ablation
F. Ruiz Santiago, L. Guzman Alvarez, A. Martinez Martinez, A. J. Láinez Ramos-Bossini*; Granada/ES (ferusan12@gmail.com)*

Purpose: To present our experience in the treatment of chondroblastoma by radiofrequency thermal ablation.
Methods and materials: In the last 15 years, we treated 9 patients (8 males) with chondroblastoma using RTA under CT-guidance. Tumours were located in the humeral head (3), the femoral head (2), and the distal femoral epiphysis (4). Age ranged from 11-20 years (median: 15 years). Tumour size ranged from 12-34 mm (median: 22 mm).
According to tumour size and location, the electrode's active tip ranged from 1-3 cm. Dry ablation or perfused monopolar electrodes were used to treat smaller (6) and larger (3) lesions, respectively. Cementation was added in 3 cases.
Imaging follow-up was performed by MRI (7), CT (1), and radiography (9). Follow-up ranged from 6 months to 15 years.
Results: Total pain control was achieved in all cases. A follow-up MRI demonstrated resolution of oedema, as well as a necrotic area extending beyond the outer edge of the lesion. Radiography showed stability of the lesions, with increased sclerosis and no cortex collapse.
In one case, a 4 cm shortening of the humerus was observed at the end of skeletal development (7 years after treatment). In another case, early hip osteoarthritis was developed (15 years after treatment).
Conclusion: Successful treatment of chondroblastoma can be achieved by RTA. MRI hallmarks associated with clinical success were resolution of bone marrow oedema and an area of necrosis extending beyond the tumour edge. Radiography remains a useful exam to demonstrate cortex integrity.
Limitations: A retrospective review of the cases, although data and images were acquired prospectively, according to hospital clinical protocols.
Ethics committee approval: This work was approved by the local ethics committee (0847-N-19).
Funding: No funding was received for this work.

Clinical utility of dual-energy CT used as an add-on to 18F FDG PET/CT in the preoperative staging of resectable NSCLC with suspected single osteolytic metastases
H. Wu, S. Dong*; Guangzhou/CN (15876530875@163.com)*

Purpose: To determine the clinical value of ^{18}F-FDG-PET/CT and dual-energy virtual noncalcium CT for detecting and identifying single osteolytic metastases (SOM) in participants with non-small cell lung cancer (NSCLC).
Methods and materials: 42 participants (mean age, 63.5 years ± 10.1; range, 41–81 years) with suspected SOM diagnosed by whole-body ^{18}F-FDG-PET/CT underwent non-enhanced dual-energy CT. All images were visually and quantitatively evaluated by two nuclear medicine physicians (R1 and R2) and two radiologists (R3 and R4), independently. The results of visual and quantitative analysis of ^{18}F-FDG-PET/CT and dual-energy CT were compared with pathological results.
Results: In the visual analysis, the specificity and positive predictive value of dual-energy CT for reader 1 and reader 2 were larger than the corresponding figures of ^{18}F-FDG-PET/CT for reader 3 and reader 4 (94.1% each vs 82.4%/76.5%; 95.2%/95.0% vs 88.9%/86.2%). The sensitivity and negative

predictive value of dual-energy CT was relatively lower than the number of ^{18}F-FDG-PET/CT for readers (80.0%/76.0% vs 96.0%/100.0%; 76.2%/72.7% vs 93.3%/100.0%, respectively). ROI-based analysis of SUV_{max} on PET/CT images and CT numbers on VNCa images showed a significant difference between metastases and non-metastases (P<0.001 each).
Conclusion: Pre-surgical evaluation by the combination of whole-body ^{18}F-FDG-PET/CT and dual-energy CT could improve the classification of SOM and may further guide surgical decision-making in participants with NSCLC.
Limitations: Results should be interpreted with caution because of the relatively small numbers of selected participants included in this exploratory analysis.
Ethics committee approval: Ethics committee approval obtained.

RPS 610-11 12:19
Dynamics of muscle injuries and recovery in diffusion-tensor imaging
I. Yel, K. Eichler, C. Booz, T. Gruber-Rouh, T. J. Vogl, B. Kaltenbach;
Frankfurt am Main/DE (Dr.IbrahimYel@gmail.com)

Purpose: MR imaging of muscle injuries in clinical routine is limited to assessing muscle morphology and integrity. Essential information about the healing process and return-to-play decisions are mainly determined clinically by sports medicine specialists. The aim was to establish measurable parameters on diffusion-tensor imaging to assess stages of muscle recovery.
Methods and materials: 25 male soccer players with a non-contact hamstring injury were included. 3 consecutive MR-examinations on a 3-Tesla-MRI were performed at initial injury (within 72 hours), and three and six weeks after injury. Freehand ROI-measurements were placed in the injured muscle to assess ADC-, fractional anisotropy (FA), and the sum of eigenvalues (TRACE). For comparison, the same ROI-measurements were also performed on the contralateral healthy muscle.
Results: Overall mean DTI-values for the injured muscle were as followed (initial examination, first follow-up, and second follow-up): ADC ($10^{-3}mm^2/s$): 1.9±0.2, 1.8±0.1, and 1.7±0,1; FA: 263±66, 305 ±73, and 259±53; TRACE: 40.7±10.2, 37.0±8.9, and 36.9±9.2. Throughout the healing course initial ADC- and TRACE-values of the injuries were significantly higher compared to the second follow-up (P≤0.016), whereas FA-values in the first follow-up increased significantly compared to baseline und final examinations (P≤0.036). When comparing the injured muscle with the contralateral healthy muscle, significant differences could be found for the initial FA-values (261.7±62.7 vs 301.7±101.1, P= 0.006) and all three TRACE-values (39.9±10.2 vs 29.3±8.5, 37.0±8.9 vs 31.3±8.8, and 36.9±9.2 vs 30.7±8.6; P≤0.023).
Conclusion: Measurements of ADC, FA, and TRACE could facilitate more a reliable clinical application of MRI imaging, especially to provide further information and more confident clinical application regarding the stage of recovery and healing process.
Limitations: A mono-centre study with high interindividual differences in injury pattern of the hamstrings.
Ethics committee approval: Approval by local IRB.
Funding: No funding was received for this work.

The effect of radiofrequency pulse transmission polarisation on metal-related artefacts in 3T magnetic resonance imaging: circular versus elliptical polarisation
I. Khodarahmi[1], G. Chang[1], J. Fritz[2]; [1]*New York, NY/US,* [2]*Baltimore, MD/US (iman.khodarahmi@nyumc.org)*

Purpose: To investigate the effect of circular and elliptical polarisation of the radiofrequency (RF) pulse on metal-related artefacts in total hip arthroplasty implants during a metal artefact reduction sequence MRI at 3T.
Methods and materials: A cobalt-chromium total hip arthroplasty system with a polyethylene liner immersed in a standard ASTM gel phantom underwent an MRI with high-bandwidth turbo spin-echo (HBW-TSE), slice encoding for metal artefact correction (SEMAC), and compressed sensing (CS) SEMAC in axial, coronal, and sagittal planes using proton density weighting. Each scan was acquired twice with circular (CP) and elliptical (EP) RF polarisation, while keeping other sequence parameters identical. After anonymisation/randomisation, artefacts were volumetrically quantified for CP and EP images using manual segmentation. Additionally, observers compared the two modes for overall image quality through a side-by-side display of each image pair and selection of the preferred polarisation mode.
Results: On quantitative analysis, artefact degraded regions were significantly smaller on EP images compared to the CP images of the same location/pulse sequence (paired t-test: p<0.02 for all pulse sequences). The overall artefact volume (including the implant itself) calculated using axial HBW-TSE images was 19% lower for EP (510 cm^3) compared to CP (608 cm^3). Readers chose the image quality of EP in 56% (95% CI: 51%-61%) and CP in 7% (95% CI: 4%-9%) of the cases with significantly superior image quality of EP (signed test: p<0.001 for all sequences).
Conclusion: 3T MRI with elliptical RF pulse polarisation results in stronger metal artefact reduction and overall superior image quality than circular polarisation. Switching to elliptical polarisation for 3T imaging of metal-containing body parts may eventually hold promise for in vivo clinical imaging.
Limitations: The in-vitro nature of the study.

The predictive value of pre- and post-neoadjuvant chemoradiotherapy MRI characteristics for patient outcomes in locally advanced rectal cancer
Y. Meng[1], C. Wang[2], P. Dou[1], H. Zhang[3], K. Xu[1], C. Zhou[3]; [1]*Xuzhou/CN,* [2]*Jiangsu/CN,* [3]*Beijing/CN (mengyankai@126.com)*

Purpose: To investigate the predictive value of pre- and post-neoadjuvant chemoradiotherapy (nCRT) magnetic resonance imaging (MRI) characteristics for the long-term survival outcomes in patients with locally advanced rectal cancer (LARC).
Methods and materials: We retrospectively evaluated pre- and post-nCRT MR characteristics of LARC patients. The 3 year DFS was estimated using the Kaplan-Meier product-limit method. Associations between MRI variabilities and survival outcomes were assessed using Cox proportional hazards model.
Results: In total, 171 LARC patients (112 men and 59 women) with a median age of 55 years (range, 27-82 years) treated with nCRT were evaluated. MRI assessment of extramural venous invasion (mrEMVI) positivity was a significant independent adverse factor of long-term survival (HR=2.589, 95% CI=1.398-4.794, P=0.002) on multivariate analysis. Patients with positive mrEMVI had significantly lower 3-year DFS than those with negative mrEMVI (52.6 months vs 65.1 months; P=0.003). Moreover, the tumour regression grade on MRI (mrTRG) also significantly correlated with survival outcomes in patients with LARC. Patients with partial response on post-nCRT MRI (mrPR) showed worse DFS than those with complete response (mrCR) (HR=4.914, 95% CI=1.176-20.533, P=0.029).
Conclusion: mrEMVI positivity was an independent adverse prognostic indicator for 3-year DFS. Further, mrTRG may also be a predictive factor for the prognosis of LARC patients.
Limitations: A single-centre retrospective analysis.
Ethics committee approval: This retrospective study was approved by our Institutional Review Board and the need for informed consent was waived owing to the retrospective nature of the study.
Funding: This study was funded by the National Natural Science Foundation of China (81771904), Beijing Science and Technology Program (Z161100000516101), and Beijing Hope Run Special Fund of Cancer Foundation of China (LC2016A05).

RPS 601a-2 11:21
What's in a name? "Polypoid" as a descriptor in pelvic MRI synoptic reporting for rectal cancer
J. S. Golia Pernicka[1], D. Bates[2], J. Fuqua[2], A. Knezevic[2], J. Yoon[3], L. Nardo[4], I. Petkovska[2], V. Paroder[2], M. J. Gollub[2]; [1]*Bridgeport, CT/US,* [2]*New York, NY/US,* [3]*Montreal, QC/CA,* [4]*Sacramento, CA/US* *(gollubm@mskcc.org)*

Purpose: To compare MR imaging morphology of rectal cancer with clinicopathologic features.
Methods and materials: 50 rectal MRI reports with the synoptic term "polypoid" tumour were reviewed retrospectively and 90 reports containing "circumferential" and "partially circumferential" tumours were randomly selected to serve as controls. Preoperative tumour (T) and lymph node (N) stages of the polypoid tumours were determined by two readers and compared to reported T-stages for the controls. To assess the difference in degrees of attachment to wall circumference (WC) (≤¼ or >¼) and the presence of a pedicle, 25 randomly selected polypoid tumours and 25 randomly selected controls were reviewed by two additional readers. Inter-reader agreement was assessed using the kappa statistics for binary measures, weighted kappa for ordinal measures, and nonparametric interclass correlation coefficient (ICC) for continuous measures. Features were compared between cases and controls using Fisher's exact test for categorical variables and Wilcoxon rank-sum test for continuous variables.
Results: Polypoid shape, pedicle presence, and degree of attachment showed moderate agreement (k=0.41-0.76). N size showed good agreement (ICC=0.83-0.91). Distinguishing characteristics of polypoid tumours were an attachment to < ¼ WC (p<0.001, 0.002) and presence of a pedicle (p<0.001, both) in significantly more cases compared to controls. Lower T and N stages, smaller largest node, and fewer number of nodes > 3mm were significantly associated with polypoid morphology compared to controls (p<0.001 to 0.008).
Conclusion: Primary "polypoid" tumours at rectal MRI represent a distinct phenotype with lower pathologic T and N stages. If the above definition of "polypoid" is validated, this synoptic term may be more than descriptive and could potentially inform patient prognostication.
Limitations: Retrosepctive study.
Ethics committee approval: IRB waiver of patient consent.

Clinical T4a rectal cancer at MRI: do these patients develop peritoneal carcinomatosis?
C. Simmers[1], M. Capanu[1], D. Bates[1], J. Fuqua[1], J. S. Golia[2], S. Javed-Tayyab[1], V. Paroder[1], I. Petkovska[1], M. J. Gollub[1]; [1]*New York, NY/US,* [2]*Bridgeport, CT/US* *(gollubm@mskcc.org)*

Purpose: To evaluate development of peritoneal carcinomatosis or other adverse short- or long-term outcomes in patients with MRI-based T4a rectal cancer.
Methods and materials: In the 5 year period from 2013-2018, the clinico-pathologic records of all patients with pretreatment rectal MRI with reported clinical (c) T3c, T3d, T4a, and T4b primary rectal adenocarcinoma were retrospectively reviewed by one radiology fellow. All MRI reported features such as nodal stage and tumour height were collected. Pathologic T and N stages were summarised among patients undergoing curative resection. Recurrence-free survival (RFS) and overall survival (OS) were estimated using the Kaplan-Meier method. Differences in survival were compared using the log-rank test. Descriptive statistics were used to describe distant metastases.
Results: 256 patients were included with 28 clinical T4a, 135 T3cd, and 93 T4b patients reported at MRI. Median follow-up among survivors was 27 months (range 0.36-70 months). All patients underwent neoadjuvant treatment and, at surgical pathology, only 3 cases were pT4a. 9 patients developed peritoneal carcinomatosis (9/256 3.5%) who had been clinical T3cd (n=5/135, 3%), T4a (n=2/28, 7%), and T4b (n=2/93, 2%). 5 of the 9 patients underwent surgery and all had pT3 disease. RFS (p=0.065) and OS (p=0.1694) did not differ between cT3cd and cT4a nor between cT4a and cT4b. RFS was worse in cT4b compared with cT3cd (p=0.03).
Conclusion: Peritoneal carcinomatosis occurs rarely in rectal cancer, even in cases diagnosed as cT4a on baseline MRI. Overall and recurrence-free survival in patients with MRI-based T4a was not worse than those with T3cd disease.
Limitations: Retrospective study.
Ethics committee approval: IRB waived the need for consent.
Funding: This research was funded in part through the NIH/NCI Cancer Center Support Grant P30 CA008748.

RPS 601a-4 11:33
MRI texture analysis for the early prediction of therapeutic response to neoadjuvant chemoradiotherapy and tumour recurrence of locally advanced rectal cancer
H. Park, K. A. Kim, S. S. Hwang, S. Y. Park, H. A. Kim; *Suwon-si/KR*

Purpose: To evaluate the efficiency of texture analysis (TA) based on baseline rectal MRI for the early prediction of therapeutic response to neoadjuvant chemoradiotherapy (nCRT) and tumour recurrence in patients with locally advanced rectal cancer (LARC).
Methods and materials: Consecutive patients with LARC who underwent rectal MRI between January 2014 and December 2015, and surgical resection after completing nCRT, were retrospectively enrolled and divided into responder and nonresponder groups according to tumour regression grade (TRG). Tumour recurrence was evaluated. TA parameters were extracted from the tumour volume of interest (VOI) from the baseline rectal T2W MRI using LifeX Software. Receiver operating characteristic (ROC) curve analysis was performed to evaluate the optimal TA parameter cut-off values to stratify the patients. Univariate and multivariate analyses were performed to assess the efficacy of each texture parameter in predicting tumour response and disease-free survival with logistic and Cox regression tests.
Results: In total, 78 consecutive patients were enrolled. In the logistic regression, good treatment response was associated with low Conv_Min (OR=0.300, p=0.013) and high Conv_Std (OR=3.174, p=0.016), Shape_Sphericity (OR=3.170, p=0.015), and Shape_Compacity (OR=2.779, p=0.032). In the Cox regression, a greater risk of tumour recurrence was related to higher grey-level run-length matrix_long-run low grey-level emphasis (GLRLM_LRLGE) (HR=2.268, p=0.046).
Conclusion: Texture analysis based on baseline rectal T2W MRI could be valuable for predicting the treatment response to nCRT for rectal cancer and tumour recurrence
Limitations: While many factors were used in our study, the small number of subjects is the limitation.
Ethics committee approval: This study was approved by the institutional review board of our institution.
Funding: No funding was received for this work.

RPS 601a-5 11:39
Value of high-resolution MRI in detecting lymph node calcifications in patients with rectal cancer
Y. Chen[1], Z. Wen[1], Y. Liu[1], X. Yang[1], Y. Ma[1], B. Lu[1], X. Xiao[2], S. Yu[1]; [1]*Guangzhou/CN,* [2]*Shenzhen/CN (chenyan_me@163.com)*

Purpose: To analyse imaging findings for nodal metastasis calcifications on MSCT and high-resolution MRI, and determine the value of high-resolution MRI in detecting nodal calcifications in rectal cancer patients.
Methods and materials: In a respective study, 229 consecutive rectal cancer patients who underwent total mesorectal excision following pelvic MSCT and rectal high-resolution MRI were included. MSCT was reviewed for the presence of nodal calcifications by two radiologists. To analyse nodal calcifications, high-

resolution two-dimensional turbo spin-echo T2-weighted imaging (2D-TSE-T2WI) and fat-suppressed gadolinium-enhanced isotropic high-resolution three-dimensional gradient-echo T1-weighted imaging (3D-GRE-T1WI) were independently reviewed by two radiologists at one-month and two-month intervals, respectively. The sensitivities, specificities, and accuracies of the two high-resolution MRI for detecting nodal calcifications were calculated using MSCT results as a reference.
Results: Regional calcified metastatic nodes were found in 28 patients. Node-to-node evaluation showed 55 of 56 calcified nodes to be metastatic. Fifty-one calcified metastatic nodes displayed scattered fine punctate calcifications to different degrees on MSCT. By the two high-resolution techniques, the calcifications demonstrated patchy, marked reductions in signal intensity in corresponding areas, but were larger than those on MSCT. The sensitivity and accuracy of the high-resolution 3D-GRE-T1WI were significantly higher than those of high-resolution 2D-TSE-T2WI (76.8% vs. 58.9%, P = 0.013; 98.3% vs. 97.9%, P = 0.007, respectively).
Conclusion: Metastatic nodal calcifications are characteristic of imaging findings in rectal cancer. Calcifications are indicated by extremely low signal intensity or extremely low enhancement within nodes on high-resolution 2D-TSE-T2WI and the high-resolution 3D-GRE-T1WI, which will aid in the accurate diagnosis of metastatic nodes.
Limitations: Did not apply diffusion-weighted imaging to evaluate nodal calcifications.
Ethics committee approval: Approved by an institutional review board. Written informed consent was obtained.

Humans cannot distinguish mucinous rectal cancer from acellular mucin post-treatment: can computers? A multi-institutional pilot study of MRI radiomics

M. J. Gollub[1], M. Fox[2], N. Horvat[3], I. Petkovska[1], S. P. Sheedy[4], E. Korngold[5], C. Moreno[6], S. Nougaret[7], P. Gibbs[1]; *[1]New York, NY/US, [2]Hull/UK, [3]Sao Paulo/BR, [4]Rochester, MN/US, [5]Portland/US, [6]Atlanta/US, [7]St Clement de Riviere/FR (gollubm@mskcc.org)*

Purpose: To determine the accuracy of MRI radiomics to distinguish between post-treatment residual cellular and acellular mucinous rectal neoplasms.
Methods and materials: At 5 institutions from the Rectal and Anal Disease Focused Panel of the Society of Abdominal Radiology, a retrospective study of all patients with rectal adenocarcinoma containing mucin on post-neoadjuvant CRT MRI and prior to surgery between 2003 and 2017 (n= 362) was performed. Patients with <75% mucin on MRI were excluded (n=308). Manual volumetric segmentation of mucinous masses was performed on Terra Recon software (Aquarius iNtuition Viewer v 4.4.13.P4) by one experienced radiologist. Radiomics and machine learning models were performed using CERR within MatLab (2017b) to generate 22 first order and 80 second order parameters. Statistical analysis was performed with SPSS (v.25) using ROC curves to determine significant individual parameters (AUC > 0.70).
Results: 54 patients, 30 males, mean age 58yr (39-75yr), and 24 females, mean age 58yr (32-87yr), had stage 0-2 and 3 disease (n= 41, 13, respectively). 54 patients underwent neoadjuvant CRT. Histopathology showed 10 acellular, mucinous, non-neoplastic masses and 44 mucinous adenocarcinomas. In univariate testing, 4/102 parameters were of significance, with the best performing radiomic model for neoplasm classification showing an AUC of 0.63 using a cubic support vector machine with 10-fold cross-validation.
Conclusion: An MRI radiomic model performed modestly in distinguishing post-treatment acellular, non-neoplastic masses from residual mucinous rectal adenocarcinoma with an AUC 0.63. While not ready for clinical dissemination, such modeling may be a step forward for informing treatment decisions in these aggressive tumours.
Limitations: Retrospective, a small number of cases.
Ethics committee approval: Waiver of consent from IRB.

T and N staging of rectal cancer: comparison between the 2012 and 2016 structured MRI report templates proposed by the European Society of Gastrointestinal and Abdominal Radiology (ESGAR)

F. M. Donati, R. Cervelli, P. Boraschi, N. Furbetta, G. Tarantini, L. Morelli, D. Caramella*; Pisa/IT (p.boraschi@gmail.com)*

Purpose: To compare the 2012 and 2016 structured MRI report templates proposed by the European Society of Gastrointestinal and Abdominal Radiology (ESGAR) for the TN staging of rectal cancer.
Methods and materials: 47 consecutive patients affected by biopsy-proven rectal cancer were included in this retrospective study. 19 out of 47 had undergone neoadjuvant chemoradiation therapy (nCRT) before surgery. All patients performed MR examination within 20 days before surgery. A comparison between the radiological TN staging obtained according to both 2012 and 2016 ESGAR guidelines and the pathological TN staging was performed.
Results: The radiological T stage did not differ between 2012 and 2016 ESGAR guidelines. It was classified as T1, T2, T3, T4 in 1, 5, 20, and 2 patients directly resected, and as T0, T2, T3, T4 in 4, 7, 6, and 2 patients who underwent nCRT, respectively. A statistical correlation was found between the radiological and pathological T stage ($p<0.0001$;ρ of Spearman=0.62). As to the radiological N stage, according to 2012 and 2016 guidelines, in 24 and 32 patients no metastatic lymph-nodes were found. The N1 stage was classified in 22 and 14 patients respectively, whereas the N2 stage in only one patient, according to both guidelines. The pathological N stage was N0, N1, N2 in 27, 16, and 4 patients. A statistical correlation was found between the radiological-pathological N stage comparison by applying both the 2012 ($p=0.009$) and the 2016 guidelines ($p<0.0001$). However, the updated 2016 version showed a stronger correlation (ρ of Spearman=0.60).
Conclusion: Both the 2012 and the 2016 ESGAR structured MRI report templates were reliable tools to assess the radiological T and N stage of rectal cancer. The 2016 templates were more accurate in estimating lymph-nodes involvement.
Limitations: Retrospective study.

The role of high-resolution apparent diffusion coefficient histogram analysis in evaluating tumour response of locally advanced rectal cancer after neoadjuvant chemoradiotherapy

L. Yang, C. Xia, D. Liu, B. Wu*; Chengdu/CN (lqyang95@163.com)*

Purpose: To evaluate the role of high-resolution ADC map based on read-out segmented echo-plannar imaging (rs-EPI) in assessing tumour response before and after neoadjuvant chemoradiotherapy (CRT) by using histogram analysis in locally advanced rectal cancer (LARC).
Methods and materials: 63 LARC who received neoadjuvant CRT and surgery were enrolled retrospectively. They all underwent pre- and post-CRT MR examinations, including DWI using rs-EPI. According to pathological results, patients were grouped as pathological complete responder (pCR, n=16) and non-pCR (n=47). Visual assessment of residual tumour and whole-tumour histogram analysis of pre- and post-CRT ADC map was performed by two radiologists, and tumour volume on the ADC map was also recorded.
Results: Overall interobserver agreement was good for histogram analysis (ICC=0.543-0.999). Tumour volume reduction rate on the ADC map showed no significant difference between two groups (P=0.468). Post-CRT mean, quantile values, and their percentage changes were higher in the pCR group (all P<0.001). Post-CRT mean value had a good diagnostic power in selecting pCR (AUCs=0.855), with a cut-off value of $1.345´10^{-3}mm^2/s$, yielding a sensitivity of 83%, specificity of 81.3%. Post-CRT quantile 95% value had the highest AUCs (AUCs=0.868) among quantile values and higher specificity (87.5% vs. 81.3%) than mean value with comparable overall diagnostic performance (P=0.563). The visual assessment showed a sensitivity of 85.1%, specificity of 68.8% in selecting pCR.

Conclusion: Quantitative ADC value of rs-EPI DWI could reliably evaluate tumour response in patients with LARC. Post-CRT 95% quantile ADC value could help mean value to more accurately identify pCR.
Limitations: This is a retrospective study with a relative small number of patients.
Ethics committee approval: This retrospective study was approved by our Institutional Review Board and the requirement for informed consent was waived.
Funding: No funding was received for this work.

Performance and inter-reader reproducibility of MRI using a simplified response template to help (pre-) select rectal cancer patients for surgery versus organ preservation after chemoradiotherapy

H. E. Haak[1], M. Maas[1], T. N. Boellaard[1], A. Delli Pizzi[2], C. Mihl[3], D. van der Zee[4], G. L. Beets[1], R. G. H. Beets-Tan[1], D. M. J. Lambregts[1]; [1]Amsterdam/NL, [2]Chieti/IT, [3]Maastricht/NL, [4]Uden/NL (doenja.lambregts@gmail.com)

Purpose: To assess the inter-reader reproducibility and performance of MRI using a simplified response template (designed for this study) to differentiate between patients likely requiring surgery and potential organ-preservation (watch-and-wait) candidates who would benefit from more detailed response assessment with endoscopy.
Methods and materials: 7 independent readers (varying from resident level to MRI-expert) retrospectively evaluated the restaging MRIs (T2W+DWI) of 62 rectal cancer patients after chemoradiotherapy using a simplified response template, taking into account the morphology on T2W-MRI (degree of fibrosis) and signal pattern on DWI (no/focal/scattered high signal). They categorised patients as poor response (tumour certain/surgery definitely required), intermediate response (tumour likely/surgery probably required), and good response (potential complete response, endoscopy required to determine eligibility for watch-and-wait). The reference standard was histopathology (and/or long-term follow-up). Inter-reader reproducibility was tested using Kendall's coefficient of concordance.
Results: 48 patients had a residual tumour and 14 were confirmed complete responders. Overall interobserver reproducibility was good (W0.65). The median % of patients categorised as good/intermediate/poor responders was 29%/50%/21%. The vast majority of MR-categorised poor and intermediate responders had confirmed residual tumour (median 100%, range 95-100% for the 7 different readers; and median 88%, range 76-100%, respectively). The majority (median 71%, range 57-93% for the 7 different readers) of the in total 14 confirmed complete responders were correctly classified in the "good response" group. The remaining ones were almost exclusively classified as intermediate responders (except for 1 complete responder who was misclassified as a poor responder by 1/7 readers).
Conclusion: MRI using a simplified structured response template can aid radiologists with varying levels of expertise in pre-selecting which patients will require surgery versus potential watch-and-wait candidates who will benefit from further endoscopic response assessment.
Limitations: This study is based on a small cohort with retrospectively included patients.

Patho-radiomic signatures predict pathological complete response to neoadjuvant chemoradiotherapy in rectal cancer

W. Lijuan[1], H. Zhang[2], Z. Sun[2], W. Peng[2], L. Wan[2]; [1]Beijing, Chaoyang/CN, [2]Beijing/CN (18345195352@163.com)

Purpose: To investigate the diagnostic performance of the patho-radiomic signatures from pathology and radiology features for predicting pathological complete response (pCR) after neoadjuvant chemoradiotherapy (nCRT) in patients with rectal cancer (RC).
Methods and materials: A total of 156 patients with RC were enrolled in this retrospectively study between March 2015 and March 2018. All patients underwent MR examination before and after nCRT, and all pathological sections were harvested from proctoscopic biopsy before nCRT. 512 pathomic features were extracted from each patient pathological section and 190 radiomic features were obtained from T2-weighted MR imaging (MRI). The least absolute shrinkage and selection operator (LASSO) method was used for pathology and radiology features selection and building signatures. The patho-radiomic signatures, other conventional MRI parameters, and clinical factors were integrated into a multivariable logistic regression analysis to determine if the signatures were independent prognostic factors for pCR.
Results: Overall, 25 patients (16.0%) achieved pCR. The pathomics and radiomics signature, which both comprised 3 selected features, was significantly associated with pCR after nCRT. On multivariate analysis, the patho-radiomic signatures were independent prognostic factors. The area under the receiver operating curve (AUC-ROC) of the multivariable regression model for pCR prediction was 0.845 (95% CI, 0.762 to 0.928).
Conclusion: In RC patients who underwent nCRT, the patho-radiomic signatures created by combining pathology and radiology features exhibited favourable for pCR prediction and can increase the confidence of the organ-preserving strategy.
Limitations: The first limitation was the relatively small size. The second is a retrospective design. Next, we need more samples to verify the diagnostic performance of the patho-radiomic signatures.
Ethics committee approval: This study was approved by our institutional ethics committee.

RPS 601a-12 12:15

Rectal cancer: a methodological approach for matching PET/MRI to histopathology

M. K. Rutegård[1], M. Båtsman[1], J. Axelsson[1], F. Brännström[2], L. C. O. K. Blomqvist[3], I. Ljuslinder[1], R. Palmqvist[1], M. Rutegård[1], K. Riklund[1]; [1]Umeå/SE, [2]Södertälje/SE, [3]Stockholm/SE (miriam.rutegard@diagrad.umu.se)

Purpose: The role of hybrid imaging with magnetic resonance imaging (MRI) and ^{18}F-fluoro-2-deoxy-D-glucose positron-emission tomography (FDG-PET) in the preoperative staging and restaging in rectal cancer is not clear. To enable evaluation of locoregional disease in the on-going RECTOPET (REctal Cancer Trial on PET/MRI/CT) study, a methodology to match mesorectal imaging findings to histopathology is presented, along with initial observations.
Methods and materials: 24 patients with rectal adenocarcinoma underwent FDG-PET/MRI. In 9 patients, of whom 5 received neoadjuvant treatment, an MRI of the surgical specimen was performed. The pathological cut-out was done according to clinical routine with the addition of photodocumentation of each slice of the specimen, noting the location, size, and type of pathology of each mesorectal finding. This allowed matching individual nodal structures from preoperative MRI examinations, via the specimen MRI, to histopathological findings.
Results: Preoperative MRI identified 197 mesorectal nodal structures, of which 92 (47%) could be anatomically matched to histopathology. Of the matched nodal structures identified in both MRI and histopathology, 25% were found to be malignant. These malignant structures consisted of lymph nodes (43%), tumour deposits (48%), and extramural venous invasion (9%).
Conclusion: We have been able to anatomically match individual nodal structures at preoperative MRI with dedicated histopathology, thus devising a method to study the characteristics of benign and malignant mesorectal structures on a finding-by-finding basis. Initial observations suggest that small malignant nodal structures assessed as lymph nodes at MRI in the majority of cases comprise other forms of mesorectal tumour spread.

Limitations:
This is a single-centre study with a small sample size.

Impact on clinical practice of updated guidelines on iodinated contrast material: CINART
E. C. Nijssen[1], P. J. Nelemans[1], R. Rennenberg[1], A. J. van der Molen[2], V. van Ommen[1], J. E. Wildberger[1]*; [1]Maastricht/NL, [2]Leiden/NL (j.wildberger@mumc.nl)*

Purpose: Guidelines on the safe use of iodinated contrast material recommend intravenous prophylactic hydration to prevent post-contrast adverse (renal) effects. The AMACING trial showed that standard prophylaxis was not (cost-) effective in the bulk of patients targeted by the guidelines and the latter have been updated accordingly. The current study aims to evaluate the consequences for the clinical practice in terms of reductions in complications, hospitalisations, and costs.
Methods and materials: The Contrast-Induced Nephropathy After Reduction of the Threshold for prophylaxis (CINART) project is a retrospective observational study. All elective procedures with intravascular iodinated contrast administration at Maastricht University Medical Centre (UMC+) in patients aged >18 years, formerly eligible for prophylaxis (eGFR30-44ml/min/1.73m^2 or eGFR45-59ml/min/1.73m^2 in combination with diabetes or >1 predefined risk factor) and currently eligible for prophylaxis (eGFR<30ml/min/1.73m^2), were included. Data was used to calculate the relative reductions in complications, hospitalisations, and costs associated with standard prophylactic intravenous hydration. CINART is registered with Clinicaltrials.gov: NCT03227835.
Results: From July 1, 2017-July 1, 2018, 1,992 elective procedures with intravascular iodinated contrast in patients formerly and currently eligible for prophylaxis were identified: 1,808 in patients formerly eligible for prophylaxis and 184 in patients currently eligible for prophylaxis. At Maastricht UMC+, guideline updates led to large relative reductions in the number of complications from prophylaxis, e.g. symptomatic heart failure (-89%), extra hospitalisations (-93%), and costs (-91%).
Conclusion: Guideline updates have had a demonstrable impact on daily clinical practice, benefiting patients, hospitals, and health care budgets. The local impact on costs, hospitalisations, and complications can be calculated using the interactive calculator.
Limitations: A single-centre study at Maastricht UMC+. Parameters may vary at other centres.
Ethics committee approval: The Medical Research Ethics Committee Maastricht UMC+ waived the requirement for informed consent.
Funding: Stichting de Weijerhorst.

Time-resolved dual-source CT angiography: an evaluation of type II endoleaks after endovascular aneurysm repair
N. Schicchi, M. Fogante, P. Esposto Pirani, G. Agliata, A. Giovagnoni*; Ancona/IT*

Purpose: To evaluate the sensibility in type II endoleak detection and compare the performance in arterial supply vessel identification between standard and time-resolved protocols after endovascular aneurysm repair (EVAR).
Methods and materials: In this prospective study, 83 consecutive patients referred for CT after EVAR were enrolled. All patients had at least one non-treated type II endoleak detected with a previous CT using a standard protocol (SP), consisting of unenhanced, arterial and venous acquisitions, serving as the reference standard. All exams were performed with DSCT (SOMATOM Force, Germany). A time-resolved protocol consisted of 8 unidirectional scan phases followed by dual-energy acquisition was used. The sensibility in endoleak detection was evaluated. The performance in arterial supply vessel identification and radiation dose were compared between 2 protocols.
Results: Using SP, 102 type II endoleaks and 69 arterial supply vessels were identified; 42 were lumbar arteries (LAs), 11 were inferior mesenteric arteries (IMA), and 16 were both. Using a time-resolved protocol, 85 type II endoleaks and arterial supply vessels were identified in all patients; 51 were LAs, 14 were IMA, and 20 were both. The sensibility in endoleak detection was 100%. The performance in arterial supply vessels identification with the time-resolved protocol was significantly higher (p<000.1). The radiation dose was 6.93±1.86 mSv with SP and 7.12± .95 mSv with the time-resolved protocol (p<0.304).
Conclusion: The time-resolved protocol compared to SP demonstrated very high sensibility in type II endoleak detection and better performance in arterial supply vessels identification with no significant difference in radiation dose.
Limitations: No external reference standard.

The clinical application of adaptive statistical iterative reconstruction V combined with a low tube current technique in head dual-energy spectral imaging CTA
T. Song, Z. Li*; Chengdu/CN*

Purpose: To explore the feasibility and clinical value of dual-energy spectral imaging combined with low tube current and ASiR-V for dose reduction on head CTA.
Methods and materials: Phantom study: An anthropomorphic PBU-60 angiographic head phantom was examined on a revolution CT using spectral imaging mode at different tube currents (280, 320, 365, 405, and 445 mA) and images were reconstructed with the filtered back-projection (FBP) 20%, 40%, 60%, and 80% ASiR-V algorithm.
Clinical study: 40 patients who underwent head dual-energy spectral imaging CTA were prospectively enrolled and randomly divided into two groups. Group A (low tube current) was the experimental group and the parameters were set according to the results of the phantom study. Group B was the control group with 445 mA tube current and the FBP algorithm.
Results: Phantom study: The image noise decreased as the tube current increased and the SNR and CNR were on the rise. With the same tube current, the image noise decreased and SNR and CNR increased as the proportion of ASiR-V increased. The noise reduction rate reached 46.73±4.27% at ASiR-V 80%. The CTDI increased as the tube current rose and there was a significant positive correlation between them.
Clinical study: The radiation dose of group A was 39% lower than group B and no significant difference was noted on the subjective scores.

Conclusion: Low tube current (280 mA) combined with ASiR-V 80% can effectively reduce the radiation dose and obtain satisfactory images for diagnosis on head CTA spectral imaging.
Limitations: This study was a single-centre study.
Ethics committee approval: This study was approved by the biomedical ethics committee of our hospital.

Split-phase aortic CTA for TAVI planning using a dual-layer spectral CT with reconstruction of low-keV virtual monoenergetic images

D. Mangold, J. Riffel, H.-U. Kauczor, T. F. Weber*; Heidelberg/DE (dav.mangold@gmail.com)*

Purpose: CT protocols for TAVI planning have to be adapted when using a dual-layer spectral CT scanner (DLCT) with 4 cm detector width instead of a conventional single-layer CT with 8 cm detector width (SLCT). The purpose of this study was to compare the objective image quality of aortic CT angiograms (CTA) performed for TAVI planning using a split-phase technique with the reconstruction of 40keV virtual monoenergetic images (VMI40) obtained with DLCT versus a single-phase technique with the reconstruction of standard polychromatic images obtained with SLCT.
Methods and materials: 115 CTA from each scanner were retrospectively analysed. For SLCT, spiral CTA with retrospective ECG-gating was performed for heart and vessel assessment at once. For DLCT, spiral CTA without ECG-synchronisation was performed immediately after a retrospectively ECG-gated spiral acquisition covering the heart. For the image quality assessment, SNR and CNR were calculated on the basis of abdominal aortic and lumbar muscle ROI analyses. Sufficient aortic enhancement was considered at attenuation >250HU.
Results: Contrast material volume was comparable for DLCT and SLCT (82±6ml vs 81±4ml, p=0.191). Aortic enhancement of VMI40 DLCT-CTA was significantly higher than of SLCT-CTA (610±273HU vs 413±127 HU, p<0.001). No significant differences were found for SNR (21±11 vs 21±8, p=0.420) and CNR (24±15 vs 24±10, p=0.524). Sufficient aortic enhancement was achieved in 97% for DLCT-CTA and in 93% for SLCT-CTA. Total dose length products of TAVI planning examinations were 2003±417mGy*cm for DLCT and 2401±754mGy*cm for SLCT (p<0.001).
Conclusion: Using a split-phase acquisition technique with the reconstruction of VMI40, CTA for TAVI planning can be obtained with similar objective image quality with DLCT compared to an ECG-gated CT acquisition of the whole aorta performed with conventional SLCT.

RPS 615-5 11:49

Artificial intelligence and the thoracic aorta: do we still have to measure manually?

M. Pradella[1], T. J. Weikert[1], J. Cyriac[1], R. Kärgel[2], J. Bremerich[1], G. Sommer[1], A. W. Sauter[1], B. Stieltjes[1], P. Brantner[1]*; [1]Basel/CH, [2]Nuremberg/DE (maurice.pradella@usb.ch)*

Purpose: Thoracic aorta dilatation is a major risk factor for dissection or rupture. Diameter measurements on cross-sectional imaging are time-consuming and show inter-reader variability.
We evaluated an artificial intelligence (AI)-Rad companion (AI-RC, Siemens Healthineers) which automatically performs guideline-based measurements of the thoracic aorta and compares them to radiologists' measurements.
Methods and materials: We identified ECG-gated scans of patients (pts) which were suspected or already diagnosed with dilatation. AHA guideline-based diameter measurements were included in the report. In parallel, those cases were processed with AIRC according to current AHA guidelines. Measurements of the aortic sinus (AS) and ascending aorta (AA) were compared. Cases with a difference of 5 mm or less between AIRC and manual measurements were considered plausible. If the difference was >5 mm, further evaluation was performed.
Results: 367 scans of 346 patients (mean age 64.5 yrs, 261 male (75.4%)) were included in this study.
The mean difference between reported and AIRC measurements were 0.26 mm for AS (95% CI: -0.71-0.40 mm) and 0.03 mm for AA (95% CI: -0.34-0.34 mm), respectively. Correlations coefficients (Pearson) were high for AS (0.702) and very high for AA (0.912).
Of 367 pts measurements, 270 (74%) were within 5 mm. 97 cases showed a difference >5 mm between measurements. 70 of those 97 cases (72%) showed a misidentification of AS, 4 (4%) a sole misidentification of AA, and 19 (20%) were correctly measured by AIRC. In total, 289/367 cases (79%) were correctly measured by AIRC.
Conclusion: AIRC shows the potential to assist radiologists since it automatically performs measurements of the thoracic aorta. It reliably measures AA but struggles in identifying the AS in some cases.
Limitations: A single-centre study and retrospective analysis.
Ethics committee approval: Approved by the regional ethics committee. Informed consent was waived.
Funding: No funding was received for this work.

Identification of fast-growing abdominal aortic aneurysms (AAAs) via radiomics analysis of contrast-enhanced computed tomography (CE-CT) imaging

F. Xiong, Y. Wang, J. Leach, E. Kao, D. Mitsouras, D. Saloner*; San Francisco/US (xiongfei0129@gmail.com)*

Purpose: To investigate the feasibility of radiomics analysis of AAA CE-CT images to predict fast growth 0.3 cm/year.
Methods and materials: This retrospective cross-sectional study included 84 AAAs (44 fast-growing, 40 stable) with an index CE-CT for morphologic assessment. Growth was calculated from subsequent clinically-indicated imaging (mean follow-up 3.3±2.6 years). A semi-automated algorithm isolated the AAA outer wall and 1,130 quantitative shape, and 1st-order and texture features were extracted for each segmentation using an open-source package. Recursive feature elimination (RFE) was used to select the maximally-independent features robustly associated with growth. A random forest (RF) classifier then classified AAAs as fast-growing or stable on the basis of the selected features. The performance of the classifier and a model using conventional risk factors (maximum diameter, age, BMI, diabetes, hypertension, and smoking) were evaluated via 5-fold cross-validation. These two were compared by the area under the receiver operating characteristic (ROC) curve (AUC) using DeLong's test. Finally, using multivariate logistic regression, the RFE-selected radiomics features and clinical factors were examined for independent association with the growth outcome.
Results: The mean AUC of the radiomics classification model was 0.80±0.09 and was statistically significantly different (P=0.017) from the conventional risk factor model (mean AUC=0.59±0.12). In multivariate regression, 10 radiomics features independently predicted fast growth. The overall model achieved an odds ratio of 63.20 (95% CI: 8.15-490.06, p<0.001).
Conclusion: Radiomics features of AAAs in CT images appear to have value in detecting fast growth and may assist in rupture risk stratification.
Limitations: The small sample size and lacked an independent stability test for the selected radiomics features.
Ethics committee approval: IRB approved.
Funding: No funding was received for this work.

Twin-beam dual-energy CT for the diagnosis of pulmonary embolisms: first clinical results

B. M. W. Petritsch, A. Weng, P. Pannenbecker, S. Veldhoen, T. A. Bley, A. Kosmala*; Würzburg/DE (petritsch_b@ukw.de)*

Purpose: To compare image quality and radiation dose of a new technical dual-energy (DE) approach using a split-filter design versus standard CTA at a single-source CT scanner in patients with suspected pulmonary embolism.
Methods and materials: Computed tomography pulmonary angiography (CTPA) was performed with 2 protocols at the same 128-row CT system (SOMATOM Edge, Siemens Healthineers). Group 1 (n=22) received standard single-energy CTPA and group 2 (n=17) received a split-filter dual-energy CTPA (Twin-Beam $_{50}$Sn & $_{120}$Au). The CT attenuation in the pulmonary artery and signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) were compared. The subjective image quality of standard CTPA and iodine maps was assessed (5-point Likert-scale). The DLP was reported and the effective radiation dose was estimated.
Results: Pulmonary artery attenuation was higher in the standard CTPA (447±146 HU) compared to the DE group (329±127 HU) ($p<0.05$). In contrast, SNR (17.0±4.6 vs 23.6±6.0) and CNR (14.8±4.6 vs 19.3±6.3) were both higher in the DE group ($p<0.05$). The subjective image quality of CTPA was rated excellent (=1) in group 1 and good (=2) in group 2. In the DE cohort, 4 iodine maps were of non-diagnostic quality (=5), possibly due to breathing artefacts. The mean DLP (138.6±61.4 mGy*cm/182.1±85.2 mGy*cm) and effective radiation dose (2.49±1.10 mSv/3.28±1.53 mSv) were similar in both groups (p=n.s).
Conclusion: Twin-beam DE CT offers the possibility to gain dual-energy information from a single-source single-layer CT system. The new technique provides higher SNR and CNR with an effective radiation dose similar to standard CT.
Limitations: A comparison of twin-beam DE with more established dual-source DE CTPA is pending and should be performed in further studies.
Ethics committee approval: This prospective study was approved by the institutional review board.
Funding: No funding was received for this work.

Low-contrast media dose protocol in renal CT angiography for non-obese patients: the usefulness of low virtual mono-energetic images derived from a dual-layer spectral detector CT

Y. Yang, F. Yan, R. Chang, X. Chen, Q. Han, H. Dong*; Shanghai/CN (yyz01a15@rjh.com.cn)*

Purpose: To evaluate the image quality and artery conspicuity of renal CTA with low virtual mono-energetic images (VMI) derived from a dual-layer spectral detector CT (DLCT) using low contrast media (CM) dose protocol.
Methods and materials: 60 non-obese (BMI≤28 kg/m^2) patients referred for renal CTA were prospectively enrolled in this study using a low CM protocol of 110 mgI/kg. Both conventional 120kVp polyenergetic images (PI) and VMIs (40-70keV) were reconstructed. CT attenuation and SD of the abdominal artery (AA), left renal arteries (LR), and right renal arteries (RR) were measured. The contrast-to-noise ratio (CNR) was calculated. The subjective image quality (IQ) was assessed using a 5-point scale and compared between VMIs and PI.
Results: The CT value of VMIs increased (AA: 187.42±38.92HU-518.80±127.50HU; LR: 174.68±36.18HU-455.25±121.47HU; RR: 179.20±39.03HU-470.98±129.88HU) as energy level decreased (70keV-40keV). VMIs from 40-60keV had a higher attenuation value than PI ($p<0.05$). The noise of VMIs subtle increased (AA: 15.39±1.92HU-18.02±2.91HU; LR: 13.77±2.52HU-17.58±2.96HU; RR: 13.60±2.67HU-17.81±3.06HU) as energy levels decreased. VMIs from 50-70keV had lower image noise than PI (all $p<0.05$). The CNR steeply increased as energy levels decreased and had significant higher CNR than PI.
Conclusion: The low CM protocol proposed was clinically feasible using low energy VMIs (40-50 keV) derived from DLCT, which could provide superior image quality in comparison to the conventional 120 kVp PI for renal CTA in terms of both objective and subjective evaluation.
Limitations: No control group of PI with routine CM protocol was introduced.
Ethics committee approval: Written informed consent was obtained.
Funding: No funding was received for this work.

A preoperative MDCT angiography study of hepatic arterial and portal venous anatomy in liver donors

P. Saraswat, S. Vohra*; New Delhi/IN*

Purpose: To study the various anatomical variations in the branching patterns and origins of the arterial supply to the liver and portal vein and discuss their surgical implications in living donor liver transplant (LDLT).
Methods and materials: The study included an MDCT angiography evaluation of 450 liver donors. The hepatic artery and portal vein branching patterns were described according to Michel's and Nakamura et al classification and miscellaneous findings were discussed separately.
Results: Standard arterial anatomy was seen in 66% of cases. The most common arterial variant was type V followed by type III and II. The remaining Michel's variants including type IV, VI, VIII, and IX were seen in 8% cases. The origin of the segment 4 artery was seen most commonly from LHA. In the remaining cases, it was seen originating from RHA, CHA, HAP, and both LHA and RHA.
Miscellaneous arterial anatomy was seen in 4% cases, including segmental arterial supply to the right lobe from LHA, GDA, CHA, and CA , early branching of the hepatic artery from CHA, aberrant origin of RHA from CA, GDA, and the aorta, and the origin of CA from SMA and the aorta.
Type A portal vein anatomy was seen in 83% cases followed by type C and B. Type D anatomy was seen in 1 case. Type E portal vein anatomy was seen in 2 cases. In 5 cases, branches to segment 7 and 8 were seen arising from LPV. In one case, the accessory segment 8 branch was arising from the MPV bifurcation.
Conclusion: Variant hepatic vascular anatomy is seen in a significant number of donors and its evaluation allows the selection of suitable donors and operative procedures, and hence decreases intra-operative time and complications.
Limitations: A single-centre study.

The diagnostic utility of hybrid: three-phase scintigraphy and CT angiography imaging in patients with acute lower limb ischaemia

O. V. Leshchinskaya, N. E. Kudryashova, I. P. Mikhailov, E. V. Migunova, O. G. Sinyakova, O. A. Lbova, E. A. Nikolaeva*; Moscow/RU (Leschinskaya78@mail.ru)*

Purpose: CT angiography (CTA) provides information on the patency of peripheral arteries and 3-phase scintigraphy can assess perfusion and viability of affected tissues. Our aim was to evaluate the utility of hybrid imaging comprising CTA and three-phase scintigraphy using osteotropic or perfusion radiotracers.
Methods and materials: From September 2018-August 2019, we examined 79 patients (mean age 68.3±9.7) with acute lower limb ischaemia. The hybrid studies comprised CT angiography (CTA) and three-phase scintigraphy performed on Discovery 670NM/16-rowCT, GE, USA. Scintigraphy was performed in group 1 in 63/79 patients using ^{99m}Tc-pyrophosphate (500MBq, 2.85mSv) and in group 2 - in 16/79 using ^{99m}Tc-MIBI (500MBq, 4.5mSv).
Results: We evaluated two groups of patients based on the severity of ischaemia: grade 1-2A-51 (45/6), grade 2B-18 (13/5), and grade 3-10 (5/5); groups 1 and 2, respectively. 51/79 patients with grades 1-2A had either normal or slightly decreased tissue blood flow. 28/79 patients with grades 2B-3 had a significant decrease in tissue blood flow. In group 1, the washout index in tissue and bone phases ("muscle/muscle") was decreasing and the "muscle/bone ratio" index in bone phase was increasing, with a clear difference between grades 1-2A, 2B, and 3. 4/5 patients from group 1 (grade 3) had areas of necrotic changes. In group 2, the washout index was significantly different between 1-2A-2B and 3 ($p\leq0.05$). ^{99m}Tc-pyrophosphate studies were more informative for acute ischaemia grades with less radiation 2.85mSv vs 4.5mSv.
Conclusion: CTA and scintigraphy are complementary and their fusion provides a reliable diagnosis of patency and grades of ischaemia. Moreover, hybrid imaging using osteotropic radiotracer defines the areas of aseptic necrosis, which is essential in planning endovascular or surgical intervention. ^{99m}Tc-pyrophosphate studies were more informative than ^{99m}Tc-MIBI with less patient exposure.
Limitations: The retrospective design.

Application of dual-layer spectral detector CT angiography in improving the imaging quality of lower extremity arteries
N. Wang, Z. Liu, X. Lu, Y. Hou*; Shenyang/CN*
(wangning19900508@126.com)

Purpose: To evaluate the application value of dual-layer spectral detector CT (DLCT) in CT angiography (CTA) of the lower extremities.
Methods and materials: 48 patients (12 males; mean age, 62.37±16.83 years) with suspected lower extremity arterial disease underwent CTA by DLCT in this prospective study. Virtual monoenergetic images (VMIs) were reconstructed at 60-80 keV, with a 5-keV increment. Attenuation, noise, the corresponding contrast noise ratios (CNR), and signal noise ratio (SNR) were assessed in the iliac artery, femoral artery, popliteal artery, and anterior tibial artery. Comparisons between VMIs and conventional images (CIs) were performed by one-way ANOVA test. The image quality was graded on a 5-point scale, 5 being the best.
Results: In CI and VMI studies, 60 keV VMI showed the highest subjective score (217 points). CNR and SNR at 60 keV and 65 keV were statistically significantly higher than other VMIs and CIs ($p < 0.01$). The image noise at 60 keV and 65 keV was significantly lower than CIs ($p<0.05$). The attenuation of each target vessel at 60 keV was significantly higher than at 65 keV and other level VMIs ($p<0.05$). The overall image quality was best at 60 keV.
Conclusion: A VMI level at 60 keV for lower extremity CTA can notably improve the overall image quality and may be used in clinical routine imaging protocols.
Limitations: The examinations used only 120 kVp and comparable imaging protocols. We only included a limited number of patients. Large-scale studies should consider a variety of different protocols.

Distinguishing well-differentiated liposarcomas from lipomas on MR images using a radiomics approach
M. P. A. Starmans, M. Vos, M. J. M. Timbergen, S. R. van der Voort, D. J. Grünhagen, S. Sleijfer, C. Verhoef, J. J. Visser, S. Klein*; Rotterdam/NL*
(m.starmans@erasmusmc.nl)

Purpose: Well-differentiated liposarcomas (WDLPS) are difficult to distinguish from lipomas. This distinction is currently made through an invasive biopsy to test for MDM2-amplification. We present a non-invasive alternative using radiomics based on MRI. This work has been accepted for publication by the British Journal of Surgery.
Methods and materials: Our dataset consisted of 116 patients (58 MDM2-negative lipomas, 58 MDM2-positive WDLPS) with at least a pre-treatment T1-weighted MRI scan who were referred to the Erasmus MC between 2009-2018. When available, T2-weighted scans were included. A clinician manually segmented the tumours, from which 113 radiomics features were extracted. Decision models were created through an automated search amongst a variety of machine learning algorithms to find the combination that maximizes performance. The evaluation was implemented through 100x random-split cross-validation, using 80% for training and model optimisation and 20% for testing. For comparison, the tumours were manually scored by 3 radiologists. Agreement was determined through Cohen's kappa.
Results: The T1w-based radiomics model had a mean area under the curve (AUC) of 0.83, a sensitivity of 0.68, and specificity of 0.84. Adding T2w MRI improved the performance to an AUC of 0.89, a sensitivity of 0.74, and a specificity of 0.88. The 3 radiologists had an AUC of 0.74/0.72/0.61, a sensitivity of 0.74/0.91/0.64, and a specificity of 0.55/0.36/0.59. The mean Cohen's kappa between the radiologists was 0.23, indicating poor interobserver agreement.
Conclusion: Our radiomics model was able to distinguish WDLPS from lipomas, with a performance superior to 3 experienced radiologists. Hence, radiomics may serve as an objective, non-invasive aid in diagnostic work-up to differentiate between lipomas and WDLPS.
Limitations: A potential volume bias, which has been assessed in additional subanalyses.

Progressive desmoid tumours: a comparison of radiomics and conventional response criteria for predicting progression during systemic therapy
A. Crombe[1], M. Kind[1], A. Bouhamama[2], A. Italiano[1]*; [1]Bordeaux/FR, [2]Lyons/FR*
(crombeamandine2@gmail.com)

Purpose: The response of desmoid tumours (DTs) to chemotherapy is evaluated with RECIST in daily practice and clinical trials. MRI demonstrates an early change in heterogeneity in responding tumours due to a decrease in cellular area and increase in fibro-necrotic content before a dimensional response. Heterogeneity can be quantified with radiomics. Our aim was to develop radiomics-based response criteria and to compare their performances with the usual criteria.
Methods and materials: 42 patients (median age: 38.2) were included, presenting with progressive DT, MRI at baseline (MRI-0), and early evaluation (3 months later, MRI-1). After signal intensity normalisation, voxel size standardisation, discretisation, and segmentation of DT volume on fat-suppressed contrast-enhanced T1-weighted-imaging, 90 baseline and delta 3D-radiomics features (RFs) were extracted. Using cross-validation and least absolute shrinkage and selection operator penalised Cox regression, a radiomics score was generated. The performances of models based on the radiomics score, modified-RECIST, EASL, Cheson, Choi and revised-Choi criteria from MRI-0 to MRI-1 to predict the progression-free survival (PFS, per RECIST) were assessed with a concordance-index. The results were adjusted for performance-status, tumour volume, prior chemotherapy, current chemotherapy, and beta-catenin mutation.
Results: There were 10 progressions. The radiomics score included 4 variables. A high score indicated a poor prognosis. The radiomics score correlated with PFS (adjusted hazard ratio=12.02, p=0.002) but none of the usual response criteria. The prognostic model based on the radiomics score had the highest concordance-index (0.85, 95% confidence interval=(0.72-0.99)).
Conclusion: Quantifying early changes in heterogeneity through a dedicated radiomics score can improve the response evaluation for DT patients undergoing chemotherapy.
Limitations: A relatively small population study, a small number of events (: progression), and a lack of standardisation of the MRI protocol.
Ethics committee approval: IRB-approved. Written informed consent obtained.
Funding: No funding was received for this work.

MRI contrast-enhanced T1 signal intensity: a potential imaging biomarker for prediction efficacy in desmoid-type fibromatosis treated with imatinib

H. C. Zhu, X. T. Li, Y. S. Sun*; Beijing/CN (zulo1481@126.com)*

Purpose: Recent studies showed that MRI signal intensity was a prognostic marker for progression-free survival (PFS) and an association has been demonstrated between desmoid tumour growth and T2 signal intensity. In this study, we present the predictive value of the hyperintensity percentage of tumours on pre-therapy MRI for PFS in patients with desmoid-type fibromatosis (DF) treated with imatinib.
Methods and materials: We enrolled 38 DF patients treated with imatinib. The evaluation of areas of signal hyperintensity on pre-therapy MRI images was performed on T2 and T1 contrast enhancement (CE) sequences. Two radiologists defined the whole tumour areas and areas of signal hyperintensity by manually drawing on each slice of stacked MR images on axial T2 and axial T1 CE sequences. Associations of clinical or radiographic characteristics with PFS (by RECIST1.1) were evaluated by Cox regression and Kaplan-Meier statistics.
Results: Hyperintense T1 CE proportion (hazard ratio [HR], 3.37; 95% confidence interval [CI], 1.23-9.25) was identified as independent predictors for PFS ($p<0.05$). Kaplan-Meier analysis showed that the hyperintense T1 CE proportion (less than 75%) was associated with improved PFS ($p<0.05$). No progression disease was exhibited in patients with a hyperintense T1 CE proportion less than 75%, while 78.4% progression disease was exhibited in patients with a hyperintense T1 CE proportion more than 75%.
Conclusion: Our study showed that hyperintense T1 CE proportion is a prognostic predictor in DF patients treated with imatinib. Those tumours with a hyperintense T1 CE proportion less than 75% have less likelihood of progressing during treatment with imatinib. Hence, MR imaging is a valuable imaging biomarker for predicting the prognosis of DF treated with imatinib, thereby contributing to personalised medicine.
Limitations: A retrospective study and a relatively small patient population.

Distinguishing desmoid-type fibromatosis from soft tissue sarcoma on MRI using a radiomics approach

M. P. A. Starmans, M. J. M. Timbergen, G. A. Padmos, D. J. Grünhagen, G. J. van Leenders, D. Hanff, S. Sleijfer, J. J. Visser, S. Klein*; Rotterdam/NL (m.starmans@erasmusmc.nl)*

Purpose: Diagnosing desmoid-type fibromatosis (DTF) is challenging due to its rarity, requiring an invasive biopsy with β-catening staining and CTNNB1 mutational analysis. We evaluated radiomics based on MRI as an alternative for distinguishing DTF from soft tissue sarcoma (STS) and determining the DTF CTNNB1 mutation (S45F, T41A or wild-type).
Methods and materials: T1-weighted MRIs were gathered from 203 patients, including 72 DTFs and 131 STS (64 fibromyxosarcomas, 36 myxoid liposarcomas, and 31 leiomyosarcomas), all pathologically proven. A clinician segmented the tumours, from which 424 radiomics features were extracted. Sex, age, and tumour location were collected. A decision model was created through an automated search amongst a variety of machine learning algorithms to find the combination that maximizes performance. The evaluation was implemented through 100x random-split cross-validation, with 80% of the data used for training and model optimisation and 20% for testing. For comparison, a location-matched subset of tumours was manually scored by two radiologists.
Results: The mean area under the curve (AUC) of the DTF versus STS radiomics imaging model was 0.79 on the full database and 0.88 on the location-matched database. The two radiologists had an AUC of 0.80 and 0.88, respectively, on the location-matched database. Age and gender performed well on their own (AUC of 0.93) and combined with imaging (AUC of 0.98). The CTNNB1 radiomics model showed a mean AUC of 0.61, 0.56, and 0.74 for S45F, T41A, and wild-type, respectively.
Conclusion: Our radiomics model is capable of distinguishing DTF from STS with a performance similar to that of two experienced radiologists. However, the model was not able to predict the CTNNB1 mutation status.
Limitations: A potential age/gender bias.
Ethics committee approval: Erasmus MC IRB (MEC-2016-339).

Desmoid-type fibromatosis: a pilot study of tumour response assessment by using MRI signal combined size criteria

H. C. Zhu, X. T. Li, Y. S. Sun*; Beijing/CN (zulo1481@126.com)*

Purpose: Desmoid-type fibromatosis (DF) is a locally aggressive tumour. RECIST 1.1 is generally used for assessing the response of DF, but the role of MRI signal isn't defined. We aimed to establish a specified MRI signal criterion for assessing the response of DF and to test the performance of signal criterion combined with RECIST 1.1.
Methods and materials: This retrospective study included 129 DF patients who received systematic therapy or were closely followed up without surgery. All patients underwent pre-treatment and six-month-interval follow-up MRIs for more than 3 years (a total of 6 follow-ups). The correlation between signal grade and size was tested, and the signal grade and size among 3 response groups (partial response (PR), stable disease (SD), and progression disease (PD)) was compared. A specified signal and size criterion was established, which was used to assess the tumour response at each follow-up and compared with the reference. The RECIST1.1 criterion at the end of 3rd year was the reference.
Results: Changes in T2 grade and size among the 3 response categories were significantly different (all $p<0.01$). The signal and size criterion accurately predicted 95% of PR patients at the 2nd follow-up and 81.2% of PD patients at the 3rd follow-up, while only 13.1% of PR and 56.3% of PD were predicted by RECIST1.1. However, the accuracy of the signal and size criterion for predicting SD was lower than RECIST1.1.
Conclusion: This study verified that MRI signal is useful for assessing the tumour response of DF and could be added to establish a specified signal and size criterion. A signal and size criterion can identify PR and PD patients earlier than RECIST1.1.

RPS 616a-6 11:45

High-grade soft-tissue sarcomas: can optimising DCE-MRI post-processing improve prognostic radiomics models?

A. Crombe[1], D. Fadli[1], X. Buy[1], A. Italiano[1], O. Saut[2], M. Kind[1]*; [1]Bordeaux/FR, [2]Talence/FR (crombeamandine2@gmail.com)*

Purpose: Heterogeneity on DCE-MRIs of sarcomas may be prognostic. The aim was to investigate the best method to extract prognostic data from baseline DCE-MRIs.
Methods and materials: 50 uniformly-treated adults with non-metastatic high-grade sarcomas and pre-treatment DCE-MRIs at 1.5T were included in this retrospective single-centre study. 92 radiomics features (RFs) were extracted at each DCE-MRI phase (11 from t=0s to 88s). Relative changes in RFs (rRFs) since the acquisition baseline were calculated (11x92 rRFs). Curves of rRF as a function of time post-injection were integrated (92 integrated-rRFs [irRFs]). K^{trans} and the area under the time-intensity curve at 88s parametric maps were computed and 2x92 parametric-RFs (pRFs) were extracted. 5 DCE-MRI-based radiomics models were built on an RFs subset (32s, 64s, 88s), all rRFs, all irRFs, and all pRFs. Two additional models were elaborated as a reference on conventional radiological features and T2-WI RFs. A common machine-learning approach was applied to the radiomics models. Features with $p<0.05$ at univariate analysis were entered in a LASSO-penalised Cox regression including bootstrapped 10-fold cross-validation. Resulting radiomics scores (RScores) were dichotomised as per their median and entered into multivariate Cox models for predicting metastatic relapse-free survival. Models were compared with a concordance-index.
Results: Only dichotomised RScores from models based on the rRFs subset, all rRFS, and irRFS correlated with prognostic ($p=0.0107$-0.0377). The models including all rRFs and irRFs had the highest c-index (0.83) followed by the radiological model. The radiological and full rRFs models were significantly better than the T2-based radiomics model ($p=0.02$).

Conclusion: The initial DCE-MRI of STS contains prognostic information. It seems more relevant to make predictions on rRFs instead of pRFs.
Limitations: A retrospective study, heavy post-processing to homogenise DCE-MRI temporal parameters, with no validation cohort.
Ethics committee approval: IRB approved.
Funding: No funding was received for this work.

The utility of 18F-FDG PET and DWI data for the assessment of therapy response of soft tissues sarcomas under neoadjuvant ILP

J. Grueneisen[1], M. Chodyla[1], B. M. Schaarschmidt[2], A. Demircioglu[1], O. Martin[2], K. Herrmann[1], M. Forsting[1], L. Podleska[1], L. Umutlu[1]; [1]*Essen/DE,* [2]*Düsseldorf/DE (johannes.grueneisen@uk-essen.de)*

Purpose: To evaluate the clinical applicability of quantitative 18F-FDG PET and DWI datasets for the prediction of therapy response of soft tissue sarcomas (STS) under neoadjuvant isolated limb perfusion (ILP).
Methods and materials: 37 patients with a confirmation of an STS of the extremities underwent an 18F-FDG PET/MR examination before and after neoadjuvant ILP with melphalan and TNF-α. Data analysis comprised measurements of the tumour size, metabolic activity (SUVs), and diffusion-restriction (ADC-values) in pre- and post-therapeutic examinations and percentage changes during treatment were calculated. A Mann-Whitney-U test and ROC analysis were used to compare the results of the different quantitative imaging parameters. Histopathological results after subsequent tumour resection served as a reference standard and patients were categorised as responders or non-responders based on the regression grading scale by Salzer-Kuntschik.
Results: Histopathological analysis categorised 22 (59%) patients as therapy responders (grade I-III) and 15 (41%) patients as non-responders (grade IV-VI). Tumours in the responder group showed a reduction in size (-9.7%) and metabolic activity (SUVpeak: -51.9%; SUVmean: -37.2%), and an increase of the ADC values (ADCmin: +23.1%; ADCmean: +31.8%) under treatment. Percentage changes in the non-responder group amounted to: tumour size -6.2%, SUVpeak: -17.3%, SUVmean: -15.1%, ADCmin: +16.1%, and ADCmean: +14.6%. The differences of the SUVs and ADCmean values between responders and non-responders were significantly different (<0.01). The corresponding AUCs were 0.63 (tumour size), 0.87 (SUVpeak), 0.78 (SUVmean), 0.54 (ADCmin), and 0.84 (ADCmean), respectively.
Conclusion: Our study demonstrates good performance of 18F-FDG PET/MR-derived quantitative imaging parameters for response prediction of STS under ILP. Integrated PET/MRI could serve as a valuable tool for monitoring neoadjuvant treatment strategies of STS.
Limitations: The limited patient cohort.
Ethics committee approval: The study was approved by the local ethics committee.
Funding: No funding was received for this work.

Low skeletal muscle mass and postoperative morbidity in surgical oncology: a systematic review and meta-analysis

L. Weerink[1], A. van der Hoorn[2], B. van Leeuwen[2], G. de Bock[2]; [1]*Almelo/NL,* [2]*Groningen/NL (lweerink@gmail.com)*

Purpose: To meta-analyse the relationship between preoperative sarcopenia and the development of severe postoperative complications in patients undergoing oncological surgery.
Methods and materials: PubMed and Embase databases were systematically searched from inception until May 2018. Studies reporting on the incidence of severe postoperative complications and radiologically determined preoperative sarcopenia were included. Data was extracted independently by two reviewers. Random effect meta-analyses were applied to estimate the pooled odds ratio (OR) with 95% confidence intervals (95CI) for severe postoperative complications, defined as Clavien-Dindo grade ≥3, including 30-day mortality. Heterogeneity was evaluated with I^2-testing. Analyses were performed overall and stratified by the measurement method, tumour location, and publication date.
Results: A total of 1,924 citations were identified and 53 studies (14,295 patients) included. When measuring the total skeletal muscle area, 43% of the patients were sarcopenic versus 33% when measuring the psoas area. Severe postoperative complications were present in 20% of patients where 30-day mortality was 3%. Preoperative sarcopenia was associated with an increased risk of severe postoperative complications (OR_{pooled}: 1.44, 95CI: 1.24-16.8, P<0.001, I^2=55%) and 30-day mortality (OR_{pooled}: 2.15, 95CI: 1.46-3.17, P<0.001, I^2=14%). A low psoas mass was a stronger predictor for severe postoperative complications compared to a low total skeletal muscle mass (OR_{pooled}: 2.06, 95CI: 1.37-3.09, OR_{pooled}: 1.32, 95CI: 1.14-1.53, respectively) and 30-day mortality (OR_{pooled}: 6.17 (95CI: 2.71-14.08, OR_{pooled}: 1.80 (95CI: 1.24-2.62), respectively). The effect was independent of tumour location and publication date.
Conclusion: The presence of low psoas mass prior to surgery as an indicator for sarcopenia is a common phenomenon and is a strong predictor for the development of postoperative complications and 30-days mortality. The presence of low total skeletal muscle mass, which is even more frequent, is a less informative predictor.

Do CT-based body composition parameters at baseline or their early changes correlate with progression in metastatic solid tumour patients treated with immunotherapy?

A. Crombe, M. Kind, M. Toulmonde, A. Italiano, S. Cousin*; Bordeaux/FR (crombeamandine2@gmail.com)*

Purpose: To investigate associations between CT-scan-based body composition (BC) parameters (and their early changes) with progression-free survival (PFS) in metastatic cancer patients treated with immunotherapy.
Methods and materials: Patients were consecutively included as they were treated with immunotherapy at our institution for a metastatic tumour with an available baseline CT-scan (CT0, ≤28 days before beginning immunotherapy) and early evaluation CT-scan (CT1, 2 months later ± 28 days). At each evaluation, the areas corresponding to psoas alone, skeletal muscle, subcutaneous, visceral, and total adipose tissues at the L3 vertebral level were extracted and weighted by height^2, providing wSMAI, SMI, SATI, VATI, and TATI, respectively, and their changes (Δt-) from the 1st day of treatment to CT1. After assessing the optimal cut-point for each BC-parameter (which maximised the bootstrapped concordance-index and balance between the subgroups of patients), correlations with PFS were evaluated using multivariate Cox models.
Results: Between December 2013-December 2016, 117 patients were included (55 female, median age: 63 years). After cut-point optimisation and adjustment with clinical covariables, 7 BC-parameters correlated with PFS: baseline BMI, SMI, VATI, Δt-wSMAI, Δt-SMI, Δt-SATI, and Δt-VATI (p-values range: <0.001-0.03). At multivariate analysis, 4 remained independently associated with lower PFS, namely: SMI <35.2cm^2/m^2 (HR=3.5, p=0.006), VATI ≥11cm^2/m^2 (HR=2.1, p=0.02), Δt-wSMAI <-0.7 cm^2/m^2/day (HR=6, p<0.001), and Δt-SATI <-0.02 cm^2/m^2/day (HR=1.9, p=0.026). Adding these BC-parameters significantly improved the prediction of PFS compared with a model that only included baseline clinical features and BMI (concordance-index=0.76 vs 0.68, p=0.007).
Conclusion: CT-based BC-parameters and their early changes could help in anticipating the outcome in metastatic cancer patients. Further prospective evaluations are required to validate these findings and to determine whether nutritional interventions are indicated.
Limitations: The retrospective, single-centre design, manual segmentation, and lack of standardisation in CT acquisition protocols.
Ethics committee approval: IRB approved.
Funding: No funding was received for this work.

Evaluating body composition by combining quantitative spectral detector computed tomography and deep learning-based image segmentation

N. Grosse Hokamp[1], D. Zopfs[1], K. Bousabarah[1], S. Lennartz[1], M. Merkt[2], D. Maintz[3], S. Haneder[1]; [1]Cologne/DE, [2]Coblenz/DE, [3]Münster/DE
(nils.grosse-hokamp@uk-koeln.de)

Purpose: To develop and evaluate an automated machine learning algorithm to segment abdominal muscle mass and visceral and subcutaneous fat mass using conventional images (CI) and iodine maps (IM) from spectral-detector computed tomography (SDCT).
Methods and materials: A deep convolutional neural network (DCNN) was trained/validated with 74/14 chest-abdomen-pelvis studies to identify the abdominal region. Afterwards, a DCNN U-Net was trained to perform segmentation of subcutaneous fat based on 1,153/203 segmented slices (training/validation). The aforementioned DCNNs were used to classify images to the abdominal region and subtract subcutaneous fat. Thresholding based on attenuation and iodine uptake was used to segment muscle mass. Test re-test matrices and Bland-Altman plots were obtained by comparing the fat-muscle ratio in 14 patients undergoing repetitive examination within a time interval of <21 days for clinical indications.
Results: The classifier DCNN assigned images to the abdominal region with an accuracy of 98.7%. Regarding the segmentation of subcutaneous fat, the mean Dice similarity coefficient per case compared to the segmented ground truth on the validation data was 0.95. Test re-test matrices for the prediction of subcutaneous fat, visceral fat, and muscle mass were well indicated by a mean difference of 9%.
Conclusion: The proposed quantitative image analysis algorithm for predicting subcutaneous and visceral fat as well as muscle mass utilises machine learning in combination with advanced reconstructions from dual-energy CT. It allows for a reproducible estimation of body composition and potentially facilitates the opportunistic and automated evaluation of body composition, allowing for risk stratification, for example, in the setting of sarcopenia.
Limitations: The small sample size.
Ethics committee approval: Obtained, informed consent was waived.
Funding: Else Kröner-Fresenius-Stiftung and Koeln-Fortune-Program/University of Cologne.

RPS 616a-11 12:15

The evaluation of various diffusion models for the differentiation of peripheral nerve sheath tumours with neurofibromatosis type 1

M. Kaul, L. Well, V.-F. Mautner, G. Adam, J. Salamon; Hamburg/DE
(mkaul@uke.uni-hamburg.de)

Purpose: Diffusion-weighted imaging is a tool for the sensitive and specific identification of malignancy in NF1. We studied various diffusion models for the ability to map parameters of significance and to test their numerical stability.
Methods and materials: Diffusion measurements were performed at 3T with b-values of 0, 10, 20, 30, 50, 70, 100, 300, 400, 600, and 800s/mm². We analysed 44 benign and 15 malign PNST tumours in 29 patients. Regions-of-interest were set manually and evaluated by fitting model functions: ADC, IVIM, kurtosis, stretched-kurtosis, gamma, and truncated-gamma. T-tests were applied to investigate significant differences in benign and malign PNST for the model parameters. The information criteria AIC, BIC, and R^2 values were compared. Numerical stability was evaluated by the number of analysable pixels normed by the tumour size.
Results: Conventional ADC-DWI fitting b-values (0 and >100s/mm²) is the most robust technique in comparison to the more complex models which provide additional parameters on the costs of larger variances and less numerical stability, as the smallest AIC and BIC value indicates. Generally, benign tumours result in better fit results as R^2 are higher and the normed area values are larger. In contrast, AIC and BIC do not differ much. The gamma-function, and especially the stretched-kurtosis model, perform on a similar level concerning robustness as the ADC model but offer additional information.
Conclusion: Various models are able to differentiate between malignant and benign PNST. ADC-mapping is a solid way. Nevertheless, using a gamma-function or the stretched-kurtosis model offers additional parameters which might also be of interest as it also offers differences detection.
Limitations: Malign PNST were larger, which probably has an effect.
Ethics committee approval: Approval by the local ethics board was given.
Funding: No funding was received for this work.

Genotype-phenotype correlation in neurofibromatosis type 1: whole NF1 gene deletion (type 1) leads to high tumour-burden and increased tumour-growth in affected patients

L. Well, K. Döbel, S. Farschtschi, V.-F. Mautner, G. Adam, J. Salamon; Hamburg/DE

Purpose: Neurofibromatosis type-1 (NF1) is a dominantly inherited tumour-predisposition syndrome and patients develop large plexiform (PNF) or cutaneous (NF) neurofibromas. High tumour-burden and tumour-growth are indicators for malignant transformation. Studies indicate that large deletions of the NF1 gene and its flanking regions (type-1-deletion) lead to more severe manifestations of NF1 compared to NF1 caused by smaller intragenic changes. Therefore, the purpose of our study was to evaluate the tumour-burden and tumour-growth of patients with type-1-deletions and to compare these with NF1 patients without large deletions of the NF1 gene (non-type-1-deletion patients).
Methods and materials: We retrospectively evaluated whole-body MRI examinations (1.5T; T1wTSE coronal, T2wTIRM coronal, T2wHASTE TIRM axial, and T2wTSE sagittal) of verified type-1-deletion patients and an age- and sex-matched collective of non-type-1-deletion NF1-patients (both n=38; 20 male vs 18 female; mean age deletion 26.2 years vs non-deletion 25.4 years). Patients were further divided into age-dependent subgroups (0-10; 11-18; 19-49; ≥ 50 years of age). All patients had received follow-up MRIs (mean observed time-period: deletion 6.3 vs non-deletion 5.5 years). Whole-body tumour-volume was semi-automatically assessed (MedX) and tumour-growth over time was calculated.
Results: NF1 patients with type-1-deletions showed a significantly higher tumour-burden on initial examination (mean volume 884.8 ml) compared to non-type-1-deletion patients (mean volume 357.1ml; p=0.0087) and an increased tumour-growth over time (mean growth/year deletion 61.4 ml vs non-deletion 9.2 ml; p<0.0001). Tumour-burden and tumour-growth were significantly higher for type 1 deletion patients in all age subgroups (all p<0.05).
Conclusion: NF1 caused by type 1 deletions leads to a high tumour-burden and an increased tumour-growth in affected patients.
Limitations: The relatively small number of patients studied.
Ethics committee approval: The study was approved by the local ethics review board.
Funding: No funding was received for this work.

Radiomics versus visual assessment of T2-weighted MR images: which is better to define T-stage in rectal cancer?

J. M. Moreira[1], I. Santiago[1], J. Santinha[1], V. Maniatis[2], M. Lisitskaya[3], N. Figueiredo[1], C. Matos[1], N. Papanikolaou[1]; [1]Lisbon/PT, [2]Aabenraa/DK, [3]Moscow/RU

Purpose: To evaluate radiomics performance in comparison to radiological visual assessment for the discrimination between ≤T2 and ≥T3 rectal cancer tumours on T2-weighted (T2w) MR images.
Methods and materials: This multi-institutional study included two datasets of consecutive patients with rectal cancer who underwent total mesorectal excision as primary curative treatment, without neoadjuvant therapy (n=23-institution A;

n=20-institution B). Two patient groups were formed based on pathological stage, <=T2 (n=22) and >=T3 (n=21). Patients underwent staging MRI before surgery comprising high-resolution T2w imaging. T2w images were blindly reviewed by 2 radiologists and primary tumours were classified as <=T2 or >=T3. A volume of interest around the whole primary tumour was drawn by the 2 radiologists and the corresponding datasets were analysed using PyRadiomics. Feature stability was tested using a correlation coefficient cutoff of 0.75. Feature reduction was performed, excluding highly correlated features. A general linear model (w/LASSO) was then run to select the best performance feature. Repeated cross-validation was performed. Interobserver agreement was estimated for T2w visual assessment by the 2 radiologists. A DeLong test was employed to assess if the differences between auROC were statistically significant.
Results: 'Spherical disproportion' was the best discriminator with an accuracy upon cross-validation of 72.3% +- 12.6%. The accuracy of the T2w visual analysis was 63% and 77% for the two reader with an intraclass correlation coefficient of 0.71 [95CI:0.46-0.84]. Comparison between radiomics analysis and visual analysis revealed no statistically significant differences (p=0.95 and p=0.14).
Conclusion: The performance of radiomics analysis based on T2w is similar to that of visual assessment by radiologists.
Limitations: An additional study to include radiomic features of the surroundings of the tumour might lead to better staging discrimination.
Ethics committee approval: Ethics committee approval obtained.
Funding: No funding was received for this work.

Radiomics to detect SDHx mutation in paragangliomas and pheochromocytomas on MRI

A. Tran, L. Duron, C. Lussey Lepoutre, L. Fournier*; Paris/FR*
(tranalexia@yahoo.com)

Purpose: To identify potential imaging biomarkers of SDHx mutation in paragangliomas and pheochromocytomas on MRI using radiomics.
Methods and materials: Mice with a subcutaneous tumour carrying a homozygous knockout of the SDHB gene ($SDHB^{-/-}$) or the wild type (WT) counterpart ($SDHB^{lox/lox}$) were studied on MRI, respectively 22 $SDHB^{-/-}$ and 16 WT tumours. Analysis of the True Fisp-weighted images using a radiomics workflow allowed for the extraction of 105 features. Feature reduction based on reproducibility and statistical analysis evaluated the performance of each feature to detect the SDHB mutation. The candidate features were then tested in patients with paragangliomas or pheochromocytomas: 9 with SDHx mutations, 10 with no mutation, and 13 with a mutation other than SDHx.
Results: In the 38 mice studied by MRI, 17 features were significantly different between the $SDHB^{-/-}$ tumours and WT tumours, using a Benjamini and Hochberg correction with a False Discovery Rate of 0.1. When the 17 features were tested in the 32 patients, only 2 remained significantly associated to the presence of the SDHx mutation in humans: 1) the glcm_JointEnergy (0.009 vs 0.004; p=0.03 between SDHx mutations and no mutation and p=0.003 between SDHx mutations and any mutation other than SDHx or no mutation) and 2) the glcm_JointEntropy (7.9 vs 8.6 ; p=0.01 between SDHx mutations and any mutation other than SDHx or no mutation).
Conclusion: Using radiomics and a data-driven and big-data method on MR images, a texture feature reflecting tumour heterogeneity was shown to be predictive of SDHx-mutation status both in a mouse model and in patients.
Limitations: Few SDHB patients. The Fiesta sequence is not systematic in the MRI protocol of paragangliomas and pheochromocytomas. A monocentric study.
Ethics committee approval: Ethical and regulatory authorisations were obtained for both the pre-clinical and clinical studies.
Funding: No funding was received for this work.

Radiomics analysis of gradient-echo MRI for lymph node classification in rectal cancer

J. M. Moreira, I. Santiago, J. Santinha, M. J. M. Barata, N. Shemesh, C. Matos, N. Papanikolaou*; Lisbon/PT*

Purpose: To characterise mesorectal lymph nodes (LNs) extracted from rectal cancer patients employing radiomics analysis on gradient-echo MRI images.
Methods and materials: 29 benign and 35 malignant LNs retrieved from 11N+ rectal cancer patient specimens were examined in a 16.4T scanner. A T2* multi-gradient-echo sequence was acquired (50 TEs starting at 1.6ms and 1.4ms interval). Datasets were denoised while a radiologist segmented the central slice of each node and the third echo was considered for radiomics analysis. 757 radiomics features were extracted from the original, Laplacian of Gaussian, and wavelet images. Feature extraction was performed using pyradiomics. Stratified partition was used to divide data into training (80%-52 LNs) and test sets (20%-12 LNs). Feature reduction was performed by removing near-zero and zero variance, as well as highly correlated features. Univariate analysis was performed while the Bonferroni test was employed for multiple comparisons correction. Significant features were used to create a logistic regression model, which was optimised using 100-times repeated 5-fold cross-validation. The fine-tuned model was applied to the test set and the area under the receiver operating characteristic curve (auROC) was calculated.
Results: The 5 features selected from the training set had auROCs between 0.79 and 0.82. After repeated cross-validation, the logistic regression model applied on the training set provided a mean auROC of 0.81, with a standard deviation of 0.12. The optimised logistic regression model applied to the test set provided an auROC of 0.89.
Conclusion: Radiomics analysis based on gradient-echo MRI has excellent performance for the distinction between benign and malignant mesorectal LNs extracted from rectal cancer patients.
Limitations: The low number of patients might be a limitation of this work.
Ethics committee approval: Ethics committee approval obtained.
Funding: No funding was received for this work.

Development and external validation of automatic diagnostic aid for multiple sclerosis using a radiomics analysis of white matter on clinical and quantitative MRI

E. Lavrova[1], H. C. Woodruff[1], C. Phillips[2], E. Salmon[2], E. Lommers[2], P. Lambin[1], P. Maquet[2]*; [1]Maastricht/NL, [2]Liege/BE*
(elizaveta.lavrova@uliege.be)

Purpose: To achieve high diagnostic precision in multiple sclerosis (MS) and to enable fast clinical decision support, it is necessary to monitor brain injury appearing in white matter (WM) with a reliable and robust method. We investigated the ability of a radiomics models to differentiate between MS patients and healthy subjects (HS) based on clinical T1w and quantitative MRI (qMRI) of WM.
Methods and materials: A dataset containing T1w and qMRI (R1, R2*, MT, PD maps) of 36 MS patients and 37 HS was used for training. Two external datasets containing T1w images of 359 HS and 15 MS patients were combined for validation. From each MRI scan, 107 radiomics features were extracted and feature selection with bootstrap sampling was performed on the training set. Various binary classification models informed by T1w and both single and mixed qMRI features were trained. Models were assessed using accuracy and “area under the receiver operator characteristic curve” (AUC) metrics. Classifiers based on T1w were tested on the external datasets using resampling, while qMRI models were tested on the training set using a standard cross-validation.
Results: The 5 most informative and reproducible features were selected for T1w and for quantitative MRI data. On the training (and external) datasets, the best performance was achieved by a support vector classifier using mixed qMRI features.
Conclusion: Brain WM radiomics features extracted from MRI can be used for automatic status estimation in multiple sclerosis. The best classification performance is achieved with mixed qMRI models. Models are based on simple features, which makes them easily interpretable.
Limitations: For external validation, available qMRI data is needed.
Ethics committee approval: The study was approved by the local ethic committee (approval B707201213806). Written informed consent was obtained from all participants.
Funding: Maastricht-Liege Imaging Valley, FRS-FNRS Belgium.

Exploring breast cancer response prediction to neoadjuvant systemic therapy using MRI-based radiomics: a systematic review

R. Granzier, T. Nijnatten, H. C. Woodruff, M. Smidt, M. B. I. Lobbes*; Maastricht/NL (r.granzier@maastrichtuniversity.nl)*

Purpose: MRI-based tumour response prediction to neoadjuvant systemic therapy (NST) in breast cancer patients is increasingly being studied using radiomics with outcomes that appear to be promising. The aim of this study was to systematically review the current literature and reflect on its quality.
Methods and materials: A systematic literature search was performed using PubMed and EMBASE databases until May 8th, 2019. Abstracts were read and screened by two reviewers independently. The quality of the radiomics workflow of all eligible studies was assessed using the radiomics quality score (RQS). An overview of the methodologies used in all steps of the radiomics workflow and current results are presented.
Results: 16 studies were selected for inclusion with cohort sizes ranging from 35 to 414 patients. The RQS scores varied from 0% to 41.2%. Methodologies used in the radiomics workflow varied greatly, especially for region of interest (ROI) segmentation, features selection, and model development with heterogeneous outcomes as a result. 7 studies applied univariate analysis and 9 studies applied multivariate analysis. The majority of the studies performed their analysis on the pretreatment dynamic contrast-enhanced T1 weighted (DCE T1W) sequence. Entropy was the best performing individual feature, with AUC values ranging from 0.83 to 0.85. The best performing multivariate prediction model, based on logistic regression analysis, scored an AUC of 0.94 in the validation cohort.
Conclusion: This systematic review revealed large methodological heterogeneity for each step of the MRI-based radiomics workflow, consequently, the (overall promising) results are difficult to compare. Consensus for standardisation of MRI-based radiomics workflow for tumour response prediction to NST in breast cancer patients is needed to further improve research in this field.
Limitations: Publication bias and data heterogeneity.
Ethics committee approval: n/a

MRI-based radiomics in breast cancer: feature robustness and its interoperability with respect to interobserver segmentation variability

R. Granzier, N. Verbakel, A. Ibrahim, J. van Timmeren, T. Nijnatten, R. Leijenaar, M. B. I. Lobbes, M. Smidt, H. C. Woodruff*; Maastricht/NL (r.granzier@maastrichtuniversity.nl)*

Purpose: In order to extract clinically useful information from medical images, it is of utmost importance that extracted features are reproducible and standardised. This study investigates the robustness of radiomics features, extracted using two commonly used radiomics software, with respect to interobserver manual segmentation variability on dynamic contrast-enhanced breast MRI. In addition, the differences in feature robustness and interobserver segmentation variability between easy-to-segment tumours and more challenging ones, as perceived by the expert, were investigated.
Methods and materials: 129 histologically confirmed breast tumours were segmented manually in three dimensions on the first post-contrast T1-weighted MR exam by four observers: a breast radiologist, a radiologist in training, a PhD candidate with a medical degree, and a medical student. Features were extracted using the RadiomiX and the open-source Pyradiomics softwares. Features with an intraclass correlation coefficient (ICC>0.9) were considered robust. Interobserver variability was evaluated using the volumetric Dice similarity coefficient (DSC).
Results: The mean DSC for all tumours was 0.81 (range 0.19-0.96). The mean DSC was higher for the easy tumours compared to the challenging tumours (0.83 vs 0.75, respectively, p<0.001). In total, 41.6% (552/1328) and 32.8% (273/833) of all RadiomiX and Pyradiomics features were identified as robust, respectively. Of the 94 easy tumours, 57.5% RadiomiX and 35.7% Pyradiomics features were robust. Of the 35 challenging tumours, only 17.2% RadiomiX and 28.6% Pyradiomics features were robust.
Conclusion: This study shows conclusively the intuitive notion that more complex, challenging tumours lead to less robust features, and that robust features are not simply interchangeable between radiomics software with respect to interobserver segmentation variability. Ultimately, a list of robust radiomics features which is independent of interobserver segmentation variability in breast MRI was identified for two commonly used software.

Reproducibility of radiomics in pelvic MRI: the effect of variations between readers, segmentation methodology, and software

N. Schurink, J. J. M. van Griethuysen, L. A. Min, R. G. H. Beets-Tan, S. R. van Kranen, D. M. J. Lambregts*; Amsterdam/NL*

Purpose: Although several studies have investigated the reproducibility of radiomics data derived from CT and PET/CT, data on the reproducibility of MR-based radiomics are scarce. This study aims to assess the reproducibility of radiomic features derived from pelvic MRI data and study the effects of variations between readers, segmentation methodology, and feature extraction software packages.
Methods and materials: 25 pelvic MRIs (T2W-MRI of anal cancer) were retrospectively analysed and segmented by two readers to include the: [1] whole-tumour volume and [2] largest single axial tumour-slice. Pixel intensities were normalised to mean=300/SD=100 and images were resampled isotropically (2x2x2mm^3). Radiomic features were extracted using 2 open-source packages (PyRadiomics-v2.2.0, CaPTk-v1.7.3), using comparable settings without image filtration. Segmented pixel intensities were quantised using a fixed bin width of 5. Only features defined in both packages were extracted (first-order, shape, GLCM, GLRLM, GLSZM, and NGTDM features, 51 total). For each feature, the intraclass correlation coefficient (ICC) was calculated between the [1] two readers, [2] two segmentation methods (whole-volume vs. single-slice), and [3] two software packages. When comparing segmentation methods, shape features were excluded from the analysis.
Results: Inter-reader reproducibility was moderate (20/51 features;0.5<ICC<=0.75) to good (15/51 features;0.75<ICC<=0.9). Between segmentation methods, the majority of features (in particular GLRLM, GLSZM, and NGTDM) showed poor reproducibility (31/45 features; ICC<0.5), though most first-order features showed good (7/15 features; 0.75<ICC<=0.9) to excellent (2/15 features; ICC>0.9) reproducibility. Between software packages, the majority of first-order, shape, GLCM, and GLRLM features showed excellent reproducibility (23/30 features; ICC>0.9). The remaining higher-order features (GLSZM and NGTDM) were all poorly reproducible (21/21 features; ICC<0.5).
Conclusion: Variations in software and segmentation methodology negatively affected measurement reproducibility in MRI-based radiomics, in particular for higher-order features. Inter-reader reproducibility was moderate-good.

Staging of endometrial cancer using MRI: prediction of deep myometrial infiltration using radiomics-powered machine learning

R. Del Grosso, A. Stanzione, R. Cuocolo, V. Romeo, A. Nardiello, A. Travaglino, P. P. Mainenti, L. Insabato, M. P. S. Maurea; *Naples/IT (renatadelgrosso91@gmail.com)*

Purpose: Deep myometrial invasion (≥ 50% wall thickness, DMI) is the most important morphological prognostic factor for endometrial cancer (EC). While DMI can be assessed on MRI, it often proves challenging, reader-experience dependent, and with interobserver variability. Radiomics allow quantification of tumour heterogeneity and has been successfully paired to machine learning (ML). We aimed to detect DMI in EC patients using radiomics-powered ML.
Methods and materials: One operator manually segmented lesion volumes of interest (VOIs) to extract radiomic features from T2-weighted images. Two additional readers performed lesion segmentation on 30 random patients to test feature stability. Patients were randomly split into model development and validation sets. Multistep feature reduction was performed on the first set. Only stable features (interobserver correlation coefficient ≥ 0.75) were employed. A variance threshold ≤ 0.01 was applied. Highly intercorrelated features (≥ 0.80) were also discarded. Finally, a random forest wrapper was used to select the most significant features. These were employed to train and test via 10-fold cross-validation an ensemble algorithm, a bagged J48 decision tree, whose performance was also assessed on the validation set.
Results: Retrospectively, 54 patients were identified (DMI histopathologically was proven in 17). 1,132 features were extracted and 144 were stable. Then, 21 were discarded due to low variance. After the removal of the highly intercorrelated ones, the set was reduced to 19 features. The random forest wrapper finally identified the 3 most useful ones. In the cross-validation testing, an 86% accuracy was obtained with an AUC of 0.92. In the validation set, these were respectively 91% and 0.94.
Conclusion: Radiomics-powered ML appears as a promising tool to accurately detect DMI in EC patients on MRI.
Limitations: No external validation and a small population.
Ethics committee approval: IRB approved and consent waived.

A radiomics-based model to identify the aetiology of liver cirrhosis using gadoxetic acid–enhanced MRI

A. Elkilany[1], T. Müller[1], M. Demir[1], M. Schmelzle[1], T. Denecke[2], D. Geisel[1]; *[1]Berlin/DE, [2]Leipzig/DE*

Purpose: To develop and validate a radiomics-based model as a noninvasive method for the accurate detection of the cause of liver cirrhosis using gadoxetic acid-enhanced magnetic resonance imaging (MRI).
Methods and materials: In this retrospective study, 104 patients (68 male, 36 female; mean age, 61.38 ± 12.8 years; age range, 22–84 years) with a known aetiology of liver cirrhosis who underwent gadoxetic acid-enhanced MRI between January 2014 and August 2019 were included. The patients were classified into 4 groups according to the aetiology of liver cirrhosis: 30 patients had alcoholic cirrhosis, 40 patients had hepatitis-induced cirrhosis, 18 patients had cirrhosis due to primary sclerosing cholangitis (PSC), and 15 patients had cirrhosis following non-alcoholic steatohepatitis (NASH). Radiomics features were extracted from the hepatobiliary phase of gadoxetic acid-enhanced MRI on 2D and 3D region of interest samples using LIFEx, version 5.10. Then, radiomic signatures were classified using a fine Gaussian support vector machine (SVM) as a classification method using a one-vs-one multiclass Gaussian kernel in MathWorks MATLAB R2019b.
Results: The radiomics model demonstrated a 99.5% accuracy in identifying the aetiology of the liver cirrhosis, preliminary without validation of the classification.
Conclusion: Radiomics analysis of gadoxetic acid-enhanced MRI is a promising approach to identify the aetiology of liver cirrhosis.
Limitations: No limitations.

Pituitary adenoma surgical consistency prediction on T2-weighted MRI: a radiomics machine learning analysis

M. B. Cipullo[1], R. Cuocolo[1], L. Ugga[2], D. Solari[1], A. D' Amico[3], L. M. Cavallo[1], P. Cappabianca[1], A. Brunetti[1]; *[1]Naples/IT, [2]Scafati/IT, [3]Salerno/IT*

Purpose: Pituitary macroadenomas are the most common tumours of the pituitary gland. As far as they are usually soft masses, some of them may present with a harder consistency, making it difficult to remove them by using their standard surgical technique, transsphenoidal adenomectomy. The objective of the following study was to determine the accuracy of machine learning texture analysis in assessing the consistency of pituitary macroadenomas in patients subdued to endoscopic endonasal surgery.
Methods and materials: A total of 89 patients (68 soft, 11 rubbery, and 10 fibrous adenomas) who underwent an endoscopic endonasal procedure for pituitary adenoma removal were retrospectively included. Two readers independently segmented the lesions on T2-weighted MR images for the extraction and stability testing of radiomic features. Oversampling of the minority classes was used to balance the data. A 75/25% training-testing split was used for model validation. During feature selection on the training data, unstable, low-variance, and highly-intercorrelated parameters were removed. Subsequently, the most informative features were identified with a random forest-based wrapper and a random forest was employed for consistency prediction in the validation set.
Results: Of the 1,118 features extracted, 599 were stable with an ICC >= 0.90. Only one of these showed a variance <= 0.01, while 526 were highly intercorrelated (>= 0.80). Among the remaining 72 features, the wrapper selected 10 as most useful. The finalised random forest model achieved an overall accuracy of 84.31% with an AUC of 0.97.
Conclusion: Radiomics and machine learning showed high accuracy in the prediction of pituitary adenoma consistency on pre-operative T2-weighted MR images, promising to be a useful tool in the surgical approach choice.
Limitations: A single institution study.
Ethics committee approval: IRB approved. Written informed consent was waived.
Funding: No funding was received for this work.

Using magnetic resonance-based machine learning radiomics to predict diagnosis and prognosis in gliosarcoma

X. Yi[1], B. Chen[2], J. Li[1]; *[1]Changsha/CN, [2]Los Angeles/US (yixiaoping@csu.edu.cn)*

Purpose: To develop and evaluate a MRI derived machine learning radiomics method to preoperatively differentiate gliosarcoma (GSM) from glioblastoma (GBM) and predict survival.
Methods and materials: A single-centre retrospective review was conducted on 39 GSM patients and 316 GBM patients [training cohort: GSM n=27, GBM n=221; validation cohort: GSM n=12, GBM n=95]. Machine learning radiomics models were built by combining the least absolute shrinkage and selection operator (LASSO), random forest (RF), and support vector machine (SVM) methods.
Results: The final SVM model provided an AUC of 0.9420 (95% CI: 0.8922–0.9918) with an accuracy of 0.9280 (95% CI: 0.8119-0.9760) in the training cohort and an AUC of 0.9447 (95% CI: 0.9025–0.9870) with an accuracy of 0.8972 (95% CI: 0.8318-0.9533) in the validation cohort. A radiomics score (Rad-score) was calculated which was computed based on Cox regression coefficients of the multivariate Cox regression. All GSM patients were separated into two groups, the low and high risk groups, which are the patients with Risk-score ≤median and Risk-score > median, respectively. The result of a lokrank test indicated that the median survival of the two groups was statistically significant (P = 0.00007).

Conclusion: This study presents a pre-enhanced MRI image-based machine learning radiomics method that could potentially facilitate the preoperative identification of GSM tumour from GBM and predict the prognosis for GSM.
Limitations: Our study was a retrospective study conducted in a single institution. Therefore, there might be case selection bias and a shortage of accurate radiology-pathology correlation study to reveal the underlying pathology.
Ethics committee approval: Our Institutional Review Board approved this retrospective study (No. 201709995) and waived informed consents as this study was retrospective.
Funding: This study is partially supported by China Postdoctoral Science Foundation funded project (2018M632997).

MRI-based radiomics to predict treatment outcome in oropharyngeal cancer patients
P. Bos[1], M. W. M. van Den Brekel[1], Z. A. R. Gouw[1], A. Al-Mamgani[1], M. Taghavi[1], C. Parmar[2], H. J. W. L. Aerts[2], R. G. H. Beets-Tan[1], B. Jasperse[1]; [1]*Amsterdam/NL,* [2]*Boston, MA/US (pa.bos@nki.nl)*

Purpose: Prognostic markers calculated from diagnostic imaging, also called radiomics, have shown promising results in predicting treatment outcomes of different cancer types. This study assessed MR-based radiomics to predict locoregional failure (LRF) after chemoradiation treatment in oropharyngeal squamous cell carcinoma (OPSCC) patients. The added value of radiomic features to traditional clinical outcome predictors was evaluated.
Methods and materials: 177 patients were included in the study, 76 (43%) HPV positive tumours and 77 (44%) negative HPV tumours. Pretreatment MRI, clinical variables, and outcome data were retrospectively collected from OPSCC patients. In addition, 824 radiomic features were extracted within the manually delineated primary tumour region. Three machine learning models based on either clinical variables (clinical model), radiomic features (radiomic model), and both combined (combined model) were created. The latter two were constructed using wrapper feature selection in combination with random forest, while the clinical model was based on a support vector machine. Prediction quality was assessed using area under the curve (AUC). Different models were compared using the McNeil test. All analyses were performed for the total population and stratified for the tumour human papillomavirus (HPV) status.
Results: Within the total patient cohort, the radiomic model showed the best predictive performance with an AUC of 0.65 compared to the clinical model (AUC: 0.41, p=0.04) and combined model (AUC: 0.63, p=0.07). The same trend was seen in HPV subgroups, however, without reaching statistical significance.
Conclusion: MR-based radiomics is able to predict LRF after chemoradiation in OPSCC patients and performed better compared to clinical variables.
Limitations: All patients were selected from a single-centre while applying radiomics in multicentre cohorts is preferred. Another limitation is the single reader design of the delineations.

The additional utility of ultrafast MRI on conventional DCE-MRI in evaluating preoperative MRI of breast cancer patients
A. Y. Park, S. J. Lee, K. H. Ko, H. K. Jung, J. E. Koh*; Seongnam-si/KR*

Purpose: To investigate whether the additional use of ultrafast MRI can improve the diagnostic performance of conventional dynamic contrast-enhanced MRI (DCE-MRI) in evaluating MRI-detected lesions in breast cancer patients.
Methods and materials: This retrospective study enrolled 103 consecutive breast cancer patients with 204 breast lesions (62 benign and 142 malignant) who underwent preoperative DCE-MRI with ultrafast imaging (9 image sets with 6.5-second temporal resolution). Two reviewers assessed the BI-RADS categories of breast lesions using conventional DCE-MRI and assessed the following parameters on the ultrafast MRI: initial enhancement phase, maximum relative enhancement, slope, and maximum slope ($slope_{max}$) on the kinetic curve. Interobserver agreement was analysed between the two reviewers. The ultrafast MRI parameters were compared between benign and malignant tumours, and cut-off values were determined. For 97 additional MRI-detected lesions, the BI-RADS category was re-assessed using the cut-off values and the diagnostic performance was compared between the conventional DCE-MRI and the combined conventional and ultrafast DCE-MRI.
Results: All ultrafast MRI parameters differed significantly between malignant and benign tumours (all, p<0.001). Initial enhancement phase by reviewer and $slope_{max}$ were the top two parameters showing significant differences between benign and malignant tumours with high reliability. With the use of cut-off values for initial enhancement phase (≤phase 2) and $slope_{max}$ (>9.8%/sec), the specificity of conventional DCE-MRI was significantly increased (29.4% vs 64.7%, p<0.001) without loss of sensitivity (100% vs 88.2%, p=0.157) in evaluating masses.
Conclusion: The additional use of ultrafast MRI can improve the specificity of conventional DCE-MRI when evaluating MRI-detected masses in breast cancer patients.
Limitations: A large proportion of malignant lesions might have influenced the study results. The kinetic curve analysis for conventional and ultrafast DCE-MRI was performed by manually selecting the most enhanced voxel.

The usefulness of postoperative surveillance MR for women after breast-conservation therapy: focusing on MR features of early and late recurrent breast cancer
H. Kim[1], J. Lee[1], H. Kim[2], B. J. Kang[1], S. H. Kim[1]; [1]*Seoul/KR,* [2]*Cheonbo-ro/KR (amgaemi@gmail.com)*

Purpose: To investigate the diagnostic performance of mammography, ultrasonography, and breast magnetic resonance imaging (MRI) for early and late recurrences in patients who underwent breast-conservation therapy (BCT) for breast cancer.
Methods and materials: This retrospective study was conducted between January 2014 and August 2018. 1,312 women with 2,026 surveillance breast MR examinations after BCT were studied. We assessed the cancer detection rate of each postoperative imaging modalities and feature of recurrent lesion in postoperative MRI.
Results: Of 2,026 cases of surveillance postoperative MRI, 103 cases were confirmed as recurrent breast cancer through biopsy. 31 cases occurred within 12 months after BCT, which was defined as an early recurrence. The other 72 cases were found to recur after 13 months after BCT and were defined as late recurrence. There were no statistically significant differences between 2 groups for patients' demographics with p > 0.05, except for the presence of symptoms. In both early and late recurrence groups, MRI showed a significantly higher cancer detection rate than other modalities (p < 0.01), and there were cases which could be diagnosed by postoperative MRI only. Recurrent lesions showed fast enhancement in the early phase regardless of their delayed phase pattern in the early recurrence group. In the late recurrence group, recurrences also showed significantly fast enhancement in the early phase, but they showed a washout pattern in the delayed phase.

Conclusion: In breast cancer patients with BCT, breast MRI showed a significantly higher cancer detection rate than others. The fast enhancing lesion in the early phase of postoperative MRI should be conscious and need further workup, such as biopsy, due to the high possibility of recurrence.

A systematic review on variability in studies of breast diffusion-weighted imaging for treatment monitoring

K. van der Hoogt, R.-J. Schipper, G. Winter-Warnars, L. C. Ter Beek, C. Loo, R. M. Mann, R. G. H. Beets-Tan*; Amsterdam/NL*

Purpose: Breast diffusion-weighted imaging (DWI) appears to have strong potential for prediction of therapy outcome in patients treated with neoadjuvant systemic therapy (NST). While summary statistics show decent results in recent meta-analyses, absolute data are variable between studies. This systematic review aims to identify methodological differences between studies and their effect on reported results in order to improve the value of DWI as a biomarker for the monitoring of NST.
Methods and materials: Pubmed was searched for papers reporting on DWI for response prediction/monitoring/evaluation of NST in breast cancer, published before February 2019. The selection was first performed on title/abstract by two independent researchers and, subsequently, full texts were screened for eligibility. Quality of selected studies was assessed using QUADAS2. Population and cancer characteristics (e.g. age, tumour types, type of NST), MRI parameters (e.g. field strength, b-values, voxel size), and post-processing approaches (e.g. ADC mapping, region of interest (ROI) selection) were extracted.
Results: The search yielded 31 papers. After assessment, 15 papers were included in this analysis. Risk of bias of included studies was low. Studies varied with regard to breast cancer types, NST types and pCR-definition (in-/exclusion of residual DCIS). Technical variation was observed in MRI-settings including b-values, ROI-selection, and timing of the MRI scans. These differences all contribute to the observed overlapping ranges of ADC values for pCR and non-pCR.
Conclusion: This systematic review reveals strong heterogeneity in DWI-studies on prediction of NST response. Consequently, DWI metrics for response monitoring should be interpreted with caution. Standardisation of the technique is important.
Limitations: The risk of bias of included studies was low.

A novel model for the evaluation of breast DWI: is it possible to predict BI-RADS categories?

Y. Selek[1], I. Durur Subaşi[2], A. T. Arikok[1], B. Hekimoğlu[1]; [1]*Ankara/TR,* [2]*Istanbul/TR (irmakdurur@yahoo.com)*

Purpose: To determine BI-RADS categories of patients based on diffusion-weighted imaging (DWI) by a novel evaluation model and compare DWI-derived categories to the previous multiparametric magnetic resonance imaging (MP-MRI) interpretations of the same group and the histopathology data.
Methods and materials: The anonymised DWIs of consecutive 400 patients were evaluated retrospectively according to a classification system based on lesion morphology and pattern of diffusion changes. To investigate the performance of DWI, the highest BI-RADS category for each patient was determined and the results were compared with BI-RADS categories found in MP-MRI reports, and, in possible cases, were also compared to pathology results. nADC values were measured and the diagnostic performance of nADC in benign and malignant discrimination and the threshold values were analysed.
Results: Evaluation system based on DWI findings provided 64% sensitivity, 98% specificity, 90% positive predictive value (PPV), 89% negative predictive value (NPV), and 89.5% accuracy when the MP-MRI was accepted as the reference standard. 87% sensitivity, 68% specificity, 70% PPV, 86% NPV, and 77% accuracy were determined according to pathology results. A threshold value of 0.784 for nADC provided 68% sensitivity, 73% specificity, 72% PPV, 69% NPV, and 71% accuracy for benign-malignant discrimination. nADC values were significantly lower in malignant lesions.
Conclusion: In this study, DWI-derived new conceptualise provided acceptable accuracy rates. Although DWI is a functional examination, its morphological data may also aid in the characterisation of suspicion of lesions.
Limitations: The evaluation was made by two radiologists in consensus, intraobserver and interobserver comparisons could not be made. For technical reasons, some patients were excluded. No reflection of the general population due to MRI indications. Retrospective design.
Ethics committee approval: DYBEAH 29.04.2019-62/18.
Funding: No funding was received for this work.

RPS 602a-5 11:49

Diffusion-weighted imaging for breast lesion detection and characterisation: additional value of synthetic higher b-values

I. Daimiel Naranjo, R. Lo Gullo, C. Rossi Saccarelli, A. Bitencourt, S. Thakur, E. A. Morris, K. Pinker-Domenig;
New York, NY/US

Purpose: To assess the performance of diffusion-weighted imaging (DWI) for breast cancer detection and characterisation by combining acquired b-values (800 s/mm2) and different synthetic b-values (1000, 1200, 1500, and 1800 s/mm2).
Methods and materials: In this IRB-approved retrospective study, 80 women with 103 benign and malignant breast lesions underwent multiparametric breast MRI at 3T with dynamic contrast-enhanced images (DCE-MRI) and DWI were included. Three readers (r1, r2, r3) independently evaluated CE-MRI and DWI combined with ADC maps for lesion visibility, malignancy likelihood, and preferred b-value. Histopathology was the standard of reference for all the lesions.
Results: Synthetic intermediate b-values (1200–1500 s/mm2) provided the best lesion conspicuity and image quality across all readers. Only 9 (8.7%) enhancing lesions (5 benign, 4 malignant) were missed by all readers, comprising diffuse tumours and masses <1cm. Overall lesion detectability for DWI ranged between 79.6%-83.4% and was 100% for DCE-MRI.
Sensitivity and specificity for lesion characterisation with DWI was r1 61.7% and 94.1%, r2 61.7% and 82.4%, and r3 65% and 82.4%, respectively. Sensitivity and specificity for DCE-MRI was r1 88.3% and 76.5%, 95% and 50%, and r3 86.7% and 70.6%. DWI was significantly less sensitive across all readers ($p<0.001$) but significantly more specific for two readers ($p=0.007$) than DCE-MRI.
Conclusion: Synthetic intermediate b-values (1200–1500 s/mm2) provided the best lesion conspicuity and image quality. DWI with synthetic high b-values increases specificity as a valuable adjunct to DCE-MRI.
Limitations: No normal cases were included in this study and therefore specificity values were unable to be obtained for lesion detectability.
Ethics committee approval: IRB-approved.

Value of multiparametric MRI with dynamic contrast-enhanced and diffusion-weighted imaging in non-mass enhancing breast tumours

M. A. Marino[1], D. B. Avendano[2], D. Leithner[3], P. Clauser[4], S. Thakur[5], P. A. T. Baltzer[4], M. S. Jochelson[5], E. A. Morris[5], K. Pinker-Domenig[5];
[1]*Messina/IT,* [2]*Monterrey, Nuevo Leon/MX,* [3]*Frankfurt am Main/DE,* [4]*Vienna/AT,* [5]*New York, NY/US (mariaadele.marino@gmail.com)*

Purpose: To evaluate the diagnostic performance of multiparametric magnetic resonance imaging (mpMRI) with dynamic contrast-enhanced (DCE) and diffusion-weighted imaging (DWI) in non-mass enhancing (NME) breast tumours.
Methods and materials: A prospectively populated database was searched for patients who underwent MRI of the breast with T2wi, DWI, and DCE MRI for a BIRADS 45 imaging abnormality, and demonstrated a suspicious NME tumour on DCE-MRI NME according to the 5th edition of the BI-RADS lexicon. Two readers independently assessed DWI and DCE, as well as the two combined as mpMRI. Appropriate statistical tests were used to compare diagnostic values with respect to sensitivity, specificity, diagnostic accuracy, and AUC.
Results: 66 patients with 66 NME breast lesions were included: 37/66 (56%) malignant and 29/66 (44%) non-malignant. DCE-MRI had a sensitivity and specificity of 94.9%, 67% (r1) and 100%, 77.8% (r2). DWI 84.1%,55.6% (r1) and 76.9%,81.5% (r2), respectively. Diagnostic accuracy was 78.8% (r1), 72.7% (r2) for DWI, and 83.3% (r1), 90.1% (r2) for DCE-MRI, respectively. When both parameters were used together as mpMRI, sensitivity was 87.2% (r1), 90% (r2), and specificity 85.2% (r1 and r2), resulting in the best diagnostic accuracy of 90.6% (r1) and 86.2% (r2). MpMRI allowed a reduction of false positives of 33.3% (6 vs 4) (r1) and 55.5% (9 vs 4) (r2). There was substantial inter-reader agreement for both DCE-MRI and MpMRI readings (k=0.610 vs k=0.719), while scarce for DWI (k=0.380)
Conclusion: Multiparametric MRI using DWI and DCE-MRI increases diagnostic accuracy for breast cancer detection for lesions presenting as NME on DCE MRI.
Limitations: Retrospective study.
Ethics committee approval: Institutional review board-approved study
Funding: Breast Cancer Research Foundation.

RPS 602a-7 12:01

A multiparametric approach of diagnosing breast lesions using diffusion-weighted imaging and ultrafast dynamic contrast-enhanced MRI

A. Ohashi[1], M. Kataoka[1], M. Iima[1], M. Honda[1], Y. Urushibata[2], M. Nickel[3], E. Weiland[3], M. Toi[1], K. Togashi[1]; [1]Kyoto/JP, [2]Tokyo/JP, [3]Erlangen/DE (amaoh135@gmail.com)

Purpose: We aimed to evaluate the diagnostic performance of multiparametric approach for breast lesions using maximum slope (MS) from ultrafast dynamic contrast-enhanced (UF-DCE) sequence, apparent diffusion coefficient (ADC), lesion size, and patient's age.
Methods and materials: Two different groups with different UF-DCE sequences were analysed. Group 1: 204 lesions (152 malignant, 52 benign) with k-space-weighted image contrast (KWIC) sequence, and group 2: 114 lesions (78 malignant, 36 benign) with improved 3D-gradient-echo volumetric interpolated breath-hold examination (VIBE) sequence with compressed sensing (both were prototype sequences). Each UF-DCE sequence acquired the image up to 1 min after gadolinium injection. DWI sequences were the same between two groups with b value of 0 and 1,000 s/mm^2. MS and ADC values were measured by two radiologists and their inter-reader agreements were evaluated using intra-class correlation coefficients (ICC). MS derived from UF-DCE sequences, ADC value from DWI, lesion size, and patients' age were used for a multiparametric model using ROC analysis. Univariate and multivariate logistic regression analysis were performed.
Results: Inter-rater agreements were excellent (≥0.95). Univariate logistic regression analysis showed that all parameters differed significantly between malignant and benign lesion (p<0.05). AUC of MS and ADC were 0.74/ 0.92 in group 1 and 0.77/ 0.86 in group 2. The combination of all parameters using multiparametric model yielded an AUC of 0.95 for group 1 and 0.91 for group 2, respectively.
Conclusion: A multiparametric approach based on UF-DCE MRI, DWI, lesion size, and patient's age provides excellent diagnostic performance.
Limitations: Retrospective design.
Ethics committee approval: This study protocol was approved by our institutional review board. The written informed consent was waived because of the retrospective design.

Comparing zoom diffusion-weighted imaging with standard diffusion-weighted imaging in MRI of the breasts

S. Panwar, H. Mahajan, R. Bhattacharjee; New Delhi/IN (panshikha@rediffmail.com)

Purpose: Diffusion-weighted imaging (DWI) forms an integral part of breast MRI to detect cancer and assess disease response following neoadjuvant chemotherapy. Apparent diffusion coefficient (ADC) allows quantification of diffusion signal and facilitates differentiating benign from malignant lesions. Zoom DWI combines 2D spatially-selective RF excitation pulses for single-shot echo-planar-imaging with reduced field-of-view in the phase-encoding direction. It leads to a decreased number of k-space acquisition lines, significantly shortening EPI echo train and susceptibility artefacts, hence reducing image distortion and blurr. This study evaluates the feasibility of zoom DWI versus standard DWI in terms of ADC quantification.
Methods and materials: 25 patients with 30 lesions, 18 malignant, including 3 post NACT followup, and 12 benign (histopathologically proven) were scanned on 3T MRI, Ingenia, Philips, using a dedicated multichannel phased-array breast coil. The comparative protocol comprised of zoom DWI and routine DWI sequence (b0 & b1000). Both sets of images were used to generate ADC maps using in-house diffusion tool. ROI were drawn at corresponding points to obtain ADC1 (zoom DWI) and ADC2 (routine DWI) by the same radiologist with 14 years experience in reading breast MRI. The mean and standard deviation of ADC values were noted.
Results: ADC1 values were lower than ADC2 in malignant lesions and were higher in most benign and post NACT lesions. Reference cut-off used for malignant lesions was < 1.2x10-2 mm2/s and for benign > 1.2. The explanation could be better image quality with less or no image distortion, blurring, and aliasing in zoom DWI, hence improved ADC map generation and accurate quantification.
Conclusion: Zoom DWI enables accurate breast lesion characterisation, especially for those with borderline ADC values, into benign and malignant on 3T imaging due to better image quality.

Diffusion with very high b-value in breast MRI: the end of the contrast injection?

H. Hamri[1], Z. Jolibois[2], M. Scholer[3], E. Weiland[2], C. de Bazelaire[2]; [1]Rabat/MA, [2]Paris/FR, [3]Vincennes/FR (hamri.hajar@yahoo.fr)

Purpose: To evaluate the diagnostic yield of diffusion-weighted imaging (DWI) with very high b-value combined with T2 weighted sequence in breast MRI.
Methods and materials: 130 patients were included consecutively in this retrospective study approved by our IRB.
All patients underwent breast MRI (MAGNETOM Aera, Siemens 1.5T, 18-channel breast antenna) with a 2D-SS-EPI-SPAIR diffusion sequence (TR/TE: 5200/67ms, b 2500s/mm²) in addition to the standard protocol with 2D-T1-FSE, 3D-T2-SPAIR, and 3D-T1-VIBE-SPAIR -DCE.
Two independent readings were performed by 2 radiologists in consensus: 1) combined analysis of the DWI and T2W sequences, and 2) analysis of the standard protocol according to BIRADS lexicon. All findings with hypersignal DWI and low T2 signal were considered as suspicious. All suspicious lesions were biopsied. BIRADS 1-3 lesions had at least 2 years follow-up or histological proof. Diagnostic yields were compared using ROC curves.
Results: A total of 180 lesions were analysed of which 27% were malignant. Low sensitivity but higher specificity were found with the combined analysis of DWI and T2W sequences compared with T1W, T2W, and DCE sequences (92%, 92% vs 96%, 82%, respectively). However, the comparison of ROC curves showed no significant difference (AUC= 0.92 vs 0.89, respectively, p= 0,364).

Conclusion: Combined analysis of DWI with a b-value of 2500s/mm² and T2W sequences could be a reliable alternative to gadolinium injection, particularly for the screening of women with a high risk of breast cancer.
Limitations: No ADC calculated with a single b-value of 2500s/mm².
Ethics committee approval: Study approved by our institutional review board.

RPS 602a-10 12:19
Feasibility of diffusion-weighted imaging (DWI) for lesion localisation during MRI-guided breast biopsy avoiding contrast-agent administration: a single-centre experience
S. Storer, R. Menghini, L. Camera, S. A. Montemezzi*; Verona/IT (storersilvia@gmail.com)*

Purpose: MRI-guided breast vacuum biopsy is used to analyse suspicious lesions if no correlation is found on US or mammography. DWI employs the differential diffusion rate of water molecules in normal and pathologic tissue, while contrast-enhanced (CE) sequences reflect tissue vascularity. Our purpose was to evaluate the feasibility of DWI for targeting lesions in MRI-guided breast biopsy without applying a contrast agent.
Methods and materials: Out of 59 MRI-guided breast biopsies performed in our institution between January 2019 and September 2019, 29 patients acquired both DWI (b value 1300 s/mm^2) and dynamic contrast-enhanced (CE) sequences during the biopsy to target the lesion in a 3T Machine. The puncture was carried out using a coaxial 9G system and DWI was repeated to evaluate the correct position of the needle. Finally, a site marker was placed.
Results: Out of 29 lesions, 21 presented DWI restriction (9 resulted B5-, 6 B2-, 6 B3-lesions). 19 lesions presented "mass-like" enhancement (size 5 mm-30 mm) and 14 of them (73,7%) demonstrated diffusion restriction, 10 lesions presented "non-mass" enhancement (5 mm-35 mm) and 7 of them showed DWI restriction (70%). DWI acquisition time was shorter than CE-sequences (4.26 min vs 5.35 min).
Correct positioning of coaxial system was confirmed on DWI as a signal loss (2 cases were limited by artefacts due to anaesthetic injection). The site marker was identified using T1-weighted images (acquisition time 1.52 min).
Conclusion: DWI can been used as an alternative to dynamic sequences for targeting lesions with a minimum size of 5 mm, mainly with "mass-like" enhancement. The most important advantages of this approach are targeting bilateral lesions, reducing use of contrast agent, with a shorter acquisition time.

Breast DTI: mean diffusivity and fractional anisotropy of IDC and DCIS
M. Nadrljanski, Z. Milosevic*; Belgrade/RS (dr.m.nadrljanski@gmail.com)*

Purpose: To assess breast DTI (mean diffusivity (MD) and fractional anisotropy (FA)) in patients with invasive ductal carcinoma (IDC) and ductal carcinoma in situ (DCIS) in comparison with DWI (apparent diffusion coefficient (ADC)).
Methods and materials: A retrospective analysis of breast MRI (N=30) included consecutive patients with unilateral lesion: IDC (n1=15) and DCIS (n2=15). All patients were examined with a 1.5T MRI system with DTI and DCE sequences. FA, MD, and ADC were computed for all lesions, and FA and MD were computed for parenchyma. Mann Whitney U test and Spearman correlations were performed.
Results: MD is significantly different between IDC and DCIS: 0.991+/-0.006 vs. 1.331+/-0.053, p<0.0001. FA is not considered significantly different between IDC and DCIS: 0.300+/-0.021 vs. 0.318+/-0.027, p=0.085. MD and FA are considered significantly different between DCIS and parenchyma (1.331+/-0.053 vs. 1.627+/-0.026, p<0.0001; 0.318+/-0.027 vs. 0.351+/-0.021, p=0.002, respectively). Correlation between DTI parameters in DCIS (MD and FA) and ADC was considered significant (r=0.581, p=0.023; r=0.710, p=0.003, respectively).
Conclusion: MD in DCIS is significantly lower in comparison with values for IDC and is significantly higher than parenchymal MD. FA is significantly different in DCIS compared to parenchyma. In correlation with ADC, DTI parameters may contribute to a better characterisation of non-mass enhancement.
Limitations: A retrospective, single-centre study on a small sample of patients may lead to lower generalisability. Manually drawn ROI definition may be the source of bias. Technical limitations include EPI-based artefacts and the 1.5T field strength in DTI.
Ethics committee approval: Referent board approval obtained for retrospective analysis.
Funding: No funding was received for this work.

Similar but not identical: radiomic analyses of areas with late gadolinium enhancement in patients with ischaemic and non-ischaemic disease
L. Baffoni1, A. Cavaliere[2], R. Motta[2], B. Giorgi[2], R. Stramare[2], M. de Lazzari[2], M. Perazzolo Marra[2], E. Quaia[2], C. Giraudo[2]*; [1]Montebelluna/IT, [2]Padua/IT (baffoniluca@gmail.com)*

Purpose: To characterise by radiomic analyses the injured myocardial tissue, shown via late gadolinium enhancement MR imaging, of patients with ischaemic (ISd) and non-ischaemic (nISd) myocardial disease.
Methods and materials: Patients with ISd and nISd who underwent a contrast-enhanced cardiac MR from January 2018 to May 2019 were included in this retrospective study. One radiologist expert in cardiovascular imaging, blind to the clinical information, applied a 3 mm standardised region of interest (i.e. using the phase-sensitive inversion recovery images) on the scar of the myocardial tissue of each patient, using a 3D slicer. 56 radiomic features belonging to three categories were extracted: first-order statistics (FOS), grey-level co-occurrence matrix (GLCM), and grey-level run length matrix (GLRLM). The student's t-test was used to compare the two groups of patients for each radiomic feature (p<0.05). The accuracy of the variables showing a statistically significant difference was assessed by receiver operating characteristic curves.
Results: 10 patients with ISd (1 female; mean age±SD 60.6±10.8 yrs) and 11 nISd (3 females, mean age±SD 51.8±21.4 yrs) were examined. For 41 out of the 56 investigated features, a significant difference between the two groups occurred (8 FOS, 17 GLCM, and 16 GLRLM; p<0.05 each). The area under the curve was excellent only for Imc1 (AUC=.982) and good only for minimum and the tenth percentile (respectively AUC=.773 and AUC=.782). All other features showed a low accuracy.
Conclusion: 3 features can be considered as good radiomic markers of ischaemic injury. Radiomic analyses support that ischaemic injuries differ from non-ischaemic lesions, despite both appearing visually very similar on late gadolinium enhanced MR sequence.
Limitations: Future studies on a larger population are necessary to confirm this finding and its clinical implications.
Ethics committee approval: Ethics committee approval obtained.

Global longitudinal diastolic strain rate as an early marker for predicting adverse outcomes in hypertrophic cardiomyopathy by cardiac magnetic resonance feature tracking
X. Chunchao, Z. Li; *Chengdu/CN*
(xiachunchao@126.com)

Purpose: Diastolic dysfunction acts as one of the predominant mechanisms responsible for main adverse cardiovascular events (MACE) in hypertrophic cardiomyopathy (HCM). The aim of this study is to explore the potential value of global diastolic strain-rate (PDSR) derived from cardiac magnetic resonance feature tracking (CMR-FT) in predicting adverse outcomes in HCM population.
Methods and materials: 98 HCM patients [including 44 patients with left ventricular outflow tract obstruction (LVOTO) and 54 patients without] were enrolled and followed for a mean (+SD) of 4.50 ± 1.89 years. LV global myocardial mechanics were assessed for each one by CMR-FT at study entry.
Results: Compared with the nonobstructive subgroup, the obstructive subgroup demonstrated a deteriorated magnitude of LV global radial, circumferential, and longitudinal peak diastolic strain rate (PDSR) at study entry (all $P < 0.05$). During a long-term follow-up, a total of 24 patients suffered from MACE. Furthermore, when applying the specified cut-off value of 0.33 1/s for longitudinal PDSR, the Kaplan-Meier curve demonstrated that patients with lower longitudinal PDSR experienced significantly lower freedom from MACE when compared with their counterparts among nonobstructive, obstructive, and overall cohorts, respectively (all log-rank $P < 0.05$). Multivariable analysis demonstrated that longitudinal PDSR remained the independent predictor of outcome despite adjusting for other confounding factors (hazard ratio: 3.17, 95% confidence interval: 1.20-8.37; $P < 0.05$).
Conclusion: CMR-FT derived longitudinal PDSR probably serves as an early marker for predicting adverse outcomes in an HCM population, which is beneficial for risk stratification. Further confirmatory studies are needed.
Limitations: A limited study population and retrospective nature of the study.
Ethics committee approval: The institutional ethics committee of our hospital approved this retrospective study.
Funding: 1.3.5 project for disciplines of excellence, West China Hospital, Sichuan University.

Rare disease: cardiac risk assessment with MRI in patients with myotonic dystrophy type 1
M. Alì, C. B. Monti, R. Cardani, L. Melazzini, F. Secchi, G. Meola, F. Sardanelli; *Milan/IT (marco.ali90@gmail.com)*

Purpose: To evaluate myocardial extracellular volume and strain in myotonic dystrophy type I patient (DM1) and appraise whether they could be viable imaging-biomarkers of subclinical cardiac pathology.
Methods and materials: We retrospectively analysed 9 DM1 without apparent cardiac disease who had undergone a cardiac magnetic resonance (CMR) examination. They were age- and sex-matched with healthy controls. Cardiac strain (CS) and extracellular volume (ECV) were calculated from CMR images. Mann-Whitney U test was used to compare independent distributions, Spearman's ρ for correlations, and t-test was used to compare the ECV obtained in DM1 with that in healthy subjects. Data was reported as median and interquartile range.
Results: The main findings were the follows:
- Global CS (-19.1%;-20.5%,-16.5%) in DM1 was lower ($p=0.011$) than that in controls (-21.7%;-22.7%,-21.3%).
- Global ECV in DM1 (32.3%;29.3%,36.8%) was significantly ($p=0.008$) lower than that reported in literature (Di Leo et al. Eur Radiol. 2019) in healthy subjects (25.6%;19.9%,31.9%).
- Global CS showed a strong, positive correlation with septal CS ($\rho=0.767$, $p=0.016$) and with both global ($\rho=0.733$ $p=0.025$) and septal ECV ($\rho=0.767$, $p=0.016$). A very strong positive correlation was observed between global ECV and septal ECV ($\rho=0.983$, $p<0.001$).
Conclusion: In DM1, the increase in ECV and decrease in CS may be taken into consideration as a trigger for follow-up and implementation of preventive measures. Physicians dealing with DM1 may potentially take into consideration CMR as an early screening tool to identify initial cardiac involvement.
Limitations: A small sample size due to the prevalence of DM1 in the population.
Ethics committee approval: Ethics committee approved.
Funding: No funding was received for this work.

Right ventricular involvement in Fabry's disease
T. Emrich[1], S. Benz[1], I. A. Abidoye[2], C. Düber[1], L. Arash-Kaps[1], J. B. Hennermann[1], C. Kampmann[1], K.-F. Kreitner[1]; *[1]Mainz/DE, [2]Ado-Ekiti/NG (tilman.emrich@gmail.com)*

Purpose: Involvement of the right ventricle is associated with a poor prognosis in several cardiomyopathies because of the increased risk for arrhythmias and subsequent sudden cardiac arrest. In Fabry's disease (FD), the myocardium is affected by the accumulation of sphingolipids. Current diagnostic tests for cardiac involvement in FD focus on the left ventricle. The purpose of this retrospective study was to evaluate right ventricular involvement in FD by CMR.
Methods and materials: We compared 61 FD patients and 56 healthy volunteers using CMR at 3T. T1 mapping, mass, and global strains were acquired for both ventricles using dedicated software. For group analysis, FD patients were divided by the severity of cardiac involvement into three stages.
Results: RV mass rose with increasing accumulation of sphingolipids. All feature tracking strain parameters of the right ventricle showed significant differences in comparison with healthy volunteers ($p<0.0001$). The most altered parameter was global right ventricular longitudinal strain with a mean of -25.3% (± 8.4) for healthy volunteers and -17.1% (±5.8) in FD. Split by the different stages of cardiac involvement, the decrease of strain parameters rose with a higher stage of the disease. Notably, even in stage I, there was already an elevation of RV mass and reduction of LV global longitudinal strain.
Conclusion: CMR parameters of the right ventricle show significant differences in all disease stages compared to healthy volunteers. RV changes (mass and strain) seem to occur earlier compared to an elevation of left ventricular mass. Therefore, analysis of the RV should be routinely included in the detailed assessment of patients with Fabry's disease.
Limitations: A single-centre study.
Ethics committee approval: The study was approved by the local ethics committee (837.196.13/837.477.14).

RPS 603a-5 11:49
Texture analysis of cine CMR sequences in patients with dilated cardiomyopathy: may the radiomic signature predict the prognosis?
N. Di Meo, L. Zanolini, G. M. Agazzi, L. Lupi, M. Ravanelli, D. Farina; *Brescia/IT (nunzia.dimeo@hotmail.it)*

Purpose: To explore the potential of texture analysis (TA) of cardiac MR (CMR) sequences in predicting major adverse cardiovascular events (MACE) in a population of patients affected by dilated cardiomyopathy (DCM).
Methods and materials: A retrospective study on 170 CMR scans performed on patients with DCM. CMR was acquired on a 1.5T scanner using a standardised protocol composed of morphologic, cine, and late gadolinium enhancement (LGE) sequences. The cine CMR short-axis stack (10-12 sections per patient) was post-processed with a freeware software (3D slicer, www.slicer.org). Circumferential ROIs were traced semi-automatically by a single operator on the entire left ventricular (LV) myocardium. TA was then performed using the pyRadiomics library which extracted 107 TA features for each ROI. Patients were followed up for 5 years during which MACE was recorded. Statistical analysis of TA features was performed applying the least absolute shrinkage and selection operator (LASSO) method in order to discard non-significant features. A radiomic score was calculated from statistically significant features.
Results: 59.5% of participants had a MACE during the follow-up. A radiomic signature including 5 TA features (Elongation, RobustMeanAbsoluteDeviation, Minimum, X10Percentile, GrayLevelVariance) allowed for diving of the population into two subgroups: patients with a low score had better prognosis (MACE free-survival: 80% at 4 years) than patients with high score (MACE free-survival: 50% at 4 years). Survival curves showed significant divergence between the two subgroups after the 2nd year of follow-up (HR 0,31; P<0,001).

Conclusion: TA of standard cine-CMR sequences on the whole LV allows to create a radiomic score which may predict the midterm prognosis of patients with DCM.
Limitations: A single-centre, retrospective study with a small sample.
Ethics committee approval: All patients gave written consent to CMR.

Manually measured global longitudinal strain in cardiac MRI scans: the evaluation of myocardial longitudinal kinesia in patients affected by hypertrophic cardiomyopathy

E. Muscogiuri, D. Caruso, T. Polidori, M. Pignatelli, G. Fraietta, M. Di Girolamo, A. Laghi*; Rome/IT (e.muscogiuri@gmail.com)*

Purpose: To evaluate manually measured global longitudinal strain (GLS) in MRI scans as a technique to detect myocardial kinesia impairment in patients affected by hypertrophic cardiomyopathy.
Methods and materials: We retrospectively evaluated 36 patients who underwent cardiac magnetic resonance imaging (MRI) between 2011 and 2019. The study population has been divided into two groups: the first group (control group) was composed of 16 patients who resulted negative for any detectable pathology and the second group was composed of 20 patients affected by hypertrophic cardiomyopathy (HCM) with preserved ejection fraction. Two radiologists independently measured global longitudinal strain (GLS) by tracing endocardial border lengths in routinely acquired cine images on vertical (VLA) and horizontal long axis (HLA). We calculated the mean values of GLS for each group and Student's test was used to compare the means as proof that they were significantly different. Possible correlations between GLS and functional parameters were also analysed (e.g. ejection fraction, volumes, and presence of fibrosis).
Results: The mean GLS values we obtained concerning the first (6 M, mean ejection fraction 63%) and the second group (13 M, mean ejection fraction 72%) were 22,9 ± 2,3 % and 16 ± 2,1%, respectively. The GLS values regarding the second group were significantly lower than the first group (p<0.01). GLS did not correlate with other parameters, such as the presence of fibrosis replacement or left ventricle volumes.
Conclusion: We demonstrated that manually measured GLS is a useful tool to detect longitudinal kinesia impairment in patients affected by hypertrophic cardiomyopathy. Thus, the parameter we measured allows to rapidly estimate myocardial longitudinal kinesia without using any dedicated software.
Limitations: A small study population and heterogeneous types of HCM.

Left ventricular feature tracking strain analysis for the detection of early cardiac involvement in Anderson Fabry disease

M. Richter, V. Bethke, A. Hasse, A. Brose, S. Harth, C. Tanislav, G. Krombach, F. Roller*; Giessen/DE (richter.martinjo@gmail.com)*

Purpose: Anderson Fabry disease (AFD) is an X-linked multi-organ disorder of lysosomal metabolism with cardiac disease being the leading cause of death. Cardiac MRI, especially native T1 mapping, showed great potential for the detection of early cardiac involvement. As a further increment, feature tracking strain analysis (FT-SA) showed promising results in other cardiac diseases. Therefore the goal of the current study is to evaluate the potential of FT-SA in AFD.
Methods and materials: 16 consecutive AFD patients (9 female) with a mean age of 49.9 years ± 16.8 standard deviation (SD) and 16 control patients (9 female; 47.5 years ± 13.2 SD) were investigated at 1.5 Tesla. Global native T1 values were evaluated and left ventricular global longitudinal feature tracking strain analysis was performed (LV-GL). Results were correlated against serum Lyso-Gb3-Levels.
Results: Native T1 values were significantly lower in all AFD patients 913.3ms ± 40.0 SD compared to control patients 959.0ms ± 23.6 SD (p<0.0004), whereas ventricular functions and strain parameters did not differ significantly between both groups. Moreover, native T1 values were significantly lower in Lyso-Gb3 positive AFD patients with 870.9ms ± 41.5 SD (p <0.0001). Lyso-Gb3 (mean level 19.3ng/ml ± 30.0 SD) showed a moderate negative correlation to native T1 (r=-0.38) and a moderate positive correlation to LV-GL strain (r=0.39). Furthermore, native T1 showed a good significant negative correlation to LV-GL strain (r = -0.69, p=0.047).
Conclusion: Although ventricular function and strain values do not differ significantly between AFD patients and controls, the moderate and good correlations of LV-GL strain to Lyso-Gb3 and native T1 values suggest that wall motion anomalies might occur early in cardiac AFD involvement. Large scale trials are needed to verify our findings.
Limitations: A small study cohort.

Texture analysis and machine learning of T1 maps and ECV compared with strain parameters: differentiation among hypertrophic cardiomyopathy, hypertensive heart disease, and normal control

R.-Y. Shi, L. Wu, J.-R. Xu*; Shanghai/CN (ryshicn@hotmail.com)*

Purpose: To assess the diagnostic potential of texture analysis (TA) applied in T1 maps and extracellular volume (ECV) obtained from cardiac magnetic resonance (CMR) for the diagnosis of hypertrophic cardiomyopathy (HCM) and hypertensive heart disease (HHD) from normal controls (NC) and compared with strain parameters.
Methods and materials: The study included 35 HCM patients, 20 HHD patients, and 21 normal NCs. Regions of interest (ROI) for TA were drawn on T1 maps and ECV by open-source software. Stepwise dimension reduction and feature selection were performed by reproducibility, machine learning, and collinearity and multivariable regression analysis for selecting features enable differential HCM and HHD. Strain parameters were calculated by cine sequences.
Results: 3 independent features allowed differentiation between abnormal (HCM and HHD) and NC in T1 map and 2 features in ECV analysis. Of the best-calculated model, the areas under the receiver operating curve (ROC) were as follows: 0.977 for T1 map and 0.909 for ECV. To distinguish HCM from HHD, 2 independent features were screen out for both T1 and ECV maps. The areas under the ROC were as follows: 0.906 for T1 map and 0.906 for ECV. Strain parameters of 3 direction could differentiate abnormal from NC, but only longitudinal strain indicated a significant difference between HCM and HHD with the area 0.703 under the ROC curve.
Conclusion: Texture analysis of T1 maps and ECV show a high accuracy for diagnosis of hypertrophy myocardium from NC and also differentiate HCM from HHD. The result of strain parameters was not ideal.
Limitations: For the software property, the 2D texture features may produce selection bias.
Ethics committee approval: The institutional review board approved this retrospective study. Informed consent was obtained from all subjects.

Quantification of right ventricular strain and strain rate using cardiac magnetic resonance feature tracking in hypertrophic cardiomyopathy subjects with preserved ejection fraction

L. Yang, K. Wang*; Harbin/CN (970082484@qq.com)*

Purpose: To evaluate the feasibility and reproducibility of using CMR-FT for analysis of bi-ventricular strain and strain rate in HCM patients as well as to explore the correlation between RV and LV deformation.
Methods and materials: A total of 60 HCM patients and 48 controls were studied. Global and segmental peak values of bi-ventricular longitudinal, circumferential, radial strain, and systolic SR were analysed. Pearson analysis

was performed to investigate the correlation between RV and LV deformation. Intraobserver and interobserver reproducibility were also assessed.
Results: Left ventricular mass in the HCM group was significantly higher than in the control group. Left ventricular end-systolic volume, left ventricular end-diastolic volume, right ventricular end-systolic volume, and right ventricular end-diastolic volume in the HCM group were significantly lower than the correlated parameters in the control group (P<0.001), whereas there was no statistical difference in ejection fraction (p >0.05). Global longitudinal strain (GLS), global longitudinal strain rate (GLSR), global circumferential strain (GCS), global circumferential strain rate (GCSR), global radial strain (GRS), and global radial strain rate (GRSR) of the LV and RV were all significantly lower compared with the control group. Segmental strain and SR were also true (p <0.001). Bi-ventricular strain and SR measurements were highly reproducible at both intra and interobserver levels. Pearson analysis showed RV GCS, GLS, and GRS positively correlated with LV GCS, GLS, and GRS (r=0.713, p<0.001; r=0.728, p<0.001; r=0.730, p<0.001).
Conclusion: CMR-FT is a promising approach to the analyse impairment of global and segmental myocardium deformation in HCM patients non-invasively and quantitatively.
Limitations: n/a

Using myocardial extracellular volume fraction to differentiate healthy from cardiomyopathic myocardium using dual-source dual-energy CT
A. F. Abadia[1], V. Vingiani[2], M. van Assen[3], S. S. Martin[1], A. Varga-Szemes[1], U. J. Schoepf[1]; [1]*Charleston, SC/US,* [2]*Rome/IT,* [3]*Groningen/NL*
(vincenzovingiani@gmail.com)

Purpose: To evaluate the feasibility of dual-energy CT (DECT)-based iodine quantification to estimate myocardial extracellular volume fraction (ECV) in patients with and without cardiomyopathy (CM), and assess its ability to distinguish healthy myocardial tissue from cardiomyopathic, with the goal of defining a threshold ECV value for disease detection.
Methods and materials: 10 healthy subjects and 60 patients with CM (mean age 66.4±9.4; 59 males; 40 ischemic and 20 non-ischemic CM) underwent late-iodine-enhanced DECT-imaging. Myocardial iodine maps were obtained using 3-material decomposition. ECV was estimated from haematocrit levels and the iodine maps, using the AHA 16-segment model of the left ventricle. ROC curve analysis was performed with corresponding AUC, along with Youden's index assessment, to establish a threshold for CM detection.
Results: The median ECV for ischaemic CM, non-ischaemic CM, and healthy myocardium were 36.9% (32.4-41.1), 38.3% (33.7-43.0), and 25.4% (22.9-27.3), respectively. Healthy myocardium showed significantly lower median ECV values compared to ischaemic and non-ischaemic CM (p<0.001). From Youden's index analysis, an ECV>29.48% would indicate the presence of CM (sensitivity=90.3; specificity=90.3). The AUC for the ROC curve was 0.950 (p<0.001).
Conclusion: Our study findings resulted in a promising threshold ECV value that could facilitate the differentiation between healthy and diseased myocardium, and highlights the potential of this DECT methodology to detect cardiomyopathic tissue. The threshold found is not intended to be used as an absolute diagnostic test, but rather as a tool that could provide additional value for the characterisation of myocardial tissue.
Limitations: A retrospective single-centre study with limited availability of healthy-subjects' contrast-enhanced DECT delayed scans.
Ethics committee approval: Approved by the Institutional Review Board and written informed consent was obtained from all subjects.
Funding: No funding was received for this work.

Differences in myocardial segmental strain between obstructive and non-obstructive hypertrophic cardiomyopathy assessed by feature tracking cardiovascular magnetic resonance
V. Palmisano, S. Cossa, M. Porcu, R. Cau, L. Saba*; Cagliari/IT*
(vitanio88@gmail.com)

Purpose: To evaluate whether there are any significant differences in myocardial strain parameters between obstructive hypertrophic cardiomyopathy (HOCM) and non-obstructive hypertrophic cardiomyopathy (HCM) as assessed by cardiovascular magnetic resonance feature tracking (CMR-FT).
Methods and materials: Cardiovascular magnetic resonance (CMR) was performed in 32 patients. 17 patients (mean age, 51 ± 17, 65% man) had an echocardiography diagnosis of HCM (aortic transvalvular pressure gradient (ATPG) < 30 mmHg) and 15 patients (mean age, 62 ± 15, 53% man) had a diagnosis of HOCM (ATPG > 30 mmHg). Left ventricle (LV) late gadolinium enhancement (LGE) was quantified. CMR-FT was used to estimate LV global and segmental strain parameters in both groups.
Results: All of the patients had normal LV volumes and ejection fraction (EF). Global radial, circumferential, and longitudinal strain and strain rate were lower than normal value reference, but there were no significant differences in both groups. Segmental strain analysis showed significantly higher values of almost all 3 components of strain, strain rate, displacement, and velocity in HOCM than HCM, in mid anteroseptal, mid anterior, and all apical myocardial segments (p <0,05). These values were independent by almost all segmental thickness and LGE.
Conclusion: Obstructive hypertrophic cardiomyopathy patients have higher left ventricle segmental strain parameters than non-obstructive patients in apex and mid anterior wall. This may represent a greater work load for the LV and explain the major risk in HOCM patients of development myocardial dysfunction.
Limitations: The small sample size of the study may introduce not optimal quantification in regional strain. We did not have a control group. We did not evaluate the inter and intravariability of the feature tracking cardiovascular magnetic resonance analysis.
Ethics committee approval: Patients provided written informed consent.
Funding: No funding was received for this work.

Preoperative prediction of peritoneal metastasis in colorectal cancer using a clinical-radiomics model
M. Li, T. T. Tong*; Shanghai/CN (17211230001@fudan.edu.cn)*

Purpose: To establish and validate a combined clinical-radiomics model for preoperative prediction of synchronous peritoneal metastasis (PM) in patients with colorectal cancer (CRC).
Methods and materials: We enrolled 779 patients (585 in the training set and 194 in the validation set) with clinicopathologically confirmed CRC. Significant clinical risk factors were used to build the clinical model. The least absolute shrinkage and selection operator (LASSO) algorithm was adopted to construct a radiomics signature, which included imaging features of the primary lesion and the largest peripheral lymph node, and stepwise logistic regression was applied to select the significant variables to develop the clinical-radiomics model. We used the Akaike information criterion (AIC) and receiver operating characteristic analysis to compare the goodness of fit and the prediction performance of the three models, respectively. An independent validation cohort, containing 139 consecutive patients from February-September 2018 was used to evaluate the performance of the optimal model.

Results: Among the three models, the clinical-radiomics model (AIC=1,043.2) was identified as the optimal model with the minimum AIC value (the clinical-only model: AIC=1,277.7; radiomics-only model: AIC=1,280.5). The clinical-radiomics model also showed good discrimination in both the training cohort (AUC=0.855) and the validation cohort (AUC=0.793).
Conclusion: The present study proposes a clinical-radiomics model created with a CT-based radiomics signature and key clinical features that can potentially be applied in the individual preoperative prediction of PM for CRC patients.
Limitations: The potential sources of bias and limitations of the design.
Ethics committee approval: Our institutional review board (Fudan University Shanghai Cancer Center Medical Ethics Committee) approved this study and waived the need for informed consent from the patients.
Funding: No funding was received for this work.

RPS 616b-2 11:21

A comparison of whole-body MRI and 68Ga-DOTATATE PET/CT findings in patients with suspected peritoneal metastases from neuroendocrine tumours

M. P. Engbersen, M. Versleijen, D. M. J. Lambregts, R. G. H. Beets-Tan, M. Tesselaar, M. J. Lahaye*; Amsterdam/NL*

Purpose: To compare whole-body MRI and 68Ga-DOTATATE PET/CT in detecting metastatic lesions from neuroendocrine tumours suspected of peritoneal metastases.
Methods and materials: In this retrospective study, patients that have undergone a whole-body MRI and a 68Ga-DOTATATE PET/CT with suspicion of peritoneal metastases from neuroendocrine origin between 2016-2019 were included. The MRI consisted of diffusion-weighted, T2-weighted, and post-contrast T1-weighted imaging of the thorax, abdomen, and pelvis. The 68Ga-DOTATATE PET/CT acquisitions were made 45 minutes after the intravenous injection of the tracer. To identify all potentially malignant lesions, the MRI images and the PET/CT images were respectively evaluated by an abdominal radiologist and a nuclear medicine physician. The findings were compared for discrepancies.
Results: 16 patients were included and 89 suspicious lesions were identified by either MRI or PET/CT. The median time between imaging modalities was 40 days (range: 1-100 days). On average, MRI and PET/CT identified 31 and 17 peritoneal lesions, 36 and 17 liver lesions, and 6 and 12 suspicious lymph-nodes, respectively. In one patient, diffuse sub-centimetre liver lesions were found that were not visible on PET/CT. The agreement of MRI over all PET/CT positive lesions was 81.2%. The overall agreement between MRI and PET/CT findings was 50.6%. Of all 18 suspected lesions found on MRI under 5 mm, only 3 were detected on PET/CT.
Conclusion: 68Ga-DOTATATE PET/CT is currently the standard staging tool for metastatic neuroendocrine tumours, however, whole-body MRI can detect more small lesions. More research is needed to determine whether detecting more peritoneal and liver metastases with MRI will have clinical implications.
Limitations: The retrospective nature and standard of reference.
Ethics committee approval: n/a
Funding: No funding was received for this work.

A comparison of diffusion-weighted MRI (DWI) and 68Ga-DOTATATE PET/CT to assess tumour response of liver metastases of primary neuroendocrine tumours (NET) following Yttrium-90 radioembolisation

M. Ingenerf, N. Fink, J. Sauerbeck, H. Ilhan, J. Ricke, C. Schmid-Tannwald*; Munich/DE*

Purpose: To compare ADC values of DWI and SUV of 68Ga-DOTATATE PET/CT in assessing treatment response in patients with hepatic metastases of primary NET undergoing selective internal radiotherapy.
Methods and materials: 30 patients with 80 target liver lesions of primary NET who underwent abdominal MRI with DWI and 68Ga-DOTATATE PET/CT before and after SIRT were included. Tumour size, mean ADC values of the lesions and normal liver parenchyma, intralesional SUVmax and SUV mean, tumour to spleen ratio (T/S ratio), and tumour to liver ratio (T/L ratio) were measured. Tumour response to radioembolisation was classified with respect to response evaluation criteria in solid tumours v1.1 (RECIST) on a follow-up examination.
Results: 67/80 metastases were categorised as stable disease (SD) and 13/80 metastases as partial remission (PR). Intralesional ADCmin and ADCmean increased significantly ($p<0.006$) after SIRT in the group of PR and SD, with a significantly higher increase of ADCmin values in the PR group (54.1±14.6% vs 24±4.9%, $p=0.02$). Currently used SUV measurements showed a significant decrease in the PR group (SUVmax, SUVmean, T/S ratio, and T/L ratio), while in the SD group, only SUVmax, SUVmean, and T/S ratio (max/max) decreased significantly. Using ROC curves, SUVmean was found as the best metric (AUC 0.75), however, similar results were obtained for ADCmin (AUC 0.7).
Conclusion: DW-MRI may be used as an alternative to 68Ga-DOTATATE PET/CT for quantitative response assessment in patients with hepatic metastases of NET following SIRT and may represent a valuable functional marker to guide the further management of these patients.
Limitations: A retrospective study.
Ethics committee approval: Approval was obtained from the LMU ethics commission. Written informed consent was waived due to fully (irreversible) anonymised data.

RPS 616b-4 11:33

Predicting the response of individual liver metastases with radiomics in HER2 amplified patients undergoing dual-targeted therapy

G. Cappello, V. Giannini, A. Defeudis, S. Mazzetti, L. Vassallo, D. Regge*; Candiolo/IT (giovanni.cappello@ircc.it)*

Purpose: To validate a machine learning algorithm to predict the response of individual liver metastases (LM) in heavily pretreated HER2 amplified metastatic colorectal cancer (mCRC) patients undergoing dual-target therapy within a phase II clinical study.
Methods and materials: 38 patients with amplified HER2 mCRC enrolled in the multicentre HERACLES trial (NCT03225937) were randomly divided into a training set (28 patients) and a validation set (10 patients). All received anti-HER2 treatment (trastuzumab plus lapatinib) and underwent CT examination every 8 weeks until disease progression. The largest diameter of each LM was measured before and after 3 months of treatment to classify metastases in responders (R+) and non-responders (R-). All LM with a diameter >10 mm were manually contoured on the baseline and 24 texture features were extracted. After selecting the most discriminative features using a genetic algorithm, a Gaussian Naïve Bayes classifier was trained on the training set and applied to the validation dataset.
Results: The dataset was composed of 141 metastases: 108 (75R+, 33R-) in the training set and 33 (21R+, 12R-) in the validation set. The classifier reached a sensitivity, specificity, PPV, and NPV of 89%, 85%, 93%, and 78% for the training set and 90%, 42%, 73%, and 71% for the validation set, respectively. Difference variance and homogeneity were the two most important radiomics features in our model.
Conclusion: Our study demonstrated the feasibility of developing a radiomics model able to predict the likelihood of response of individual LM in patients with HER+ mCRC undergoing dual-target therapy.
Limitations: The low number of lesions in the validation dataset, low specificity, especially in the validation dataset, and the manual segmentation with consequent interobserver variability.
Ethics committee approval: Ethics committee approval obtained.
Funding: AIRC 5x1000 2018-ID.21091, AIRCx1000-ID 9970, and contribution from F Hoffmann-La Roche.

The value of apparent diffusion coefficients (ADC) to assess the response of hepatic metastases of primary neuroendocrine tumours (NET) undergoing selective internal radiotherapy with 90Yttrium-microspheres

M. Ingenerf, N. Fink, J. Sauerbeck, H. Ilhan, J. Ricke, C. Schmid-Tannwald*; Munich/DE*

Purpose: To evaluate the role of diffusion-weighted imaging (DWI) with ADC measurements in the assessment of tumour response in patients with liver metastases of primary NET undergoing Yttrium-90 radioembolisation.
Methods and materials: 43 patients with hepatic metastases of primary NET who underwent abdominal MRI with DWI 39±28 days before and 74±46 days after SIRT were included. Tumour size, intralesional minimal, and maximal and mean ADC (ADCmin, ADCmax, and ADCmean, respectively) were measured for a maximal 3 target lesions per patient on pre- and post-interventional DWI by two readers independently. The tumour response to radioembolisation was classified corresponding to response evaluation criteria in solid tumours v1.1 (RECIST) on a follow-up examination.
Results: A total of 120 metastases with a mean pre-interventional diameter of 3.04 cm±1.59was analysed. 27/120 target lesions were categorised as partial remission (PR), 87/120 lesions as stable disease (SD), and 6 lesions as progressive disease (PD). After radioembolisation, ADC values (ADC min, max, and mean) increased significantly ($p<0.005$) in the group of PR and SD, whereas there was no significant change of ADC values in the group of PD. Between the group of PR and PD, a significant difference in the percentage change of ADCmean (61% vs 11%, respectively, $p<0.05$) was found before and after SIRT.
Conclusion: ADC values, especially ADCmean changes on DWI, appear to represent a valuable quantitative marker to assess the response of hepatic metastases of primary NET beyond morphologic changes and may help in assessing further therapeutic strategies of patients who undergo SIRT.
Limitations: A retrospective study.
Ethics committee approval: Approval was obtained by the LMU ethics commission. Written informed consent was waived due to fully (irreversible) anonymised data.
Funding: No funding was received for this work.

RPS 616b-6 11:45

The impact of inter-reader contouring variability on textural radiomics of CRC liver metastases

F. Rizzetto[1], C. de Mattia[2], F. Calderoni[2], L. Vassallo[3], V. Giannini[4], A. Defeudis[4], D. Regge[4], A. Torresin[2], A. Vanzulli[5]; *[1]Rho/IT, [2]Milan/IT, [3]Monasterolo di Savigliano/IT, [4]Candiolo/IT, [5]Segrate/IT (Francesco.rizzetto@studenti.unimi.it)*

Purpose: Radiomics is actually at the forefront of precision medicine, but to fully develop it requires multicentre collaboration. In this context, the impact of inter-reader contouring variability on radiomics features (RFs) must be evaluated.
Methods and materials: The liver metastases (n=70) from colorectal cancers were segmented on CT scans by two readers. RFs from grey-level co-occurrence and run-length matrices were extracted from the whole-lesion volume (3D ROIs) and from the largest cross-section (2D ROIs) for each metastasis. Inter-reader contouring variability was evaluated with the Dice coefficient (DC) and Hausdorff distance (HD), while its impact on RFs was assessed using the mean relative discrepancy and intraclass correlation coefficient (ICC). For the main lesion of each patient, one reader also delineated circular ROIs in the same slice of the 2D ROIs.
Results: According to the similarity indices, the best inter-reader contouring agreement was observed for 2D ROIs (mean DC: 0.83±0.09; mean HD: 0.25±0.18). Comparing RFs values, the mean relative discrepancy was lower from 2D than 3D ROIs for 24/32 (75%) RFs, ranging from 0.04%-1,567% and from 0.02%-752%, respectively. Correspondingly, an ICC >0.9 was observed for more RFs from 2D ROIs (53%) than from 3D ones (34%). The variability between 2D and circular ROIs was equal or lower than inter-reader variability for 94% of RFs.
Conclusion: As automatic segmentation tools are currently lacking, a careful selection of the contouring methods is required to minimise differences in the results of texture analysis. 2D contouring seems to reduce this variability but it could be less informative than a whole-lesion analysis.
Limitations: The choice of different preprocessing parameters could impact on the results.
Ethics committee approval: All patients signed informed consent.
Funding: Supported by a grant from AIRC 5 x mille.

Baseline clinical and imaging predictors of treatment response and overall survival of patients with metastatic melanoma undergoing immunotherapy

A. E. E. Othman, A. Schraag, S. Afat, T. Eigentler, B. Klumpp; *Tübingen/DE*

Purpose: To identify predictive clinical and CT imaging biomarkers and assess their predictive capacity regarding overall survival (OS) and treatment response in patients with metastatic melanoma undergoing immunotherapy.
Methods and materials: 103 patients with immunotherapy for metastatic melanoma were randomly divided into a training (n=69) and validation cohort (n=34). Baseline tumour markers (LDH, S100B), baseline CT imaging biomarkers (tumour burden and Choi density), and CT texture parameters (entropy, kurtosis, skewness, uniformity, MPP, and UPP) of the largest target lesion were extracted. To identify treatment response predictors, binary logistic regression analysis was performed in the training cohort and tested in the validation cohort. For OS, Cox regression and Kaplan Maier analyses were performed in the training cohort. Bivariate and multivariate models were established. The goodness of fit was assessed with Harrell's C-index. Potential predictors were tested in the validation cohort also using Cox-regression and Kaplan-Meier analyses.
Results: Baseline S100B (hazard ratio (HR)=2.543, p=0.018), tumour burden (HR=1.657, p=0.002), and kurtosis (HR=2.484, $p<0.001$) were independent predictors of OS and were confirmed in the validation cohort ($p<0.048$). Tumour burden and kurtosis showed incremental predictive capacity, allowing a good predictive model when combined with baseline S100B levels (C-index=0.720). Only S100B was predictive of treatment response (OR=0.630, p=0.022). Imaging biomarkers did not predict treatment response.
Conclusion: We identified easily obtainable baseline clinical (S100B) and CT predictors (tumour burden and kurtosis) of OS in patients with metastatic melanoma undergoing immunotherapy. However, imaging predictors did not predict treatment response.
Limitations: A retrospective, single-centre predictive study.
Ethics committee approval: The institutional ethics committee of the university hospital approved this retrospective study and waived informed patient consent.
Funding: No funding was received for this work.

RPS 616b-8 11:57

Changes in tumour heterogeneity with tyrosine kinase inhibitor therapy in metastatic renal cell carcinoma: preliminary results from the STAR trial

A. Azam[1], A. Jahangeer[1], L. Gervais-Andre[1], C. Kelly-Morland[1], M. M. Siddique[1], G. Cook[1], F. Collinson[2], V. Goh[1], J. Brown[2]; *[1]London/UK, [2]Leeds/UK (aishah2018@hotmail.co.uk)*

Purpose: Quantification of tumour heterogeneity potentially captures anti-vascular treatment effects beyond mean attenuation and size change during anti-angiogenic drug therapy. We aimed to assess global and locoregional heterogeneity changes during tyrosine kinase inhibitor therapy in metastatic renal cell carcinoma patients within the multicentre STAR trial.
Methods and materials: 59 prospective adults (54 male; mean age 67.5±7.0) with 108 lesions underwent arterial-phase contrast-enhanced CT prior to (T0) and 3 months after treatment (T1). Volumetric regions-of-interest were delineated for the same lesions (5 maximum) at each time point. 183 radiomic features (including surface, shape, fractal, histogram, and second and high-order features) were derived using validated in-house software. Highly correlated features ($r>0.80$) were excluded prior to further analysis. Changes on treatment were compared using the Wilcoxon signed-rank test (correcting for multiple comparisons, $p<0.0025$).

Results: Accompanying a tumour volume decrease on treatment (100.22 cm^3 vs 74.77 cm^3, p<0.001), global tumour attenuation also decreased (41.6 vs 38.2, p<0.001) while negative skewness improved (-1.4 vs -0.94, p<0.001) in keeping with lower vascularisation. Additionally, locoregional GLCM contrast (37.89 vs 48.77, p<0.001), GLSZM intensity variability (0.003 vs 0.004, p<0.001), and GLTDM texture strength (2.52 vs 3.78, p<0.001) increased. GLRL long-run high-grey-level emphasis (1,857 vs 1,611, p<0.001) decreased, indicating greater local texture variation and higher texture visibility and granularity.
Conclusion: Following tyrosine kinase inhibitor therapy, a global reduction in tumour attenuation and negative skewness during the arterial phase is accompanied by increasing locoregional variability capturing the spatial heterogeneity of therapy anti-vascular effects.
Limitations: The small sample and heterogeneity in CT parameters.
Ethics committee approval: Ethical board approval and informed consent - NRES Committee REC ref: 11/NW/0246.

Patterns of progression under immunotherapy in metastatic kidney cancer
S. Mezghani[1], B. Rance[2], A. Simonaggio[2], J. Deidier[2], A. Bellucci[3], M. Florin[2], S. Oudard[2], Y. Vano[2], L. Fournier[2]; *[1]Boulogne-Billancourt/FR, [2]Paris/FR, [3]Issy Les Moulineaux/FR (sarah.mezghani@gmail.com)*

Purpose: To determine patterns of progression or pseudoprogression in patients with mRCC treated by immunotherapy.
Methods and materials: A retrospective monocentric ethics committee-approved study included patients with mRCC treated by immunotherapy between January 2013-January 2019 for which all the imaging history was available on our PACS. Tumour response was evaluated using RECIST 1.1 and iRECIST criteria. The numbers of responders and pseudoprogression were collected. Patterns of unconfirmed progression (iUPD) and confirmed progression (iCPD) were analysed.
Results: 96 patients met the inclusion criteria. The median follow-up was 13 months. Only 4/96 pseudoprogressions were observed during follow-up. Including pseudoprogressions, 34/96 (35%) patients were responders. 55/96 (57%) patients progressed according to RECIST, with a median PFS of 2.6 months. Progression was confirmed according to iRECIST in 18/22 (82%) cases during the next follow-up, 4/22 (18%) cases after 2 follow-ups. In 3/33 (9%) cases, patients remained iUPD and continued immunotherapy with a clinical benefit despite RECIST progression. 7/96 (7%) patients were lost to follow-up. There was no preferential organ in which response, pseudoprogression, unconfirmed, or confirmed progression occurred.
Conclusion: Pseudoprogressions seem rare in mRCC under immunotherapy. However, some patients do not confirm progression immediately, or at all, and may benefit from continuing therapy beyond RECIST progression.
Limitations: A retrospective monocentric study.
Ethics committee approval: Ethics committee approval was obtained.

Diagnostic performance of trimodality imaging follow-up in bladder cancer patients treated with preservation therapy
S. Ahmed; *Assiut/EG (shimaaabdalla@aun.edu.eg)*

Purpose: To evaluate the diagnostic accuracy of abdominopelvic ultrasound (US), virtual cystoscopy (VC), and MRI diffusion (MRI DWI) compared to conventional cystoscopy (CC) in the diagnosis of bladder lesions after transurethral resection (TURT).
Methods and materials: 45 patients with a history of high-grade T1 or T2-T4a bladder cancer who underwent TURT and received chemoradiation schedule were included. They were followed-up on the basis of serial cystoscopies. Before each cystoscopy, the patients underwent bladder ultrasound, CT-based virtual cystoscopy, and diffusion-weighted MRI. The results of these 3 non-invasive modalities were compared with those of cystoscopy and with histological findings obtained by (repeat) transurethral resection. Sensitivity, specificity, positive and negative predictive values, and accuracy were calculated and compared to CC and histopathology as a gold standard.
Results: After a median 24 month follow-up, US, CT VC, and MRI DWI detected 23, 28, and 29 lesions respectively of the 30 lesions detected at CC. There was pathology-confirmed local recurrence in 18 lesions (40%) and benign changes in 12 lesions (27%), while the remaining 15 patients were negative. 18 lesions (60 %) were larger than 1 cm and 23 lesions showed polypoidal morphology (77 %). The accuracy of US, CT VC, and MRI DWI in the diagnosis of bladder lesions were 73%, 93%, and 93%, respectively (P>0.10).
Conclusion: Imaging surveillance in bladder cancer preservation should include MRI DWI as part of the surveillance programme to reduce the frequency of cystoscopy. MRI and CT VC were of comparable accuracy and US had the lowest sensitivity, however, it is still can be used as the first step of surveillance.
Limitations: The lack of standardisation of the time interval among the studied imaging modalities.
Ethics committee approval: The study protocol was approved by the local institutional review board (IRB: IORG0006563).
Funding: No funding was received for this work.

RPS 616b-11 12:15
Whole-body MRI: a 'one-stop-shop' for staging high-risk prostate cancer?
N. Ali[1], P. Charters[1], N. Burns-Cox[2], P. Burn[2]; *[1]Bristol/UK, [2]Taunton/UK (noorali@doctors.org.uk)*

Purpose: To determine if whole-body MRI (WBMRI) has a role as a single imaging test for patients with newly diagnosed prostate cancer with a high risk of metastatic disease.
Methods and materials: Patients newly presenting with serum prostatic specific antigen (PSA) of ≥50 ng/mL who had undergone WBMRI as part of clinical staging were assessed retrospectively. For each scan, the nodal and metastatic status were recorded. In addition, tumour conspicuities (lesion ADC to background gland ADC) within the prostate were recorded and compared with tumour conspicuities on contemporaneous dedicated prostate MRIs (in patients in whom both tests were performed).
Results: 50 patients were assessed, with a serum PSA range of 50-4,751 ng/mL (median 150 ng/mL). 68% (35/50) of patients had metastases on WBMRI (15/50 bone only, 3/50 lymph node only, and 16/50 both bone and lymph node metastases). Of patients with serum PSA ≥100 ng/mL, 87% (26/30) had metastases. The primary prostate tumour was positively identified in all cases. 20/50 patients had both prostate MRI and WBMRI; for these, reciprocal of the ratio of the mean prostate tumour ADC to the mean background gland ADC for prostate MRI was 2.0 (range 1.2-3.1) compared to 1.7 for WBMRI (range 1.2-2.3).
Conclusion: In patients with PSA ≥50, WBMRI identified metastases in a high proportion of patients. Lesion conspicuity within the prostate gland was found to be relatively similar to that on dedicated prostate MRI. WBMRI may, therefore, have a 'one-stop-shop' role in selected high-risk patients for both directing the targeted biopsy of the prostate tumour and for the staging of metastatic disease.
Limitations: A restrospective study with small numbers.

The role of PET-CT with 18F-FDG in the initial assessment of patients with carcinoma of an unknown primary origin (CUP)
S. Yaremenko, N. Rucheva, V. E. Sinitsyn; *Moscow/RU (yaremenkosa@yandex.ru)*

Purpose: To assess the effectiveness of PET-CT with 18-fluorodeoxyglucose (FDG) in patients with carcinoma of an unknown primary origin (CUP).
Methods and materials: 187 patients diagnosed with CUP were included in the single-centre retrospective study from September 2018-March 2019: m/f ratio was 123/64 (65.8%/34.2%) and the mean age of patients was 61.9±7.5 years. All patients had a biopsy of at least one metastatic lesion and the malignant

nature of the neoplasm was histologically verified. The standard oncological evaluation (including body CT) done before the PET/CT failed to detect the primary tumour.
Results: Among 187 patients included in the study, the biopsy-proven histological diagnoses were squamous cell cancer (n=87, 46.5%), melanoma (n=15, 8%), undifferentiated carcinoma (n=45, 24.1%), adenocarcinoma (n=23, 12.3%), and undifferentiated malignant neoplasm (n=17, 9.1%). After PET-CT, the primary tumour was detected in 93 (49.7%) patients. New metastatic lesions were revealed in 93 (49.7%) patients. Re-classification of the TNM stage after PET/CT was recorded in 131 (70.1%) cases. TNM stage reclassification was significantly more often observed in patients with an identified primary tumour (100%) compared to the group with an unknown location of the primary tumour (40.4%, p<0.01).
Conclusion: PET-CT with 18F-FDG allows the performance of significantly more accurate diagnostic workup and tumour staging in the majority of patients with CUP. PET-CT with 18F-FDG is an essential part of the diagnostic protocol in patients with CUP.
Limitations: A single-centre study.
Ethics committee approval: The study was approved by the local ethics committee.
Funding: No funding was received for this work.

Identification of women at high risk of breast cancer and in need of supplementary screening

M. Eriksson[1], K. Czene[1], S. Zackrisson[2], P. Hall[1]; [1]Stockholm/SE, [2]Malmö/SE (mikael.eriksson@ki.se)

Purpose: Mammography screening reduces breast cancer mortality but a large proportion of breast cancers are missed and detected at later stages, or develop in between screening intervals. We developed the KARMA model, taking the risk of breast cancer into consideration. This model identifies women who are likely to be diagnosed with breast cancer before or at the next screen.
Methods and materials: The study was based on the KARMA cohort, a prospective screening cohort including 70,877 participants. We identified 974 incident cancers and sampled 9,376 healthy individuals from the cohort. Risk scores were developed using mammographic features (density, masses, microcalcifications) and their asymmetry, age, menopausal status, family history of breast cancer, body-mass index, hormone replacement therapy, tobacco and alcohol, and a polygenic risk score including 313 SNPs. The KARMA score was developed from the risk scores using age stratified logistic regression.
Results: The full model reached an area under the curve of 0.77 (95% CI 0.76, 0.79) with good model fit (Hosmer-Lemeshow = 0.2). There was an 8-fold difference in risk between the 8% of women at high risk and at general risk. Women identified as high risk were more likely to be diagnosed with more aggressive cancers. The image-based model was validated in two independent cohorts.
Conclusion: By combining mammographic features, lifestyle factors, family history, and a polygenic risk score, we generated a model that identifies women with a high likelihood of being diagnosed with breast cancer within two years and in need of supplementary screening.
Limitations: Limited to model 1 validation.

Comparing contrast-enhanced spectral mammography with breast MRI in high and intermediate risk women: preliminary results

V. Pasqualino, G. Gennaro, A. Pittaro, E. Baldan, E. Bezzon, I. Polico, F. Caumo; *Padua/IT (vincenzopasqualino@gmail.com)*

Purpose: To compare contrast-enhanced spectral mammography (CESM) with breast MRI and in a women population at high and intermediate risk of developing breast cancer.
Methods and materials: 59 women at high and intermediate risk for breast cancer, aged above 35 years, without known allergies to iodine and gadolinium contrast-agents, were prospectively recruited. CESM and MRI were performed with a minimum 72-hour interval to avoid nephrotoxicity. CESM images were evaluated independently by two breast radiologists, while MRI studies were interpreted by two different independent breast radiologists. Background parenchymal enhancement (BPE) and breast density (BD) were scored in 4 classes, while possible lesions were classified according to BIRADS scale. Sensitivity, specificity, positive-predictive-value (PPV), and negative-predictive-value (NPV) were compared by modality, and inter- and intra-modality agreement evaluated.
Results: Sensitivity was 100% for both modalities, while specificity was 81.1% with CESM and 71.6% with MRI. PPV was 76.6% with CESM and 66.4% with MRI, while NPV was 100% for both modalities. Neither specificity nor NPV differences were significant. The agreement for BPE and BD was from good to excellent for both modalities. The agreement between CESM and MRI for BPE was fair (k=0.34), probably due to the different phase of the ovarian cycle at the time of the two examinations.
Conclusion: CESM showed the same sensitivity as MRI, with some benefits in terms of specificity, even if not significant.
Limitations: Small sample size (preliminary results). BPE inter-modality disagreement likely influenced by the possible different phase of the ovarian cycle at the time of examinations.
Ethics committee approval: Study approved by the IRB. Patient informed consent collected.
Funding: Research project.

Radiation dose with contrast-enhanced spectral mammography as a screening test for high and intermediate risk population

G. Gennaro, V. Pasqualino, E. Baldan, E. Bezzon, A. Pittaro, F. Caumo; *Padua/IT (gisella.gennaro@iov.veneto.it)*

Purpose: To estimate the amount of radiation dose associated with contrast-enhanced spectral mammography (CESM).
Methods and materials: CESM is a dual-energy technique consisting in the sequential acquisition of two images, one at low-energy, equivalent to a standard mammogram, and the second at higher energy, both after the injection of iodine contrast agent. The two paired images are recombined to provide a "subtraction" image where possible lesions are contrast-enhanced. CESM was used within a clinical study comparing the clinical performance of CESM and breast MRI for the screening of women at high and intermediate risk of breast cancer. Patients enrolled in the study underwent both bilateral CESM in two views and breast MRI. Dosimetric data from the first 60 CESM examinations (486 images) was extracted from the DICOM header of all low- and high-energy image pairs acquired for each patient. Mean glandular dose (MGD) per-view was compared between low- and high-energy images and the increase in MGD compared to standard mammography was calculated.
Results: The mean compressed breast thickness was 50.8±15.8 mm. The average total MGD per view was 2.22±0.44 mGy; 70% due to the low-energy image, 1.53±0.42 mGy, obtained with the same exposure parameters as for a standard mammogram, while the remaining 30% of the dose, 0.70±0.07 mGy, was due to the high-energy image. Compared to standard mammography, the mean dose increase associated with CESM was 48%. For any breast thickness per-view, CESM dose was either within or below MGD limiting values established for both standard mammography and tomosynthesis.
Conclusion: The modest increase in radiation dose by CESM should not be an obstacle for its use as a screening test for women at high and intermediate risk of breast cancer.
Limitations: Relatively small sample size.
Ethics committee approval: Study approved by the Institutional Ethics Committee.
Funding: Regional Healthcare System.

Effect of BPE on cancer detection in MRI-guided biopsies for high-risk lesions distinguished only on MRI
K. Sirkovich[1], T. Arazi-Kleinman[2], G. Bar On[3]; [1]Holon/IL, [2]Zeriffin/IL, [3]Natanya/IL (kserkovich@hotmail.com)

Purpose: To evaluate the effect of background parenchymal enhancement (BPE) on cancer detection in patients undergoing magnetic resonance imaging (MRI)-guided biopsy for lesions that were perceived on MRI but were not appreciated on other modalities, such as mammography (MG) or ultrasound (US).
Methods and materials: An analysis of 145 MRI-guided biopsies for high-risk lesions on MRI that were not visible on MG or US was conducted. The procedures were performed in Wolfson Medical Center by two experienced breast radiology specialists from January 2017 to December 2018 and recorded retrospectively. BPE was evaluated on the latest MRI examination for each patient. Pathology was compared between women, low BPE (mild or minimal) to high BPE (moderate to marked), by using Fisher's exact test.
Results: Of 145 MRI guided biopsies, 126 were classified with low BPE and 19 were classified with high BPE (87% vs. 13%, P>0.999). In the low BPE group, 74 biopsies confirmed a malignant process, while 52 were benign (59% vs. 41%, P>0.999). In the high BPE group, 11 biopsies confirmed a malignant process, while 8 were benign (58% vs. 42%, P>0.999).
Conclusion: Different BPE levels had no significant impact on rates of breast cancer in MRI-guided biopsy for high-risk lesions detected only on MRI.
Limitations: Larger samples are needed.

RPS 602b-5 11:39
Six-month interval screening with mammography and ultrasound in BRCA mutation carriers who undergo annual MRI: does it improve cancer detection?
B. Musaiev, K. A. Musaieva, D. L. Kaduri, E. Carmon, T. Sella; Jerusalem/IL (tamarse@hadassah.org.il)

Purpose: Alternating breast cancer screening for patients with the highest risk suggests performing annual MRI and annual mammography (MG) and/or ultrasound (US) at 6-month intervals. The purpose of this study was to evaluate the supplemental benefit of 6-month interval MG/US in patients who undergo this alternating screening.
Methods and materials: We retrospectively reviewed MG, US, and MRI screening images and clinical charts of 177 women with known BRCA mutations. The study group included 83 women (age 26-70, mean 42) who underwent between 2-12 annual rounds of alternating screening for a total of 380 rounds (mean 8.5).
The control group was compromised of 94 women (age 25-67, mean 44) with between 5-14 annual rounds of MR only screening for a total of 646 rounds (mean 7.5).
Results: Overall, 14 cancers were detected among the 177 women (7.9%), 6/83 women in the study group (7.2%) and 8/94 women in the control group (8.5%).
Two malignancies were clinically missed on MRI and diagnosed on 6-month interval MG/US, however, on retrospective blinded review by an expert radiologist, both were detected on 6-month prior MRI, hence, all malignancies were initially present on MRI.
Amongst the study group, 39 findings were referred for biopsy with 6 cancers diagnosed (15%), 4 based on MR findings, 1 on US, and 1 on MG. 33 benign biopsies (85%) were performed, 20 detected on MR, 12 on US, and 1 on MG.
A total of 29 biopsies were performed in the MR only control group with 8 yielding malignancy (27.5%) and 21 benign (72.5%).
Conclusion: Six-month interval MG/US screening in BRCA woman undergoing annual MR screening did not add to cancer detection, while increasing the rate of FP benign biopsies.
Limitations: A retrospective study.

RPS 602b-6 11:45
Surveillance scheme after risk-reducing mastectomy in BRCA1 BRCA2 mutation carriers: to screen or not to screen?
N. Kanana[1], M. Sklair-Levy[1], E. Friedman[2], E. Klang[1], Y. Yagil[3], A. Shalmon[1], M. Gotlieb[1], D. Madorsky Feldman[1], M. A.Ban David[1]; [1]Ramat Gan/IL, [2]Tel Aviv/IL, [3]Herzliya/IL (Nayruz.Knaana@sheba.health.gov.il)

Purpose: To assess the rate of breast cancer diagnosis in BRCA mutation carriers after bilateral mastectomy and the need for ongoing MRI surveillance.
Methods and materials: This retrospective study focused on Jewish female carriers of pathogenic BRCA1 or BRCA2 mutation who underwent bilateral mastectomy at BC diagnosis. All participants underwent breast imaging (MRI alternating with US at 6-12 month intervals) after mastectomy. Data on subsequent BC diagnosis and timing and the diagnostic breast imaging modality were collected, and BC recurrence rates were calculated.
Results: Overall, 189 female mutation carriers (133 BRCA1, 45 BRCA2, 5 both BRCA genes, 6 unknown) with BC underwent mastectomy between April 1, 2009, and August 31, 2018. During a mean follow-up of 6.1±4.2 years, 13 (6.9%) were diagnosed with BC: 12 ipsilateral BC (range from surgery 0.4-28.8 years) and 1 contralateral BC (15.9 years from risk-reducing surgery RRS). Notably, clinical suspicion of BC diagnosis was prompted by palpation (6, 46%), imaging surveillance (5, 38%; 4 MRI, 1 US), tumour markers (1, 8%), and, in one case, unknown.
Conclusion: BRCA1/2 mutation carriers who undergo RRS (risk-reducing surgery) after BC diagnosis should be considered for ongoing breast imaging surveillance.
Limitations: A retrospective study conducted in one institute in carriers of a limited spectrum of BRCA1/2 mutations with different surgical approaches performed by several surgical teams. Although follow-up encompassed a fair amount of women of different ages, the total number of women with post risk-reducing surgery cancer diagnosis was relatively limited.
Ethics committee approval: The Institutional Review Board approved the study. The need for a specific informed consent was waived by the Sheba Ethics committee.
Funding: No funding was received for this work.

Ductal carcinoma in situ as seen on MRI in BRCA mutation carriers
R. Faermann, M. Brodsky, J. Weidenfeld, O. Halshtok, A. Shalmon, M. Gotlieb, Y. Yagil, M. Sklair-Levy; Ramat Gan/IL (rfaermann@gmail.com)

Purpose: Recent studies have shown that BRCA mutation carriers are prone to earlier onset of DCIS and invasive breast cancer with a higher prevalence of DCIS in BRCA carriers than non-carriers. Most of BRCA-associated tumours have DCIS present, favouring the existence of a premalignant pathway. However, DCIS in those studies was diagnosed with mammography (calcifications).
MRI screening has become an important tool for screening and early detection in BRCA carriers. MRI can detect DCIS even if non-calcified on mammography. The aim of our study was to analyse BRCA patients with DCIS on MRI biopsy and the MRI presentation.
Methods and materials: A retrospective study of BRCA patients with pure DCIS diagnosed with MRI biopsy between 2015 until 2019 at the Sheba Medical Center. All MRI and mammography studies were analysed by a fellowship-trained radiologist.
Results: 950 BRCA carriers underwent surveillance MRI. 22 had a diagnosis of DCIS on MRI biopsy. 14 patients (64%) were BRCA1 carriers, while 8 patients (36%) were BRCA2 carriers. The median age of BRCA1 patients was 40 years old, which was lower than of BRCA2 patients (66 years old) (p<.05). The most common MRI presentation was non-mass enhancement. BRCA 1 patients were more commonly hormone receptors negative (9 patients, 64%) and had high-grade DCIS (100%), while BRCA2 patients were more commonly hormone

receptors positive (5 patients, 63%) and had more commonly intermediate grade DCIS (5 patients, 63%).
Conclusion: MRI detected non-calcified DCIS is more common in BRCA1 gene-mutation carriers and presents earlier than in BRCA2 patients, usually as a high-grade disease. This finding is opposite to calcified DCIS detected on mammography, which is more common in BRCA2 carriers.
Limitations: Single-centre only, retrospective study.

Association of the differences in average glandular dose with breast cancer risk
L. Ma, X. Lin, G. Qin, Y. Cai, W. Chen*; Guangzhou/CN*
(male2@mail2.sysu.edu.cn)

Purpose: To compare the differences in average glandular dose (AGD) between both breasts of healthy subjects and those of breast cancer patients, and to investigate if the AGD difference is associated with breast cancer risk and improves breast cancer classification.
Methods and materials: The craniocaudal-view and mediolateral-view full-field digital mammography (FFDM) images from 1,005 healthy subjects whose both breasts were BI-RADS categorised as I or II and 475 biopsy-confirmed unilateral breast cancer patients whose breast at the contralateral side was category I or II were collected. Both two populations were randomised into training and test sets. Multivariate logistic regression analysis was used to build the breast cancer risk assessment model and the area under the receiver operating characteristic curve (A_z) was used to evaluate the model. An independent 24 breast cancer patients who originally were BI-RADS categorised I or II for both breasts, but were diagnosed with unilateral biopsy-confirmed breast cancer later, were included to validate the model.
Results: The AGD differences in both FFDM images between tumour-bearing and healthy breasts of patients were significantly higher than those in healthy subjects ($P<0.001$). The model with AGD differences had a higher A_z value than the model without AGD differences. While there were no AGD differences between originally healthy breasts of breast cancer patients, significant AGD differences between now tumour-bearing breasts and the then previously healthy breasts were found in both FFDM images.
Conclusion: The AGD differences between both breasts could be included in the breast cancer risk assessment model to evaluate breast cancer risk.
Limitations: The follow-up sample size was small.
Ethics committee approval: This study was approved by institutional review board. The necessity to obtain written informed consent was waived.

Breast density from low-dose risk assessment mammograms
G. Ionescu[1], S. Squires[1], E. F. Harkness[1], A. Mackenzie[2], D. G. Evans[1], A. J. J. Maxwell[1], S. Howell[1], S. M. Astley[1]; *[1]Manchester/UK, [2]Guildford/UK*
(sue.astley@manchester.ac.uk)

Purpose: To quantify breast density from low-dose mammograms and hence facilitate screening stratification for young women.
Methods and materials: We analysed routine screening mammograms from women in the Predicting Risk of Cancer at Screening study (PROCAS) and from a study of Automated Low Dose Risk Assessment Mammography (ALDRAM) in which both standard and low-dose mammograms (one-tenth the original dose) were acquired. We simulated low dose mammograms in a PROCAS case-control set of 335 prior mammograms of women with interval and subsequent screen-detected cancers, each matched with three controls on age, BMI group, menopausal status, and parity. We developed an automated breast density method using a convolutional neural network trained on the average visual assessment of two readers who recorded percent mammographic density on visual analogue scales (VAS). With this, we predicted density in the 1,340 simulated low-dose PROCAS images and in the low-dose and standard mammograms from 148 women aged 31-45 in ALDRAM. For the case-control set, we computed odds ratios (OR) of developing breast cancer between the highest and lowest quintiles of predicted density. We also calculated the per-breast Pearson correlation between predicted density on standard and low dose mammograms in ALDRAM.
Results: The OR between the highest and lowest quintiles of mammographic density in the simulated low-dose case-control set was 3.57 (95% CI 2.25-5.68). In the ALDRAM cohort, the correlation between density in standard mammograms and their low-dose equivalents was 0.987.
Conclusion: Automated assessment of breast density in mammograms taken with one-tenth of the usual dose is feasible and has the potential to be used for stratification of young women in personalised breast screening programmes.
Limitations: Only GE mammograms were used.
Ethics committee approval: NHS-REC ref:19/NW/0037.

RPS 602b-10 12:09
Measurement of breast density in each breast: is it also suggestive of breast cancer risk?
J. L. Browne, L. Casas, G. Santandreu, A. Rincon, I. Rodriguez, M. A. Pascual*; Barcelona/ES*
(juabro@dexeus.com)

Purpose: Previous studies of breast density (BDen) suggest a 4 to 6-fold increase in breast cancer risk (BCR) for high density relative to non-dense breasts. However, many incidental factors have to be accounted for in these studies: family and personal history, BMI, obstetric history, hormonal treatment, and age.
Our objective was to compare glandular volume (GVol), breast volume (BVol), and breast density (BDen) in each breast of women with unilateral breast cancer (UBC) versus no cancer contralateral breast (NCCB), and determine if BDen is an independent BCR.
Methods and materials: We reported the results of GVol, BVol, and BDen measured during clinical practice in 216 women with unilateral invasive cancers from 4/2014 to 12/2015.
All women had mammography performed with photon counting equipment. The detector separates photons in low and high energy photons, allowing spectral determination of GVol, BVol, and calculates BDen.
Cancers were detected using mammography, ultrasound, or MRI.
Results: Of the 216 cases, 104 were right NCCB/left UCB and 112 were left NCCB/UCB. Mean BDen was 30.1% in UBC vs 28.8% for NCCB and mean GVol was 160.3cc vs 147,4cc, respectively (both $P<0.0001$). BVol differences were not significant ($P= 0.199$). In 117 cases, BDen was higher in UCB than NCCB, in 59 cases lower, and in 40 cases the same. In 131 cases, GVol was higher in UCB, while lower in 85.
Conclusion: Our results indicate that even with identical hormonal status, immunologic system, genetic background, BMI, and habits, higher BDen and higher GVol are significantly associated with a higher BCR. Our study shows that even clinically non-appraisable BDen and GVol differences are independently associated with a higher BCR.

Characterisation of sub-centimetre enhancing breast masses on MRI with radiomics in BRCA mutation carriers
R. Lo Gullo, I. Daimiel Naranjo, C. Rossi, A. Bitencourt, P. Gibbs, M. Fox, E. A. Morris, K. Pinker-Domenig*; New York, NY/US*
(logullor@mskcc.org)

Purpose: To verify whether radiomics features extracted from MRI of BRCA-positive patients with breast masses smaller than 1 cm can differentiate benign from malignant lesions using model-free parameter maps.
Methods and materials: In this retrospective study, 96 BRCA mutation carriers (mean age at the time of biopsy = 45.5±13.5 years) as assessed with genetic testing and who had an MRI from November 2013–February 2019 that led to a biopsy (BI-RADS 4) or imaging follow up (BI-RADS 3) were included. Two radiologists assessed all lesions independently and in consensus according to the breast imaging and reporting and data system (BI-RADS) lexicon. Radiomics features, based on first-order statistics, the grey level co-occurrence matrix (GLCM), run length matrix (RLM), size zone matrix (SZM), neighbourhood grey level dependence matrix, and neighbourhood grey tone difference matrix, were calculated
Results: Consensus BI-RADS classification assessment achieved a diagnostic accuracy of 53.4%, a sensitivity of 73.1%, a specificity of 42.1%, a positive predictive value (PPV) of 40.5%, and a negative predictive value (NPV) of 76.2%. The model combining 5 parameters (age, lesion location, GLCM-based correlation from the pre-contrast phase, first-order coefficient of variation from the 1st post-contrast phase, and SZM-based grey level variance from the 1st post-contrast phase) achieved a diagnostic accuracy of 81.5%, a sensitivity of 63.2% (24/38), a specificity of 91.4% (64/70), PPV of 80.0% (24/30), and NPV of 82.1% (64/78).
Conclusion: Radiomics improves diagnostic accuracy compared to qualitative morphological assessment with BI-RADS classification alone in BRCA mutation carriers.
Limitations: Using only single-centre data. Relatively small sample size. We included small breast masses which constitute few pixels in the final ROI.
Ethics committee approval: IRB approved.

RPS 602b-12 12:21
Correlation of 18F-FDG PET/MRI imaging information with relevant immunohistochemical markers in breast cancer patients: could PET/MRI identify high-risk patients?
O. Martin[1], J. Kirchner[1], N.-M. Bruckmann[1], B. M. Schaarschmidt[1], J. Grueneisen[2], L. Umutlu[2], G. Antoch[1], L. M. Sawicki[1]; [1]Düsseldorf/DE, [2]Essen/DE (o.f.martin@web.de)

Purpose: To correlate prognostically relevant immunohistochemical parameters of breast cancer with simultaneously acquired standardised uptake values (SUV) and apparent diffusion coefficient (ADC) derived from hybrid PET/MRI.
Methods and materials: 56 female patients with therapy-naive, histologically-proven breast cancer (mean age 54.1±12.0 years) underwent dedicated prone 18F-FDG breast PET/MRI and supine whole-body 18F-FDG PET/MRI. Diffusion-weighted imaging (DWI, b values: 0, 500, 1000 s/mm²) was performed simultaneously with PET acquisition. A region of interest (ROI) encompassing the entire primary tumour was drawn into each patient's breast and prone PET/MR images to determine the glucose metabolism represented by maximum and mean SUV and into ADC maps to assess tumour cellularity represented by mean and minimum ADC values. Histopathological tumour grading, as well as additional prognostically relevant immunohistochemical markers, i.e. Ki-67, progesterone, estrogen receptor, and human epidermal growth factor receptor 2 (HER2/neu), were determined.
Results: We found a significant inverse correlation between both SUV- and ADC-values derived from breast PET/MRI (r=-0.49 for SUVmean vs. ADCmean and r=-0.43 for SUVmax vs. ADCmin, both p<0.001). Tumour grading, as well as Ki67, showed a significant positive correlation with SUVmean from both whole-body PET/MRI (r=0.42 and r=0.37, p<0.001) and breast PET/MRI (r=0.37 and r=0.32, p<0.01). For immunohistochemical markers, HER2/neu significantly correlates inverse with ADC-values from breast PET/MRI (r=-0.35, p<0.01).
Conclusion: The present data show a correlation between increased glucose-metabolism, cellularity, degree of differentiation, as well as Ki67 and HER2/neu expression of breast cancer primaries. 18F-FDG-PET and DWI from hybrid PET/MRI may offer complementary information for the evaluation of breast cancer aggressiveness in initial staging and treatment response.
Limitations: A small population and potential measurement error in ADC-values due to centrally necrotising tumours.

Two-dimensional shear wave elastography for significant liver fibrosis in patients with chronic hepatitis B: a systematic review and meta-analysis
H. Wei, H. Jiang, B. Song; Chengdu/CN (weih_cat@163.com)

Purpose: To assess the diagnostic performance of two-dimensional shear wave elastography (2D SWE) for detecting significant liver fibrosis in patients with chronic hepatitis B (CHB).
Methods and materials: A systematic literature search of the PubMed, EMBASE, Cochrane Library databases, and Web of Science was conducted. Bivariate modelling and hierarchical summary receiver-operating-characteristic modelling were constructed to summarise the diagnostic performance of 2D SWE. Subgroup analyses were performed to explore the source of heterogeneity.
Results: 11 eligible studies with 2592 patients were included. 2D SWE showed a summary sensitivity of 88% (95% CI: 83–91), specificity of 83% (95% CI: 78–88), and summary AUC of 0.92 (95% CI: 0.89-0.94) for detecting significant liver fibrosis in CHB patients. Subgroup analysis revealed that sensitivity was significantly higher for prospective studies than retrospective studies (89% vs 82%, p <0.01) and for studies excluding patients receiving antiviral therapies than studies without excluding patients with antiviral treatment (89% vs 82%, p <0.01). Specificity was significantly higher for studies with larger populations (≥110) than those with smaller sample size (<110) (85% vs 75%, p <0.05). In particular, the cutoff values in studies exclusively including antiviral treatment-naïve CHB patients were generally lower than studies without excluding patients receiving antiviral treatment, with an average of 6.91 kPa and 8.87 kPa, respectively (p <0.01).
Conclusion: 2D SWE is an excellent modality for the prediction of significant liver fibrosis in CHB populations. Further work is required to establish the cutoff values that account for antiviral treatment as a potential confounding factor.
Limitations: A small number of studies were included in our research.

RPS 601b-2 11:31
Etiology of the liver stiffness assessed with ultrasound elastography: a cross sectional twin study
D. L. Tarnoki[1], M. O. Erdei[2], M. Piroska[1], A. Hernyes[1], H. Szabó[1], M. Fekete[3], A. Tarnoki[1]; [1]Budapest/HU, [2]Linz/AT, [3]Kaposvar/HU (tarnoki4@gmail.com)

Purpose: Non-alcoholic fatty liver disease (NAFLD) is an epidemic and a common radiological finding. However, the background of liver stiffness assessed with the ultrasound based noninvasive shear wave elasticity imaging (SWEI) method is still sparse. Our aim was to determinate whether the SWEI

based liver stiffness has a heritable component or if it is determinated by the environment.
Methods and materials: 160 Hungarian twins (97 monozygotic, MZ, 62 dizygotic, DZ; mean age 50.6±14.7 years) recruited from the Hungarian Twin Registry underwent a cross sectional ultrasonographic SWEI between 2016 and 2018. Patients with cirrhosis or a history of oncologic disease were excluded. Heritability was calculated using univariate ACE model.
Results: Men had higher Young-modulus values than the women (8.47±3.52 vs. 6.83±3.09, p=0.01). Young-modulus values were higher in patients with ultrasound based steatosis (6.36±2.55 vs. 8.42±3.57, p=0.001) which was confirmed by increasing mild and moderate steatosis compared to healthy patients without NAFLD. In MZ twins, there was a lower intrapair correlation for the Young-modulus (r=0.32, 95% CI, 0.011 to 0.569) than in DZ twins (r=0.507, 95% CI, 0.172 to 0.734), which demonstrated no additive genetic component, a high unique environmental (E=0.609, 95% CI, 0.427 to 0.831), and moderately common environmental effect (C=0.391, 95% CI, 0.169 to 0.573), respectively.
Conclusion: SWEI assessed liver stiffness is elevated in men and in patients with NAFLD and demonstrates no heritability. Our results might stimulate further studies to understand the environmental factors determining the liver stiffness.
Limitations: Relatively low number of DZ twins compared to MZ twins might slightly bias the heritability results.
Ethics committee approval: The local ethical committee approved the study (approval number: 189-1/2014). All participants gave informed consent.
Funding: No funding was received for this work.

RPS 601b-3 11:37

Comparison of sound touch elastography (STE), shear wave elastography (SWE), and vibration controlled transient elastography (VCTE) using liver biopsy as reference for chronic liver disease assessment

I. Gatos[1], P. Drazinos[2], S. Yarmenitis[3], I. Theotokas[1], E. Panteleakou[1], A. Soultatos[1], P. S. Zoumpoulis[1]; *[1]Athens/GR, [2]Kifissia/GR, [3]Marousi/GR (p.drazinos@echomed.gr)*

Purpose: Chronic liver disease (CLD) is currently one of the major causes of death and the major cause of hepatocellular carcinoma development. Accurate diagnosis regarding CLD progress is very important. Although liver biopsy (LB) is considered 'gold standard' for diagnosis, several non-invasive methods exist in order to avoid LB complications. Sound touch elastography (STE) that is available in the Resona 7 ultrasound (US) device and is similar to shear wave elastography (SWE) seems promising but needs to be validated. Our aim is to evaluate and compare a new commercial variant of US elastography, STE, against already established methods such as SWE and vibration controlled transient elastography (VCTE), using LB as a 'gold standard'.
Methods and materials: 139 subjects, 28 normal (F0) and 111 with CLD (F1-F4), were included in the study. A B-Mode and elastographic examination was performed on each patient with Resona 7, Aixplorer (SWE), and Fibroscan (VCTE) US devices. The STE, SWE, and VCTE measurements were performed on the right lobe (RL) of each patient and were compared to LB results according to the Metavir Classification System (F0-F4). Receiver operating characteristic (ROC) analysis was performed for all methods to obtain best cut-off stiffness values.
Results: ROC analysis showed AUC (STE/SWE/VCTE) 0.9541/0.9581/0.9632 for F=F4, 0.9591/0.9623/0.9631 for F≥F3, 0.9346/0.9481/0.9415 for F≥F2, and 0.9224/0.9397/0.9348 for F≥F1. Best cut-off stiffness values calculated (STE/SWE/VCTE) in kPa: F=F4: 11.05/10.5/10.6, F≥F3: 9.05/8.7/8.8, F≥F2: 8.0/8.3/7.6, F≥F1: 7.15/7.05/6.2, respectively.
Conclusion: In conclusion, STE performs similarly to VCTE and SWE in terms of accuracy and could be used as alternative to the other methods.
Limitations: n/a

Preoperative evaluation of the liver using 2D-shear wave elastography with propagation map for prediction of post-hepatectomy liver failure: comparison with transient elastography

D. H. Lee, J. Y. Lee, J. Bae*; Seoul/KR (dhlee.rad@gmail.com)*

Purpose: To evaluate whether 2D-shear wave elastography (SWE) could predict post-hepatectomy liver failure (PHLF) in patients who underwent resection for liver tumours in comparison with transient elastography (TE).
Methods and materials: Between July 2018 and March 2019, we prospectively enrolled 49 patients who underwent surgical resection for liver tumours. After liver resection, development of PHLF was assessed using criteria proposed by an international study group of liver surgery. Association between liver stiffness values obtained by TE/SWE and development of PHLF was assessed using ROC analysis.
Results: After liver resection, 15 patients (15/49, 30.1%) experienced PHLF. Mean liver stiffness value obtained from TE in 15 patients with PHLF was higher than in 34 patients without PHLF, but there was no statistically significant difference (9.3 kPa vs. 10.5 kPa, P=0.086). The area under the curve (AUC) of TE for prediction of PHLF was 0.655 (P=0.082, 95% confidence interval [CI]; 0.505-0.785). Regarding liver stiffness value obtained 2D-SWE, 15 patients with PHLF had significantly higher liver stiffness value compared to 34 patients without PHLF (8.1 kPa vs. 10.6 kPa, P=0.011). The AUC of 2D-SWE for prediction of PHLF was 0.729 (P=0.006, 95% CI; 0.584-0.846), which was not significantly different from TE (P=0.275). The estimated sensitivity and specificity of 2D-SWE for detecting PHLF was 80.0% and 73.5% when the cut-off value was set at 7.8 kPa.
Conclusion: 2D-SWE with propagation map could have a potential to predict PHLF in patients who underwent resection for liver tumour.
Limitations: Small number of partcipants.
Ethics committee approval: Our institutional review board approved this prospective study.
Funding: Canon medical system supported this study. Whole data was collected and analysed by the authors.

RPS 601b-5 11:49

Comparison between transient elastography and liver surface nodularity for detecting clinically significant portal hypertension

R. Sartoris[1], A. Souhami Amanou[1], A. Calandra[2], P.-E. Rautou[1], F. Cauchy[1], V. Vilgrain[1], R. Maxime[1]; *[1]Clichy/FR, [2]Palermo/IT*

Purpose: To compare the performance of liver surface nodularity (LSN) and transient elastography (TE,Fibroscan®) for the detection of clinically significant portal hypertension (CSPH), and to propose a combined algorithm to improve diagnostic performance.
Methods and materials: This study included patients with compensated cirrhosis who underwent CT, TE, and hepatic venous pressure gradient (HVPG) measurement within 30 days between 2015-2018. Accuracy of TE and LSN for predicting CSPH was evaluated with AUROC. Student t-test and Pearson correlation coefficient were used. Rule-in and rule-out values were evaluated.
Results: 140 patients underwent both tests: 109 men (78%,mean age 63±9 yrs), including 39 (28%) with CSPH. LSN was valid in 130 patients (93%) and correlated with HVPG (r=0.68;P<.001). Patients with CSPH had a higher LSN than those without (mean 3.14±0.15 vs. 2.50±0.03,P<.001; AUROC=0.87±0.03). TE was valid in 132 patients (94%) and correlated with HVPG (r=0.75,P<.001; AUROC=0.87±0.03). In patients with both valid LSN and TE values (n=122), no significant difference in terms of diagnostic performance was found (DeLong, P=.54). In this group, using cutoff values of 2.57 (LSN) and 21.5kPa (TE) correctly classified 75% and 80% patients, respectively (p=0.36). Patients with 0 (n=45), 1 (n=51), and both tests (n=26) above cutoff values had 0%-24%-92% CSPH.
Conclusion: LSN score showed similar diagnostic performance and feasibility as transient elastography for detecting CSPH. Combination of both tests improved correct patient classification.
Limitations: This study only included patients with cirrhosis during pre-surgery evaluation for hepatocellular carcinoma.
The study did not analyse the predictive role of LSN score for portal hypertension–related complications such as bleeding esophageal varices or death.

Liver stiffness and fatty liver quantification in high risk patients

I. Sporea, R. Mare, S. Nistorescu, A. Vitel, R. Sirli, A. S. Popescu, A. Sima, R. Timar, M. Tomescu; *Timisoara/RO (isporea@umft.ro)*

Purpose: To assess the severity of liver fibrosis and steatosis in both type 2 diabetes patients (T2DM) and those with metabolic syndrome (MS) using non-invasive methods: transient elastography (TE) and controlled attenuation parameter (CAP).
Methods and materials: The study included 704 T2DM and 150 MS patients who were prospectively evaluated in the same session by means of TE and CAP (FibroScan EchoSens) to assess liver fibrosis and steatosis. Reliable liver stiffness measurements (LSM) were defined as the median value of 10 LSM with an IQR/median <30%. A cut-off value of 10.1 kPa was used to define severe fibrosis (F≥3). For differentiation between stages of steatosis we used the following cut-off values proposed by the manufacturer: S1 (mild) 230-275, S2(moderate) 275-300 db/m, S3(severe) > 300 db/m.
Results: Of 854 patients screened, we excluded those with associated viral hepatitis, those with an AUDIT-C score ≥8, and those with unreliable LSM. The final analysis included 546 T2DM and 133 MS patients. BMI ≥ 30 kg/m^2 was found in 59.9% T2DM and in 72.2% (96/133) of MS patients (p<0.001). There were no significant differences between grades of steatosis by means of CAP in patients with T2DM (S1-15.6%, S2-15.6 % and S3-59.3%) and those with MS (S1-22.5%, S2-10.5% and S3-54.1%). Severe fibrosis was detected by means of TE in 19% (104/546) of subjects with T2DM and in 18% (24/133) with MS.
Conclusion: In our group, 79.5% obtained reliable LSM by means of TE and CAP. Presence of steatosis was found in 88.7% of patients by means of CAP and 18.8% of them had severe fibrosis suggesting the need for further assessment.
Limitations: Some patients with metabolic syndrome had diabetes.
Ethics committee approval: Written consent.

RPS 601b-7 12:01

Spleen stiffness for predicting the presence of high risk varices: comparison between two different elastography techniques

F. Renata, I. Sporea, B. Felix, R. Lupusoru, M. Danila, P. Alina, S. Roxana; *Timisoara/RO (renata.fofiu@yahoo.com)*

Purpose: To establish the usefulness of spleen stiffness (SS) values measured using two elastography techniques, point shear wave elastography (pSWE) and 2D-shear wave elastography (2D-SWE), as non-invasive markers for predicting the presence of high risk varices (HRV) in patients with compensated liver cirrhosis and to compare their performances.
Methods and materials: A prospective study was performed, including 107 subjects with compensated liver cirrhosis who underwent both upper endoscopy and SS measurements (SSM) by means of two elastographic techniques: pSWE - using virtual touch quantification (VTQ) technology (Acuson S2000-Siemens); and 2D-SWE (LOGIQ E9-General Electric), in the same admission. Reliable SSM were defined for both techniques as the median value of 10 measurements acquired in a homogenous area with IQR/M<0.30. HRV were defined as grade II, III esophageal and gastric varices. Compensated liver cirrhosis was diagnosed based on clinical, biological, and elastographic criteria (liver transient elastography>12.5 kPa).
Results: We obtained reliable SSM in 96.2% (103/107) by means of 2D-SWE.GE and in 94.4 (101/107) subjects by means of pSWE-VTQ. 98 subjects were included in the final analysis, 40.8% (40/98) had HRV. The mean SS values were significantly higher for patients with HRV as compared to those with first grade or no varices for both techniques (16.74±3.42 kPa vs. 12.71±2.2 kPa,p<0.0001 for 2D-SWE.GE; 3.52±0.49 m/s vs. 2.7±0.3 m/s,p<0.0001 for pSWE-VTQ). The best SS cut-off value by 2D-SWE.GE for predicting the presence of HRV was 13.2 kPa (AUROC–0.84; sensitivity-87.5%; specificity-69%; PPV-66%; NPV-88.9%), while for pSWE-VTQ was 2.91 m/s (AUROC–0.9; sensitivity-85%; specificity-75.8%; PPV-70.8%; NPV-88%). Based on AUROC comparison, there was no significant difference between the performance of the two techniques for predicting the presence of HRV (p=0.2191).
Conclusion: SS has a good accuracy for predicting HRV with both elastography techniques, 2D-SWE.GE and pSWE-VTQ.

RPS 601b-8 12:07

Measurement of the relationship between the histologic stage of liver fibrosis and the spatial variability of liver shear stiffness (kPa) using 2D magnetic elastography (MRE)

N. Layyous[1], C. B. Sirlin[2], K. J. Fowler[2], E. Z. Sy[2], T. Wolfson[2], A. Pecorelli[3], T. I Delgado[2], A. S. Boehringer[2], R. Loomba[2]; *[1]Rancho Santa Margarita, CA/US, [2]San Diego/US, [3]Milan/IT (nadera.layyous@ucdconnect.ie)*

Purpose: To investigate the relationship between the histologic stage of liver fibrosis and the spatial variability of liver shear stiffness (kPa) as measured by 2D magnetic elastography (MRE) in adults with known/suspected non-alcoholic fatty liver disease (NAFLD). Secondarily, to explore possible confounders (age, sex, and body mass index (BMI)).
Methods and materials: We retrospectively identified 156 adult patients with known or suspected NAFLD who underwent research 2D MRE exams (4 slices per patient) at 3T between 2014 and 2015 and for whom the following was available: age, sex, BMI, and liver biopsies performed within 180 days before or after MRE. Analysts placed regions of interest (ROI) on each of the four slices in areas of liver parenchyma with planar wave propagation. Number of pixels, mean stiffness, and standard deviation (SD) of stiffness was computed across the four ROIs. Stiffness SD was used as a metric of spatial variability. An expert pathologist scored liver fibrosis stage for each patient using the NASH CRN system. Stiffness SD was correlated with fibrosis stage (Spearman correlation). A multivariable linear regression was used to model stiffness SD as a function of fibrosis stage and possible confounders (stiffness mean, age, sex, and BMI).
Results: Stiffness SD positively correlated fibrosis stage. In multivariable analysis, the strongest predictor of stiffness SD was stiffness mean. Sex and fibrosis stage had trend-wise significant association with stiffness SD, while BMI and age did not.
Conclusion: Spatial variability of liver stiffness increases with fibrosis stage. Further research is needed to determine whether spatial variability of stiffness reflects the spatial variability in fibrosis or other factors.
Limitations: Stiffness measured by MRE comes from only within the ROI.
Ethics committee approval: All patients gave informed consent.
Funding: NIH grant and in part from GE.

RPS 601b-9 12:13

Interobserver variability in the evaluation of magnetic resonance elastography in patients with fibrotic liver disease

M. W. Raudner[1], D. Bencikova[1], S. Pötter-Lang[1], N. Bastati[1], K. Grąt[2], G. Reiter[3], S. Kannengiesser[4], S. Trattnig[1], M. Krssak[1], A. Ba-Ssalamah[1]; [1]Vienna/AT, [2]Warsaw/PL, [3]Graz/AT, [4]Erlangen/DE (marcus.raudner@meduniwien.ac.at)

Purpose: To assess the feasibility of a manual segmentation approach in magnetic resonance elastography (MRE) using a spin echo echo-planar imaging (EPI) prototype sequence in patients with various hepatic diseases.
Methods and materials: In total, 111 (46 female, mean age 61.0±13.6 years) individuals were examined at 3T (Magnetom PRISMAfit, Siemens Healthineers, Erlangen, Germany) using a prototype spin echo EPI sequence. The derived MRE images were independently evaluated by two readers, both qualitatively and quantitatively (in kPa) with strict adherence to the QIBA Consensus Profile for MRE of the Liver of the RSNA.
Results: The wave propagation was graded as disorganised in 11 and 9 cases, suboptimal in 34 and 28 cases, and optimal in 66 and 74 cases, by both readers respectively.
Mean stiffness was 3.2±1.8 kPa for reader 1 and 3.4±1.8 kPa for reader 2. The agreement of both readers was excellent with an ICC of 0.969 (95%CI 0.950-0.980) with only a minimal bias of -0.14 kPa (95%CI -0,228023 to -0,0532536). There was no correlation between disagreement and increasing kPa (r_{sp}=0.019, p=0.856). Also, the mean difference between both readers did not differ between groups with better or worse wave propagation (p=0.549 and p=0.584).
Conclusion: Based upon the presented data, assessing the agreement of manual stiffness assessment in MRE at 3T using a spin echo EPI prototype sequence, the interobserver agreement was excellent. However, evaluating the cause-specific sources for suboptimal wave propagation is warranted.
Limitations: There is no gold standard for in vivo MRE using a spin echo EPI sequence at 3T. This study was conducted retrospectively with various hepatic diseases.
Ethics committee approval: Approved by the ERB of the Medical University of Vienna. Written and informed consent received from all participants.
Funding: No funding was received for this work.

RPS 601b-10 12:19

Single- and multi-frequency MR elastography with gradient-recalled echo and spin-echo echo-planar acquisitions: comparison of robustness and intersegmental liver stiffness variation

V. C. Obmann[1], R. Kreis[1], I. Sack[2], A. Berzigotti[1], M. M. Obmann[3], J. T. Heverhagen[1], A. Christe[1], A. T. Huber[1]; [1]Berne/CH, [2]Berlin/DE, [3]Basel/CH (verena.obmann@insel.ch)

Purpose: To assess the agreement between single-frequency (sf) gradient recalled echo (GRE), sf spin echo echoplanar (SE-EP) and multifrequency (mf) SE-EP magnetic resonance elastography (MRE) sequences of the liver for the assessment of liver fibrosis.
Methods and materials: In this prospective proof-of-concept study, 22 patients (11 male, mean age 57 year, range 30-80 years) with histologically proven different degree of liver fibrosis (F0-F4) underwent MRE at 3T with three different MRE methods at 4 slices through the liver: i) sf 2D GRE MRE (sf-greMRE), ii) sf 2D SE-EP MRE (sf-se-epiMRE) and iii) multifrequency SE-EP MRE (mfMRE). Sequence robustness was assessed as number of segments per sequence in which image quality was good enough to measure liver stiffness. Intrasequence consistency was assessed by the coefficient of variance (CV) over regional stiffness estimates. For statistical analysis, ANOVA with post-hoc group comparison was performed.
Results: Evaluable segments for sf-greMRE, sf-se-epiMRE, and mfMRE were 3.0±1.5, 6.9±1.6, and 5.9±2.5; p<0.001. In pairwise comparison, sf-greMRE showed significantly fewer evaluable segments than sf-se-epiMRE and mfMRE (both p<0.001), while there was no significant difference between sf-se-epiMRE and mfMRE (p=0.147). The CV between segments for sf-greMRE, sf-se-epiMRE, and mfMRE was 15.0±9.5, 16.1±9.4, and 12.0±4.3; p=0.234. There was a trend towards lower CV in mfMRE.
Conclusion: Our data suggest that sf-se-epiMRE and mfMRE may be more robust alternatives to sf-greMRE, although a bigger sample size is needed for diagnostic accuracy to assess grading of liver fibrosis with these sequences.
Limitations: We acknowledge small study population as the main limitation of our study.
Ethics committee approval: This study was approved by the cantonal ethics committee Bern. Written informed consent was given.
Funding: This project was funded by the Swiss National Science Foundation (SNF) grant # 320030_188591.

RPS 601b-11 12:25

Can T1-mapping serve as an alternative to MR-elastography in the staging of liver fibrosis?

S. Freiin von Ulmenstein[1], S. Bogdanovic[2], H. Honcharova-Biletska[1], S. Blümel[1], A. Deibel[1], C. Jüngst[1], A. Weber[1], C. Gubler[1], C. S. Reiner[1]; [1]Zurich/CH, [2]Gossau/CH (sophie.vonulmenstein@usz.ch)

Purpose: To compare the diagnostic performance of T1-mapping and MR-elastography (MRE) for staging of hepatic fibrosis with histopathology as standard of reference.
Methods and materials: 48 patients who underwent liver biopsy for suspected fibrosis or were diagnosed with alcohol-toxic cirrhosis prospectively underwent look-locker inversion recovery T1-mapping and MRE. T1 relaxation time and liver stiffness (LS) were measured in the right and left liver lobe by two readers. Hepatic fibrosis was histopathologically staged according to a standardised fibrosis score (F0-F4). For statistical analysis independent t-test, Mann-Whitney-U-Test and ROC analysis were performed. ROC analysis was performed to determine accuracy of T1-mapping and MRE for fibrosis staging.
Results: Histopathological analysis diagnosed 3 patients with F0 (6%), 14 with F1 (29%), 13 with F2 (27%), 7 with F3 (15%), and 11 with F4 (23%, including previously diagnosed cirrhotic patients). T1-mapping and MRE both showed significantly higher values for patients with significant fibrosis (F0-1 vs. F2-4; T1-mapping p=0.001, MRE p<0.0001) as well as for patients with severe fibrosis or cirrhosis (F0-2 vs. F3-4; T1-mapping p=0.010, MRE p<0.0001). The diagnostic performance of T1-mapping and MRE was similarly high for significant fibrosis (F2-4) (AUC 0.798 vs. 0.868, p=0.39), but was significantly higher for MRE for severe fibrosis (F3/4) (AUC 0.952 vs. 0.745, p=0.02).
Conclusion: T1-mapping may be used as an alternative to MRE for diagnosing fibrosis in patients with different liver diseases, especially for the detection of clinically significant fibrosis.
Limitations: T1-maps were not fat-corrected, which might have influenced the results and should be a target of further studies.
Ethics committee approval: The local ethics committee approved this prospective study and all patients gave written informed consent.
Funding: No funding was received for this work.

Classifying white matter hyperintensities according to intensity and spatial localisation reveals a specific association with cognition

L. Melazzini[1], V. Bordin[1], S. Suri[2], E. Zsoldos[2], K. Ebmeier[2], M. Jenkinson[2], C. Mackay[2], F. Sardanelli[1], L. Griffanti[2]; [1]Milan/IT, [2]Oxford/UK
(lucamelazzini@yahoo.it)

Purpose: White matter hyperintensities (WMH) on T2-weighted images are imaging biomarkers of brain small vessel disease. When classified according to location (periventricular/deep), they have shown different associations with cognition. WMH can also appear hypointense on T1-weighted (T1w) images as a possible sign of irreversible tissue damage.
We hypothesise that sub-classifying WMH combining intensity information and spatial localisation may provide better insight into the association with cognition, not detectable for the total WMH burden.
Methods and materials: We analysed data from 680 subjects of the Whitehall II imaging sub-study. A supervised machine learning method (BIANCA) was used to segment WMH. An automatic method based on cluster localisation and image intensity were then applied to classify WMH into 4 categories according to adjacency to the ventricles (periventricular/deep) and appearance on T1w images (either T1w-hypointense or not). Derived volumes were entered into a general linear model as predictors of the participants' cognitive scores on neuropsychological tests.
Results: Periventricular T1w-hypointense WMH were significantly related to worse performance in trail-making test A (p=0.006), trail-making test B (p=0.028), digit-symbol coding (p=0.018), and digit-span (p=0.032) tests. When including only the total WMH burden in the model, the only significant associations between WMH and cognition were with trail-making test A (p=0.040) and the digit-symbol coding task (p=0.022).
Conclusion: Sub-classifying WMH according to both location and appearance on T1w images provided added value compared to total WMH burden alone. These are promising findings for WMH interpretation in the clinical practice and for the development of methods for analysing imaging biomarkers related to cognition.
Limitations: This study is cross-sectional in its design.

Brain structural covariance in subtypes of mild cognitive impairment at risk of disease progression

H. Yao[1], L. Zhao[2], Y. Luo[2], L. Shi[2], D. Lew[2], V. Mok[3], B. Zhou[1], X. Zhang[1], N. An[1]; [1]Beijing/CN, [2]Shenzhen/CN, [3]Hong Kong/HK

Purpose: To investigate the structural covariance in mild cognitive impairment (MCI) subtypes and a newly defined MCI subgroup with more severe Alzheimer's disease (AD)-like brain atrophy pattern.
Methods and materials: We included 72 subjects with AD, 96 with MCI, and 108 normal controls (NC). The MCI subjects were further grouped into amnestic MCI (aMCI, n=72) and non-amnestic MCI (naMCI, n=24). T1-weighted MRI scans were collected for all the participants and were processed with AccuBrain for brain volume quantification of basal ganglia structures. An AD resemblance atrophy index (AD-RAI) was generated by AccuBrain to evaluate the severity of AD-like brain atrophy patterns. Based on this index, the MCI group was subdivided into MCI-L (AD-RAI<0.5, with a lower risk of progression to AD, n=70) and MCI-H (AD-RAI>0.5, with a higher risk of progression to AD, n=26). We compared the volumetric measures of the different groups, with multiple comparison corrections where appropriate. Structural covariance, which was calculated by correlations of brain volumes between regions, was compared between MCI subgroups and NC or AD.
Results: MCI-L and naMCI presented similar brain volumes of basal ganglia structures with the NC group, while MCI-H and aMCI presented similar brain volumes with the AD group. Subjects with aMCI had more extensive volumetric connections than naMCI and the MCI-H group triggered even more extensive brain volumetric connections than AD.
Conclusion: AD-RAI that measures the AD-like brain atrophy degree identified a subgroup of MCI with more extensive network-level brain structural changes than AD and other subtypes of MCI. Future study should aim to validate the structural covariance of this MCI subgroup in possible progression to AD in a longitudinal dataset.
Limitations: The generalisability of the findings warrants further validation due to the small sample size.

Study on feasible elemental statistics of MR-phase information for AD diagnosis

S. Shinohara[1], T. Yoneda[1], Y. Tatewaki[2], B. Thyreau[2], T. Nagasaka[2], T. Mutoh[3], H. Arai[3], Y. Taki[3]; [1]Kuhonji Chuo-Ward, Kumamoto/JP, [2]Sendai/JP
(sabo30115@gmail.com)

Purpose: MR-phase can detect iron in the amyloid plaque (AP) as a pathological feature of Alzheimer's disease (AD). This study aimed to suggest a reliable evaluating method of AP via statistics of MR-phase information.
Methods and materials: 20 MRIs of AD, MCI due to AD, and normal cognition patients visiting Tohoku University Hospital (April-July 2017, m/w=9/11, 78.6±8.0y, MMSE=22.6±4.1) were used. The scan was done by SWIp (echo space=4, 1st TE/DTE=7.3/8 ms) and MPRAGE on 3T-MRI. We automatically classified brain areas using AAL atlas equipped in SPM12 on native space of phase image using MATLAB. We derived elemental statistics (mean value, SD, skewness, and kurtosis) of extracted phase histograms derived from each cortex area and evaluated them by changing TE.
Results: All statistics linearly changed proportionally to TE. The proportional coefficient of skewness to TE showed a high correlation to MMSE (r^2>0.4; SFG, >0.6; PrCn, p<0.01) that the rest of parameters didn't show (r^2<0.1; p>0.05). The histogram analysis showed that skewness changing was coming from the lower lobe distortion of phase histogram, which might be corresponding to AP iron loading in the cortex. Although some of the data couldn't fit the Gaussian model as reported previously to derive AP, we could derive statistics in all cases.
Conclusion: We could derive elemental statistics of MR-phase histogram in all data. The proportional coefficient of skewness to TE might be a candidate of novel quantity to bring to the clinical site for AD diagnosis using MRI.
Limitations: Truncation artefact around the brain boundary and phase distortion near the vessel may affect phase distribution.
Ethics committee approval: This study was approved by IRB (approved #2017-1-1097).
Funding: No funding was received for this work.

Prediction of Alzheimer's disease by using a novel 3D deep learning model

J. Ma, Q. Chu, B. Pan, J. Gu, S. Wang; *Shenzhen/CN (wangsilun@gmail.com)*

Purpose: It has been shown that deep learning methods provide high diagnostic accuracy for Alzheimer's disease diagnosis. We aim to investigate the novel deep learning model named 3D Deepbrain for AD diagnosis and applied it to real-world data.
Methods and materials: 391 AD patients and 492 age- and sex-matched controls (mean age 73.8±15.1 vs 74.9±15.5, p>0.05) from the ADNI database were recruited for Deepbrain model training. The model was tested by 71 AD patients and 77 matched controls (mean age 64.5±10.3 vs 64.4±0.2, p>0.05). All 3D MRI images were preprocessed by using the SPM12 software package to generate the grey and white matter. Diagnostic accuracy were compared by the Deepbrain model and VGG16 model. The Deepbrain model introduces the squeeze and excitation blocks as the deeper feature extractors which can enhance the capability of channel-wise feature extraction.
Results: For the testing dataset of ADNI, the Deepbrain model has a better diagnostic accuracy of 89.26%, sensitivity of 87.67%, precision 86.48%, specificity of 90.38%, and NPV of 91.26% than the VGG16 (accuracy 87.00%, sensitivity 82.43%, precision 85.91%, specificity 90.29%, and NPV 87.73%). For the real-world data, the Deepbrain model achieved an accuracy of 81.08%, sensitivity of 61.97%, precision 97.77%, specificity of 98.70%, and NPV of 73.78%, which was also better than VGG16 (accuracy 75.51%, sensitivity 42.29%, precision 99.99%, specificity 99.99%, and NPV 67.85%).
Conclusion: A novel 3D Deepbrain model was developed which can achieve promising AD diagnostic accuracy when compared to a conventional model in both public and real-world datasets. The Deepbrain model has the potential to be used in clinical tasks.
Limitations: More real-world data needs to be tested.

Abnormal cerebral microstructures revealed by diffusion kurtosis imaging in amyotrophic lateral sclerosis

H.-J. Huang, H.-J. Chen, T.-X. Zou; *Fuzhou/CN (chj0075@126.com)*

Purpose: To investigate cerebral microstructural changes in amyotrophic lateral sclerosis (ALS) using diffusion kurtosis imaging (DKI) for the first time.
Methods and materials: 18 ALS patients and 20 controls were included and underwent DKI scanning. A revised-ALS functional rating scale (ALSFRS-R) was administered to assess disease severity. Disease duration and progression rate were also recorded. Voxel-based analysis was applied to examine the alteration of DKI metrics (i.e. mean(MK)/axial(AK)/radial(RK) kurtosis) and conventional diffusion metrics (i.e. fractional anisotropy and mean/axial/radial diffusivity).
Results: ALS patients showed MK reductions in grey-matter areas, including the bilateral precentral gyrus, bilateral paracentral lobule, and left anterior cingulate gyrus. They also showed decreased MK values in white matter (WM) in the bilateral precentral gyrus, bilateral corona radiata, bilateral middle corpus callosum, left occipital lobe, and right superior parietal lobule. The spatial distribution of regions with reduced RK was similar to those with decreased MK. No between-group AK difference was found. The correlation analysis revealed significant associations between DKI metrics and clinical assessments such as the ALSFRS-R score and disease duration. Additionally, several WM regions showed between-group differences in conventional diffusion metrics, but the spatial extent was smaller than that with reduced DKI metrics.
Conclusion: The reduction in DKI metrics indicates decreased microstructural complexity in ALS, involving both motor-related areas and extra-motor regions. DKI measurements can serve as potential biomarkers for assessing disease severity and provide supplementary information to the conventional diffusion in relecting ALS-related WM abnormalities.
Limitations: The sample size is relatively small.
Ethics committee approval: Approval for this evaluation was obtained from the Research Ethics Committee of Fujian Medical University Union Hospital, China. All of the subjects provided written informed consent.
Funding: National Natural Science Foundation of China (No. 81501450).

Diffusion basis spectrum imaging quantifies microstructural changes of the substantia nigra in early-stage Parkinson's disease

Z. Hu[1], P. Sun[2], X. Ceng[1], A. George[2], R. Yang[1], S. Song[2]; *[1]Guangzhou/CN, [2]Saint Louis/US (jassica1227@126.com)*

Purpose: To examine the microstructural changes in the substantia nigra (SN) of patients with early-stage Parkinson's disease (PD) using diffusion basis spectrum imaging (DBSI).
Methods and materials: 37 age- and sex-matched early-stage PD patients and 22 healthy controls (HCs) were enrolled. All participants underwent clinical assessments and diffusion-weighted MRI scans. SN regions were manually drawn then analysed by diffusion tensor imaging (DTI) and DBSI to assess the microstructural integrity of SN, using both DTI- and DBSI-derived diffusion metrics to reflect tissue loss (DBSI-fiber-fraction and DTI-fraction-anisotropy(FA)), dendritic injury (DBSI-fiber-axial-diffusivity (AD) and DTI-AD/mean-diffusivity(MD)), inflammation (DBSI-restricted-fraction), and oedema (DBSI non-restricted-fraction).
Results: Only DTI-FA among DTI metrics was significantly decreased in PD (PD: 0.32±0.03 vs HCs: 0.33±0.02, p=0.015), suggesting potential but not specific tissue damage in SN. Interestingly, DBSI-restricted-fraction was significantly increased (PD: 0.13±0.05 vs HCs: 0.11±0.04, p=0.031), potentially reflecting increased inflammatory cell infiltration in PD. More importantly, the significantly increased DBSI non-restricted-fraction (PD: 0.15±0.05 vs HCs: 0.12±0.05, p=0.02) and decreased DBSI-fiber-fraction (PD: 0.72±0.07 vs HCs: 0.77±0.07, p=0.003) in PD, potentially indicating the presence of oedema and/or coexisting tissue loss, further reflecting the dopaminergic neuronal loss and/or dendritic loss in SN. Other DBSI metrics were insignificantly altered. Furthermore, DBSI-restricted-fraction was negatively correlated with the Hamilton anxiety rating scale (HAMA) (r=-0.501, p=0.005), but no correlation was found between DTI-FA and clinical scales.
Conclusion: DBSI detected and quantified the extent of SN dendritic and/or neuronal loss with coexisting oedema and increased inflammatory cellularity, consistent with the hallmark SN pathologies in PD. DBSI results potentially indicate the specific pathological changes in SN with early-stage PD. A finding remains to be further investigated through more extensive longitudinal DBSI analysis of PD patients.
Limitations: There is no intergroup comparison within different stages of PD.
Ethics committee approval: Ethics committee approval and written informed consent were obtained.
Funding: No funding was received for this work.

Comparing "swallow tail sign" and striatal uptake in early-stage Parkinson's disease: a potential surrogate of 18F-DTBZ PET

N. W. Wang, X. Liu, Y. Li; *Shanghai/CN (wangna100medical@126.com)*

Purpose: To compare the changes of "swallow tail sign" (STS) and striatal uptake on PET to construct an evaluating scale based on bilateral STS in each patient and to estimate its diagnostic performance in early-stage Parkinson's disease (PD).
Methods and materials: 39 patients with early-stage PD and 28 healthy controls (HC) underwent quantitative susceptibility mapping scanning on 3T MRI, of whom 35 patients were assessed on [^{18}F]9-fluoropropyl-(+)-dihydrotetra-benazine (^{18}F-DTBZ) PET. The alterations of STS and striatal uptake in each hemisphere were visually rated as 0-2 points, respectively, with the concordance rate being calculated. In the participant level, an evaluating scale was acquired by adding the bilateral STS points and its diagnostic power was being estimated.
Results: The concordance rate of rating points on STS and ipsilateral striatal binding was 94.3% in the right side and 91.4% in the left. Of 70 nuclei, 28 STS showed a total loss, all of the ipsilateral striatum exhibited decreased uptake, and 39 STS displayed partial loss, 36 ipsilateral striatum presented decreased uptake. Bilateral total loss was in 7 patients, unilateral total loss with contralateral partial loss in 14 patients, bilateral partial loss in 14 patients, and unilateral partial loss with contralateral normal in 1 patient. Using the bilateral partial loss of STS as the threshold, the sensitivity and specificity achieved 94.59% and 92.49% for discriminating PD from HC. The specificity was 100% when the total loss of STS was found in the unilateral hemisphere.
Conclusion: The alterations of STS correspond well with striatal uptake in early-stage PD. The evaluating scale of STS change has a satisfactory diagnostic performance in discriminating the disease. Given that unilateral total loss of STS is detected, the PET examination would not be necessarily applied.

RPS 611a-8 11:57

Intra-network functional connectivity changes of the frontoparietal network in Parkinson's disease

N. A. Teichert[1], C. Rubbert[1], C. Mathys[2], S. B. Eickhoff[3], M. Südmeyer[1], C. J. Hartmann[1], B. Turowski[1], A. Schnitzler[1], J. Caspers[1]; [1]*Düsseldorf/DE,* [2]*Oldenburg/DE,* [3]*Jülich/DE*
(nikolas.teichert@med.uni-duesseldorf.de)

Purpose: The frontoparietal network (FPN) is involved in cognitive action control mediating between the dorsal attention (DAN) and default mode (DMN) networks. While neuroimaging studies have shown network alterations of DMN and DAN in Parkinson's disease (PD), the role of FPN in PD is unclear. Hence, we investigated functional connectivity changes of the FPN in PD.
Methods and materials: Resting-state functional magnetic resonance imaging (3T, EPI, TR=2.2s TE=30ms, 3.1mm³, 11min) was assessed in 38 PD patients and 43 healthy controls (HC, matched for age, gender, and movement). Patients were scanned under dopaminergic medication (ON) and after >12h withdrawal (OFF). The preprocessed fMRI time-series were split into 20 intrinsic brain networks using independent component analysis and left and right FPN were identified. For both FPN, voxel-wise group differences in functional connectivity (PD vs HC, for both medical conditions) were determined using a dual regression approach and permutation testing (n=5000; TFCE; p<0.05, FWE-corrected).
Results: Compared to HC, there was increased connectivity with right FPN in ipsilateral sensorimotor, inferior parietal, parietal opercular, and extrastriate visual areas in PD OFF. For left FPN, PD OFF showed increased connectivity with ipsilateral postcentral, inferior parietal, intraparietal sulcus, extrastriate visual, and frontopolar regions. In PD ON, there was decreased connectivity with contralateral primary sensorimotor areas for both FPN. For left FPN and PD ON, there was increased connectivity with ipsilateral postcentral, inferior parietal, inferior frontal, parietal opercular, thalamic, frontopolar, and ventral visual areas.
Conclusion: Both FPN show increased connectivity in PD. After dopaminergic treatment, there seems to be a connectivity shift from right to left FPN with a decoupling of right FPN from its contralateral counterpart and an increase of ipsilateral connectivity in left FPN.
Limitations: n/a
Ethics committee approval: Approved by the local ethics committee.

Histogram analysis of DTI metrics of grey and white matter in the cognitive decline of Parkinson's disease

C. V. Gkizas[1], L. G. Astrakas[1], M. Chondrogiorgi[1], S. Konitsiotis[1], J.-P. Pruvo[2], M. Argyropoulou[1]; [1]*Ioannina/GR,* [2]*Lille/FR (chgkizas@gmail.com)*

Purpose: To investigate the role of histogram analysis of diffusion tensor imaging (DTI) metrics in detecting microstructural changes of grey (GM) and white matter (WM) associated with cognitive decline in Parkinson's disease (PD).
Methods and materials: 21 PD-patients with dementia (PDD), 21 with mild cognitive impairment (PD-MCI), and 20 without dementia (PD-CTRL) were enrolled in the study. The Parkinson's disease-cognitive rating scale (PDCRS) was used for neuropsychological assessment. Histogram scalars for fractional anisotropy (FA), mean diffusivity (MD), axial diffusivity (AD), and radial diffusivity (RD) were assessed. Differences between groups were evaluated using a Mann Whitney U-test. P<0.05 was considered statistically significant.
Results: In GM compared to PD-CTRLs, the MD showed higher mean, median, mode, and percentile prc75 in PDDs, the FA showed higher mean, median, maxima, and prc25 in PDD and MCI, the AD and RD showed increased maxima, median, and prc75 in PDD, and the AD showed increased median, prc25, and prc75 in PD-MCI. In WM compared to PD-CTRLs, the MD, RD, and AD showed decreased mean, median, mode, and prc25 in PD-MCI, and the FA showed increased mean and prc25. The RD showed higher mean and maxima in PDD than in the PD-MCI group.
Conclusion: GM abnormalities underlying cognitive decline in PD follow a continuum starting with increased AD and ending with additional RD and MD increases. A loss of WM diffusion restriction is present from the early stages of cognitive decline. Neuronal and axonal losses at early stages and additional demyelination might be the histological substrate explaining these microstructural changes.
Limitations: The use of 1.5T MRI.
Ethics committee approval: All patients signed a detailed consent. The study was approved by our hospital's ethics committee.
Funding: No funding was received for this work.

Measuring the midsagittal midbrain area in T1-weighted 3D MRI to differentiate between TDP-43-proteinopathies (ALS) and tauopathies (PSP)

D. Cantré, C. Koch, M. Dyrba, J. Prudlo*; Rostock/DE*
(daniel.cantre@med.uni-rostock.de)

Purpose: Amyotrophic lateral sclerosis (ALS, TDP-43-proteinopathy) and progressive supranuclear palsy (PSP, tauopathy) are histopathologically different neurodegenerative diseases. In cases with overlapping clinical features (i.e. frontotemporal dementia and predominant upper motoneuron symptoms), the prediction of the underlying histopathology can be impossible by clinical criteria alone but is important for adequate therapy. To our knowledge, data regarding midbrain morphology in ALS-patients is not available. The aim of this study was to investigate whether the neuroimaging markers midsagittal midbrain area (MBA) and midbrain-to-pons-ratio (MB/P-ratio) can differentiate between both histopathological entities.
Methods and materials: We assessed T1-weighted 3D MPRAGE sequences in patients with ALS (n=71), PSP (n=36), and in healthy controls (HC, n=72). Two blinded investigators performed manual planimetric measurements to obtain MBA and MB/P-ratios for all individuals. For statistical analysis, inter-rater-reliability, regression analysis, and receiver-operating-characteristics (ROC) were calculated.
Results: Pearson correlation coefficients were r=0.98 for the MBA and r=0.96 for MB/P-ratio. Both MBA and MB/P-ratio were significantly higher in individuals with ALS compared to PSP-patients (p<0.001 for both parameters) and showed no difference compared to healthy controls (p>0.5 for both parameters). Areas under the ROC-curves were 0.935 for MBA and 0.899 for MB/P-ratio (ALS vs PSP).
Conclusion: Our data shows that no measurable midbrain atrophy occurs in ALS-patients. Results for PSP-patients with significantly reduced MBA are in line with the findings of previous studies. Therefore, measuring the MBA is a suitable surrogate marker to differentiate TDP-43-proteinopathies (ALS) from tauopathies (PSP). As a single measurement, the MBA can be easily determined in clinical routine MRI-assessment. MB/P-ratio may be used alternatively but requires two measurements and, therefore, is more time-consuming.
Limitations: A potential selection bias may exist because of the matching algorithm.
Ethics committee approval: n/a

Multimodal imaging to quantify serial changes of the putaminal region during a precursor state and the early stage of Parkinson's disease

H. Takahashi[1], Y. Watanabe[2], H. Tanaka[3], H. Kato[3], H. Adachi[3], M. Mihara[1], H. Mochizuki[3], N. Tomiyama[3]; [1]*Osaka/JP,* [2]*Otsu/JP,* [3]*Suita/JP*
(hiroto.takahashi07@gmail.com)

Purpose: Rapid eye movement sleep behaviour disorder (RBD) is known as a precursor to Parkinson's disease (PD) and identifying a predictor is important to assess PD development from RBD. We aimed to assess the serial putamen changes in a precursor state and determine a predictive image marker for PD development from RBD.

Methods and materials: 8 patients with RBD (RBD group) and 16 patients (PD group) with early PD (Hoehn and Yahr scale: 1-2) underwent dopamine transporter (DAT) imaging and diffusion tensor magnetic resonance imaging (DTI).
The DAT-specific binding ratio (SBR) and the putamen DTI value [mean diffusivity (MD) and fractional anisotropy (FA) values] were calculated.
For each value, the time course in the RBD group and the significance of intergroup differences using a Mann-Whitney's U test were assessed.
Logit (p) was used to estimate the probability of early PD from RBD in relation to the SBR and the DTI value, and the performance of each value to discriminate early PD from RBD was assessed using receiver operating characteristic (ROC) analysis.
Results: During the time course of RBD, there were no significant changes in any value. Both the SBR and the FA value were significantly less in the PD group than in the RBD group.
RBD and PD groups can be separated clearly with the SBR and the FA value. The respective areas under the ROC curve (AUCs) for SBR/FA value were 0.95/0.80 and the AUC for logit (p) was 1.00.
Conclusion: The use of both DAT-SBR and DTI-FA can provide a high performance to discriminate early PD from RBD.
Limitations: The RBD group underwent a short time follow-up.
Ethics committee approval: Our institutional review board approved this study.

Neurite orientation dispersion and density imaging in the substantia nigra and striatum in early-stage idiopathic Parkinson disease
X. Zeng, Y. Xu, C. Ye, H. Yuan*; Beijing/CN (xiangzhuzeng@126.com)*

Purpose: Neurite orientation dispersion and density imaging (NODDI) was used to quantify microstructural changes in substantia nigra (SN) and striatum in early stage of Parkinson disease (PD).
Methods and materials: 19 PD and 20 healthy control cases were investigated. All PD patients were at stage ≤2.5 on the Hoehn and Yahr (H-Y) Scale.
The NODDI sequence consists of one shell with 30 gradient directions and b=711 s/mm^2, and the other with 60 directions and b=2855 s/mm^2. T2 FLAIR images were also acquired.
All DWI data was fitted to the NODDI model using the AMICO algorithm where intracellular volume fraction (Vic), orientation dispersion index (OD), and isotropic volume fraction (Viso) maps were generated. An experienced neuroradiologist drew both sides of the head of the caudate nucleus (CN), putamen (Pu), globus pallidus (GP), substantia nigra pars compacta (SNpc), substantia nigra pars reticulate (SNpr), and thalamus on T2 FLAIR images. T2 FLAIR images were registered to the b_0 images using FSL. Then we extracted the values of each parameter of NODDI and calculated the average values of the nuclei.
Results: Compared with HC, the OD of PD group was significantly different in bilateral GP and right thalamus ($p_{right\ GP}$=0.02, t=-2.39; $p_{left\ GP}$=0.01, t=-2.65; $p_{right\ Thalamus}$=0.005, t=-3.30). There was no significant difference in Vic and Viso between the two groups among the nuclei.
Compared with PD patients whose H-Y Scale was equal or greater than 2, those less than 2 have a significant difference of OD in the right CN (p=0.048, t=-2.13).
Conclusion: As a potential biomarker, OD of NODDI is effective to measure regional neurite changes in early PD patients.
Limitations: The sample size is relatively small.
Ethics committee approval: Ethics committee approval and informed consent was obtained.
Funding: No funding was received for this work.

The value of superb microvascular imaging for evaluating indeterminate lymph nodes in patients with papillary thyroid carcinoma
S. Y. Lee, J. Y. Lee, R. G. Yoon*; Seoul/KR (20170141@eulji.ac.kr)*

Purpose: Ultrasound (US) is regarded as a primary imaging modality for the diagnosis of lateral cervical lymph node (LN) metastasis from papillary thyroid cancer (PTC). However, US has limitations for evaluating metastatic LNs in the indeterminate LN category. Recently, a detailed analysis of vascular structures on US became feasible with the application of superb microvascular imaging (SMI). We aimed to assess the value of SMI for detecting metastasis in indeterminate LNs in PTC.
Methods and materials: This retrospective study included 80 lateral cervical lymph nodes with indeterminate grey-scale US features (41 metastatic and 39 benign) from 80 patients with PTC (70 initially diagnosed and 10 recurrences). Patients underwent power Doppler US and SMI before US-guided biopsy. Two readers independently analysed the distribution of feeding vessels and the number and appearance of internal vessels, and compared them between metastatic and benign LNs. Inter-reader agreement was assessed. The diagnostic performance of SMI for distinguishing between benign and malignant LNs was calculated and compared.
Results: Interobserver agreement was strong for SMI. There was no significant difference in vascular patterns between benign and metastatic LNs on PDUS (distribution of feeding vessels, P=0.59; the number of internal vessels, P=0.52; internal vessel appearance, P=0.59). SMI depicted significant difference in vascular patterns between metastatic and benign LNs (distribution of feeding vessels, number of internal vessels, internal vessel appearance, P<0.001). SMI showed a diagnostic sensitivity, specificity, and accuracy of 82.9%, 79.5%, and 81.3%, respectively.
Conclusion: SMI can improve the identification of lateral lymph node metastasis in patients with indeterminate LNs.
Limitations: It was a retrospective observational study, which might have a possibility for selection bias.
Ethics committee approval: This study was approved by the IRB and requirement for written informed consent was waived.
Funding: No funding was received for this work.

Diagnostic performance of US-guided core-needle biopsy versus fine-needle aspiration for diagnosing thyroid neoplasm as a first-line biopsy method: a propensity score matching study
J. Y. Lee[1], S. L. Jung[1], H. K. Lim[1], J. H. Shin[1], S. Y. Han[1], J. E. Lee[2]*; [1]Seoul/KR, [2]Bucheon/KR (peachwh@naver.com)*

Purpose: The efficacy and safety of CNB for initially detected thyroid nodules remain unclear. The purpose of this study was to evaluate the diagnostic performance of CNB as a first-line diagnostic method for diagnosing thyroid neoplasms and compare against those of FNA via a propensity score analysis.
Methods and materials: This study included 2,898 thyroid nodules from 2,662 patients from three institutions. Adjustments for differences in baseline characteristics were done by using a propensity score analysis. The rates of non-diagnostic and inconclusive results, diagnostic accuracy for diagnosing malignancy, neoplastic follicular patterns lesions (NFPLs), and thyroid neoplasms were compared. Subgroup analyses were performed according to the K-TIRADS categories.

Results: After 1:1 matching, 753 nodules with CNB and 753 nodules with FNA were enrolled. The non-diagnostic and inconclusive results were significantly lower in the CNB group than the FNA group (all, P<0.001). For diagnosing malignancy, the diagnostic performance of CNB did not significantly differ from FNA. For diagnosing NFPLs, CNB showed significantly higher sensitivity (P<0.001) and AUC (P<0.001) than FNA. On subgroup analysis according to K-TIRADS category, CNB showed significantly higher sensitivity in the low suspicion category (P<0.001) for diagnosing malignancy. For diagnosing NFPLs, CNB showed significantly higher sensitivity and AUCs than FNA in all K-TIRADS categories (all, P<0.001). Regarding thyroid neoplasms, CNB showed significantly higher sensitivity than FNA in low and intermediate suspicion categories (all, P<0.001). The complication rate was similar between groups in matched cohorts.
Conclusion: CNB might be useful and safe for initially detected thyroid nodules, especially in the low and intermediate suspicion category.
Limitations: It was a retrospective observation study.
Ethics committee approval: This study was approved by the IRB and requirement for written informed consent was waived.
Funding: No funding was received for this work.

The role of repeated fine-needle aspiration for Bethesda I thyroid nodules: a 12-year single-centre experience

M. Daud, H. Maze, B. Mali, K. Atlan, P. Lebensart, K. Azam, Y. Azrak, N. Goldberg, L. Appelbaum*; Jerusalem/IL (marron.daud01@ateneopv.it)*

Purpose: Fine-needle aspiration of the thyroid is the gold-standard method for the assessment of thyroid nodules, with results expressed by the Bethesda system. Bethesda I, "non-diagnostic", is noted in up to 15% of the cases, which by definition presents a diagnostic dilemma. The aim of this study is to determine whether repeated FNA for patients receiving an initial Bethesda I provides substantial additional diagnostic information.
Methods and materials: A retrospective review of Bethesda I cases which underwent repeated FNA of the same nodule between 2006-2018 in our institution was performed. Demographic data, sonographic features, TIRADS classification, results of the repeated FNA, and surgical pathology reports were collected and analysed.
Results: Of 1,200 patients, 144 (12%) were classified as Bethesda I (117 females, 27 males) with a median age of 52 years (16-85). Among them, only 36 (25%) remained in the same category after the second aspiration. 85 (59%) were reclassified as B2, 4 (2%) as B3, 5 (3.4%) as B4, 7 (4.8%) as B5, and 8 (5.5%) as B6. Retrospective analysis determined that 90% of these 36 cases were mainly cystic or spongiform benign-appearing nodules with a pre-biopsy indication such as symptomatic or growing nodules. Upon subsequent 3rd FNA, 18 (50%) of these patients remained in the same category (BI) and 2 (5.5%) had B2. The remainder 16 (44.5%) received only follow-up.
Conclusion: Repeat aspiration of non-diagnostic thyroid nodules has a positive impact, with diagnostic resolution in over 70% of the cases. However, for nodules with classic benign cystic or spongiform features, follow-up only should be considered.

Radiological-pathological correlation of thyroid nodule ultrasound and cytology using the TIRADS and Bethesda classifications

S. Aslan*; Giresun/TR (serdaraslan28@hotmail.com)*

Purpose: To compare the thyroid imaging reporting and data system (TIRADS) of classifying thyroid nodules with the findings on fine-needle aspiration cytology (FNAC) reported using the Bethesda system.
Methods and materials: A prospective analysis of 250 patients was performed comparing thyroid nodule ultrasound findings based on the TIRADS classification to the FNAC report based on the Bethesda classification. TIRADS 1 and biopsy-proven malignancy were excluded. Benign-appearing nodules were reported as TIRADS 2 and 3. Indeterminate or suspected follicular lesions were reported as TIRADS 4 and malignant-appearing nodules were reported as TIRADS 5. All the nodules were performed to FNAC and TIRADS findings were compared to Bethesda classification.
Results: Of the 250 patients, 137 were TIRADS 2, 48 were TIRADS 3, 26 were TIRADS 4, and 39 were TIRADS 5. The probability of a malignant FNAC (Bethesda V-VI) in TIRADS 2, 3, 4, and 5 classes were 0%, 6.9%, 18.9%, and 92.3%, respectively. The benign FNAC (Bethesda II) in TIRADS 2 was 100%, while for TIRADS 3, 4, and 5 were 74.5%, 25.8%, and 7.6%, respectively. Of the 39 patients that were TIRADS 5, 36 patients had a biopsy-proven cancer (92.3% concordance), but 3 were benign (false-positive sonographic impression). Overall concordance rate with FNAC was 94% and the sensitivity, specificity, and negative predictive value were 89%, 90.5%, and 96%, respectively.
Conclusion: Our study shows a fairly good correlation of thyroid ultrasound reporting using the TIRADS classification with the Bethesda classification of FNAC.
Limitations: Being a single-centre study can be seen as a limitation.
Ethics committee approval: This prospective study was approved by our institutional ethics committee. Informed consent was obtained from all individual participants included in the study.
Funding: No funding was received for this work.

RPS 608-5 11:49

Correlation of ACR 2017 thyroid imaging reporting and data system (ACR TI-RADS) scoring on ultrasound and Bethesda cytopathology for thyroid nodule risk stratification

A. A. Singhal, D. Sarin, H. Sarin, A. Mithal, S. S. Baijal*; Gurgaon/IN (dr.alkaasinghal@gmail.com)*

Purpose: To assess the efficiency of the ACR TI-RADS 2017 in selecting the thyroid nodules on ultrasound for FNAC and its correlation with Bethesda cytopathology classification.
Methods and materials: A prospective study was conducted of 1,000 thyroid nodules evaluated on ultrasound in the radiology department from 2015-2019 at our tertiary hospital. Selection criteria included all discrete thyroid nodules where ACR TI-RADS was applied and the patients had an ultrasound-guided fine-needle aspiration cytology (FNAC) done at our institute as per TI-RADS criteria. TIRADS 1 nodules were excluded from the study. Cytopathology Bethesda classification findings were compared with TI-RADS score on ultrasound.
Results: Of the 1,000 nodules, 398 nodules were TIRADS 2 (39.8%), 256 nodules were TIRADS 3 (25.6%), 152 nodules were TIRADS 4 (15.2%), and 194 nodules were TIRADS 5 (19.4%). Of the 400 TIRADS 2 nodules, 98 % were benign (Bethesda II). The remaining 2 % were Bethesda III. TIRADS 3 were benign in 72% and malignant in 28% cases. TIRADS 4 nodules were benign in 24% and malignant in 76% cases. TIRADS 5 nodules were malignant in 98% cases (2% false-positive). Overall concordance of ACR TI-RADS and FNAC Bethesda classification was 92% for benign nodules and 95% for malignant nodules. The sensitivity, specificity, and negative predictive value were 90%, 93%, and 96%, respectively.
Conclusion: Ultrasound ACR TI-RADS 2017 scoring is an efficient system for selecting thyroid nodules on ultrasound for FNAC and has a fairly good correlation with Bethesda cytopathology classification.
Limitations: Ultrasound being an operator dependent modality, the skill and experience of the operator with thyroid imaging may impact the results.
Ethics committee approval: Ethics committee approval from MIER (Medanta Institute of Education and Scientific Research) was obtained.
Funding: No funding was received for this work.

Comparative evaluation of conventional ultrasound-based thyroid imaging reporting and data system (TIRADS) and contrast-enhanced ultrasound qualitative parameters in the differentiation of thyroid nodules

L. Garg, S. B. Grover, S. Patra, Chintamani, G. Khanna*; New Delhi/IN (lovishgarg05@gmail.com)*

Purpose: To compare the diagnostic accuracy of conventional ultrasound-based thyroid imaging reporting and data system (TIRADS) and contrast-enhanced ultrasound (CEUS) qualitative parameters in the differentiation of benign and malignant thyroid nodules using histopathology as a gold standard.
Methods and materials: This prospective IRB approved study comprised 60 patients with thyroid nodules at primary presentation. In patients with multiple nodules, the single most suspicious nodule was interrogated. All patients were examined with conventional ultrasound and classification of nodules was performed following ACR TIRADS, followed by CEUS using 2.4 ml of intravenous second-generation contrast agent. Nodules were categorised as benign or malignant based upon both TIRADS and CEUS. The CEUS qualitative parameters evaluated were enhancement degree, homogeneity, margins, order, and wash-out pattern. The diagnosis obtained by each technique were compared with histopathology as a gold standard. Statistical analysis was done to calculate sensitivity, specificity, NPV, and PPV.
Results: In the series of nodules evaluated, 28 were benign and 32 were malignant on histopathology. TIRADS classified 29 nodules as benign and 31 as malignant. Whereas on CEUS, 27 were classified as benign and 33 as malignant. For TIRADS, sensitivity was 75%, specificity was 75%, PPV was 77.4%, and NPV was 72.4%. For CEUS, sensitivity was 84.4%, specificity was 78.6%, PPV was 81.8%, and NPV was 81.5%.
Conclusion: CEUS qualitative parameters were found to have superior diagnostic accuracy to conventional ultrasound-based TIRADS in the differential diagnosis of thyroid nodules. Therefore, CEUS is a valuable supplementary technique in the definitive diagnosis of thyroid nodules and should be exploited further.
Limitations: A single-centre study.
Ethics committee approval: Informed consent from all patients. Animal board approval n/a.

RPS 608-7 12:01

Thyroid multimodal-imaging comprehensive risk stratification scoring (TMC-RSS) system: a quantitative scoring system for characterising thyroid nodules

A. Mahajan, N. Sable, R. Vaish, S. V. Kane, D. Chaukar, A. Dcruz*; Mumbai/IN (drabhishek.mahajan@yahoo.in)*

Purpose: To create an algorithm (TMC-RSS-system) using ultrasound features in combination with Doppler and elastography (ES-Asteria) and to test its diagnostic performance.
Methods and materials: A prospective study over 2 years, with all studies performed on the same equipment and US, Doppler, and elastography performed by same observer. The gold standard was the pathology. 650 nodules (560 patients) with a final analysis of 616 nodules. 47.2% benign and 52.8% malignant. TMC-RSS system scoring showed malignant characteristics plus (+)3 points for ES-score 3/4 and malignant nodes, (+)1 point for taller than wider, microcalcification, hypoechogenicity, solid composition, ill-defined margins, and central+/-peripheral vascularity, and (+)0.5 point for an irregular halo, size >1 cm. For benign characteristics, minus (-)3 points for purely cystic, ES-score-1, (-)1 point for a spongiform, comet-tail artefact, complete halo, and (-)0.5 point for peripheral vascularity. Final TMC-RSS-score was calculated by addition and subtraction of positive and negative points.
Results: The mean age was 52.1 yrs. The mean size was 2.6+/-1.9 cm. Diagnostic performance of combined US, ES, TIRADS, and CD (sensitivity: 96%, specificity: 95%, PPV: 95%, NPV: 96%, and kappa: 0.911) was statistically ($p<0.001$) higher than either combination of US, TIRADS, ES, and CD. On univariate analysis, all US features and on multivariate analysis all except taller than wider was statistically significant for predicting malignancy ($p>0.05$). TMC-RSS score had a 90% sensitivity, 89% specificity, and 91% accuracy for characterising the nodules. On the ROC curve, the cut-off for best performance of TMC-RSS score was 5.75. The cumulative risk of malignancy based on TMC-RSS score was 2.4% for <3.0 score, 18% for score 3-6, and >80% for score >6.1.
Conclusion: TMC-RSS is easy-to-use, robust, reproducible, and provides a higher degree of confidence to an average non-expert radiologist.
Limitations: Match-pair analysis with other scoring systems.
Ethics committee approval: Ethics committee approval obtained.
Funding: No funding was received for this work.

The determination of diagnostic accuracy of ACR (TI-RADS) in thyroid nodules on ultrasonography

G. Jameel*; Islamabad/PK (ghazal.jameel@yahoo.com)*

Purpose: TIRADS (thyroid imaging reporting and data system) is a risk stratification system for classifying thyroid lesions and was recognised by the American College of Radiology (ACR) in 2017. TIRADS classification is now being used in the daily routine categorisation of sonographically visualised thyroid nodules. The aim of the study was to categorise all solid nodules of thyroids identified sonographically according to the TIRADS score and correlating the TIRADS score with BETHESDA histopathological category of the same nodule after FNAC. This correlation, if validated, could help to avoid many unnecessary aspirations and thyroid-related surgical procedures in cases where both sonographic and histopathological grades are low and to warrant early intervention in case of high-scores with increasing risk of malignancy.
Methods and materials: Ultrasound of the thyroid was carried out on GE logic with a linear transducer of 7.5–12 MHz frequency. 210 patients referred for sonography of thyroid nodules were included in the study from 1st January 2018-31st July 2019. Fine-needle aspiration was carried out under ultrasound guidance and cytology was done on all nodules categorised according to TIRADS. TIRADS and Bethesda scores were correlated.
Results: A total of 210 patients with 233 nodules of a mean size of 2.5 ± 1.5 cm were included. The risk of malignancy of the TIRADS categories were as follows: TIRADS 2 0%, TIRADS 3 2.2%, TIRADS 4A 5.9%, TIRADS 4B 57.9%, and TIRADS 5 100%.
Conclusion: TIRADS is a useful diagnostic classification in predicting malignancy and with FNAC using BETHESDA classification, unnecessary surgical procedures can be avoided.
Limitations: n/a
Ethics committee approval: n/a

Malignancy in the contralateral lobe and the role of surveillance US after hemithyroidectomy for thyroid cancer

O. O'brien, S. Wright, O. Hilmi, C. McArthur*; Glasgow/UK (owen.o'brien@nhs.net)*

Purpose: There is a limited consensus on the duration of surveillance neck ultrasound (US) in hemithyroidectomy-only differentiated thyroid cancer (DTC) patients. Our aim was to determine follow-up US findings, when available, and identify rates of contralateral malignancy in patients with DTC at hemithyroidectomy.
Methods and materials: A retrospective observational study of all patients who underwent hemithyroidectomy between 01/12/13–31/01/15 in the Greater Glasgow and Clyde (GG&C) healthboard.
Results: 49 patients had DTC identified following hemithyroidectomy (46) or isthmusectomy (3). Based on largest/worst prognostic cancer if multifocal, subtypes were papillary (36), follicular (8), and Hurthle cell (5) with a mean diameter of 23 mm (range 0.3-75 mm). 20 were papillary microcarcinomas (PMC) and 16 of these were incidental. 13 patients had multifocal lobar disease. 36/49 proceeded to initial completion thyroidectomy. 30 completions would have been recommended/reasonable with the current guidelines. Further malignancy was found in 16/36 (44%), all PMC.
The remaining 13 patients had US follow-up over 0.5-5.5 years. In one, a contralateral U3/Thy3f nodule on 1st surveillance US 2 years postoperatively had PMC at completion. A further case had a contralateral U2 nodule upgraded to U3/Thy3a at 3rd annual US/FNA, which was benign on completion. Otherwise, there was normal appearances or sonographically benign nodules with no lymphadenopathy demonstrated.

Conclusion: In patients with hemithyroidectomy DTC not meeting criteria for initial completion, US/FNA follow-up prompted later completion in 2/13, with one case of completion malignancy, PMC. Otherwise, US findings were limited.
Overall completion malignancy rate was 45%, all PMC.
PMC is often undetectable at US and the role of repeated post-hemithyroidectomy US surveillance is of doubtful benefit in this group.
Limitations: A small sample size. Future collaborating studies with other Scottish/UK healthboards would be beneficial.
Ethics committee approval: n/a
Funding: No funding was received for this work.

The size did matter: radiofrequency ablation for benign thyroid nodules
N. Kan, W.-C. Lin*; Kaohsiung/TW (naning@hotmail.com.tw)*

Purpose: To compare the effectiveness of radiofrequency ablation (RFA) for thyroid nodules among groups with different volume of nodules.
Methods and materials: This retrospective study evaluated 186 patients with benign thyroid nodules (BTNs) who underwent ultrasound-guided RFA treatment. The BTNs were categorised into group 1 (≤10 ml), group 2 (10-30 ml), and group 3 (> 30 ml), according to the initial volume of BTNs before ablation. The RFA procedures were performed using the moving shot technique. The volume reduction ratio (VRR) of each nodule, cosmetic score, symptomatic score, and complications were analysed at 1, 3, and 6 months after RFA among the three groups.
Results: At 1-month follow-up, group 3 showed significantly greater VRR compared to the other two groups (group 1, 31.88 ± 37.91%; group 2, 38.9 ± 19.18%; group 3, 48.7 ± 20.43%, $p < 0.05$). At 6-month follow-up, there was no significant difference of VRR among the three groups (group 1, 74.6 ± 20.92%; group 2, 68.1 ± 17.07%; group 3, 75.0 ± 11.88%). The major complication was temporary vocal palsy. One skin burn, one haematoma, and nodular rupture occurred during or after the procedure. The complication rate of group 3 was higher compared to the other two groups, but there was no statistical significance.
Conclusion: RFA was effective in patients with larger thyroid nodules (>30 ml) and its therapeutic efficacy and safety were similar to those in patients with smaller thyroid nodules.
Limitations: A retrospective single-centre study and a relatively short-term follow-up period (6 months).
Ethics committee approval: This study was approved by the institutional review board and informed consent for each procedure was obtained.
Funding: No funding was received for this work.

A task-based MTF comparison between a new deep learning-based CT reconstruction and current iterative methods
T. Szczykutowicz[1], B. Nett[2], J. Tang[2], J. Hsieh[3]; *[1]Madison, WI/US, [2]Waukesha, WI/US, [3]Brookfield, WI/US (tszczykutowicz@uwhealth.org)*

Purpose: With filtered back-projected image reconstruction, spatial resolution performance is not dependent on image contrast or noise/dose. Existing iterative methods have been shown to produce a spatial resolution that is dependent on image contrast or noise/dose. Here, we characterise the contrast and dose dependence of TrueFidelity (GE Healthcare), a CE marked new deep learning image reconstruction (DLIR) approach.
Methods and materials: We imaged acrylic, bone, polyethylene, and air phantom inserts. We imaged at dose levels of 16, 8, and 4 mGy. Images were reconstructed using 6 methods: filtered back projection (FBP), 2 levels of a statistical iterative reconstruction (ASiR-V), and 3 levels of the vendor's new deep learning (DLIR) approach. The ASiR-V level was chosen based on a vendor recommendation (AR50, 50%). The tasked-based modulation transfer function (MTF task) methodology was used to obtain contrast dependent spatial resolution for each insert.
Results: The 50% and 10% MTF task values for all DLIR strengths were all comparable to FBP and all ASiR-V levels. The 10% MTF task at 8 mGy for FBP was 0.69/0.65/0.65/0.66 for poly/air/acrylic/bone, respectively. The 10% MTF task at 8 mGy for 50% ASiR-V was 0.7/0.65/0.68/0.66 for poly/air/acrylic/bone, respectively. The 10% MTF task at 8 mGy for medium-strength DLIR was 0.71/0.69/0.69/0.69 for poly/air/acrylic/bone, respectively. All reconstruction methods showed an expected decreased performance when the focal spot switched from medium to large between the 8/4 and 16 mGy levels, respectively.
Conclusion: Unlike other advanced iterative CT algorithms, this deep learning method did not exhibit contrast or noise/dose dependencies with respect to spatial resolution.
Limitations: Other abstracts address noise texture differences.

How does a deep learning image reconstruction algorithm affect image quality in CT abdominal imaging?
X. Liu[1], J. Rong[1], C. T. Jensen[1], A. G. Chandler[2]; *[1]Houston, TX/US, [2]Waukesha, WI/US (xliu@mdanderson.org)*

Purpose: To access noise characteristics of a new deep learning image reconstruction (DLIR) and compare its performance with adaptive statistical iterative reconstruction (ASiR-V) and filtered back-projection (FBP).
Methods and materials: The uniform section of an ACR CT phantom was surrounded by an oval-shaped fat-equivalent ring to mimic the patient size/shape and scanned on a GE Revolution CT scanner using a clinical abdominal CT protocol at 4 dose levels to simulate ultra-low, low, routine, and high-quality dose CT abdominal imaging with reported $CTDI_{vol}$ of 2, 6, 20, and 50mGy, respectively. Images reconstructed with ASiR-V and DLIR at various noise reduction strengths were compared with baseline FBP. Additionally, modulation transfer functions (MTF) were measured to assess the spatial resolution properties of different reconstructions.
Results: Both DLIR and ASiR-V reduced noise when compared with baseline FBP, while DLIR also maintained the shape of NPS distribution across the spatial frequency to be similar to FBP. In contrast, high strength ASiR-V (60% and 90%) reduced noise significantly at the higher spatial frequency but the peak frequency of NPS shifted toward the lower frequency end as ASiR-V strength increased, demonstrating a different image texture to that of FBP. Similar behaviours of NPS have been observed at all radiation levels. Both ASiR-V and DLIR improved the spatial resolution compared with FBP. DLIR resulted in the best MTF performance regardless of the strength applied.
Conclusion: DLIR has the potential to achieve an optimised image quality with reduced noise and hence the option for patient dose reduction; at the same time, the image texture was maintained similarly to that of FBP.
Limitations: This study was conducted using a phantom. The outcome of clinical patient imaging needs to be investigated and is under evaluation.

RPS 613-3 11:27
The performance assessment of a novel deep learning CT reconstruction algorithm: a phantom study
C. Franck[1], P. D. Deak[2], G. Zhang[3], F. Zanca[4]; *[1]Edegem/BE, [2]Berlin/DE, [3]Leuven/BE, [4]Heverlee/BE*

Purpose: For the past few years, "low dose" was the benchmark for image quality in CT and the introduction of iterative reconstruction (IR) allowed dose reductions by about 50% compared to filtered back projection (FBP) at the expense of image texture. In this study, we aimed to assess whether a novel

deep learning (DL) reconstruction can preserve the FPB-like image texture at dose levels attained by IR.
Methods and materials: Noise (SD), NPS, and MTF were measured on Catphan phantom derived images. The acquisition occurred on a 512-slice GE Revolution at 100kVp, 350 ms, 0.98 pitch, 40 mm collimation, and 1.25 mm thickness. Two different dose levels (3.0 and 7.6mGy $CTDI_{vol}$) were used, relevant for clinical practice and reconstructed with FBP, ASIR-V (50% and 100% blending), and DL.
Results: Compared to FBP, both ASIR-V and DL reduced image noise. At 3.0mGy, SD decreased by 37%, 69%, and 35% and NPS area by 53%, 83%, and 54% using 50% ASIR-V, 100% ASIR-V, and DL, respectively. While the NPS apex of 50% and 100% ASIR-V (f_{peak}=0.23, 0.13 mm^{-1}; f_{avg}=0.28, 0.18 mm^{-1}) shifted towards lower frequencies with respect to FBP (f_{peak}=0.28 mm^{-1}; f_{avg}=0.33 mm^{-1}), no difference was observed with DL (f_{peak}=0.28 mm^{-1}; f_{avg}=0.31 mm^{-1}).
Noise and NPS of 3.0mGy DL (SD=13.5; f_{peak}=0.28 mm^{-1}; f_{avg}=0.31 mm^{-1}) and 7.6mGy FBP (SD=13.9; f_{peak}=0.30 mm^{-1}; f_{avg}=0.3 $3mm^{-1}$) were similar, suggesting a 60% dose reduction is possible with DL, while preserving the image texture.
No spatial frequency differences were observed between FBP, ASIR-V, and DL ($MTF_{50\%}$=0.36 mm^{-1}).
Conclusion: The DL-based reconstruction reduces noise with respect to FBP without modifying the image texture. Moreover, it has the potential to reduce the dose with respect to FBP, in a similar way as IR.
Limitations: No clinical images were used to evaluate the radiologists' perception of image quality and texture.

Equal CNR at thinner slice thicknesses enabled the use of a CE-marked deep learning reconstruction method for CT
T. Szczykutowicz[1], B. Nett[2], J. Tang[2], J. Hsieh[3]; *[1]Madison, WI/US, [2]Waukesha, WI/US, [3]Brookfield, WI/US (tszczykutowicz@uwhealth.org)*

Purpose: New CT image reconstruction frameworks can alter the fundamental tradeoffs between spatial resolution, noise, and dose. Here, we investigate the performance of a new deep learning-based CT image reconstruction algorithm (TrueFidelity, GE Healthcare).
Methods and materials: We imaged a phantom with low and high contrast inserts at a slice thickness ranging from 0.625 mm-5 mm. We imaged at dose levels of 16, 8, and 4 mGy. All measurements were repeated 5 times. Images were reconstructed using filtered back projection (FBP), 2 levels of an advanced statistical iterative reconstruction (ASiR-V), and 3 levels of a deep learning image reconstruction (DLIR) approach. The ASiR-V levels were chosen based on institutional (20%) and vendor (50%) recommended levels. CNR, uniformity, and CT number were assessed for each slice thickness, reconstruction type, and dose level.
Results: All slice thicknesses, reconstruction types, and dose levels exhibited acceptable results for uniformity and CT number for all algorithms. The performance of CNR was highest for DLIR, followed closely by 50% ASiR-V, and was lowest for FBP. At 5 mm slice thickness and 16 mGy, DLIR low/medium/high CNR was 1.18/1.33/1.53 compared to 1.03 for FBP and 1.17/1.47 for 20%/50% ASiR-V. DLIR allowed for equal CNR as FBP at smaller slice thicknesses. For example, at 16 mGy, DLIR had the same CNR at 1.25 mm thickness as FBP had at 5 mm thickness.
Conclusion: The new TrueFidelity DLIR method outperforms existing ASiR-V and FBP. Our results have motivated several sections in our institution to utilise thin 1.25 mm images for tasks for which they used to use a thicker 5 mm slice.
Limitations: Additional abstracts address spatial resolution and noise texture.

The potential of deep learning image reconstruction for CT for reducing radiation exposure: a phantom study
N. Nagasawa, K. Kitagawa, N. Kubooka, Y. Ichikawa, A. Yamazaki, H. Maki, H. Sakuma*; Tsu/JP*
(nagasawa@clin.medic.mie-u.ac.jp)

Purpose: Deep learning image reconstruction (DLIR) is a new reconstruction method which can provide efficient noise reduction. The purpose of this phantom study was to investigate the relationship between radiation dose and physical metrics of the latest DLIR algorithm.
Methods and materials: Acquisitions on a physical evaluation phantom (Catphan 700, The Phantom Laboratory, Salem, NY, USA) equipped with low-(⊿60H.U.) and high(⊿240H.U.)-contrast model objects were performed at 120kV and 10 dose levels (CTDIvol: 1-10mGy in 1mGy steps) with a multidetector CT scanner (Revolution CT, GE Healthcare, Milwaukee, WI, USA). Raw data was reconstructed with a 1.25 mm slice thickness using standard kernel for FBP, hybrid iterative reconstruction (HIR), and 3 strength levels of DLIR (low, med, high, TrueFidelity, GE Healthcare, Milwaukee, WI, USA). The noise power spectrum (NPS), modulation transfer function (MTF), and detectability index (SNR^2) were computed.
Results: The 50% MTF and 10% MTF of DLIR were comparable to those of FBP for low-contrast objects and were higher for high-contrast objects at all dose levels. The NPS peak frequency of DLIR was similar to FBF and was higher than HIR, indicating less noise texture change from FBP compared to HIR. The highest SNR^2 was obtained with DLIR-high for both low- and high-contrast models. FBP-equivalent image quality can be achieved with -40% radiation dose for HIR, -50% for DLIR-low, -60% for DLIR-med, and -70% for DLIR-high for the high-contrast model. These values were -29%, -46%, -55%, and -64%, respectively, for the low-contrast model.
Conclusion: DLIR can substantially reduce noise without sacrificing spatial resolution or changing noise texture, which might provide a dose reduction of up to -70%.
Limitations: A phantom study

RPS 613-6 11:45
Deep learning reconstruction and hybrid-iterative reconstruction for ultrahigh-resolution CT: the impact of radiation dose on spatial resolution and noise texture
L. J. Oostveen, M. M. Prokop, F. de Lange, I. Sechopoulos*; Nijmegen/NL*
(luuk.oostveen@radboudumc.nl)

Purpose: To determine how radiation dose affects spatial resolution and noise in ultra-high-resolution CT (UHRCT) using deep learning reconstruction (DLR) and hybrid-iterative reconstruction (Hybrid-IR) algorithms.
Methods and materials: We acquired images of a Catphan 500 phantom and a 320 mm water phantom using a UHRCT system with 0.25 mm effective detector size (Aquilion Precision, Canon Medical Systems) in high-resolution mode at $CTDI_{vol}$ values of 4.3, 9.1, and 22.3 mGy. The images were reconstructed with DLR (AiCE body standard) and Hybrid-IR (AiDR3D-enhanced, FC08). Modulation transfer functions (MTFs) at the isocentre were determined using the edge of the teflon rod of the catphan images. Image noise (standard deviation, SD) and noise power spectra (NPSs) were determined from the water phantom images, with the frequency where the NPS peaks used to quantify noise texture.
Results: All results are provided in increasing dose order. The MTF of DLR is higher than that of Hybrid-IR at all dose-levels. The 50% of the MTFs is crossed at 9, 10, 10 lp/cm for DLR; Hybrid-IR: 6, 7, 7 lp/cm. SD values for DLR are 13.6, 18.7, and 17.1, while for Hybrid-IR these values are 21.9, 27.0, and 27.5. For both techniques, the NPS peak shifts with dose. Peak frequencies for DLR are 0.4, 0.7, and 0.9 lp/cm, while for Hybrid-IR these values are 0.7, 1.1, and 1.3 lp/cm.
Conclusion: DLR creates higher-resolution images with lower noise compared to Hybrid-IR at all dose levels. As opposed to with filtered back projection, spatial resolution and noise coarseness are a function of the dose with these reconstruction algorithms.

Limitations: The use of linear metrics with non-linear reconstruction algorithms must be performed with care and only for the evaluation of relative differences between techniques, as done here.

Impact of a deep learning-based reconstruction algorithm on pulmonary nodule detection in chest CT

C. Franck[1], M. J. Spinhoven[1], A. Snoeckx[1], H. El Addouli[1], S. Nicolay[1], A. van Hoyweghen[1], P. D. Deak[2], F. Zanca[3]; [1]*Edegem/BE,* [2]*Berlin/DE,* [3]*Heverlee/BE*

Purpose: Detection of pulmonary nodules is a challenging task in low-dose CT. Dose reduction using iterative reconstruction (IR) results in image texture changes, impacting pathological structures. A novel deep learning (DL) reconstruction technique can suppress noise without impacting image texture, using dose levels comparable to IR. Our aim was to assess whether DL is non-inferior to IR for the clinical task of nodule detection.
Methods and materials: Up to 6 (range 3-6, mean 4.2) artificial lung nodules (diameter: 3, 5, and 8mm; density: -800, -630, and +100HU) were inserted at different locations in the Lungman anthropomorphic phantom (Kyoto Kagaku). 6 configurations were imaged (10 abnormal and 6 normal). Each configuration was scanned at 7.6mGy (clinical protocol) and 3 different levels of dose reduction: 60% (3mGy), 80% (1.6mGy), and 95% (0.38mGy). Images were reconstructed using 2 different algorithms (50% ASIR-V and DL with low, medium, and high strength). The 256 CT-scans (160 abnormal, 96 normal) were evaluated by 4 chest radiologists. Nodules were located and scored on a 5-point scale, blinded for dose and reconstruction algorithm. Data was analysed by the jackknife free-response receiver operating characteristic method.
Results: We found no statistically significant difference in nodule detection among the image reconstruction algorithms (p=0.987, the average across readers AUC: 0.555, 0.561, 0.557, and 0.558 for 50% ASIR-V, DL-L, DL-M, and DL-H, respectively) for all dose reduction levels together. When stratifying per dose, no statistical difference (p=0.97) was found for the lowest dose (0.38mGy).
Conclusion: Our study suggests that this DL algorithm is non-inferior to IR for the clinical task of nodule detection, even at very low dose levels.
Limitations: Research assessing the change in image texture has been conducted in a separate study to uncover the full potential of DL.

A comparison of advanced AI-based CT reconstructions by noise magnitude and centroid frequency ratios

T. Pan[1], A. Hasegawa[2]; [1]*Houston, TX/US,* [2]*Chapel Hill/US (akira.hasegawa@algomedica.com)*

Purpose: To compare noise reduction and texture change of CT images reconstructed by True Fidelity (TF), ASiR-V of GE, and PixelShine of AlgoMedica. Both TF and PixelShine are deep-learning algorithms.
Methods and materials: The homogeneous module of an ACR CT phantom was scanned at radiation levels ranging from 1.4-4.8mGy (CTDI-16) and reconstructed using FBP, ASiR-V, and TF. All FBP reconstructions were further processed by PixelShine. Noise power spectrum (NPS) was computed. The centroid frequency ratio (CFR) of NPS centroid frequencies and the noise magnitude ratio (NMR) of areas under NPS between noise reduction and FBP were compared. An ideal reconstruction should maintain CFR close to 1 (less image blurring) and NMR close to 0 (more noise reduction).
Results: All reconstructions reduced more noise at a higher dose than a lower dose. However, there was a larger change of NMR for TF than for ASiR-V or PixelShine at the same CFR, suggesting the performance of TF was highly dependent on the amount of image noise. At 1.4mGy and the same CFR (same image blurring), PixelShine>ASiR-V>TF, where '>' means more noise reduction (lower NMR). At 3.4mGy, PixelShine>ASiR-V=TF. At 4.8mGy, PixelShine>TF>ASiR-V. TF and ASiR-V switched places from 1.4mGy to 4.8mGy.
Conclusion: The performance of TF was highly dependent on image noise. TF reduced more noise than ASiR-V at 4.8mGy. Conversely, ASiR-V reduced more noise at 1.4mGy than TF. PixelShine reduced more noise at the same CFR than TF and ASiR-V at all dose levels.
Limitations: The limited range of doses and that we only used tube current to change the dose.

Deep learning applied to low kV imaging in CT

T. Szczykutowicz[1], B. Nett[2], J. Tang[2], J. Hsieh[3]; [1]*Madison, WI/US,* [2]*Waukesha, WI/US,* [3]*Brookfield, WI/US (tszczykutowicz@uwhealth.org)*

Purpose: This work characterises the use of low kV imaging on Revolution Apex (GE Healthcare) with a new x-ray tube and TrueFidelity, a CE marked deep learning-based image reconstruction (DLIR) technique.
Methods and materials: We imaged a CT phantom (30 by 40 cm solid water with 2, 5, and 15 mg/cc of iodine, fat, brain, and blood inserts) at 70, 80, 100, 120, and 140 kVp. We imaged at dose levels of 18, 8, and 4 mGy. Images were reconstructed using 3 methods: filtered back projection (FBP), a statistical iterative reconstruction (ASiR-V), and the vendor's new deep learning image reconstruction approach. The ASiR-V levels were chosen based on institutional (20%) and vendor (50%) recommended levels. DLIR was set at medium strength. The relative dose reduction factor (RDF) methodology was applied to quantify the potential of changing kVp and or applying the ASiR-V/DLIR methods to reduce the dose.
Results: As expected, for materials that increase the CT number while decreasing kVp, the RDF predicted a dose reduction for all recon types. For materials like the brain where FBP exhibited a dose penalty with decreasing kVp, DLIR enabled lowering of the kVp without any dose penalty (RDF for brain tissue FBP at 70 kVp was 1.10 while DLIR had a brain RDF at 70 kVp of 0.26). For 5 mg/cc strength iodine at 16 mGy and 70 kVp, FBP/ASiR-V 20%/ASiR-V 50%/DLIR had RDF values of 0.49/0.36/0.20/0.10, respectively.
Conclusion: New deep learning reconstruction (TrueFidelity, GE Healthcare) allowed for a better simultaneous realisation of iodine and non-iodine imaging tasks on the same exam.
Limitations: Noise texture and spatial resolution are evaluated in other abstracts.
Ethics committee approval: n/a
Funding: GE Healthcare.

Image quality capabilities and dose reduction opportunities of a deep learning image reconstruction algorithm: a phantom study

J. Greffier[1], H. Pasquier[2], A. Hamard[1], J. P. Beregi[1], J. Frandon[1]; [1]*Nîmes/FR,* [2]*Buc/FR (joel.greffier@chu-nimes.fr)*

Purpose: To assess the impact on image quality and dose reduction opportunities of a deep learning image reconstruction (DLIR) algorithm compared to a model-based iterative reconstruction (MBIR) algorithm.
Methods and materials: Acquisitions were performed on an image quality phantom at 7 dose levels (CTDIvol: 15/10/7.5/5/2.5/1/0.5mGy). Raw data was reconstructed using the filtered back-projection (FBP), 2 levels of MBIR, and 3 levels of DLIR algorithms. The mean attenuation, noise, contrast-to-noise ratio (CNR), noise-power-spectrum (NPS), and task-based transfer function (TTF) were computed. The detectability index (d') was computed to model the detection of a large mass in the liver, a small calcification, and small lesion with low-contrast.
Results: CNR values obtained with all DLIR levels were lower than AV100 and higher than AV50 (except with DLIR-L). NPS peaks were higher with AV50 than with all DLIR levels and only higher with AV100 than with DLIR-L. The average NPS spatial frequencies were higher with DLIR than with MBIR. For all DLIR

levels, $TTF_{50\%}$ obtained with DLIR were higher than MBIR. d' values increased with the level of DLIR and the percentage of MBIR. d' were higher with DLIR than with AV50, but lower with DLIR-L and DLIR-M than with AV100. d' values were higher with DLIR-H than with AV100 for the small lesion with low-contrast (10%±4%) and in the same range for other simulated lesions.
Conclusion: DLIR algorithms reduced noise and improved spatial resolution and detectability without changing the noise texture. Images obtained with DLIR seem to be more adapted to a dose optimisation process than those with MBIR.
Limitations: Raw-data was reconstructed using the single-kernel "standard" and conducted on a phantom that does not take into account the difference in morphology between patients.

Towards 4D interventional guidance: reconstructing interventional tools from four x-ray projections using a deep neural network
E. Eulig[1], J. Maier[1], N. R. Bennett[2], M. Knaup[1], D. K. Hörndler[3], A. Wang[2], M. Kachelrieß[1]; [1]*Heidelberg/DE,* [2]*Palo Alto/US,* [3]*Nuremberg/DE (elias.eulig@dkfz-heidelberg.de)*

Purpose: To reconstruct interventional tools from only 4 x-ray CBCT projections for tomographic interventional guidance.
Methods and materials: Single or biplane x-ray fluoroscopy is the standard imaging technique for interventional guidance. Due to its projective nature, it only provides a limited ability to resolve three-dimensional structures. While tomographic (3D+time) interventional guidance could overcome this drawback, it is currently infeasible due to the exceedingly high dose to both the patient and the surgeon. Prior work demonstrated that interventional tools can be reconstructed from 10 to 20 cone-beam CT (CBCT) projections by using prior knowledge of an appropriately sampled patient scan together with principles from a compressed sensing theory. To achieve a further dose reduction, which is necessary to make tomographic interventional guidance clinically feasible, we trained a deep neural network to segment interventional tools (stents and guidewires) from CT reconstructions of only 4 x-ray projections. We assumed to have a perfect prior scan, therefore subtracted the prior scan from any interventional scan results in a sparse volume consisting of only interventional tools and noise. The network was trained on simulated CBCT data of several different stent models and guidewires and tested on both simulated data and measured data of a Siemens Zeego robot-driven C-arm system.
Results: For both the simulated and the measured data, we observed very good agreement with the ground truth, indicating that the network is able to generalise from simulated to measured data while having been trained exclusively on the former.
Conclusion: Deep learning-based reconstruction of interventional tools has the ability to overcome the dose issue of tomographic interventional guidance.
Limitations: Currently, the method assumes to have a perfect patient prior. We want to address this limitation in the future.

Contrast-enhanced ultrasound (CEUS) following renal cryoablation: potential and limits
I. Campo, C. Sachs, R. Ciabattoni, M. A. Cova; *Triest/IT (irenecampo11@gmail.com)*

Purpose: To investigate how long after cryoablation successfully ablated tumours became completely avascular at CEUS.
Methods and materials: Between January 2012 and January 2018, 79 patients (55 men, 24 women, median and average age: 73 yo; range 46-89 yo) with 82 renal tumours treated with percutaneous cryoablation underwent CEUS before the procedure and at postoperative day one. If the lesion was avascular at the CEUS performed at postoperative day one, no further imaging was obtained before the reference contrast-CT/MR scheduled six months after the procedure. If the lesion still displayed enhancement at postoperative day one, CEUS was repeated up to the disappearance of the intralesional vascularity after one week, two weeks, one month, and three months, if necessary.
Results: The reference contrast-CT/MR obtained six months after the ablation procedure showed 80 successfully ablated tumours and two cases of tumour persistence. 46/80 (57%) successfully ablated tumours were avascular on postoperative day one, 67/80 (84%) within one week, 72/80 (90%) within two weeks. All successfully ablated tumours were avascular after one month. The two lesions with tumour persistence displayed intralesional vascularity after three months.
Conclusion: After successful cryoablation, intralesional enhancement disappears within two weeks in the majority of cases but can persist for up to one month.
Limitations: A retrospective study.

Accuracy of contrast-enhanced ultrasound qualitative parameters for the characterisation of complex cystic and solid renal masses: a comparative study
S. B. Grover[1], M. Altamash[1], S. Patra[1], H. Grover[2], A. Katyan[1], A. Kumar[1], A. K. Mandal[1]; [1]*New Delhi/IN,* [2]*New York/US (shabnamgrover@yahoo.com)*

Purpose: To compare the diagnostic accuracy of contrast-enhanced ultrasound (CEUS) qualitative parameters for the characterisation of complex cystic and solid renal masses, using histopathology as a gold standard.
Methods and materials: This Institutional Review Board approved prospective study comprised 102 consenting patients, including 50 complex cystic and 52 solid renal masses. Conventional ultrasound (US) was performed, followed by CEUS with 1.2 ml intravenous injection of second-generation ultrasound contrast agent. For complex cystic renal masses, contrast-enhancement within septae/mural nodule/s was observed and classified using a Bosniak system. For solid renal masses, wash-in pattern, degree of peak enhancement, homogeneity at peak enhancement, wash-out pattern, and peripheral rim enhancement were recorded, using adjacent normal parenchyma as control. Parametric diagnostic

tests were applied to evaluate the diagnostic accuracy of CEUS qualitative parameters for both complex cystic and solid renal masses.
Results: Of 102 patients, 38 (37.3%) were benign and 64 (62.7%) malignant on histopathology. Sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV), and accuracy of CEUS qualitative parameters for complex cystic masses were 77.78%, 100%, 100%, 88.89%, and 92%, respectively. For solid masses, sensitivity was 65.22%, specificity was 100%, PPV was 100%, NPV was 55.56%, and accuracy was 69.99%.
Conclusion: CEUS quantitative parameters show comparable diagnostic accuracy for the characterisation of both complex cystic and solid renal masses as benign or malignant. The technique holds promise not only for reducing exposure to radiation but for great clinical utility in patients with impaired renal function, in whom iodinated/gadolinium-based contrast agents are contraindicated.
Limitations: A single-centre study and limited cohort of patients.
Ethics committee approval: Informed consent from all patients. Animal board approval N/A.

RPS 607-3 11:37

A comparison between the diagnostic accuracy of CEUS qualitative parameters and conventional ultrasound-based IOTA simple rules (SR) for the sonographic characterisation of complex adnexal masses

S. Patra[1], S. B. Grover[1], H. Grover[3], P. Mittal[1], G. Khanna[1]; [1]*New Delhi/IN,* [2]*New York, NY/US (patrasayantan92@gmail.com)*

Purpose: The purpose of this study was to compare diagnostic accuracy between contrast-enhanced ultrasound (CEUS) qualitative parameters and conventional ultrasound (US) based IOTA simple rules (SR) in patients with sonographically complex adnexal masses, using histopathology as a gold standard.
Methods and materials: This Institutional Review Board approved prospective study consisted of 70 consenting patients with 70 complex adnexal masses. Conventional US examination was followed by CEUS using intravenous administration of 4.8 ml of second-generation ultrasound contrast agent. Tumours larger than 10 cm were examined by a transabdominal route and the rest transvaginally. Tumours were categorised into “benign”, “malignant”, or “inconclusive” based on IOTA SR. CEUS qualitative parameters evaluated were enhancement order, extent, and pattern relative to the myometrium, with at least two features required for categorisation. Histopathology diagnosis was obtained for all tumours. The diagnostic accuracy of qualitative parameters and IOTA SR was obtained.
Results: Of 70 patients, 34 (48.6%) were benign and 36 (51.4%) were malignant. Sensitivity, specificity, positive predictive value (PPV), and negative predictive value (NPV) for IOTA SR were 87.5%, 79.2%, 89.5%, and 76%, while for CEUS qualitative parameters these were 93.6%, 86.4%, 96.1%, and 79.2%.The type of enhancement showed highest sensitivity (94.9%), specificity (90.5%), PPV (97.4%), and NPV (82.6%). Accuracy for CEUS qualitative parameters was 92%, while for conventional US based IOTA SR was 84.7%, p <0.05.
Conclusion: CEUS qualitative parameters were found to have better diagnostic accuracy than conventional US-based IOTA SR for the characterisation of sonographically complex adnexal masses. The technique holds potential not only for reducing invasive biopsies/diagnostic laparotomy but also is of immense clinical utility in patients with impaired renal function.
Limitations: A single-centre study with a imited number of patients.
Ethics committee approval: Ethics committee approval obtained.
Funding: No funding was received for this work.

Evaluation of diagnostic accuracy of contrast-enhanced ultrasound (CEUS) quantitative parameters for the characterisation of solid renal masses

S. B. Grover[1], M. Altamash[1], S. Patra[1], H. Grover[2], A. Katyan[1], A. Kumar[1], A. K. Mandal[1]; [1]*New Delhi/IN,* [2]*New York/US (shabnamgrover@yahoo.com)*

Purpose: To evaluate the diagnostic accuracy of contrast-enhanced ultrasound (CEUS) quantitative parameters for the characterisation of solid renal masses, using histopathology as a gold standard.
Methods and materials: In this Institutional Review Board approved prospective study, 52 consenting patients with solitary solid renal masses were recruited. Conventional ultrasound (US) was performed, followed by CEUS with 1.2 ml bolus intravenous injection of second-generation ultrasound contrast agent. For every tumour, a time-intensity curve was constructed and peak enhancement (PE), time to peak (TTP), area under the time-intensity curve (AUTIC), and mean transit time (MTT) were documented. Multiple linear regression and ROC curves were used to evaluate cut-off values and the diagnostic accuracy of CEUS quantitative parameters.
Results: Of 52 patients evaluated, 6 (11.5%) were benign and 46 (88.5%) malignant on histopathology. TTP and MTT showed reliable accuracy for the characterisation of solid renal masses. For TTP, considering cut-off of 18s, sensitivity, specificity, PPV, and NPV were 97.73%, 75%, 95.56%, and 85.71%, respectively (AUC 0.94). For MTT, considering cut-off of 28s, the same were 95.65%, 83.33%, 97.78%, and 71.43%, respectively (AUC 0.93). Neither AUTIC (cut-off >3100, AUC 0.68) nor PE (cut-off >17, AUC 0.65) were independently capable for the characterisation of solid renal masses. Using all four criteria, sensitivity, specificity, PPV, and NPV were 95.4%, 47.1%, 90.2%, and 66.7%, respectively (p<0.05).
Conclusion: CEUS quantitative parameters have a significant role in the characterisation of solid renal masses. The technique holds potential not only for reducing exposure to iodinated contrast and radiation dosage but is of great clinical utility in patients with impaired renal function, in whom iodinated/gadolinium-based contrast agents are contraindicated.
Limitations: A single-centre study.
Ethics committee approval: Informed consent from all patients. Animal board approval N/A.
Funding: No funding was received for this work.

Shall we use contrast-enhanced ultrasound (CEUS) for the characterisation of nonpalpable testicular lesions? An analysis from a cost-effectiveness perspective

J. Rübenthaler[1], S. H. Kim[2], W. G. Kunz[1], W. Sommer[1], D.-A. A. Clevert[1], M. F. Froelich[3]; [1]*Munich/DE,* [2]*Frankfurt am Main/DE,* [3]*Mannheim/DE*

Purpose: Accurate characterisation of testicular lesions is crucial to allow for the correct treatment of malignant tumours and to avoid unnecessary procedures in benign ones. In recent years, contrast-enhanced ultrasound (CEUS) proved to be superior in specifying the dignity of small, nonpalpable testicular lesions (<1.5 cm) compared to B-mode and colour-Doppler ultrasound, which were previously regarded as the primary imaging method. The aim of this study was to analyse the cost-effectiveness of CEUS as compared to unenhanced ultrasound for the characterisation of nonpalpable testicular lesions.
Methods and materials: A decision model based on Markov simulations estimated lifetime costs and quality-adjusted life-years (QALYs) associated with unenhanced ultrasound and CEUS. Model input parameters were obtained from recent literature. A deterministic sensitivity analysis of diagnostic parameters and costs was performed. Probabilistic sensitivity analysis using Monte-Carlo modelling was also applied. The willingness-to-pay (WTP) was set to $100,000/QALY.
Results: In the base-case scenario, unenhanced ultrasound resulted in total costs of $5,113.14 and an expected effectiveness of 8.29 QALYs, whereas CEUS resulted in total costs of $4,397.77 with 8.35 QALYs. Therefore, the strategy unenhanced ultrasound was dominated by CEUS in the base-case scenario. Sensitivity analysis showed CEUS to be the cost-effective alternative along with a broad range of costs.
Conclusion: Contrast-enhanced ultrasound is a cost-effective imaging method for the characterisation of nonpalpable testicular lesions.
Limitations: There is only little published and available data for sensitivities and specificities of colour-Doppler and CEUS for the evaluation of small non-palpable testicular lesions, and the current model is based on a single study with 115 patients instead of a meta-analysis which would be the more preferred option.

Strain elastography: is it valuable in the assessment of cervical incompetence during pregnancy?
E. Elkayal; *ElFayoum/EG (engy.elkayal@gmail.com)*

Purpose: Can strain elastography assess the elasticity characteristics of the cervix between 12-14 weeks of pregnancy?
Methods and materials: We conducted a descriptive cross-sectional study in the ultrasound unit of the radiology department, Fayoum University Hospital, between January 2018 and January 2019. This study included 40 women presenting for the routine first trimester. The following data was recorded: elastographic colour assessment of the cervical canal and ultrasound cervical length, maternal age, obstetrical history, and the gestational age at birth. Elastographic assessment of the cervical canal was performed using a colour map: red (soft), yellow (medium-soft), green (medium-hard), and purple (hard). If two colours were visible in the region of the cervical canal, the softer option was noted.
Results: It was found that the red colour group (soft cervix in elastography reading) had a 62.5% sensitivity and 70.9% specificity, with a total diagnostic accuracy of 70% in predicting preterm delivery. When adding the "yellow colour", the sensitivity was raised to 87.5%, the specificity to 72.5%, and the total accuracy increased to 74.3% of cases of preterm delivery. The number of preterm deliveries (<37 weeks of pregnancy) was significantly higher in the red and yellow groups than in the green and purple groups.
Conclusion: Elastography has been increasingly used in the assessment of the cervical canal at 12-14 weeks of pregnancy and can identify patients with a high-risk of preterm delivery in women with cervical incompetence.
Limitations: There is no distinction between a reference tissue and the target tissue in the cervix. There are multiple pressure sources such as a patient's respiration, arterial pulsations, foetal movements, and the shaking hands of the operator.
Ethics committee approval: Ethics committee of Fayoum University.
Funding: No funding was received for this work.

RPS 607-7 12:01
Shear-wave elastography of the prostate for the detection of Ca prostate in cases of elevated PSA and BPH
S. S. Sachar[1], S. Sachar[2]; *[1]New Delhi/IN, [2]Muzaffarnagar/IN (drsacharsaurabh@gmail.com)*

Purpose: To conduct a prospective study to evaluate transrectal shear-wave elastography (SWE) in the detection of prostate cancer (PC) in patients with elevated PSA and enlarged prostate, and to correlate with TRUS-guided biopsy and CE-MRI (3 Tesla) findings and detect the sensitivity, specificity, PPV, and NPV for SWE.
Methods and materials: A total of 26 male patients with a minimum cut-off age of 60 years, minimum grade II prostatomegaly/prostatic hyperplasia on grey-scale imaging and PSA levels of at least 10.0 ng/mL were evaluated, and their transrectal SWE findings were correlated with CE-MRI and TRUS biopsy findings.
Results: Cross imaging and biopsy data analysed per core for SWE findings showed that for patients with PSA <20 µg/L, the sensitivity and specificity of SWI for prostate cancer detection were 90% and 88%, while in patients with PSA >20 µg/L, the sensitivity and specificity were 93% and 93%, respectively. Prostate cancer had significantly higher stiffness values compared to benign tissues, with a trend toward stiffness differences in different Gleason grades.
Conclusion: Shear-wave elastography has a high sensitivity, specificity, PPV, and NPV for the detection of PC. With a high PPV, patients with elevated PSA levels, prostatomegaly on routine grey-scale imaging or abnormal results in digital rectal examination and negative SWE may not require a biopsy. This could significantly reduce the need for uncomfortable interventions like TRUS-guided biopsy's negative biopsy rate in prostate cancer detection.
Limitations: Uncooperative patients due to very old age, a user bias, and unavailability of a full spectrum of diagnostic capabilities including PSA and CE-MRI (3T).
Ethics committee approval: Written and informed consent was obtained.
Funding: No funding was recieved for this work.

Does shear-wave elastography correlate with biopsies in acute renal graft dysfunction patients? Preliminary results
C. G. García Roch[1], G. F. Maria Esther[1], A. Roca Muñoz[1], F. X. Aragon Tejada[1], S. Aso Manso[1], P. A. A. Barón Rodiz[2], F. García García[2]; *[1]Toledo/ES, [2]Madrid/ES (carmen.roch@gmail.com)*

Purpose: Can shear-wave elastography provide early and confident diagnosis of parenchymal injury in acute kidney graft dysfunction patients compared to biopsies?
Methods and materials: A single-centre, prospective, longitudinal, and analytical study that included all kidney transplanted patients referred for biopsy at our institution due to acute graft failure (post-implantation dysfunction or >20% baseline Cr increase) between January 2018-March 2019.
Within 24 hours after laboratory tests and after a baseline ultrasound examination to rule out non-parenchymal complications, six quantitative shear-wave elastography (SWE) valid measurements (kPa) at graft's cortical interpolar region were acquired by the same senior ultrasound specialist radiologist.
From each graft, kPa range, mean, median, standard deviation, and interquartile range were collected. Shortly after, same-point biopsies were performed and informed by two pathologists according to the 2013 Banff classification.
Exclusion criteria were age <18 years, non-informed consent, adjacent collections, hydronephrosis, vascular stenosis/thrombosis, drug toxicity, recurrent graft disease, and pyelonephritis.
Results: 6 patients were finally enrolled (4 women, 2 men). Allograft age ranged between 5-3,320 days. Creatinine values ranged between 1.8-5.0mg/dL and SWE measurements ranged between 12.7-25.6kPa.
Biopsies resulted in Banff II category in 2 patients, Banff III category in 1 case, and Banff IV category in 3 cases.
After statistical analysis, we found a positive correlation of creatinine levels with SWE values.
Surprisingly, sex seemed to be positively related to SWE values, whereas we found no statistical significance of SWE with the type of Banff classification.
Conclusion: Forthcoming investigations with a larger sample size are needed to validate our findings and define if SWE could be proposed as a future alternative to biopsy in graft dysfunction.
Limitations: A single-centre study with a small sample size.
Ethics committee approval: n/a
Funding: No funding was received for this work.

RPS 607-9 12:13
Comparing computed tomography (CT) and contrast-enhanced ultrasound (CEUS) in the management of complex renal cysts: a single-centre experience
E. Gioulis[1], L. Angelini[2], N. Civitareale[2], A. Zago[2], M. Coss[2], G. Piccoli[2], R. Napoli[2], S. Valerio[2], M. Salemi[2]; *[1]Vittorio Veneto/IT, [2]Conegliano/IT (egioulis@sirm.org)*

Purpose: To gauge the correspondence between CT Bosniak classification, CEUS modified Bosniak classification, and clinical/histological outcomes.
Methods and materials: From March 2017-September 2018, 60 patients underwent CT and CEUS. 65 complex renal cysts were evaluated first by CT and then by CEUS. Benign lesions were defined as those with a Bosniak classification of 2-2F and malignant lesions as those with a Bosniak classification of 3-4, or those with histological diagnosis or those that showed progression during follow-up. Cohen K test, CEUS, CT sensitivity and specificity, and ROC curves were performed.
Results: Bosniak score from CT to CEUS: 17 downgraded ● 11 concluded the follow-up (CEUS Bosniak I) ● 1 operated: pseudocyst (CT Bosniak 4 → CEUS Bosniak 3) ● 5 continue to be monitored 31 maintained ● 4 surgeries: 3 RCC (1 Bosniak 2F, 1 Bosniak 3, 1 Bosniak 4), 1 oncocytoma (Bosniak 4) ● 1 biopsy: HG B-Cell Lymphoma (Bosniak 4) ● 24 continue to be monitored ● 2 were lost to follow-up
17 upgraded ● 6 surgeries: 4 RCC (1 CT Bosniak 2F, 3 CT Bosniak 3 → 4 CEUS Bosniak 4), 1 MCRNLMP (CT Bosniak 2F → CEUS Bosniak 3) 1 simple cyst (CT Bosniak 2F → CEUS Bosniak 3) ● 9 continue to be monitored ● 2 were lost to follow-up
Cohen Kappa test = 0.658 "good"
Conclusion: CEUS can help to better define a Bosniak score, being an alternative to CT when iodinated contrast is contraindicated. CEUS can be

performed bedside. CEUS can reduce ionising radiation exposure and CT scanner workload.
Limitations: CEUS limitations consist in the patients constitutions, location of the renal cyst, and bowel gas.
Ethics committee approval: Written informed consent obtained. Specific literature reviewed.
Funding: No funding was received for this work.

Association between 2D transperineal ultrasound and physical examination in evaluation of pelvic floor muscle functions
A. Aryan, M. Arab Ahmadi*; Tehran/IR (arvinaryan@yahoo.com)*

Purpose: Transperineal ultrasound has been introduced for the assessment of pelvic floor muscles functional status, however, the accuracy of these modalities as compared to physical examination remains uncertain. Moreover, the assessment of levator ani function status via physical examination is subjective and requires high gynaecological experience. The study aimed to compare the correlation between 2D transperineal ultrasonography and physical examination (intravaginal palpation) for the evaluation of pelvic levator ani function.
Methods and materials: This cross-sectional study was performed on 40 women aged 29 to 75 years who were candidates for structural evaluation due to the suspicion of pelvic floor muscles dysfunction. The status was assessed by both physical examination (graded based on the Oxford Grading System) and transperineal 2D ultrasound.
Results: Strong correlations were revealed between the Oxford physical examination score and both US parameters as levator ani assessment in the midsagittal plan, the difference between AP dimension of hiatus at rest and at squeezing ($r=0.671$, $p<0.001$), and also the cranial shift of muscle ($r=0.498$, $p<0.001$). The decrease in hiatus dimension and cranial shift assessed by ultrasound was found by an increase in the Oxford physical examination score.
Conclusion: Because of the high correlation between physical and ultrasound examination in assessing pelvic floor muscle performance, ultrasound, as an available low-cost method, can be used safely instead of a physical evaluation for this purpose. The assessment of levator ani function by mid sagital 2D transperineal ultrasound should be using the two indices including cranial shift and the decrease in hiatus dimension during squeezing.
Limitations: A small sample size.
Ethics committee approval: The study was approved by the ethical committees at the University of Medical Sciences.
Funding: No funding was received for this work.

RPS 607-11 12:25
How to increase eligibility in MRgFUS (magnetic resonance-guided focused ultrasound surgery) to treat difficult cases of uterine fibroids (UFs): tips and tricks
L. P. Vazzana, S. Iafrate, I. Capretti, F. Arrigoni, M. Di Luzio, S. Mascaretti, G. Mascaretti, C. Masciocchi*; L'Aquila/IT (luciavazzana@gmail.com)*

Purpose: To investigate additional tips and tricks to increase the eligibility of MRgFUS in patients showing some limitation.
Methods and materials: From September 2015 to June 2017, we evaluated 19 women with UFs showing an inadequate acoustic window to MRgFUS. Additional to the common techniques used to obtain an adequate acoustic window, such as filling the bladder with saline and filling the rectum with ultrasound gel, we tried to evaluate some strategies to increase the eligibility to the procedure. We used an inversion table with the patients in an antigravity position in order to move up the bowel loops. Furthermore, a low-fibre diet for a week before the MRgFUS was advised to reduce intestinal bloating, distension, and intestinal peristalsis. The volume of treated fibroid and non-perfused volume (NPV) were calculated with specific software.
Results: Out of 19 patients, 12 showed an adequate acoustic window and underwent MRgFUS after using inversion table (21%), filling the bladder and rectum (48%), and a low-fibre diet (31%). The UFs presented a mean extension of the NPV of about 50-65%, with good effectiveness of the treatment. 7 patients, despite these strategies, continued to display an inadequate acoustic window and were not treated.
Conclusion: Some practical tips and tricks to get an adequate acoustic window for the ultrasound beam may increase the eligibility of patients to MRgFUS, thus allowing the procedure. Furthermore, in these patients, MRgFUS shows good safety profile and an improvement of clinical outcomes.
Limitations: A small number of patients.

The effect of deep learning reconstruction on cyst scores in patients with cystic lung diseases
C. Steveson[1], J. Schuzer[2], S. Rollison[2], T. Machado[2], A. Jones[2], P. Julien-Williams[2], J. Moss[2], M. Chen[2]; *[1]Adelaide/AU, [2]Bethesda/US (chloe.steveson@medical.canon)*

Purpose: To investigate the effect of a deep learning image reconstruction algorithm on cyst scores (percentage of lung volume occupied by cysts) in chest CT scans.
Methods and materials: 105 consecutive patients with cystic lung diseases underwent chest CT at standard radiation doses on a 320 detector row CT scanner with the following scan parameters: Helical scan, 0.5mm x 80 detector rows, 120 or 100kV, automatic exposure control, 0.275s rotation speed, and standard pitch. Each scan was reconstructed using a soft tissue kernel with hybrid iterative reconstruction (AIDR3D) and deep learning reconstruction (AiCE) techniques. Cyst scores were quantified by semi-automated software. The signal to noise ratio was calculated for each reconstruction. The data was analysed by linear correlation, paired t-test, and Bland-Altman.
Results: Patients averaged 49.1 years (range 27-76yrs), 91% were female. The mean radiation dose was 4.50 mSv ±2.24 mSv. The mean cyst score was 8.9±10.8 (range 0-43.8) for clinical AIDR 3D reconstruction and 9.2±11.2 (range 0-45.1) for deep learning reconstruction AiCE, representing an insignificant difference of 0.28%. Linear correlation coefficient was excellent at 0.99 ($p<0.0001$). Signal-to-noise for AiCE images was higher than AIDR3D images (8.76 vs. 7.38, respectively, $p<0.001$).
Conclusion: Deep learning image reconstruction has an excellent correlation with conventional AIDR 3D reconstruction for chest CT at standard radiation doses.
Limitations: A single-centre study.
Ethics committee approval: Institutional ethics approval obtained (National Institutes of Health, USA).

From infancy to adulthood: developmental changes in pulmonary quantified computed tomography parameters

J. F. M. Gawlitza[1], F. Trinkmann[2], F. Trudzinski[1], H. Wilkens[1], A. Bücker[1], J. Stroeder[1], P. Fries[1]; [1]*Homburg/DE,* [2]*Mannheim/DE (joshua.gawlitza@uks.eu)*

Purpose: Quantified computed tomography (qCT) is known for correlations with airflow obstruction and fibrotic changes of the lung. However, as qCT studies often focus on diseased and elderly subjects, current literature lacks physiological qCT values during body development. We evaluated the chest CT examinations of a healthy cohort, reaching from infancy to adulthood, in order to determine physiological qCT values and changes during body development
Methods and materials: Dose-optimised chest CT examinations performed over the last 3 years using a dual-source CT scanner were retrospectively analysed. Exclusion criteria were age >30 years and any known or newly diagnosed lung pathology (n = 151). Lung volume, mean lung density, full-width-at-half-maximum, and low attenuated volume (LAV) were semi-automated quantified. qCT values between different age groups as well as unenhanced (Group 1) and contrast-enhanced (Group 2) protocols were compared. Models for the projection of age-dependent changes in qCT values were fitted.
Results: Significant differences in qCT parameters were found between the age subgroups ($p < 0.05$). All parameters except LAV merge into a plateau level above this age as shown by fitted polynomial models (r^2 between 0.85 and 0.67). In group 2, this plateau phase is shifted back around 5 years. Except for the volume, significant differences in all qCT values were found between group 1 and 2 ($p < 0.01$).
Conclusion: qCT parameters underlie a specific age-dependant dynamic from infancy to adulthood. Except for LAV, qCT parameters reach a plateau phase around adolescence. Contrast-enhanced protocols seem to shift this plateau backwards.
Limitations: Group findings are projected on individuals. Nonetheless, a yearly CT for lung evaluation in healthy patients would be unacceptable. No spirometric triggering. The sample size.
Ethics committee approval: Institutional Review Board Waiver.

Interstitial lung abnormality in abdominal and thoracoabdominal computed tomography scans performed for routine clinico-surgical indications

G. Milanese, M. Silva, V. R. Papapietro, E. Bacchini, G. Capretti, F. Specchia, S. E. Gazzani, E. Iezzi, N. Sverzellati*; Parma/IT*

Purpose: To define the prevalence of interstitial lung abnormality (ILA) in patients undergoing routine abdominal and/or thoracic-abdominal computed tomography (CT) without clinical indication for pulmonary disease (PD). To evaluate the percentage of radiological under-reporting of CT features of ILA.
Methods and materials: This retrospective study included patients undergoing an abdominal or thoracoabdominal CT scan for clinico-surgical indications other than PD.
The detection of CT features of ILA was visually performed by a group of investigators. Subsequently, selected subjects were evaluated by an expert thoracic radiologist for classification into $ILA_{fibrotic}$/$ILA_{non-fibrotic}$/$ILA_{equivocal}$ /ILA_{absent}. Patients with $ILA_{fibrotic}$ were classified according to the 2017 Fleischner Society criteria for IPF, including a description of individual abnormalities. The pattern of $ILA_{non-fibrotic}$ was also evaluated.
Results: ILAs were assessed in 26,295 consecutive subjects of whom 663 (2.5%) subjects had ILA on at least one CT as follows: 255 (1%) had $ILA_{fibrotic}$ (0.22% typical UIP, 0.24% probable UIP, 0.33% indeterminate for UIP, and 0.17% most consistent with a non-IPF diagnosis), 161 (0.6%) had $ILA_{non-fibrotic}$, and 247 (0.9%) had $ILA_{equivocal}$.
A total of 374 out of 663 ILA (56.4%) were unreported in the original radiology reports of baseline abdominal/thoraco-abdominal CT scans.
Conclusion: In this large study cohort of unselected subjects undergoing abdominal/thoracoabdominal CT for clinical indications other than PD, the frequency of ILA, particularly that of $ILA_{fibrotic}$, was not negligible, with substantial under-reporting.
Limitations: A monocentric setting.
Ethics committee approval: 210/2017/OSS/AOUPR.

Cross-border knowledge sharing in the diagnostic workup of a rare disease: experiences with a Trans-European teleradiology project on idiopathic pulmonary fibrosis

T. J. Weikert, G. Sommer, M. Tamm, P. Haegler, J. Cyriac, A. W. Sauter, K. Hostettler, J. Bremerich*; Basel/CH (thomas.weikert@usb.ch)*

Purpose: To share experience from a large, ongoing expert reading teleradiology program in Europe and Asia aiming at supporting referring centres to interpret high-resolution computed tomography (HRCT) with respect to the presence of usual interstitial pneumonia (UIP)-pattern in patients with suspected idiopathic pulmonary fibrosis (IPF).
Methods and materials: We analysed data from 01/2014 to 05/2019, including HRCTs from 239 medical centres in 12 European and Asian countries that were transmitted to our picture archiving and communication system (PACS) via a secured internet connection. Structured reports were generated in consensus by a radiologist with over 20 years experience in thoracic imaging and a pulmonologist with specific expertise in interstitial lung disease according to current guidelines on IPF. Reports were sent to referring physicians. We evaluated patient characteristics, technical issues, report turnaround times, and frequency of diagnoses. We also conducted a survey to collect feedback from referring physicians.
Results: HRCT image data from 703 patients was transmitted (53.5% male). The mean age was 63.7 years (SD:17). In 35.1% of all cases, the diagnosis was “UIP”/”Typical UIP”. The mean report turnaround time was 1.7 days (SD:2.9). Data transmission errors occurred in 7.1%. The overall satisfaction rate among referring physicians was high (8.4 out of 10; SD:3.2).
Conclusion: This Eurasian teleradiology program demonstrates the feasibility of cross-border teleradiology for the provision of state-of-the-art structured reporting to centres with limited expertise in chest radiology.
Limitations: A low response rate of the survey. No cost-effectiveness analysis was conducted.
Ethics committee approval: Informed conset was waived by the local ethics committee (Project ID: Req-2019-00403).
Funding: No funding was received for this work. The teleradiology program is financially supported by Boehringer Ingelheim.

RPS 604a-5 11:49

Characteristics of lung disease patterns on CT scans in patients with idiopathic inflammatory myopathies: association with myositis specific auto-antibodies

A. Laporte, K. Mariampillai, Y. Allenbach, O. Benveniste, P. Grenier, S. Boussouar*; Paris/FR (mandine_31@hotmail.fr)*

Purpose: To identify different lung patterns associated with idiopathic inflammatory myopathies (IIM) and to evaluate the potential relationship between the CT findings of interstitial lung disease (ILD) and myositis specific antibodies (MSA).

Methods and materials: All consecutive IIM patients referred to the internal medicine department between 2004 and 2019 were included and chest CT scans were retrospectively assessed by two radiologists. The CT findings were used for multivariate analysis to identify subgroups of patients.
Results: CT scans of 257 patients with IIM including inclusion body myositis (IBM) (n=68), dermatomyositis (DM) (n=67), immune-mediated necrotising myopathy (IMNM) (n= 63), and antisynthetase syndrome (ASS) (n=59) were analysed. MSA were present in 173 patients (67.3%). 94 patients (36%) had ILD. The cluster analysis identified three subgroups of patients. The first cluster (n= 21) was characterised by consolidation (95%). DM with anti-MDA5 was significantly more present in this cluster. All the patients of the second cluster (n=34) presented cysts (including honeycombing). The patients in the last cluster (n=39) had significantly more intralobular-reticulations, an absence of cysts, and 17% of consolidation. Patients with ASS were significantly more present in cluster 2 and 3.
Conclusion: Despite the heterogeneity of ILD observed in IMM, ILD could be split among 3 clusters according to CT-scan criteria and theses clusters were associated to MSA. The identification by radiologists of those clusters could facilitate diagnostic screening, following, and prognostic value.
Limitations: It was a monocentric, retrospective study and we didn't take into account the evolution of lung pattern through different CT scans for each patient.
Ethics committee approval: Written informed consent was provided by all patients for use of the database.
Funding: No funding was received for this work.

Evaluation of the relationship between pulmonary manifestations and laboratory findings in rheumatoid arthritis patients

H. Çelik, N. S. Gezer, G. O. Simsek, A. Ozgen Alpaydın, S. Tarhan, E. Yilmaz, P. Balci*; Izmir/TR (dr.celik90@gmail.com)*

Purpose: The relationship between radiological and laboratory findings in rheumatoid arthritis (RA) patients is not fully documented in the literature. We aimed to show the correlation between chest computed tomography (CT) findings and laboratory tests used in the diagnosis and follow-up of patients with RA.
Methods and materials: Chest CT scans of 263 patients with RA were evaluated for a rheumatoid nodule, serositis, bronchiectasis, constrictive bronchiolitis, follicular bronchiolitis, and interstitial fibrosis pattern (Figure 1-3). Anti-nuclear antibody (ANA), rheumatoid factor (RF), C-reactive protein (CRP), and erythrocyte sedimentation rate (ESR) values synchronous with CT scans were recorded. The relationship between the radiological findings and laboratory data was analysed.
Results: 70% of patients were female. CT scans revealed rheumatoid nodules in 25% and cavitation in at least one rheumatoid nodule in 21% of patients with rheumatoid nodules. Nonspecific interstitial pneumonia (NSIP) was the most common fibrosis pattern (% 65). Serositis, bronchiectasis, and constrictive bronchiolitis were defined in 18%, 36%, and 22% of the patients, respectively. A statistically significant relationship was found between constrictive bronchiolitis and ESR (p: 0.001), between serositis, ESR, and CRP (p=0.003 ve p<0001 respectively), and between bronchiectasis and CRP (p=0.005) (Table 1). There was no statistically significant relationship between ANA values and any radiological findings.
Conclusion: This study suggests that some specific laboratory tests used in the diagnosis and follow-up of RA may predict lung involvement patterns that may develop due to rheumatoid arthritis such as constructive bronchiolitis, serositis, and bronchiectasis.
Limitations: There were differences in some of the chest CT protocols such as the use of high-resolution CT or contrast media. Also, some laboratory tests were not performed in all patients.
Ethics committee approval: Ethics committee approval is available.
Funding: No funding was received for this work.

Comparison of the relevancies of different reconstruction kernels and slices thickness for disease progression in idiopathic pulmonary fibrosis

J. Pan[1], J. Hofmanninger[1], S. Röhrich[1], F. Prayer[1], N. Sverzellati[2], H. Prosch[1], G. Langs[1]*; [1]Vienna/AT, [2]Parma/IT (jeanny.pan@meduniwien.ac.at)*

Purpose: To compare image markers and the importance of the different reconstruction kernels and slice thickness in chest CT scans in idiopathic pulmonary fibrosis (IPF) using unsupervised machine learning (ML).
Methods and materials: CT scans from 106 IPF patients were reconstructed with 5 different reconstruction kernels and 3 different slice thicknesses. Firstly, supervoxels were computed using autonomously segmented lung regions. The texture grey-level co-occurrence matrix was computed for assigning 1 to 20 cluster labels to each supervoxel. Cluster label volume maps were generated for each scan. The differences between the label maps of two subsequent scans were computed for different combinations of slice thickness and reconstruction kernels. The volume differences between subsequent scans with different kernel combinations were tested. The computed globally labelled volume fractions were utilised as input to train a random forest classifier. The trained classifier identified progression markers by predicting the sequence of longitudinal examinations for randomly chosen patients.
Results: The classifier's performance was evaluated with 10 different runs. 10% of the patients were used as test data. The mean accuracies after 10 runs were 76% for subsequent scans with the same kernel, 79% for scans with all 5 kernels combined, 88% for scans with Boneplus and Bone kernels, 85% for scans with Boneplus, and 60% for scans with Bone kernel alone. 2 clusters are identified as stable texture clusters for the assessment of IPF progression with different combinations of kernels and slice thickness.
Conclusion: The proposed ML methods were able to identify the relevance of different combinations of kernels. For applying a machine learning approach, homogeneous slice thickness is more relevant than reconstruction kernels. 2 stable texture patterns are shown as markers for the assessment of IPF.

The evaluation of lung CT densitometry in interstitial lung diseases

Y. Şengül, D. Kocakaya, C. Ilgin, E. Eryuksel, N. Inanc, N. C. Cimsit*; Istanbul/TR (yldzsngl34@gmail.com)*

Purpose: To evaluate the relationship between changes in the density in lung parenchyma with pulmonary function test (PFT) and visual CT features, regardless of the pattern differences in ILD, and also to investigate the threshold values of densitometric parameters in predicting the severity of pulmonary fibrosis.
Methods and materials: 69 patients with idiopathic pulmonary fibrosis (IPF), systemic sclerosis (SSc), and rheumatoid arthritis (RA) were evaluated who had no more than a 1-month interval between thorax CT and PFT measurements. CT scans were scored visually then processed to obtain mean lung density (MLD), the percentage of high attenuation area (HAA%), and the HU value in 85th percentile. The relationships between the densitometry with PFT and semiquantitative scoring were evaluated.
Results: All densitometry values in patients with ILD were significantly higher than the control group. MLD threshold value was -760 (sensitivity 50%, specificity 81%), the HAA% 7.3 (sensitivity 65%, specificity 81%), 85th perc -660 (sensitivity 62%, specificity 81%) based on DLCO% predicted value of 70 in determining the severity of pulmonary fibrosis.
Densitometric parameters showed a statistically significant correlation with physiologic quantities and fibrosis score (r: -0.40 to -0.50) and (r:0.52 to 0.66), respectively.
The fibrosis score and densitometry parameters were high in patients with a pulmonary artery diameter greater than 29 mm.
Conclusion: Quantitative densitometric CT parameters correlate with pulmonary function test results and visual scoring. This objective method may be useful for determining the extent and severity of fibrosis in ILD.
Limitations: A retrospective study and the low number of samples.
Ethics committee approval: The local Medical Ethical Committee permission (09.2018.782) was obtained.
Funding: No funding was received for this work.

The impact of hybrid iterative reconstruction on quantitative analysis with pulmonary CT
Z. Liu*; Beijing/CN (liuzhuormyy@sina.cn)*

Purpose: To investigate the impact of hybrid iterative reconstruction blending levels on quantitative analysis and objective image quality of pulmonary CT.
Methods and materials: Pulmonary CT images were acquired from 52 subjects and reconstructed using different hybrid iterative reconstruction blending levels including FBP, ASIR-V30%, ASIR-V50%, ASIR-V70%, and ASIR-V100%. Quantitative analyses were compared including emphysema index(EI), total lung volume, luminal area, wall area, wall thickness, diameter of airway, and nodule volume. CT value and standard deviation (SD) were also measured and compared.
Results: EIs were found statistically different [FBP (3.34 %), ASIR-V30% (2.13 %), ASIR-V50% (1.46 %), ASIR-V70% (0.98 %), and ASIR-V100% (0.57 %)(P<0.001)]. SDs decreased dramatically with the increase of ASIR-V percentage [air in trachea: FBP (29.8HU), ASIR-V30% (25.5HU), ASIR-V50% (22.6HU), ASIR-V70% (19.6HU), ASIR-V100% (15.2HU), descending aorta: FBP (35.2HU), ASIR-V30% (27.6HU), ASIR-V50% (22.7HU), ASIR-V70% (18.0HU), ASIR-V100% (12.1HU) (P<0.001)]. There was no statistically significant difference of CT values, airway dimensions, nodule volumes, and lung volumes among different blending levels (P>0.05).
Conclusion: With the increase of blending level of ASIR-V, EI and SD decreased significantly, while volumetric quantification of lung nodule and airway dimensions were not affected.
Limitations: The results of this single-centre study were limited to only one scanner and one iterative reconstruction algorithm. The sample size of patients in our study was small, which may affect the statistical results.

RPS 604a-10 12:19
A comparison between the ATS/ERS/JRS/ALAT criteria of 2011 and 2018 for usual interstitial pneumonia on HRCT: a cross-sectional study
L. L. Wuyts, M. Camerlinck, D. de Surgeloose, L. Vermeiren, D. Ceulemans, J. Clukers, H. Slabbynck*; Antwerp/BE*

Purpose: To determine whether the revised 2018 ATS/ERS/JRS/ALAT radiological criteria for usual interstitial pneumonia (UIP) provide better diagnostic agreement compared to those published in 2011.
Methods and materials: The cohort for this cross-sectional study (single-centre, nonacademic) was recruited from a multidisciplinary ILD team discussion (MDD) from July 2010 to December 2018, with clinical suspicion of idiopathic pulmonary fibrosis (n= 325). Exclusion criteria were technical HRCT issues, images not acquired within reference centre, the presence of lung neoplasm, the patient suffering from known connective tissue disease, drug exposure to pulmonary toxins, or a lack of a working diagnosis after MDD (Figure 1). Four readers with varying degrees of experience in the interpretation of HRCT independently assessed 192 HRCT scans for the presence of fibrotic lung disease characteristics. A diagnostic category was assigned to each HRCT according to both the previous (2011) and current (2018) radiological criteria based on the ATS/ERS/JRS/ALAT statements on IPF (Figures 2 and 3). An inter-rater variability analysis (Gwet's second-order agreement coefficient) was performed.
Results: The resulting estimate of Gwet's AC_1 coefficient for the use of the ATS/ERS/JRS/ALAT radiological criteria for 2011 and 2018 is 0.62 (± 0.06) and 0.65 (± 0.06), respectively (Table 1). The inter-rater variability improved for every pair of readers, except for one. Considering the varying degree of experience of these 4 radiologists, we report only minor differences in the agreement level.
Conclusion: No statistically significantly higher degree of diagnostic agreement is observed when applying the revised ATS/ERS/JRS/ALAT radiological criteria for UIP of 2018 compared to those of 2011. The estimated inter-rater variability for assigning the diagnostic categories is moderate for both classification systems, although it improves consistently, independent from the degree of experience in HRCT interpretation.

Can we improve the prediction of survival in fibrotic interstitial lung diseases? Texture-based quantitative CT model outperforms expert diagnosis
E. J. M. Barbosa Jr., W. Gefter, D. Kontos, B. Haghighi*; Philadelphia, PA/US*

Purpose: Usual interstitial pneumonia (UIP) is generally associated with a worse prognosis than other types of non-UIP fibrotic interstitial lung diseases (ILD). We hypothesised that a texture-based model utilising high-resolution quantitative HRCT (qCT) imaging features can better predict survival in ILD patients when compared to the clinical standard of UIP versus non-UIP expert diagnostic labels.
Methods and materials: 40 ILD patients (20 UIP, 20 non-UIP ILD) were classified by expert consensus of 2 radiologists and followed for 7 years. Clinical variables (CVs) such as age, gender, smoking status, and co-morbidities, as well as the outcomes such as time to death or lung transplantation, were recorded. A survival analysis (Kaplan-Meier with Cox regression) was performed, comparing expert diagnostic labels (UIP vs non-UIP) versus a texture-based model utilising 26 higher-order 3D imaging metrics derived from quantitative HRCT, with varying region of interest (ROI) sizes, controlling for age and co-morbidities.
Results: Survival curves of UIP vs non-UIP ILD patients (using expert diagnostic labels) were not statistically different (p=0.59). In contrast, our texture-based qCT model with CVs achieved statistically significant partition of the cohort (p=0.029, c-statistic = 0.73) into distinct survival sub-groups.
Conclusion: Our texture-based qCT model substantially outperformed expert diagnostic labels (UIP vs non-UIP expert) to predict survival in ILD patients. These models, by capturing latent HRCT derived lung parenchymal texture biomarkers that are not explicitly accounted for in clinical standard diagnostic labels, may provide more accurate prognostication, ultimately contributing to more effective patient management, treatment planning, and possibly improving long-term outcomes.
Limitations: The retrospective nature and sample size of the study.
Ethics committee approval: Approved by the local IRB (#821679) with HIPAA waiver of informed consent.

Bronchial artery diameter as a predictor of haemoptysis: a single-centre experience
B. S. R. Reddy[1], P. Chatterjee[2], K. Sunder[3], R. Kumar[3], V. Mazumdar[3]; *[1]Chennai, Tamil Nadu/IN, [2]Guwahati, ASSAM/IN, [3]Chennai/IN (sudeepreddy2009@gmail.com)*

Purpose: To evaluate the bronchial artery diameter in multidetector CT angiography (MDCTA) as a predictor of haemoptysis and to compare this with digital subtraction angiography (DSA) prior to bronchial artery embolisation.
Methods and materials: MDCTA was performed in 40 patients (35 men, 5 women; age range=19-82 years; mean=52.6 years) with haemoptysis who were referred for bronchial artery embolisation. Bronchial arteries with a diameter of more than 2 mm were considered abnormal and hypertrophied. Transverse, multiplanar reconstruction, and 3-dimensional reconstruction (maximum intensity projection and volume-rendered) images were analysed to identify the abnormal hypertrophied bronchial arteries causing haemoptysis. Their origin and course were noted. DSA was performed with the knowledge of findings from MDCTA. Selective arteriograms of abnormal bronchial arteries were performed. Embolisation was done for all patients using polyvinyl alcohol particles (300-500 µm), gel foam, or coils.
Results: DSA was performed for all cases and the results were compared with MDCTA. MDCTA shows a 96.2% sensitivity and 100% specificity in identifying abnormal hypertrophied bronchial arteries with a diameter of more than 2 mm.
Conclusion: There is a strong positive correlation of bronchial artery diameter of more than 2 mm in MDCTA for predicting haemoptysis.
Limitations: A small sample size. A multicenteric study may be required for further evalution.

Transpulmonary chemoembolisation (TPCE) and transarterial chemoperfusion (TACP) in patients with primary and secondary lung neoplasms: evaluation of apparent diffusion coefficient (ADC) values
T. J. Vogl, T. Hoppe, N. N. N. Naguib, N.-E. A. Nour-Eldin, T. Gruber-Rouh, L. Basten*; Frankfurt am Main/DE*
(t.vogl@em.uni-frankfurt.de)

Purpose: To evaluate the predictive value of the apparent diffusion coefficient (ADC) for the treatment response in unresectable primary and secondary lung neoplasms using transpulmonary chemoembolisation (TPCE) and transarterial chemoperfusion (TACP).
Methods and materials: 42 primary (n=13) and secondary (n=29) unresectable lung lesions of 31 patients undergoing TPCE and TACP were included. Lesion diameter, volume, and ADC values were measured on an MRI series including a diffusion-weighted imaging (DWI) sequence at the beginning and end of each treatment cycle. Treatment response was evaluated on a per-lesion basis. Partial response (PR) was defined as a size decrease of ≥30%, progressive disease (PD) as an increase of≥20%, and stable disease (SD) was the remaining lesions. A statistical analysis of ADC values was performed using t-tests, an analysis of variance, and receiver-operating characteristic curves.
Results: 9 lesions recorded PR: the mean pre-treatment ADC was $1.164x10^{-3}$ mm²/s and the mean ADC increase was 32.9%. 19 lesions recorded SD: the mean pre-treatment ADC was $1.449x10^{-3}$ mm²/s and the mean ADC increase was 6.9%. 14 lesions recorded PD: the mean pre-treatment ADC was $1.418x10^{-3}$ mm²/s and the increase in the mean ADC was 5.0%. The difference in ADC changes between response groups was significant (p≤0.02). Pre-treatment ADC recorded an area under the curve (AUC) of 0.774 for response prediction. A threshold ADC increase of 20.7% showed 88% sensitivity and 78% specificity for response prediction (AUC 0.838).
Conclusion: The study showed significant differences in mean ADC changes comparing PR to SD (p=0.02) and PR to PD (p<0.01) groups with a correlation between lesion volume reduction and an early increase in ADC in patients undergoing TPCE and TACP.
Limitations: A retrospective study design with a small number of patients.
Ethics committee approval: Approval by the Institutional Review Board.

Lung cancer CT-guided FNAC with rapid on-site evaluation (ROSE)
F. Fiore, L. D'acierno, V. Stoia, N. Martucci, R. D'angelo, F. Somma*; Naples/IT*
(ludovicad.a@gmail.com)

Purpose: To evaluate the efficacy and accuracy of CT-guided fine-needle aspiration citology (FNAC) in lung cancer typing.
Methods and materials: From January 2013-December 2017, 640 FNAC specimens were collected from 640 patients and examined with rapid on-site evaluation (ROSE), and subsequently underwent immunological tests (TTF-1, p40, CK 5/6, CK 7, and Napsin). Afterwards, cytological findings were compared with final histologic diagnoses. Overall adequacy and accuracy rates were determined by comparison with the final diagnosis.
Results: Of the 640 cases, concordance between "adequate" interpretation by ROSE and unequivocal malignant or benign diagnoses on final interpretation was 100%. In 80% of the specimens, it was possible to perform immunohistological analysis. The complication rate was 7%; no bleeding occurred but we did observe pneumothorax, which was distinguished in "early", when it was diagnosed during or at the end of the procedure and treated percutaneously, or "delayed", when it occurred in the first 24 hours and was surgically treated.
Conclusion: Lung cancer typing according to cytological criteria is feasible, accurate, and comparable with results of a histological analysis on small specimens. In addition, the possibility of immunological testing combined with the minimally invasive specimen harvesting can come up to the oncologists' increasing demands of a specific target for the new therapeutic frontiers (chemoimmunotherapy, radiotherapy, or surgery).
Limitations: A retrospective study and a single-centre experience.

Correlation between the length of embolisation material pulmonary arteriovenous malformation and the distal pulmonary hypoperfusion evaluated by spectral imaging in patients with HHT
J. Bizouerne, L. Cassagnes*; Clermont-Ferrand/FR*
(julie.bizouerne@gmail.com)

Purpose: Pulmonary arteriovenous malformation (PAVM) embolisation creates a ventilation-perfusion mismatch (V/Q defect). The pulmonary hypoperfused volume generated can be viewed on an iodine map with a dual-energy computed tomography as a defect, like acute pulmonary embolism. Our objective was to evaluate a correlation between the distance embolisation material PAVM, and the pulmonary hypoperfused volume, using spectral imaging in patients with hereditary haemorrhagic telangiectasia (HHT).
Methods and materials: 5 patients with HHT who had at least one embolised PAVM at our university hospital between March 2018 and May 2019 were included prospectively. A chest dual-energy computed tomography was performed. The distal pulmonary hypoperfused volume was quantified with manual segmentation using an iodine map. This distal pulmonary hypoperfused volume and the distance embolisation material PAVM were compared.
Results: 9 PAVM were studied. We found a high correlation between the distance embolisation material PAVM and the distal pulmonary hypoperfused volume (0.77, p=0.02), and between the diameter of the embolised artery and the distal pulmonary hypoperfused volume (0.88, p=0.004). The correlation between the distance embolisation material PAVM and the distal pulmonary hypoperfused volume still remained after exclusion of the effect of the diameter of the embolised artery (0.35, p=0.03).
Conclusion: Our study found a correlation between the distance embolisation material PAVM and the distal pulmonary hypoperfused volume, independent of the diameter of the embolised artery. It suggests an importance to realise the most distal embolisation possible.
Limitations: A monocentric study.
Ethics committee approval: The study was approved by CERIM (IRB: CRM-1904-005).
Funding: No funding was received for this work.

Endovascular treatment of haemoptysis: a study of failures and relapses
W. Mohammad[1], E. Mahdjoub[1], L. Saker[1], T. Israel[2], M.-P. Debray[1], A. Khalil[1]; *[1]Paris/FR, [2]Tros-Rivières, Guadeloupe/FR (antoine.khalil@aphp.fr)*

Purpose: To identify the causes of failure and/or relapse of the endovascular treatment of haemoptysis.
Methods and materials: We conducted a retrospective study from a prospective database of all patients who underwent endovascular treatment for haemoptysis from September 2015-March 2019. We collected clinical data such as age, gender, volume, the tolerability of haemoptysis, and the cause of haemoptysis. We reviewed CT-angiography and digital angiography. We defined failure (failure of catheterism or persistence of haemoptysis), short-term relapse (<1 month), and long-term relapse (>1 month).
Results: 148 patients (114 men and 34 women, median age: 57 y) were included in the study. Cancer (51 cases), tuberculosis (22 cases), bronchiectasis (20 cases), aspergillosis (15 cases), and cryptogenic haemoptysis (14 cases) accounted for more than 80% of causes. Failures and relapses were observed in 38 patients (26%). Failure, short-term relapse, and long-term relapse were respectively observed in 6 (4%), 23 (16%), and 9 (6%) patients. Among the 29 patients who experienced a failure of treatment or a short-term relapse, the two most common causes of failure and relapse were an incomplete embolisation (17 patients/29; 59%) and an error concerning the involved circulation (4 patients/29; 14 %). A re-embolisation enabled the control of haemoptysis in 22 of 29 patients (76%), for a total of 141/148 patients in the whole study (95%).
Conclusion: Incomplete embolisation and an error concerning involved circulation are the most frequent causes (21 patients/29) of failure/relapse in patients who experienced a failure of treatment and short-term relapse. Re-embolisation enables the control of haemoptysis in 22 of these 29 patients (76%).
Limitations: A retrospective monocentric analysis of a patient series with haemoptysis.

Multiparametric evaluation of CT-guided local thermal ablation of inoperable lung tumours

E. H. A. Emara[1], E. Elhawash[2], T. J. Vogl[3], N. N. N. Naguib[3], N.-E. A. Nour-Eldin[3], H. Mansour[4], S. Saber[4], S. E. Hegab[2], M. Abouelezz[4]; *[1]Kafr ElSheikh/EG, [2]Alexandria/EG, [3]Frankfurt am Main/DE, [4]Zagazig/EG (emademara85@yahoo.com)*

Purpose: To determine the value of conventional MRI with contrast, apparent diffusion coefficient (ADC) value calculation, and CT with contrast in the assessment of early- and long-term treatment response after ablation of inoperable lung tumours with microwave ablation (MWA) and radiofrequency (RFA).
Methods and materials: 58 patients with 86 lung lesions were treated with MWA and RFA according to the guidelines and evaluated by MRI with contrast including T1.T2 WI, T1 post-contrast, and diffusion-weighted imaging (DWI) using b-values (50, 400, and 800 mm2/s) and ADC value measurement before and 24 hours after ablation. Follow-up by chest CT and/or MRI after 24 hours, three, six, nine months, one year, and every 6 months onwards to determine response to ablation was conducted. ADC value changes after ablation were compared to NRT response.
Results: 56 lesions (65.1%) showed complete response and 30 lesions (34.9%) showed a local progression (residual activity). There was a statistical significant difference in T2 WI signal intensity after ablation in both groups (P=0.047) but no significant difference in T1 WI at all over the follow-up period (P=0.914). There was a statistical significant difference in contrast enhancement between local progression lesions and responsive lesions during the follow-up period (P=0.001).
The ADC value measured 24 hours after ablation in the responding groups (1.71 ± 0.3× 10^{-3} mm^2/s) was statistically significantly higher than in the non-responding groups (1.42 ± 0.3×$10^3$$mm^2$/s) (P=0.001).
A cut-off ADC value (1.42) has been suggested as a reference point to predict the response (66.69% sensitivity, 84.23% specificity, 66.8% PPV, and 84.3% NPV).
Conclusion: MRI with contrast is effective in the evaluation of local tumour control after thermal ablation of inoperable lung tumours. ADC value measurement may allow early prediction of the treatment efficacy before morphological changes in conventional imaging can be detected.
Limitations: Respiratory motion artefacts and difficulty in small lesion detection.

CT fluoroscopy-guided single-needle core biopsy of anterior mediastinal masses: retrospective analysis of accuracy and complications

G. Vatteroni[1], E. Lanza[2], D. Poretti[1], V. Pedicini[1], R. Lutman[2], C. Sicuso[2], L. Trieste[3], F. D'antuono[4]; *[1]Milan/IT, [2]Rozzano/IT, [3]Pisa/IT, [4]Rocchetta S. Antonio/IT (giulia.vatteroni@gmail.com)*

Purpose: To retrospectively evaluate the safety, diagnostic yield, and risk factors of the diagnostic failure of CT fluoroscopy-guided core-needle biopsy (CNB) of anterior mediastinal masses performed with a large calibre single-needle technique.
Methods and materials: We retrospectively evaluated 85 patients who underwent CT fluoroscopy-guided CNB of anterior mediastinal masses between June2017-June2019. All procedures were performed using an automated cutting needle (14 to 18G, 10 cm length), collecting at least one specimen considered adequate. The biopsy results were compared with the final diagnosis in order to evaluate the diagnostic accuracy. The procedures were divided into diagnostic success and diagnostic failure groups. Variables related to patients (age, sex, and presence of PET-CT or CE-CT/MRI prior to biopsy), lesions (size, presence of calcification, and fluid and/or fat), and procedures (patient position, approach type, size of needle, number of samples, operator's experience, procedure time, and complications) were assessed to determine the risk factors for diagnostic failure.
Results: Procedures were performed on 48 women and 37 men (mean age 47.7±19years). In 35 (41%) and 57 (67%) patients, PET-CT and/or CE-CT/MRI were available before performing the biopsy. The mean lesion size was 68±32.9 mm (range 9-159); 10 and 22 lesions demonstrated respectively calcification and fluid on CT images. On 85 procedures, 78 (92%) were diagnostic successes and 7 (8%) were diagnostic failures. The diagnosed masses included 42 lymphomas, 17 thymomas, 7 thymic carcinomas, 3 liposarcomas, and 10 others. The variables between the two groups were compared using Fisher's exact test. No significant risk factor for diagnostic failure was identified.
Conclusion: CT fluoroscopy-guided biopsy of anterior mediastinal masses performed with a large calibre (≤18G) single-needle technique is a safe and highly accurate procedure with a low complications rate (4%).
Limitations: A retrospective study.

The effect of an autologous blood clot seal to prevent and minimise the risk of pneumothorax in CT-guided lung and mediastinal biopsy: an initial experience

B. K. Choudhury; *Guwahati/IN (choudhury60@gmail.com)*

Purpose: To determine whether an autologous blood clot seal (ABCS) after lung and mediastinal biopsy can prevent and minimise the risk of pneumothorax.
Methods and materials: A prospective study enrolling 20 patients was conducted from August 2018-July 2019. Patients undergoing CT-guided biopsy of lung and mediastinal masses were candidates. A biopsy path of at least 2 cm aerated lung was selected so that an effective blood clot seal might be applied and any blebs, fissures, and blood vessels in the pathway were avoided. The biopsy was performed with CT guidance using a 20-gauge coaxial system. The patient's clotted blood, which ranged from 1 ml to 5 ml, was injected into the needle track while the guiding needle was withdrawn, filling the entire needle track to the visceral pleura. Immediately after withdrawing the needle, the puncture site was put in a dependent position.

Results: ABCS after a biopsy was performed in 20 deep-seated and risky lung and mediastinal masses ranging from 10 mm-25 mm in the age group of 35-68 years. Only one patient developed a very small pneumothorax, which was revealed only in post-procedure CT and was not seen in a chest skiagram taken one hour after the procedure.
Conclusion: The use of autologous blood clot seal after biopsy of deep lung and mediastinal lesions significantly prevents and minimizes the risk of pneumothorax. It appears to be more beneficial when a 20 gauge coaxial needle and immediate dependant positioning of the puncture site is used.
Limitations: An ongoing study with a limited number of patients within a one year period. Long-term study with more number of patients is needed.
Ethics committee approval: n/a
Funding: No funding was received for this work.

Retrievable covered metallic segmented Y airway stents modified with 3D printing for gastro-respiratory fistulas involving carina and bronchi distal to carina: a preliminary retrospective study

Q. Shan, W. Huang, Z. Wang*; Shanghai/CN (1010818490@qq.com)*

Purpose: To evaluate the efficacy and safety of retrievable covered metallic segmented Y airway stents modified with 3D printing for gastro-respiratory fistulas involving carina and bronchi distal to carina.
Methods and materials: We designed a new covered metallic segmented Y airway stent for fistulas involving carina and bronchi distal to carina. All stents were individually customised with the aid of 3D printing. 6 patients with gastro-respiratory fistulas after an oesophagectomy of oesophagal cancer underwent stent implantation. Stents were retrieved when the fistula was cured or stent-related complications occurred.
Results: 7 Y stents were successfully implanted and removed in 6 patients (100%). All stents expanded well and the fistulas were sealed completely. Excessive granulation tissue proliferation was found in 1 patient (16.7%), which was treated by cryotherapy under bronchoscope. The stent was removed and second stenting was performed afterwards. The median KPS of patients after stenting significantly improved compared with that prior to stent implantation. Sputum retention was the most common complication after stenting (83.33%). The indwelling time of the stent was 61.00±9.43 (50-70) days. After stent removal, the bronchoscopy showed a cure of the fistula in all patients and no stents showed fracture after the removal.
Conclusion: Retrievable covered metallic segmented Y airway stents modified with 3D printing appears to be effective and safe in the treatment of gastro-respiratory fistulas involving carina and bronchi distal to carina.
Limitations: The small sample size and retrospective nature. In addition, the assessment of long-term outcome and complication after stent removal is needed. Larger prospective controlled studies are warranted.
Ethics committee approval: This retrospective study was approved by the institutional review board and written informed consent was obtained.
Funding: No funding was received for this work.

The role of multi-detector computed tomography angiography for preprocedural planning and radiation dose reduction in bronchial artery embolisation

B. S. R. Reddy[1], P. Chatterjee[2], K. Sunder[3], R. Kumar[3], V. Mazumdar[3];
[1]Chennai, Tamil Nadu/IN, [2]Guwahati, Assam/IN, [3]Chennai/IN
(sudeepreddy2009@gmail.com)

Purpose: To evaluate prospectively bronchial and non-bronchial systemic arteries with MDCT angiography (MDCTA) prior to bronchial artery embolisation (BAE) in patients with haemoptysis and the amount of radiation dose reduction when BAE is performed with the knowledge of MDCTA.
Methods and materials: MDCTA was performed in 40 patients with haemoptysis who were referred for BAE. Transverse, multiplanar reconstruction, and 3-dimensional reconstruction images were analysed to identify the abnormal hypertrophied arteries causing haemoptysis. Their origin and course were noted. Digital subtraction angiography (DSA) was performed with the knowledge of findings of MDCTA. Selective arteriograms of abnormal arteries were performed. DSA findings were compared with MDCTA. Embolisation was done in all the patients using polyvinyl alcohol particles (300-500 µm), gel foam, or coils. The total cumulative dose for a single BAE intervention ranges from 0.2–2.7 Gy as a standard range and we compared this with our radiation dose parameters. Radiation dose parameters were recorded for all cases.
Results: MDCTA shows a 96.2% sensitivity and 100% specificity in identifying abnormal bronchial arteries, and a 64.7% sensitivity and 100% specificity in identifying abnormal non-bronchial systemic arteries. There was 40.2% reduction in cumulative DAP, 30.7% reduction in cumulative air kerma, and 77.1% reduction in contrast dose when BAE was performed with the knowledge of MDCTA.
Conclusion: MDCTA allows for the rapid and detailed identification of abnormal arteries using a variety of reformatted images. This information may be helpful for the interventional radiologist in order to avoid thoracic aortography and ro attempt direct catheterisation of the arteries to be occluded, resulting in reducing the examination time in the angiography suite and minimising contrast load and radiation dose.
Limitations: A small sample size. A multicentric study may be required for further evaluation.

Transvenous pulmonary chemoembolisation (TPCE) and intra-arterial chemoperfusion (IACP) in primary lung malignancies: a palliative treatment approach

T. J. Vogl[1], A. I. Mekkawy[2], M. El-Sharkaway[2], D. B. Thabet[2], N. N. N. Naguib[1], N.-E. A. Nour-Eldin[1], T. Gruber-Rouh[1], R. Hammerstingl[1], A. Hasan[2];
[1]Frankfurt am Main/DE, [2]Assiut/EG
(t.vogl@em.uni-frankfurt.de)

Purpose: To evaluate tumour response, local tumour control, and patient survival after the palliative treatment of primary lung cancer using transpulmonary chemoembolisation (TPCE) and intra-arterial chemoperfusion (IACP).
Methods and materials: 118 patients with unresectable primary lung cancer not responding to systemic chemotherapy underwent either repetitive TPCE (n=56) or IACP (n=62) from 01/2006-04/2017 (mean number of sessions/patient: 5.3±2.2, median number of nodules: 3, bilateral lung involvement 45.8%). The chemotherapeutic agents used were mitomycin C and gemcitabine (n=14), without cisplatin (n=98), or other combinations (n=6).
Regional delivery of the chemotherapeutic agents was performed either through selective catheterisation of the tumour-supplying pulmonary arteries with subsequent embolisation or through non-selective IACP. Tumour response was assessed according to the rRECIST criteria.
Results: Partial response was achieved in 15.3%, stable disease in 60.2%, and progressive disease in 24.6%. The estimated mean survival time (MST) and time-to-progression were 15.8±1.7 and 9.2 ±1.3 months in the TPCE group and 20±3.8 and 11.1±1.7 months in the IACP group, respectively. These differences were statistically insignificant.
Patients with advanced disease who underwent subsequent ablative therapy had a significantly longer mean survival time of 24.6±4 months versus the non-ablation group (MST=15.3±2.8; p=0-001).
Conclusion: TPCE and IACP have the potential to improve local tumour control and prolong survival in a selected group of patients who have limited treatment options.
Limitations: Patients were assigned to each treatment case-by-case. It might be better to do perfusion in less vascular tumours and embolisation in highly vascular ones.
The effects of critical prognostic factors were difficult to evaluate due to insufficient information in the database.
Ethics committee approval: Institutional Review Board approval was obtained. Written informed consent was not required due to the retrospective design.
Funding: No funding was received for this work.

Accelerating breast cancer screening using an abbreviated MRI protocol and artificial intelligence
X. Jing, M. Wielema, L. Cornelissen, S. Zheng, J. Guo, P. Sijens, M. Oudkerk, M. Dorrius, P. M. van Ooijen*; Groningen/NL (x.jing@umcg.nl)*

Purpose: Breast MRI is not considered a cost-effective tool for breast cancer screening. Abbreviated protocols combined with artificial intelligence (AI) could achieve high efficiency, rapid throughput, and lower costs. The aim of this study was to investigate the feasibility of automatically pinpointing abnormality using a convolutional neural network (CNN) in breast MRI screening with different shortened protocols.
Methods and materials: 96 breast MRI exams (61 normal, 35 abnormal) were collected and labelled by radiologists. For each exam, maximum intensity projection (MIP) images were generated from both Twist (time-resolved angiography with interleaved stochastic trajectories) and dynamic contrast-enhanced T1-weighted sequences (T1) at different time points after contrast agent administration. Three MIP images from 1) Twist, 2) Twist + T1, and 3) T1 were stacked together to generate a composite image, where the different combinations represent different MRI protocols. The composite images, assigned the same label as their original exams, were then used for the training of CNN (ResNet18). During testing, the result of an exam was determined by the majority of the predictions on all composite images generated from the exam under test. The performance of the proposed method was evaluated using 4-fold cross-validation, where each fold contains 15 normal and 8 abnormal exams.
Results: Twist alone achieved a sensitivity of 97%, specificity of 98%, positive predictive value (PPV) of 97%, and negative predictive value (NPV) of 98%. Twist+T1 achieved the same sensitivity and NPV, but lower specificity (93%) and PPV (89%). T1 alone gained the lowest performance on any metrics.
Conclusion: Use of an abbreviated protocol without T1 sequence, in combination with AI, could accelerate the breast MRI screening without affecting performance, leading to reduced costs.

Mammographic breast density classification and risk assessment using deep learning
M. Jie[1], M. Xu[1], X. Lin[1], S. Wu[1], Y. Zhang[2], Z. Cao[2], L. Huang[1], M. Wu[1], Y. Wang[1]*; [1]Shenzhen/CN, [2]Palo Alto/US (majie688@hotmail.com)*

Purpose: High consistency and accuracy of breast density assessment are necessary and routinely visually assessed by radiologists. Furthermore, breast density is a vital risk factor for breast cancer diagnosis. However, qualitative assessment of mammographic breast density is subjective and differs largely between radiologists.
Methods and materials: We designed two models of two-category, including scatted density and heterogeneously density, and four-category, including almost entirely fatty, scattered areas of fibroglandular tissue, heterogeneously dense, and extremely dense. The novelty of the presented method employed pyramidal residual units instead of down-sampling to a concatenate feature map by increasing it gradually. Data augmentation implemented by this investigation involved several real-time transforms source images during the training progress. Additionally, image preprocessing, extracting the region of interest of breast, and normalising images by using adjudgment of window-width and window-centre were adopted to keep the training-set from different vendors consistent and uniform. In this retrospective study, the developed method was trained and validated by utilising 40,364 and 9,000 mammograms from in-house hospital, respectively.
Results: The presented CNN-based breast density classification models were tested directly by using 1,821 images. The two-classification accuracy was 94.56% and the area under ROC curve (AUC) 96.8%, respectively. The other four-classification accuracy was 81.88% and AUC 94.40%, respectively.
Conclusion: Our experimental results demonstrated high classification accuracies between two hard to distinguish breast density categories. It is helpful for addressing inconsistency in density assessment of mammograms. Importantly, we anticipate that the proposed method will improve assessment of breast density and promote risk judgment of breast cancer. It assists radiologists to provide better notification to patients in breast cancer screening.
Limitations: The bias caused by race difference was not well considered.

Performance of radiologists versus a machine learning classifier for optoacoustic imaging of the breast
G. Menezes, S. Dykes, B. A. Clingman, A. T. Stavros*; San Antonio, TX/US (giselalgm@gmail.com)*

Purpose: Our imaging device fuses laser optical imaging with grey-scale ultrasound (OA/US) to differentiate between benign and malignant masses of the breast. The study compared the performance of radiologists to a machine learning (ML) classifier.
Methods and materials: We used a subset of 1,585 masses from the PIONEER trial (USA, December 2012-September 2015) to train the ML classifier. The training set consisted of image feature scores that were assigned by 7 independent breast radiologists (5 ultrasound and 5 OA/US features), in addition to mass size, mass depth, patient age, and the mammogram BI-RADS category. We then tested the classifier using all 213 masses from the MAESTRO OA/US trial (Netherlands, March 2015-February 2016). Sensitivity, specificity, and AUC were calculated for both the radiologists and classifier predictions.
Results: The classifier's sensitivity was 97.0% versus 95.5% obtained by the radiologists. The classifier also outperformed the radiologists in specificity (55.5% vs 41.1%). AUC was 86.9% for the classifier and 83.1% for the radiologists. Partial AUC (over the sensitivity range 95.0% to 100%) was 73.9% (classifier) versus 61.0% (radiologists). Because the classifier and the radiologists use the same feature scores, the only difference between the classifier and the radiologist results is how those feature scores are combined into a final likelihood of malignancy score.
Conclusion: The ML classifier exceeds the performance of radiologists on new/external data. This indicates that the classifier might help radiologists improve their final OA/US assessment. The correct assignment of OA/US features is essential for an optimal classifier performance.
Limitations: The main limitations of our study were sample size and inclusion criteria of the Maestro trial. Only 213 BI-RADS 4A and 4B masses were included.

RPS 605b-4 11:43

Detecting and delineating suspicious masses in contrast-enhanced mammography (CEM) using a deep learning workflow

M. Beuque, Y. van Wijk, H. C. Woodruff, Y. Widaatalla, M. B. I. Lobbes, P. Lambin*; Maastricht/NL (m.beuque@maastrichtuniversity.nl)*

Purpose: CEM has superior diagnostic accuracy compared to conventional mammography. Applying machine learning techniques would potentially increase the accuracy of CEM even more, but is hampered by the labour-intensive process of contouring lesions. Automated detection and ranking of lesions seen on CEM would shorten this process and facilitate automated classification as part of a machine learning workflow.
Methods and materials: Our dataset (n=828) included both craniocaudal (CC) and mediolateral oblique (MLO) views consisting of low-energy and recombined images. All images contained manual delineations of lesions made by expert radiologists. Pre-processing consisted of: (1) cropping the image around the breast, (2) merging of 2x low-energy and 1x recombined image as layers into an RGB image, and (3) rebinning from 16 to 8 bits using adaptive histogram equalisation. A retinaNet model was trained with ResNet50 as a backbone. We considered a mass to be 'detected' when the intersection over union (IoU) of the detected mass area and expert delineation was greater than 0.1.
Results: When looking at both views separately, our model correctly detected 87% of the masses in the test set with an average IoU of 0.7 for detected masses. On the training set, it detected 84% of masses with an average IoU of 0.7. When combining different views, 90 (97)% of the (cancerous) masses were detected on a patient level in the training set (88 (91)% in the test set).
Conclusion: Our automated detection and localisation tool was able to detect the vast majority of masses seen on CEM. The machine learning workflow can be accelerated significantly using this tool as this is normally a time consuming and labour intensive process.
Limitations: This workflow is not applicable for micro-calcification.

Can artificial intelligence reduce the interval cancer rate in mammography screening?

K. Lang[1], S. Hofvind[2], A. Rodriguez Ruiz[3], I. Andersson[1]; *[1]Malmö/SE, [2]Oslo/NO, [3]Nijmegen/NL (kristina.lang@med.lu.se)*

Purpose: To analyse the detection performance of interval cancers (ICs) on prior standard digital screening mammograms using an artificial intelligence (AI) system.
Methods and materials: 430 IC screening exams acquired with different mammography devices at four screening sites in Southern Sweden (2013–2017) were analysed with a deep learning-based AI system. The system assigns risk scores from 1 to 10 with an increasing risk of malignancy. Recall recommendations were also provided by the AI tool at approximately 4% and 1% recall rates (risk score ≥ 9.67, and ≥ 9.92, respectively). For the cases with recommended recall, two experienced breast radiologists classified the IC type in consensus (true-negative, minimal sign, or false-negative) and whether the AI system correctly localised the lesion.
Results: A large number of the ICs had an AI risk score of 10 (33%, 143/430), while 40% were assigned scores 1 to 7 (part of the 70% of the screening population with a lower likelihood of cancer by the AI). At a 4% recall rate, 17% of the ICs (73/430) were included, 74% of which were visible in retrospect (28 minimal sign, 26 false-negative), and all but 7 were correctly localised. At a 1% recall rate, 6% of the ICs (24/430) were included, 79% of which were visible in retrospect (12 minimal sign, 7 false-negative), and all were correctly localised.
Conclusion: The AI system was able to detect a substantial number of interval cancers on the prior screening exam. Applying an AI-derived recall rate recommendation for the most suspicious cases to, for example, a 3rd reader or a consensus discussion, might provide means to help the radiologist reduce the interval cancer rate.
Limitations: A single AI vendor. A retrospective review of IC cases
Ethics committee approval: Ethics committee approval and informed consent obtained.
Funding: No funding was received for this work.

Breast cancer detection by mammographic view with artificial intelligence in digital breast tomosynthesis

E. F. Conant[1], A. Y. Toledano[2], S. Periaswamy[3], S. Fotin[3], H. Haldankar[3], J. Go[3], J. Boatsman[4], J. Hoffmeister[3]; *[1]Philadelphia, PA/US, [2]Washington/US, [3]Nashua, NH/US, [4]San Antonio/US (emily.conant@pennmedicine.upenn.edu)*

Purpose: To evaluate the performance of artificial intelligence (AI) with digital breast tomosynthesis (DBT) by craniocaudal (CC) versus mediolateral oblique (MLO) mammographic views.
Methods and materials: A diagnostic accuracy study of an AI system was conducted with 260 retrospectively collected DBT exams, 65 biopsy-proven cancer, and 195 non-cancer, from sequential blocks of cases from seven U.S. sites, randomly selected to match a screening population. The maximum AI scores overall and across breasts within mammographic view (CC versus MLO) were compared to a previously validated threshold for cancer detection. 95% confidence intervals (CI) for the difference in correlated proportions for sensitivity and specificity were calculated using a McNemar test.
Results: The estimated sensitivity (95% CI) for CC and MLO were 0.74 (0.62, 0.83) and 0.77 (0.65, 0.85), respectively; a difference of -0.03 (-0.30, 0.24). The estimated specificity with CC images was 0.64 (0.57, 0.70), which is significantly higher than that of MLO images at 0.54 (0.47, 0.61), giving a difference of 0.10 (0.01, 0.19). Among the 65 cancer cases, 9 were detected by CC alone, 11 by MLO alone, and 39 by both. Among the 195 non-cancer cases, 45 were correctly ruled out by CC, 26 by MLO, and 79 by both. Overall, the AI system detected 91% (59/65) of cancers and ruled out 41% (79/195) non-cancer cases.
Conclusion: While the AI system was not trained to maximise performance within mammographic view, these results suggest that unbalanced conspicuity across mammographic views may have implications for AI performance with single-view exams.
Limitations: The performance of AI may not be indicative of radiologists in clinical practice.
Ethics committee approval: IRB approval and waiver of informed consent was obtained for HIPAA-compliant retrospective case collection.

Deep learning model used in mammographic breast density assessment

J. Tao, F. Yang, J. Liu*; Wuhan/CN (2014xh0917@hust.edu.cn)*

Purpose: To investigate if the clinical value of a deep learning (DL) model can be used to help radiologists improving the diagnostic efficiency of mammography.
Methods and materials: In this prospective study, 50 cases were randomly selected each week, 2,548 mammograms of 637 women, from November 2018 to February 2019. All evaluations were performed by four radiologists. The ResNet-18 model was used to evaluate breast density. 200 digital mammograms of 50 women were collected 4 weeks later. The density of each mammogram was evaluated by machine and four radiologists provide breast density classification based on the DL model results independently. The final gold standard was determined by majority decision and joint discussion.
Results: The consistency of the four images' overall assessment evaluated by the four radiologists in each patient (K=0.75) was higher than the assessment of unilateral breast images (0.718) and single image (0.696). The accuracy of the four images' overall assessment, unilateral breast images assessment, and single image assessment in patients were 0.856, 0.834, and 0.825. The consensual assessment of single image evaluated between DL model and four

radiologists（K=0.675）was higher than the overall assessment given by a single radiologist (0.675) and the assessment of unilateral breast images (0.599). The consistency of 200 breast densities in March evaluated by four radiologists who refer to AI results increased to 0.825.
Conclusion: Adding four experienced radiologists evaluating all cases independently is where we differ from previous studies. The evaluations of a DL model and four radiologists agree well with each other, the consistency of evaluations by four radiologists assisting with DL model increase.
Limitations: The limitation of our experiment is that we have fewer cases. We will add more cases and multiple centres in the future.

Comparing the mammography screening performance of three external AI CAD algorithms and radiologists within a true population-based screening cohort

M. Salim, E. Wåhlin, K. Dembrower, M. Eklund, K. Smith, F. Strand*; Stockholm/SE (mattiesalim@gmail.com)*

Purpose: To examine if there was any difference in cancer detection between various state-of-the-art AI CAD algorithms applied as independent readers of screening mammography and if they reached radiologist-level performance.
Methods and materials: This case-control study, nested within a population-based screening cohort during 2008 to 2015, consisted of the latest screening examination for 740 women diagnosed with breast cancer (positive) and a random sample of 8,066 healthy controls (negative). Positive ground truth was determined by pathology-verified diagnosis at screening or within 12 months thereafter. Negative ground truth was determined by 2-year cancer-free follow-up. There were 25 original first-reader radiologists, one for each examination. Three AI CAD algorithms, sourced from different vendors, yielded a continuous prediction score for the suspicion of cancer of each examination. For a binary decision, the cut-point was defined by the mean specificity of the original first-reader radiologists (96.56%). The processing of one of the three AI algorithms has not yet been completed and those results cannot currently be reported.
Results: The average age was 58.2 and 55.1 years for positive and negative cases, respectively. AUC was 0.96 (95%CI: 0.95 to 0.97) and 0.91 (95%CI: 0.90 to 0.92) for AI algorithm 1 and 2, respectively (p<0.001). At radiologists' specificity, the sensitivity was 82%, 66%, and 76% for AI algorithm 1, AI algorithm 2, and the original first-reader radiologists, respectively (p<0.001 for each pair-wise comparison).
Conclusion: One AI algorithm outperformed the other AI algorithm and the original first-reader radiologists. The time has come for prospective screening trials using carefully chosen AI CAD algorithms under controlled circumstances.
Limitations: n/a

Evaluating the feasibility of fully automated mammography image positioning assessments

M. Abdolell[1], N. Paquet[1], R. Duggan[1], N. Sharma[2], S. Hofvind[3], S. E. Iles[1]; *[1]Halifax/CA, [2]Leeds/UK, [3]Oslo/NO (Nisha.sharma2@nhs.net)*

Purpose: To evaluate the level of agreement between an automated mammography image positioning assessment tool and a panel of experts to determine if such a tool may be practically integrated in routine breast screen activities.
Methods and materials: 672 FFDM studies rejected due to positioning errors were independently reviewed by 5 Radiographers and 2 Radiologists. Reviewers evaluated studies for positioning errors including (1) portion cut off, (2) inadequate inframammary fold (IMF), (3) pectoralis muscle position, and (4) pectoralis muscle thickness. Inter-rater agreement was evaluated between the consensus of the 7 reviewers and the automated tool using weighted Fleiss' Kappa.
Results: Inter-rater agreement between the algorithm and the panel of experts ranged from good to excellent (kappa = 0.546-0.84).
Conclusion: An automated mammography image positioning error algorithm demonstrates good to excellent agreement with a consensus of experts and may be effective for continual quality assurance efforts in routine breast screening activities.
Limitations: A limitation in this analysis is that the expert reviewers were not given a training session or training dataset prior to performing their assessments for this study.
Ethics committee approval: n/a

RPS 605b-10 12:19

Differential diagnosis of benign and malignant breast lesions using ultrasound-derived texture analysis features and a machine learning approach

V. Romeo[1], R. Cuocolo[1], R. Apolito[2], A. Ventimiglia[3], A. Vitale[1], R. Buonocore[4], M. R. Argenzio[2], M. P. S. Maurea[1], M. Imbriaco[1]; *[1]Naples/IT, [2]Salerno/IT, [3]Castellamare di Stabia/IT, [4]Pontecagnano Faiano/IT (valeria.romeo@unina.it)*

Purpose: To assess the applicability of a machine learning (ML) approach using texture analysis (TA) features extracted from ultrasound (US) images acquired in two different institutions to differentiate benign from malignant breast lesions.
Methods and materials: Ultrasound examinations of 117 patients with 135 breast lesions (benign n=91, malignant n=44) from institution 1 and 55 patients with 57 breast lesions (benign=19, malignant n=38) from institution 2 were retrospectively selected. Fine needle aspiration and/or tru-cut biopsy or follow-up were used as a standard of reference. The breast lesions of institution 1 were used as a training set, while the breast lesions of institution 2 were used as a validation set. After grey-scale image normalisation and data discretisation using a bin width=3, breast lesions were manually segmented on 2D US images delineating regions of interest (ROIs). ROIs and images were imported in a dedicated software to extract first, second, and higher-order TA features. Features were then normalised according to the training set population. ML analysis was then conducted to obtain the highest accuracy, expressed as the percentage of correctly classified instances.
Results: A total of 697 features were extracted. Among these, 579 highly correlated (r>0.8) and 37 showing a variance <0.01 were excluded from the final dataset, with 81 features left. A data mining software was then run using the subset evaluator that identified 5 final features. Employing such features with a random forest algorithm, 1,000 iterations, and a 10-fold cross validation, an accuracy of 80.7% was obtained on both training and validation sets.
Conclusion: A ML approach using US-derived features may represents a promising tool to discriminate benign from malignant breast lesions.
Limitations: A retrospective study.
Ethics committee approval: IRB approved.
Funding: No funding was received for this work.

Machine learning ensembled a with deep learning model to classify density and detect lesions in mammography studies

M. Shoura[1], S. Halabi[2], W. Taha[3], O. Mahanna[3], J. Tonthat[3], E. Abdelfatah[3], I. Hasan[4], Y. Shalaby[5]; *[1]Newton, MA/US, [2]San Francisco/US, [3]Boston/US, [4]Kuwait/KW, [5]Cairo/EG (mohamed.shoura@paxerahealth.com)*

Purpose: We have developed an ensemble model of multiple machine learning and deep learning algorithms to detect lesions, detect density levels, and show the overall probability of malignancy in mammography studies.

Methods and materials: We used a pre-trained model that used a DenseNet-121 architecture to train a model against a labelled dataset that consists of 200K+ high-resolution mammography exams to detect lesions and show in an ROI or heatmap. We also used 500K+ labelled exams with structured reports to be used for building a density classification model. We balanced a dataset of 90K studies and used a GoogleNet architecture to train a model that classifies images into two levels (Low and High dense) with an AUC of 89%. Another patch classifier pre-trained model for detecting the probability in malignancy was run against a balanced dataset of 2.5K studies (10K images). This generated a structured dataset that represents predicted lesions locations and classifications per breast (MLO/CC). The dataset was enriched with some more tags like malignant probability, benign probability, number of malignant/benign lesions, age, density (High/Low), and exposure time. ML Models used: ridge classifier, decision tree, random forest, ExtraTree, voting classifier, and AdaBoost. The voting classifier model provided the best results with an AUC of 88%.
Results: The ensemble model was tested with experienced radiologists on a subset of 100 studies as phase one and it managed to classify malignancy and density with an accuracy rate of 87%.
Conclusion: The ensemble model improves the accuracy of the models by 6%. A built-in chatbot embedded in the PACS viewer helped radiologists to verify the results in a much easier way.
Limitations: The model will be tested with more datasets to increase the accuracy of the detection.

Lead shielding significantly reduces the dose to the breasts during head CT: a phantom study
N. Zalokar[1], N. Mekis[2]; *[1]Slovenska Bistrica/SI, [2]Ljubljana/SI*

Purpose: Since the breasts are considered one of the most radiosensitive organs in the human body, the aim of this study was to investigate whether the dose to the breasts during head CT is reduced with the use of lead shielding.
Methods and materials: The research was carried out on an anthropomorphic phantom of body and head PBU 60 in two major hospitals (hospital A and B) in Slovenia using axial and helical protocols. The breast implant size of 340 ml was attached to the phantom and served to simulate the breast. The dose to the breasts was measured 20 times during each protocol. Half of the measurements conducted during each protocol were performed with the use of lead shielding of 0.5 mm equivalent lead density. Measurements were carried out on the General Electric Healthcare Revolution EVO and the Toshiba Aquilion 64 slice CT unit; 40 measurements' data was collected. The absorbed dose was measured with the EDD30 dosimeter, which was positioned to the centre of the breast implant.
Results: A significant decrease of the absorbed dose to the breasts in both hospitals was shown. The use of lead shielding reduced the absorbed dose to the breast by 95% ($p<0.001$) in hospital A and 86% ($p<0.001$) in hospital B during the axial head CT examination. A significant dose reduction was also shown during the helical head CT examination; 96% ($p<0.001$) dose reduction in hospital A and 82% ($p<0.001$) in hospital B.
Conclusion: The use of lead shielding to the breasts is highly recommended during a head CT examination, regardless of the used protocol, due to the significant dose reduction.
Limitations: The study was only conducted on a phantom.

A comparison between two trauma CT protocols: can a multiphase contrast injection, single-pass acquisition be a viable technique in major trauma?
D. J. Biddle, S. Freeman, S. Upponi; *Cambridge/UK (david.biddle@nhs.net)*

Purpose: A comparison between two trauma CT protocols. Can a multiphase contrast injection, single-pass acquisition be a viable technique in major trauma?
Methods and materials: A retrospective analysis of 100 consecutive major trauma patients referred for CT from January-February 2019 was conducted. 50 patients were imaged with the established two-pass protocol (arterial thoracoabdominal and portal venous abdominopelvic phases) and 50 patients underwent the single-pass, multiphase injection protocol (mixed arterial and venous phase of chest, abdomen, and pelvis). Patients were imaged on a Siemens Definition AS+ 128 slice scanner. Both trauma protocols were bolus-triggered using a region-of-interest (ROI) placed over the descending thoracic aorta. Hounsfield unit measurements were obtained from the main pulmonary artery, thoracic aorta, and portal vein. Two consultant radiologists assessed the overall quality of the studies, rating the studies as diagnostic or non-diagnostic. Splenic enhancement was specifically assessed as a marker of solid organ enhancement. Radiation dose and injury severity score (ISS) data were evaluated for each cohort.
Results: The single-pass cohort had significant dose reduction compared to the two-pass method (DLP 903.84 vs 1856.42 mGycm: $p=0.0001$). Pulmonary artery enhancement was comparable ($p=0.3247$), whilst the aortic ($p=0.0026$) and portal vein ($p=0.0118$) attenuation was significantly higher in the single-pass cohort. Both cohorts had excellent diagnostic quality: 100%. There was no significance between splenic attenuation ($p=0.6845$) in both techniques. There was no significance relating to ISS ($p=0.1668$).
Conclusion: The single-pass, multiphase technique significantly reduces the radiation dose in trauma patients whilst maintaining excellent diagnostic accuracy.
Limitations: The study cohort was limited to 50 patient from each technique. A larger inclusion would provide more diversity of trauma referrals to evaluate the technique

The factors associated with radiation dose variation in cardiac CT angiography
M. F. M. McEntee[1], A. B. Alhailiy[2], E. U. Ekpo[2], P. Kench[2], E. Ryan[3], P. C. Brennan[2]; *[1]Cork/IE, [2]Sydney/AU, [3]Brisbane/AU (mark.mcentee@ucc.ie)*

Purpose: To examine the factors associated with dose variation during cardiac CT angiography (CCTA).
Methods and materials: A questionnaire was distributed to CT centres across Australia and Saudi Arabia. All participating centres collected data for adults who underwent a CCTA procedure. The questionnaire gathered information about the examination protocol, scanning parameters, patient parameters, volume CT dose index ($CTDI_{vol}$), and dose length product (DLP). A stepwise regression analysis was performed to assess the contribution of tube voltage (kV), padding time, cross-sectional area (CSA) of the chest, and weight to DLP.
Results: A total of 17 CT centres provided data for 423 CCTA examinations. The median $CTDI_{vol}$ and DLP were 18 mGy and 256 mGy.cm, respectively. There was a statistically significant difference in DLP between retrospective and prospective ECG gated modes ($p=0.001$). The median DLP from CCTA using a padding technique was 61% higher than CCTA without padding ($p=0.001$). The stepwise regression showed that kV is the most significant predictor of DLP followed by the padding technique then CSA. Correlation analysis showed a strong positive correlation between weight and CSA ($r=0.78$), and there was a moderate positive correlation between weight and DLP ($r=0.42$), as well as CSA and DLP ($r=0.48$).

Conclusion: Findings show radiation dose variations for CCTA. The factors associated with dose variation found in this study are scanning mode, kV, padding time technique, and CSA of the chest.
Limitations: Only Australia was included.
Ethics committee approval: Approved the human research ethics committee of the University of Sydney.

The accuracy of Hounsfield values with "artificial 120 kVp" reconstruction kernel on different tissues and kVp at multislice CT: a phantom study

M. Kusk, M. Vestergaard*; Esbjerg/DK (martin.weber.kusk@rsyd.dk)*

Purpose: Advances have made scanning at kVps other than 120 feasible; optionally with spectral filtering for dose reduction. This has prompted “artificial 120 kVp” kernels scoring to correct Hounsfield values acquired at other kVps, primarily for coronary calcium scoring. Our purpose is to assess the accuracy of this kernel compared to “true” 120 kVp scans over a wider range of kVps and tissue equivalents.
Methods and materials: Images were acquired on Siemens Somatom FORCE scanner. A Gammex-RMI 461 phantom with 5 different density inserts was scanned 5 times in 10 kV steps from 70-150 plus at 100 and 150 kV with a spectral filter. CTDI was kept constant. 3 mm slices were reconstructed at standard and “artificial 120 kVp” kernel. Measurements of Hounsfield value and standard deviation were performed. ANOVA was used to test for differences from 120 kV scans.
Results: For soft-tissue and fat equivalent tissues, "artificial 120 kVp" kernel did not significantly alter Hounsfield values for images acquired without spectral filtration, regardless of kVp. The difference from "true" 120 kVp varied by up to 30%. At 100 kVp with tin filter, Hounsfield values matched within 1%. 150 kVp images with tin filter differed by 35%. Bone/calcium equivalent tissue Hounsfield values matched "true" 120 kVp images to within 4%.
Conclusion: Hounsfield values of soft tissue and adipose tissue are not recovered by the "artificial 120 kVp" kernel and observers should be aware of these limitations when viewing images reconstructed with this kernel. Hounsfield values are accurate for calcifications.
Limitations: As a phantom study, results should be verified on real patients before results can be generalised.

40keV virtual mono-energetic image quality and optimisation of window settings in pancreas dynamic contrast enhancement

J. Xu, Y. Yang, R. Chang, Q. Han, X. Chen, H. Dong*; Shanghai/CN (919669640@qq.com)*

Purpose: To explore virtual monoenergetic (MonoE) image quality and determine the optimal window settings for Mone-E40 keV images in pancreatic multiphase enhanced scans based on spectral detector CT (SDCT).
Methods and materials: In this retrospective study, 30 patients suspected for pancreatic neuroendocrine tumour (PNET) underwent a pancreatic multiphase-enhanced CT scan on an SDCT. The polyenergetic (PolyE) and MonoE-40keV images of arterial phase portal venous phase were reconstructed respectively. CT values, noise values, background noise, signal-to-noise ratio (SNR_{pnet}), and contrast-noise ratio (CNR_{pent}) in the lesion area were recorded to reflects the image quality between all groups. The best individual window settings for $MonoE_{AP}$-40keV and $MonoE_{PVP}$-40keV were also recorded to assess the display of the pancreas and its lesion area. Through regression analysis, the optimal window settings were obtained from the resulting equations. Subjective image quality scores and lesion diameter were measured to determine the effects of different W/L settings.
Results: The CT value, SNR, and CNR of MonoE-40keV were significantly higher than those of PolyE images, both in the arterial phase and the portal venous phase. For MonoE-40keV images, the optimal window settings were 880/230 and 840/260. All adjusted W/L settings were significantly different and produced a higher subjective score than the standard window settings (350/60). There was no difference between the manual adjustment and the math calculated W/L settings ($p > 0.05$) and no significant differences in lesion diameter were found between all of the window settings ($p > 0.05$).
Conclusion: In pancreatic multiphase SDCT enhanced scan, the quality of virtual monoenergetic 40keV images is better than polyenergetic images. For MonoE-40keV, the appropriate window setting is required to achieve the best pancreatic lesion visualisation.
Limitations: The number of patients was relatively small.
Ethics committee approval: Written informed consent was obtained.
Funding: No funding was received for this work.

Establishing DRLs for the most common CT procedures based on patients' body mass indexes

N. Zalokar[1], M. Kukuljan[2], M. Karić[2], A. Diklić[2], N. Mekis[3]; *[1]Slovenska Bistrica/SI, [2]Rijeka/HR, [3]Ljubljana/SI*

Purpose: To establish DRLs based on patients' body mass indexes and compare them with DRLs established based on patients' weight.
Methods and materials: Data for 1,633 patients that were imaged on a single CT unit in a time span of 6 months were collated. Only adult patients were included in the study. Filtration of the data was made based on patients' weights which was selected according to the ICRP 135 publication; patients with 70±10 kg were included in the study. Another filtration of the data was made in the second part of the study based on the patients’ average BMIs; patients with BMI 27 ± 5 were included in the study. Examinations performed less than 20 times were excluded. The DRLs were established at the 75th percentile for the total DLP.
Results: The data of 621 patients was analysed after the filtration based on patients’ weights. After the filtration based on the average BMI, 1,152 patients remained for the analysis. DRLs were established for 7 examinations (abdomen, abdomen-pelvis, CT angiography, extremity, head, pulmonary angiography, and the thorax). Established DRLs based on patients’ BMIs were increased by 11%, 22%, 10%, 46%, 6%, 22%, and 11% for the abdomen, abdomen-pelvis, CT angiography, extremity, head, pulmonary angiography, and the thorax, respectively, compared to the DRLs based on patients’ weights. It has to be stated that the average patient weight from our collected data was 80.3 kg and the median was 80 kg.
Conclusion: Based on our results and the fact that the population is becoming heavier, we would recommend that DRLs should be established based on patients’ BMIs to get more accurate results.
Limitations: No CTDIvol data.
Ethics committee approval: n/a
Funding: No funding was received for this work.

The influence of a scan projection radiograph sequence and decentring on a total dose at thoracoabdominal CT: a phantom study

M. Kusk, M. B. Vestergaard*; Esbjerg/DK (martin.weber.kusk@rsyd.dk)*

Purpose: To examine the influence on the sequence of lateral and frontal scan projection radiographs (SPR), with and without patient de-centring, on dose-length-product using CAREDose4D tube current modulation at thoracoabdominal CT.
Methods and materials: Two scanners were examined: A) Definition FLASH and B) Definition AS (Siemens Healthcare AG). A full-body anthropomorphic phantom was marked for placement reproducibility and placed in the standard position. 5 identical thoracoabdominal scans were performed for each of the SPR combinations as follows: A-P, P-A, lateral, A-P plus lateral, lateral plus A-P, PA-plus lateral, and lateral plus P-A. All series were repeated three times: with an iso-centred phantom and 5 cm decentring anterior and posterior, respectively. DLP was noted for each scan. mAs vs Z-position was plotted.
Results: For both scanners, A-P or P-A SPRs alone resulted in higher doses than lateral alone. Scans with P-A or A-P SPR followed by lateral SPR resulted in 30% lower DLP than with A-P or P-A performed first. With decentring, the variation in the dose was less than 5% when lateral SPR performed alone or after A-P or P-A SPR. When P-A or A-P performed alone or after lateral SPR,

decentring resulted in differences of up to 50%. Relative variations were largest in denser regions, but lower in the thorax.
Conclusion: Incorrect sequencing of SPRs can seriously alter the patient radiation dose when using CAREDose4D, especially when the patient is not centred. Radiographers must be aware of this when designing protocols or prescribing additional SPRs.
Limitations: As this was only a phantom study and dose variations were not uniform across anatomy, the effective total dose variations are not necessarily linearly correlated with DLP. Other software versions may exhibit other behavior.
Ethics committee approval: n/a
Funding: No funding was received for this work.

Dose outliers in computed tomography
L. Kuopusjärvi, M. Hanni, A. Kotiaho*; Oulu/FI (lassi.kuopusjarvi@gmail.com)*

Purpose: Abnormal doses in CT examinations have been studied in the past, although often with complex methods. We developed a practical method to detect abnormal radiation doses in CT examinations via Radimetrics.
Methods and materials: 4 CT protocols were chosen for evaluation from 1/10/2017-22/08/2019: routine head (n=23985), abdomen in venous phase (n=4445), pulmonary embolism (n=2404), and thorax/abdomen/pelvis suspected malignancy scan (n=3668). Examinations were investigated with the following parameters: $CTDI_{VOL}$/SSDE vs WED, acquisition count vs scan length, and maximum DLP recorded per protocol. Dose outliers were visually inspected based on the graphs containing these parameters.
Results: Some dose outliers were excluded based on patient-based reasons such as hands inside the scan FOV, wrongly registered protocol name, or unusual imaging instructions given by the radiologist. We observed the following outliers per protocol: routine head (n=5), abdomen in venous phase (n=13), pulmonary embolism (n=26), and thorax/abdomen/pelvis scan (n=8). Out of 52 outliers, 33 included double scanning. Too long scan length or scanning outside of survey radiograph was present in 27 incidents. 8 incidents included contrast media extravasation and in 7 of those, a second scan was required. 17 examinations had to be repeated because of a failed timing of a contrast media bolus. Most commonly, this was because the patient held their hands down. This caused image quality degradations in the monitoring phase of i.v. contrast injection, yielding a scan start delay.
Conclusion: This project led to clarifications in CT-examination instructions, detailed presentations on the causes of dose outliers, and changes in CT imaging protocols. For example, the lateral survey radiographs were optimised in pulmonary embolism to make the pulmonary area more visible.
Limitations: This method is applicable to other CT protocols as well.
Ethics committee approval: The institutional review board approved the study (204/2019).
Funding: No funding was received for this work.

RPS 614-9 12:13
Acceptable quality dose (AQD) for common CT examinations: a UAE multicentre study
W. Elshami[1], M. M. Abuzaid[1], D. Z. Joseph[2], I. H. M. Elhag[3], M. A. Musallam[1]; *[1]Sharjah/AE, [2]Kano/NG, [3]Abu Dhabi/AE (welshami@sharjah.ac.ae)*

Purpose: Acceptable quality dose (AQD) is a bottom-top optimisation approach based on image quality, radiation dose, and a patient's weight. The standard dose value is used as an optimisation tool for producing a quality image in the diagnostic examination. The primary purpose of this study is to determine the AQD resulting from various protocols for adult patients undergoing CT examinations in 4 hospitals in the UAE.
Methods and materials: The data used in this study was collected from 4 CT scanners for adult patients undergoing brain, chest, abdomen, and chest-abdomen CT. 320 patients were included in the study. Patient information and exposure parameters were extracted. All images were assessed for image quality according to scoring criteria 1, 2, 3, and 4 corresponding to bad, not acceptable, acceptable, and higher than necessary quality, respectively. Only images with acceptable quality (score of 3) were selected and grouped into 8 weight groups. The median values for CTDIvol and DLP were determined as the AQD.
Results: The results were depicted in table form.
Conclusion: AQD is a bottom-top optimisation approach based on image quality, radiation dose, and a patient's weight. The integration of image quality scoring with dose might result in the detection of situations with higher-than-necessary image quality. Thus, awareness and orientation of radiologists in image quality are essential to optimise image quality and patient dose.
Limitations: The study focused on the common examinations only, thus, other examinations such as angiography and the spine were not included in the study.
Ethics committee approval: Approval Reference No: MOHP/REC-18/2018.

Optimisation of post-processing parameters for abdominal forensic CT scans
J. B. Nielsen[1], P. A. Nielsen[2], D. M. Bech[3], P. L. Hansen[4], S. Deppe Mørup[5], P. M. Leth[6], H. Precht[7]; *[1]Odense V/DK, [2]Odense C/DK, [3]Odense SØ/DK, [4]Odense/DK, [5]Kolding/DK, [6]Esbjerg/DK, [7]Middelfart/DK (juliebn@live.dk)*

Purpose: Forensic institutes have widely embraced the use of postmortem CT (PMCT) as a supplement or replacement of autopsy in postmortem examinations. However, imaging of the deceased provides an array of challenges not observed in the living: rigor mortis, damage by fire, severe decomposition, or dismemberment not only complicates the proper identification of anatomy but also affects the positioning and centring of the diseased. Consequently, there is a need for reconstruction methods aimed specifically for postmortem conditions to compensate for the variable states of the bodies. In this study, alternative reconstruction methods were tested.
Methods and materials: 4 reconstruction protocols, 3 newly constructed and 1 standard, were compared using a visual grading analysis with 4 observers. The study population was 20 retrospective PMCT scans with different degrees of decomposition. Interobserver agreement was assessed using Fleiss Kappa, with a 95% confidence interval.
Results: The stage of decomposition highly influenced the evaluation from the observer of the usefulness of the reconstruction. Excluding the severely decomposed bodies, 93.4-100% of the 20 PMCTs evaluated were found to be useful for diagnosis using the 4 reconstructions. One newly constructed protocol scored higher in VGAS compared to the standard protocol, with respect to usefulness and beam hardening, indicating a better diagnostic value.
Conclusion: There is a need for improved reconstruction parameters in PMCT, focusing on an increase of details otherwise lost to decay. Moreover, protocols must be targeted to the condition of the body, as highly decomposed, incinerated, and waterlogged bodies all differ structurally from the recently deceased as well as pose-practical problems in relation to positioning.
Limitations: Observers had limited experience in forensic imaging. A limited study population. The question for noise assessment was worded ambiguously.
Ethics committee approval: n/a
Funding: No funding was received for this work.

A model-based iterative reconstruction with a lung image filter versus filtered back projection and adaptive statistical reconstruction in chest CT: a comparative assessment of image quality
M. Tsuda[1], K. Ichikawa[2], S. Yata[1], A. Murakami[1], H. Yunaga[1]; *[1]Yonago-Shi Tottori-Ken/JP, [2]Kanazawa/JP*

Purpose: To assess the image quality of chest CT using a model-based iterative reconstruction (MBIR) with a lung-image filter.
Methods and materials: The image quality was assessed subjectively and objectively. In the subjective assessment of overall image quality, 25 clinical lung images were assessed by 3 radiologists and scored using a 5-point scale. The images were reconstructed using filtered back projection (FBP), adaptive statistical iterative reconstruction (ASiR-V), and MBIR with a lung-image filter. ASiR-V blending level was 50%. Modulation transfer function (MTF) and noise power spectrum (NPS) were measured in the objective image quality assessment. The MTF measurement phantom has 20, 100, 200, and 500 Hounsfield unit (HU) blocks. The blocks were set into a water phantom and 4 contrast MTFs were obtained using the phantom. NPS measurements were obtained using a water phantom. All measurements in the objective assessment

were made using the "CT measure" application (Japanese Society of Technology).
Results: The images obtained by MBIR with lung-image filter received the highest scores in the subjective assessment and showed improved spatial resolution under high-contrast conditions. NPS showed mostly good noise reduction at the MBIR with a lung-image filter.
Conclusion: Using MBIR with a lung-image filter significantly improved the image quality in chest CT.
Limitations: Objective assessments were not made using task-based methods.
Ethics committee approval: This study has been approved by Certified Review Board, Tottori University Hospital.
Funding: No funding was received for this work.

Ventricular mass index for non-invasive treatment control of balloon pulmonary angioplasty in chronic thromboembolic pulmonary hypertension
A. Brose[1], M. Richter[1], V. Bethke[1], A. Hasse[1], M. Richter[1], K. Tello[1], C. B. Wiedenroth[2], G. Krombach[1], F. Roller[1]; *[1]Giessen/DE, [2]Bad Nauheim/DE (alexander.brose@radiol.med.uni-giessen.de)*

Purpose: Within the last decade, balloon pulmonary angioplasty (BPA) has grown as a valuable therapy option for inoperable CTEPH, accompanied by invasive right heart catheterisation as the gold standard in therapy monitoring. The purpose of this study was to investigate the ventricular mass index as a non-invasive parameter to monitor BPA treatment success.
Methods and materials: 26 patients with CTEPH who underwent BPA received cardiac MRI and right heart catheterisation (RHC) prior to and 6 months after treatment. Ventricular mass index (VMI) was evaluated by two experienced radiologists and the mean pulmonary arterial pressure (mPAP) was derived from RHC. Paired testing of the pre- and post-interventional values was performed with a Wilcoxon signed-rank test. The Spearman-Rho correlation coefficient was used to correlate invasive and non-invasive parameters. Univariate linear regression analysis was performed to show the impact of mPAP on VMI.
Results: VMI and mPAP both showed a mean decrease by 20% 6 months after BPA (VMI -19.0% vs mPAP -23.4%). The VMI ratio (postBPA/preBPA) correlated significantly with the mPAP ratio (r=0,403*) and the ratio of brain natriuretic peptide (r=0,577**), whereas the ratio of right or left ventricular mass showed only mediocre correspondence. In addition, the total decrease in VMI also correlated significantly with the total change in mPAP (r=0,457*) and NT-proBNP (r=0,452*). Univariate linear regression analysis between VMI and mPAP showed significant interrelation (R=0,401; p=0,042 and R=0,474; p=0,014).
Conclusion: Cardiac MRI allows for non-invasive assessment of therapy outcomes in BPA treated CTEPH. Thereby, VMI is a better parameter than right or left ventricular mass only.
Limitations: The study comprises only a small number of patients.
Ethics committee approval: Institutional Review Board approval was obtained.
Funding: No funding was received for this work.

RPS 603b-2 11:31
Association of left and right ventricular strains with presence of pulmonary hypertension: a cine realtime feature-tracking study
V. Nizhnikava, G. Reiter, U. Reiter, C. Kräuter, C. Reiter, G. Kovacs, H. Olschewski, M. Fuchsjäger; *Graz/AT (volha.nizhnikava@gmail.com)*

Purpose: Pulmonary hypertension (PH) is associated with left (LV) and right ventricular (RV) myocardial alterations, which should be reflected in alterations of LV and RV strain parameters. The aim of the current study was to analyse if global myocardial strain parameters derived from cine realtime feature-tracking predict the presence of PH.
Methods and materials: 65 patients with known or suspected PH underwent right heart catheterisation and free-breathing cardiac MR cine realtime imaging at 3T (Skyra, Siemens Healthcare) within 1±3 days (mPAP=43.47±11.07mmHg in PH; mPAP=18.97±3.7mmHg in non-PH, n=34 and 31, respectively). LV and RV global radial (GRS), circumferential (GCS), and longitudinal (GLS) strains and strain rates (GRS_{rate}, GCS_{rate}, and GLS_{rate}, respectively) were evaluated by cvi42 (Circle Cardiovascular Imaging, Canada) using a two-dimensional approach. Group differences of resulting strain parameters and their association with PH were analysed employing t-test, correlation, and receiver operating characteristic curve analysis.
Results: Apart from RV diastolic GRS_{rate} and GCS_{rate}, all RV strains and strain rates, as well as LV diastolic GRS_{rate} and GCS_{rate}, differed significantly between PH and non-PH subjects and correlated significantly with mPAP.
The strongest correlation with mPAP (r=0.59) was found for RV-GLS (-21±4% vs. -15±4%, p<0.0001, in PH and non-PH, respectively). RV-GLS also demonstrated the highest area under the curve (AUC) for the prediction of PH (AUC=0.86, 95% confidence interval: 0.75-0.94). A cut-off RV-GLS>-17.6% resulted in a sensitivity of 79% (95% confidence interval: 62-91%) and a specificity of 86% (95% confidence interval: 67-96%) for the diagnosis of PH.
Conclusion: Despite the significant association of global LV and RV strains and strain rates derived from cine realtime feature-tracking with PH, the prediction of PH from global myocardial strain parameters is limited.
Limitations: A single-centre study.
Ethics committee approval: NCT01725763.

RPS 603b-3 11:37
Atrial measurements: can they predict adverse events in patients with acute pulmonary embolism (PE)?
R. R. Kirkbride[1], A. C. Monteiro[1], D. C. Dabreo[2], B. H. Heidinger[3], D. M. Tridente[1], C. Wiest[1], G. Aviram[4], B. J. Carroll[1], D. Litmanovich[1]; *[1]Boston, MA/US, [2]Kingston, ON/CA, [3]Vienna/AT, [4]Tel-Aviv/IL (rachaelkirkbride1@gmail.com)*

Purpose: To determine the association between atrial size and adverse events (AE) in patients with acute PE.
Methods and materials: Left (LA) and right atrial (RA) volume (Image 1), area (largest axial), and diameter (perpendicular to interatrial septum), along with ventricular diameters and pulmonary artery (PA) diameter, were retrospectively measured in 493 patients with acute PE. Interventricular septal bowing and reflux of contrast into the inferior vena cava was also assessed. Tricuspid annular plane systolic excursion (TAPSE) was measured as a representative echocardiography parameter and ECG evidence of right-heart strain documented. AE was defined as 30-day PE-related mortality or the need for advanced therapy i.e. thrombolysis, thrombectomy, or vasopressors. Mann-Whitney and Chi-squared tests were used to compare those with and without

AE. The area under the curve values and multivariate logistic regression were used for prediction analysis.
Results: There was 62/493 patients with AE. There was no significant sex (p=0.6) or age (p=0.2) difference between the groups. Decreased LA volume, area, and diameter, along with increased RA/LA volume, area, and diameter ratios, septal bowing, and contrast reflux were associated with AE. PA diameter was not associated.
LA volume was the best atrial predictor of AE (AUC=0.67) and was an equivocal predictor compared to the combination of RV/LV diameter ratio, TAPSE, and ECG (AUC=0.71)(P=0.07).
Conclusion: Decreased LA measurements along with septal bowing and contrast reflux are associated with acute PE-related adverse events. LA volume is of similar predictive value compared to a combination of ventricular diameter ratio, TAPSE, and ECG.
Limitations: A retrospective study with selection bias as only patients with acute PE and echo were included. Non-gated images were degraded by motion.
Ethics committee approval: IRB waived informed consent(#2015P000425).
Funding: No funding was received for this work.

RPS 603b-4 11:43
Unmasking the occult heart involvement in systemic sclerosis of recent onset: the role of strain imaging by using cardiac magnetic resonance
P. Palumbo, E. Cannizzaro, C. de Cataldo, F. Cobianchi Bellisari, P. Ruscitti, R. Giacomelli, P. Cipriani, E. Di Cesare, C. Masciocchi*; L'Aquila/IT (palumbopierpaolo89@gmail.com)*

Purpose: To assess the occult cardiac involvement in asymptomatic SSc participants of recent onset by strain imaging derived from cardiac magnetic resonance (CMR) for very early identification of myocardial involvement associated with a poor prognosis
Methods and materials: 16 consecutive SSc participants of recent onset were included. We considered SSc of recent onset, all those participants fulfilling the ACR/EULAR 2013 classification criteria, in less than 1 year from the onset of Raynaud's phenomenon. All the participants underwent pharmacological stress, rest perfusion, and late enhancement (LE) CMR. Strain evaluations of the left ventricle were performed on cine-images and the values were compared with 15 healthy controls (HCs). All 2-d radial, circumferential, and longitudinal strain values were analysed
Results: No SSc participant showed internal organs or skin involvement, "traditional" cardiovascular risk factors, episodes of chest pain, and all were naïve to any medication. Perfusions defects were detected in 5 SSc participants and LE in 1 participant. By analysing strain values, we observed a significant reduction of radial (SSc: 29.47% ±4.41 vs HCs: 40.43% ± 13.24, p= 0.006) and longitudinal (SSc: -15.36% ± 1.72 vs HCs: -17.94% ±1.84, p= 0.002) values in SSc. Conversely, the comparison of circumferential values did not result in statistical difference (SSc: -19.17% ± 2.52 vs HCs: -20.30% ± 3.32, p= 0.348).
Conclusion: The decreased radial and longitudinal strain values could unmask an early sub-endocardial involvement in asymptomatic SSc participants, which is independent from traditional cardiovascular risk factors and seems to be a specific hallmark of recent onset of the disease.
Limitations: A small sample size.
Ethics committee approval: The study was conducted in accordance with Helsinki declaration.
Funding: No funding was received for this work.

RPS 603b-6 11:49
Myocardial deformation in patients having Takayasu's arteritis with pulmonary artery involvement using cardiac magnetic resonance feature tracking
X. Guo, M. Liu, Z. Ma, T. Jiang, J. Gong*; Beijing/CN (xjguo1001@126.com)*

Purpose: To explore the feasibility of a CMR-derived feature tracking algorithm for assessing left ventricular myocardial deformation in patients having Takayasu's arteritis with pulmonary artery involvement (PTA), and to determine if these parameters are correlated to clinical assessments.
Methods and materials: Patients with PTA (n = 25) and healthy controls (n=17) were enrolled and underwent CMR examination. Feature tracking of CMR cine imaging was used to obtain left ventricular global, segmental longitudinal, circumferential, radial strain, and their respective strain rates. Clinical assessments were performed concurrently. ROC curve was performed to detect patients with PTA.
Results: PTA patients had significantly reduced global peak longitudinal strain (GLS) (-12.7± 3.9%,-14.9± 2.5%), a peak longitudinal diastolic strain rate (GLDSR) (0.65± 0.57%,0.94± 0.28%), and a peak radial diastolic strain rate (GRDSR) (-2.08±1.22,-2.85±0.87%). The basal peak circumferential strain (CS), peak radial diastolic strain rate (RDSR), mid-ventricular CS, peak circumferential diastolic strain rate, LDSR, and RDSR were also decreasing (P<0.05). GLS was correlated to ESRs (r=-0.48, P=0.02). GLS had the highest sensitivity (84%), specificity (53%), and accuracy (75%) for the identification of PTA patients.
Conclusion: The abnormal LV myocardial deformation of PTA patients with preserved LVEF can be detected early using feature tracking CMR. GLS is associated with ESR and had a high sensitivity for PTA patients.
Limitations: The patients included in our study were limited to PTA. Most patients in our study were enrolled later into the disease course. This likely influences the strength of associations between clinical and imaging assessments. There was an insufficient sample size and this may affect the strength of our results.
Ethics committee approval: The study protocol was approved by the Beijing Chao-Yang Hospital Ethics Committee (2017-K-127).
Funding: This study was supported by the National Natural Science Foundation of China (81871328).

Left ventricular function assessment in significant hypertension with primary aldosteronism: evaluation by cardiac magnetic resonance feature tracking
R. Shi, Z.-G. Yang, X.-M. Li, T. Pang*; Chengdu/CN*

Purpose: To evaluate left ventricular (LV) global myocardial strain in newly diagnosed primary aldosteronism (PA) patients compared with healthy controls.
Methods and materials: Form May 2018 to April 2019, 33 significant hypertension patients with newly diagnosed PA and 20 healthy controls were enrolled retrospectively. Cardiac magnetic resonance (CMR) was used to determine LV feature-tracking parameters. Global peak strain (PS), peak systolic strain rate (PSSR), and peak diastolic strain rate (PSDR) were measured and compared among patients and controls. Clinical variables, medication, and other cardiovascular risk factors were obtained through patient questionnaires or medical records.
Results: PA patients had a higher LV mass than normal controls (71.74 ± 16.87 vs. 94.44 ± 24, p=0.002). A decrease in global circumferential PSSR, longitudinal, and radial PSDR were found in PA patients compared to healthy individuals (all p<0.05). Systolic blood pressure and serum aldosterone concentration (SAC) was closely related to LV mass index and LV deformation (all p < 0.05).
Conclusion: Our findings may indicate that in PA patients, CMR-feature tracking could quantify LV deformation effectively. Further, systolic blood pressure and SAC may induce LV hypertrophy and functional impairment.
Limitations: Our study is single-centred and retrospective, based on a small sample size, which may cause bias. Patients with subclinical coronary heart disease and kidney disease may affect the outcome.
Ethics committee approval: This study was approved by the Institutional Review Board of West China Hospital, Sichuan University (Chengdu, Sichuan, China) with a waiver of informed consent due to the retrospective nature of this investigation.
Funding: No funding was received for this work.

People living with HIV have diverse and independent forms of cardiac involvement: insights from cardiac magnetic resonance imaging

C. Arendt, D. Leithner, T. Wolf, A. Haberl, C. Stephan, T. J. Vogl, E. Nagel, P. de Leuw, V. Puntmann*; Frankfurt am Main/DE (crt.arendt@gmail.com)*

Purpose: To screen for the prevalence and type of cardiovascular disease (CVD) in people living with HIV (PLHIV) using cardiovascular MRI in a contemporary cohort with highly active antiretroviral therapy.
Methods and materials: All participants underwent a standardised MRI protocol for cardiac function, myocardial perfusion (regadenosone), and scar by late gadolinium enhancement (LGE). Myocardial fibrosis and oedema using native T1/T2-mapping were also assessed. Blood sampling was performed prior to MRI.
Results: 141 participants were identified (n=32 in category C/AIDS). 16 patients had previously documented (n=23) myocardial diseases: myocarditis, n=1 coronary artery disease (CAD), n=8 myocardial infarction, n=3 congestive heart failure, n=3, and arrhythmia, n=8. The mean value for hs-cTnT, CRP and NT-proBNP was 9±18ng/l, 0.3±0.6mg/l and 104±229ng/l. The mean current CD4-count was 695±346/µl, significantly (p<0.001) improved from initial HIV-diagnosis (336±265/µl). 14 subjects had impaired LV-EF (<50%) and 35 presented borderline LV-EF (50-55%). Myocardial LGE was present in 28 patients: non-ischemic pattern, n=16, ischemic pattern, n=11, and both patterns, n=1. 2 patients had relevant inducible ischaemia, whereas a pattern of microvascular disease (MVD) was found in 23 patients. 72 subjects had diffuse fibrosis and 25 had active inflammation. Elevated native T1/T2 was significantly associated with low (<350/µl), current, and initial CD4-count (χ^2=5.317,p=0.021; χ^2=3.841,p=0.050), just as with category C/AIDS (χ^2=4.949,p=0.026). Native T2 showed a significant correlation with initial CD4-count (r=-0.252,p=0.008) and current NT-proBNP (r=0.190,p=0.030), but not with other laboratory values.
Conclusion: PLHIV have prevalent and diverse cardiac involvement, which is predominantly non-ischaemic inflammatory in origin. Relevant ischaemia due to epicardial CAD is a minor presentation compared to MVD. Our MRI findings emphasise the role for in-depth phenotyping of CVD due to chronic inflammation, bearing a potential for personalised treatment.
Limitations: Visual assessment of LGE and MVD.
Ethics committee approval: Ethics committee approval and written informed consent.

Selected clinical parameters and changes in cardiac magnetic resonance in patients with rheumatoid arthritis and ankylosing spondylitis without clinically apparent myocardial injury

W. Tanski, P. Gac, A. Chachaj, M. Sobieszczanska, R. Poreba, A. Szuba*; Wroclaw/PL (pawelgac@interia.pl)*

Purpose: The relationship between the occurrence of rheumatoid arthritis (RA) and ankylosing spondylitis (AS) and the cardiac magnetic resonance (CMR) changes in people without clinically overt heart disease.
Methods and materials: The study group consisted of 74 people (48.81±11.35 years): 29 patients with RA, 23 patients with AS, and 22 people from a control group. Blood samples were taken to assess laboratory parameters, disease activity was determined using activity scales, and CMR was performed.
Results: It was shown that the factors independently related to higher left ventricular mass index are AS occurrence, human B27 leukocyte antigen occurrence, higher neutrophil gelatinase-associated lipocalin concentration (NGAL), and higher body mass index (BMI). The lower right ventricular ejection fraction is a result of an independent effect of RA, AS, and higher NGAL. RA presence, methotrexate use, higher rheumatoid factor titer, higher NGAL, older age, and higher BMI should be considered independent risk factors for greater left ventricular myocardium hydration. RA occurrence, AS occurrence, type 2 diabetes occurrence, and a higher C-reactive protein concentration can be independently associated with a higher probability of non-ischaemic left ventricular myocardium injury. A larger volume of fluid in the pericardial sac is a result of an independent effect of higher NGAL, higher anti-cyclic citrullinated peptide antibodies titre, and higher DAS28 disease activity index. The use of steroids is a protective factor against larger volumes of pericardial fluid.
Conclusion: RA and AS in people without clinically apparent myocardial injury are associated with the occurrence of adverse changes in CMR. NGAL is the most useful clinical parameter for the purpose of predicting the risk of adverse changes in CMR in the studied group of patients with RA and AS.
Limitations: A small study group size. Only standard CMR sequences.
Ethics committee approval: Local Bioethics Committee.
Funding: No funding was received for this work.

The effects of cardiac geometry, microcirculation, and tissue characteristics on cardiac deformation in silent diabetic cardiomyopathy

J. Li, Z.-G. Yang, Y.-K. Guo, Y. Gao, X. Liu*; Chengdu/CN (jianglifs@163.com)*

Purpose: We evaluated the effects of LV geometry, myocardial microcirculation, and tissue characteristics on cardiac deformation in silent type 2 diabetes mellitus (T2DM) patients, utilising multiparametric cardiac magnetic resonance (CMR) imaging.
Methods and materials: A total of 55 clinically diagnosed T2DM patients and 29 healthy controls were evaluated. CMR-derived parameters including cardiac geometry, function, microvascular perfusion, T1 mapping, T2 mapping, and strain were analysed and compared between T2DM patients and controls.
Results: Compared with the controls, those with T2DM presented a higher remodelling index, decreased perfusion function, higher extracellular volume (ECV), higher T2 values, and decreased cardiac strain. Additional univariable and multivariable analysis revealed that a longer duration of diabetes was associated with a decreased longitudinal peak systolic strain rate (PSSR-L) (β = 0.195, p = 0.013), and remodelling index, and ECV tended to correlate with a longitudinal peak diastolic strain rate (PDSR-L) (remodelling index, β = −0.339, p = 0.000; ECV, β = −0.172, p = 0.026), while microvascular perfusion index and T2 value affected both PSSR-L (perfusion index, β = −0.328, p = 0.000; T2 value, β = 0.306, p = 0.000) and PDSR-L (perfusion index, β = 0.209, p = 0.004; T2 value, β = −0.275, p = 0.000) simultaneously.
Conclusion: T2DM patients demonstrated LV concentric remodelling, microvascular injury, myocardial fibrosis, myocardial oedema, and deformation dysfunction. In addition, the existing pathological changes have diverse effects on cardiac systolic and diastolic functions.
Limitations: A single-centre study. The studied variables are weakly correlated with LV deformation.
Ethics committee approval: The study was approved by the institutional ethics committee of our hospital (No. 2016-24).

Combined dedicated lung and cardiac screening with third generation dual-source CT: potential for dose reduction

M. Vonder, M. Dorrius, R. Vliegenthart, G. de Bock*; Groningen/NL (marleenvonder@gmail.com)*

Purpose: Currently, two different CT acquisitions are used for dedicated lung cancer screening and dedicated cardiovascular screening of an individual. These acquisitions originate from older CT systems. The aim of this phantom study was to determine the accuracy of low-dose ECG-triggered chest CT for the quantification of coronary artery calcium compared to a dedicated full dose ECG-triggered cardiac CT.
Methods and materials: A phantom insert with 9 calcifications was placed in a thorax phantom simulating a small to medium patient size. The phantom was repeatedly scanned in high-pitch spiral mode with low-dose ECG-triggered chest protocol (chest equivalent quality reference of 20 mAs) and compared to default full dose ECG-triggered cardiac protocol (cardiac quality reference of 64 mAs) as reference. Mann-Whitney U testing was used to compare Agatston scores and noise levels, and a total radiation dose was logged. Potential dose reduction was calculated as the percentage of complete lung and cardiac examination.
Results: The combined acquisition protocol resulted in a similar median Agatston score (p=0.31) of 685 (IQR:669-699) and a similar noise level (p=0.095) of 22.0 HU (IQR:20.5-24.5) as the dedicated cardiac reference

protocol (median Agatston: 667 [IQR:654-692], noise: 20.0 HU [IQR:19.5-21.0]). The $CTDI_{vol}$ of only the cardiac region of the ECG-triggered chest protocol was 0.61 mGy (0.20 mSv) vs 0.86 mGy (0.28 mSv) for the reference protocol. If a dedicated cardiac acquisition can be eliminated, the potential dose reduction was 20% for small-medium patient size for complete lung and cardiac evaluation in one acquisition.
Conclusion: With the new protocol, the total radiation dose for combined lung and cardiac screening in one CT acquisition can potentially be reduced by 20% without compromising on CAC quantification and image quality.
Limitations: n/a

Validation of a dose tracking software for skin dose map calculation using on-phantom measurements with radiochromic films

P. E. Colombo[1], F. Rottoli[1], M. M. J. Felisi[1], C. de Mattia[1], S. Riga[1], M. Sutto[1], C. Dillion[2], S. Massey[2], A. Torresin[1]; [1]*Milan/IT,* [2]*Scottsdale, AZ/US*
(paolae.colombo@ospedaleniguarda.it)

Purpose: To validate the algorithm within the radiation dose index monitoring software NEXO[DOSE]® (Bracco Injeneering SA, Lausanne). It provides the skin dose distribution in interventional radiology procedures.
Methods and materials: To determine the skin dose distribution in interventional radiology procedures, the software uses exposure parameters taken from the radiation dose structured report and additional information specific to each angiographic system. To test the algorithm accuracy, GafChromic® XR-RV3 films, wrapped on a cylindrical PMMA phantom, were irradiated with different setups and two different angiographic systems. The film measurements were compared in terms of absolute dose and geometric accuracy, with the ones that the software calculated on the same cylindrical model.
Results: The cumulative dose values estimated by the software are in correlation with the GafChromic® measurements (differences lower than 15%) within the regions of the higher dose, whereas we are more interested in assessing patient exposure. Concerning the geometric accuracy, the differences between the dose spatial distribution simulated and the measured ones are less than 3 mm (4%) in simple tests and 5 mm (5%) in setups closer to clinical practice. Moreover, similar results are obtained for the two different angiographic system vendors.
Conclusion: In the tests performed, NEXO[DOSE]® provides an accurate estimate of skin dose similar to or better than those obtained by other software packages. The validation on cylindrical geometry phantom proved that the calculation can be extended to anthropomorphic geometry and can be used to simulate the patient skin dose.
Limitations: The dose value discrepancies increase up to 33% in regions with lower doses because the software does not consider the out-of-field scatter contribution of the neighbouring fields.

Large biodegradable microspheres: evaluation using dynamic renal CT-perfusion in an experimental pig model

C. L. Schlett[1], T. Reichenbacher[2], D. F.-J. Vollherbst[2], T. Gockner[2], T. D. D. Do[2], S. Macher-Göppinger[3], P. L. L. Pereira[4], H.-U. Kauczor[2], C. Sommer[2]; [1]*Freiburg/DE,* [2]*Heidelberg/DE,* [3]*Mainz/DE,* [4]*Heilbronn/DE*
(christopher.schlett@post.harvard.edu)

Purpose: To compare relatively large new biodegradable and established non-biodegradable microspheres for the embolisation of the right kidney in a swine embolisation model using renal perfusion by dynamic CT imaging.
Methods and materials: Transarterial embolisation of the kidneys was performed from a central position within 9 swine using three different microspheres: L1 and L2 as a prototype (PharmaCept, Germany) of biodegradable starch microspheres (in-vitro biodegradation time/size-d_{50}/size-d_{100}: <52-72h/539µm/1240µm for L1 and <54h/569µm/1495µm for L2) and EmboSphere700-900 as commercially non-biodegradable microspheres. Dynamic contrast-enhanced CT was performed pre-interventional, after 1h, and 7d post-interventional; blood flow (BF) was derived from CT using Syngo volume-perfusion-CT-body. BF was measured across the entire kidney at the hilus (covering 10 mm z-axis) as well as stratified into 4 anatomic regions (dorsolateral, dorsomedial, ventrolateral, and ventromedial segments).
Results: CT derived a physiological renal BF of 181.03±31.4mL/100mL/min pre-interventional. Overall, post-interventional BF was reduced to 40.0% at 1h and recovered after 7d to 69.2% of the pre-interventional value. The observed relative BF decrease at 1h was lower for non-biodegradable than for biodegradable microspheres (-49.2±18.6% vs -64.0±18.0%, respectively) without reaching statistical significance (p=0.10). If analysed per anatomic section, there was a significantly larger BF decrease in the dorsal segments (β=0.28, p<0.0001) and in the lateral segments (β=0.14, p=0.008), independent of the used microspheres.
Conclusion: Renal perfusion after embolisation with relatively large microspheres varied significantly across anatomic locations, potentially due to flow and gravitational effects. Observed differences between biodegradable versus non-biodegradable microspheres did not reveal statistical significance.
Limitations: Limited power due to sample size.
Ethics committee approval: The study was approved by the Regional Council of Karlsruhe (35-9185.81/G-17/15) and followed the directive of the German Animal Protection Law.
Funding: The study was supported technically and financially by PharmaCept GmbH, Berlin, Germany without any publication restrictions.

MR-guided high-power microwave ablation in hepatic tumours: initial experience in clinical routine

R. Hoffmann, M. T. Winkelmann, S. Clasen, J. Weiß, G. Gohla, K. Nikolaou; *Tübingen/DE (ruediger.hoffmann@med.uni-tuebingen.de)*

Purpose: Evaluation of the technical success and patient safety of high-power MR-guided microwave ablation using a wide-bore 1.5T MR system.
Methods and materials: 13 Patients (61.0 years ± 6.8 [standard deviation]) with 17 hepatic malignancies (6 hepatocellular carcinomas, 11 hepatic metastases) underwent MR-guided tumour ablation with a high-power, water-cooled microwave ablation system from 08/2018-09/2019. The mean tumour size was 13.7 mm ± 5.9 (range: 6-25 mm). Planning, applicator placement, therapy monitoring, and control imaging were carried out using a 1.5T MR system. Technical success and ablation zone diameters were assessed by contrast-enhanced post-ablative control MR imaging. The mean follow-up was 3.6 months ± 4.4 (range: 0-14 months).
Results: Technical success was achieved in all lesions. Lesions were treated using 1.5 ± 0.5 applicator positions with an ablation power of 100W. The mean energy applied was 70,6kJ ± 31,4kJ per tumour (range: 18-120 kJ). The mean total duration of energy application was 11.7 min ± 5.2 (range: 3-20 min) per tumour. Ablation zone short-axis and long-axis diameters were 29.0 mm ± 6.9 (range: 19-41 mm) and 39.6 mm ± 7.8 (range: 28-58 mm), respectively. 3 patients developed new tumour manifestations in the untreated liver during initial follow-up. No complications were observed.

Conclusion: MR-guided high-power microwave ablation provides safe and effective treatment of hepatic malignancies with short ablation durations.
Limitations: The small study population and short follow-up due to the relatively short availability of the MR-conditional microwave ablation system.
Ethics committee approval: Institutional review board approval and patient informed consent were obtained for this prospective study.
Funding: No funding was received for this work.

The joint application of T1 and T2 mapping magnetic resonance imaging (MRI) for the characterisation of the tumour microenvironment in an untreated rabbit hepatic cancer model
S. Keller, T. Borde, M. Shahryari, A. Kader, J. Brangsch, C. Reimann, M. R. Makowski*; Berlin/DE (sarah.keller@charite.de)*

Purpose: To characterise the tumour microenvironment of liver VX2 rabbit tumours using T2 and T1 mapping MRI.
Methods and materials: N=9 female New Zealand white rabbits with left-hepatic VX2 tumours received MRI scans at 14, 21, and 28 days following tumour implantation. MRI was performed on a 3T system (mMR Biograph, Siemens) using a head-neck coil. An axial T2map FLASH (TR/TE 207.4/1.32ms, slice thickness 3 mm), contrast-enhanced imaging (TR/TE 167/5.23ms, slice thickness 0.7 mm), and an axial pre-/post-contrast modified look-locker inversion recovery (MOLLI) (TR/TE 1155/2.45ms, slice thickness 3 mm) were performed. Gd-EOB-DTPA (Primovist, Bayer) at 0.025mmol/kg/KG was injected intravenously through an ear vein IV placement. Images were analysed using Horos (v4.0.0.0RC1). Tumours were segmented into a central, marginal, peripheral, and liver region. Histopathology was obtained in all tumours. For statistical analysis, a two-way ANOVA was applied using SPSS (v.25, IBM, Armonk, NY).
Results: The intrahepatic tumour was established successfully in all rabbits. Within 4 weeks, the tumour size increased from average (SD) 8.3 (1.2) to 14.3 (2.9) mm. Between 14 days and 21 days, T2 relaxation times were significantly decreased in the tumour centre (mean difference 18.6 ms; p=0.025). T2 relaxation times did not change between the tumour regions. Pre- and post-contrast T1 times significantly delineated the three tumour regions and liver parenchyma on days 21 and 28 ($p<0.05$). T1 times were not changed between the three groups.
Conclusion: T1 mapping delivers best results in discriminating tumour regions during longitudinal observations of untreated VX2 liver rabbit tumours, making it a promising technique for future experimental treatment studies.
Limitations: A small sample size using female New Zealand white rabbits.

RPS 609b-5 11:39
Fabrication of adriamycin/Fe_3O_4 gelatin microspheres via a high-voltage electrospraying method for embolisation
J. Li, J. Ji, C. Lu, N. Zhang*; Lishui/CN (a15990007235@126.com)*

Purpose: Usually, adriamycin microspheres (ADM-MS) used in TACE are prepared by an emulsion-crosslinking method. However, the size of ADM-MS can’t be controlled conveniently. Here, we utilise electrospraying to fabricate uniform adriamycin/Fe_3O_4 magnetic gelatin microspheres for embolisation.
Methods and materials: ADM/Fe_3O_4-MS were obtained from a mixture of adriamycin and Fe_3O_4 nanoparticles in gelatin aqueous solution via high-voltage electrospraying method. In electrospraying, the liquid flowing out of a nozzle, which is maintained at high electric potential, is forced by the electric field to be dispersed into fine microspheres. The content of adriamycin and the release curve of the microsphere drug in vitro were measured. Furthermore, the microwave applied elevates to the microspheres temperature. The inhibition of VX2 cells under ADM/Fe_3O_4-MS with MTT assay was observed.
Results: ADM/Fe_3O_4-MS with a diameter range from 200-800μm can be obtained by adjusting the parameters of electrospraying, such as flow rate, voltage, and needle diameter. Meanwhile, ADM/Fe_3O_4-MS posses the sustained release of adriamycin capability. The percent of drug release from ADM/Fe_3O_4-MS after 26 days was about 76.2%. Both microwave heating and adriamycin can inhibit or kill the VX2 cells directly.
Conclusion: A targeted, microwave-sensitive and magnetic ADM/Fe_3O_4-MS is developed by a high-voltage electrospraying method. In electrospraying, the diameter ADM/Fe_3O_4-MS can be controlled to some extent via the parameter of electrospraying, such as voltage, flow rate, and needle diameter. The in vitro studies demonstrate that ADM/Fe_3O_4-MS have an extended sustained-release phase and anti-tumour effect. Furthermore, microwave activates the efficiency of chemotherapy based on increasing the thermal-agent effect of Fe_3O_4 nanoparticles in the tumour.
Limitations: ADM/Fe_3O_4-MS can be applied in the magnetic resonance imaging and achieve a visualised therapy which needs to be further described by data.

Identification of the effects on PD-1 and Tim-3 expressions and the function of T lymphocytes in tumour-bearing mice by RFA
M. Xu, T. Y. Huang, X. Y. Xie*; Guangzhou, Guangdong/CN (xu2004m@sina.com)*

Purpose: To investigate the dynamic changes of immune function in patients with colorectal metastatic liver cancer after RFA.
Methods and materials: BALB/C mice bearing dual colorectal cancer were randomly divided into an ablation group and control group. The tumour on the right side was ablated and the growth of the contralateral tumour was observed by means of vernier caliper, ultrasonography, and pathological examination. T lymphocytes of blood, spleen, and TILs were harvested, and immune checkpoints (PD-1, Tim-3) at different times after ablation, as well as T cell function of secreting cytokines, were measured by flow cytometry, immunofluorescence, and immunohistochemistry.
Results: At the early stage after RFA treatment, a slight stagnation of the contralateral tumour was observed in the contralateral tumour, and the tumour volume was observed to be the smallest on the 3rd day before rapid growth resumed. The percentage of total TILs, CD8+, and CD4+ TILs in contralateral tumours was higher than that in the control group at 3, 9, and 12 days after ablation. PD-1 and Tim-3 were highly expressed on TILs and there was no significant difference in the expression level of PD-1 and Tim-3 in control groups at different times. The levels of PD-1+CD8+TILs, Tim-3+CD8+TILs, and PD-1+Tim-3+CD8+TILs in the ablated group decreased to a minimum of about 50% compared to the control group on the 3rd day, and then began to rise, being close to or exceeding the control group on the 12th day.
Conclusion: RFA can enhance the anti-tumour immunity of organism in the early 3 days, with inhibited tumour growth, increased percentage of TILs, and a remarkable decrease of PD-1 and Tim-3 expression on CD8+TILs.

Low-dose CBCT based on optimised source-detector trajectories for C-arm
S. Hatamikia[1], A. Biguri[2], G. Kronreif[1], J. Kettenbach[1], T. Russ[3], W. Birkfellner[1]; *[1]Vienna/AT, [2]Southampton/UK, [3]Heidelberg/DE (sepidehhatamikia@yahoo.com)*

Purpose: We propose a target-based cone-beam computed tomography (CBCT) imaging framework in order to optimise the x-ray source-detector trajectory by incorporating prior information available in interventional images. The main aim was to design a CBCT with a minimum dose to the patient.
Methods and materials: A patient-specific model from a preoperative CT was used as a digital phantom for trajectory simulations. We introduced a trajectory optimisation scheme that tries to minimise the radiation dose by means of reducing projections while keeping a reasonable imaging quality at the region of interest of the reconstructed image. We used a structural similarity index (SSIM) as the objective function for the evaluation of the reconstructed image based on simulations. A Philips Allura FD20 Xper C-arm was used for the experiments.

We used an adaptive steepest descent projection onto convex sets (ASD-POCS) algorithm for the reconstruction. The performance of our framework was investigated with an Alderson-Rando head phantom. The dose was evaluated by the computed tomography dose index (CTDI).
Results: Our experiments based on the head phantom showed that our optimised trajectory could achieve a comparable image quality with respect to the reference C-arm CBCT while using one-quarter of projections. We used a feature similarity index (FSIM) in order to quantify the reconstruction results. The relative deviation of FSIM was achieved by 7.54% between the reconstructed image and the reference CBCT. Our results showed the CTDI per mAs delivered by the optimised trajectory was six times lower than by the standard trajectory.
Conclusion: We demonstrate that a minimal dedicated set of projections with optimised orientations is sufficient to localise targets and has a potential for low-dose CBCT interventions.

Phase-contrast imaging based on the microbubble monitoring of radiofrequency ablation: an ex vivo study
P. Haopeng, H. Wei, L. Jian, T. Rongbiao, W. Zhiyuan, D. Xiaoyi, W. Qingbing, W. Zhongmin, C. Kemin*; Shanghai/CN*
(panghaopeng@126.com)

Purpose: To explore the potential of synchrotron radiation phase-contrast imaging for real-time microbubble formation monitoring during radiofrequency ablation.
Methods and materials: Radiofrequency ablation was performed on ex vivo porcine muscle tissue using unipolar and multi-tined expandable electrodes. Images of microbubble formation in the samples were captured by both synchrotron radiation phase-contrast imaging and absorption-contrast imaging. The synchronous ablation temperature was recorded. Ablation size was assessed by histologic examination.
Results: Microbubble formation during radiofrequency ablation could be visualised by synchrotron radiation phase-contrast imaging. The diameter of the microbubbles revealed on the image ranged from tens of microns to several millimetres, and these microbubbles first appeared at the edge of the RFA electrode when the target region temperature reached approximately 60℃ and rapidly extended outwards. The range of microbubbles corresponded to the ablation zone.
Conclusion: Phase-contrast imaging enabled real-time high-resolution visualisation of microbubble formation during radiofrequency ablation, indicating a potential for its use in ablation monitoring.
Limitations: An ex vivo study might not reflect actual microbubble transformation in vivo and the influence of microvessel perfusion and the heat sink phenomenon should be considered. The RFA zone of multi-tined expandable electrodes was larger than the field of the CCD and its range could not be measured by PCI. Although in our study, the range of microbubbles after RFA using unipolar electrodes was close to that measured on histological cross-sections, which contained complete and partial coagulation necrotic areas. The transition between complete coagulation necrosis and partial coagulation necrosis was gradual, and the boundary was indistinct.
Ethics committee approval: n/a

A preclinical endogenous rat HCC model system for the prospective evaluation of imaging-derived biomarkers in interventional tumour therapy
F. Lohöfer[1], G. Kaissis[1], E. Bliemsrieder[1], P. Bohrer[1], J. Werner[1], R. Buchholz[2], E. J. Rummeny[1], R. Braren[1], P. M. Paprottka[1]*; [1]Munich/DE, [2]Münster/DE*
(fabian.lohoefer@tum.de)

Purpose: To establish a preclinical model system for catheter-based interventions in hepatocellular carcinoma (HCC).
Methods and materials: HCC was induced in rats by oral administration of diethylnitrosamine (DEN) over 10 weeks. Tumour growth was monitored by weekly T2-weighted MRI. When tumours reached a size over 10 mm, MRI with DCE-imaging and T1-mapping were performed using a liver-specific contrast agent. Digital subtraction angiography (DSA) was then performed through a left common carotid artery approach. A 1.2 French catheter was navigated to the common hepatic artery. DSA was performed with a standardised flow rate. After DSA-imaging, Cis-Platin was injected selectively over the angiographic microcatheter. After 10 minutes, the animals were euthanised and the tumours were excised. Deposition of platinum and gadolinium was assessed by laser ablation inductively coupled plasma mass spectrometry (LA-ICP MS) on tissue slices.
Results: Contrast dynamic parameters (time to peak and influx/efflux slopes) correlated well between DSA and DCE imaging in HCCs. T1-mapping showed no significant uptake of liver-specific contrast agent in HCC. LA-ICP MS allowed for spatially resolved ex vivo quantification of gadolinium and platinum in the hepatic and tumour tissues. High arterial vascularisation in in vivo imaging correlated strongly with increased platinum concentrations.
Conclusion: The development of a transarterial chemoembolisation model in HCC-bearing DEN rats allows for sensitive quantification of tumour perfusion and chemotherapeutic agent uptake, validated with a spatially resolved, high-accuracy mass spectroscopy method.
Limitations: This is a preclinical proof of concept study with a limited number of animals.
Ethics committee approval: ROB-55.2Vet-2532.Vet_02-16-25.
Funding: No funding was received for this work.

Monodisperse microspheres based on PMMA (polymethyl methacrylate) hydrogels: a novel embolisation agent tested in a rabbit renal model
F. N. Fleckenstein, F. Streitparth, B. Gebauer, D. Geisel, D. C. Schmidt, R. W. W. Günther, W. M. Lüdemann*; Berlin/DE*
(willie-magnus.luedemann@charite.de)

Purpose: The effectivity of in vivo visibility and biocompatibility of novel, loadable, and potentially bioresorbable monodisperse microspheres for embolotherapy based on PMMA hydrogels was evaluated in a rabbit renal model.
Methods and materials: The microparticles were provided as anionic particles (300 µm) with a loading capacity for cationic substrates of up to 40% mass fraction and were tagged with 1% magnetite by the manufacturer. Particle embolisation of an interlobar artery via a 2.4F microcatheter was carried out in 24 rabbits. Contrast-enhanced (CE) magnet resonance imaging (MRI) was performed afterwards to demonstrate magnetite deposition and renal perfusion defects. The rabbits were sacrificed after follow-up angiography and MRIs taken in cohorts of 8 animals each after 7, 28, or 56 days. Changes to the parenchyma as well as signs of particle degradation and vessel recanalisation were evaluated histologically and angiographically.
Results: The embolisations were technically successful. Three animals had to be sacrificed prematurely due to complications not related to the renal embolisation. The wedge-shaped perfusion defects on angiography corresponded in shape and size with infarcts and magnetite depositions observed in CE T1w and native T2w MRI sequences, respectively. No relevant particle degradation or vessel recanalisation was observed. There was little heterophilic cellular infiltrate and vascular inflammation consistent with high biocompatibility.

Conclusion: The newly developed microparticles are easy to handle and effective embolisation agents with good biocompatibility. Recent advances in the reduction of chemical cross-linking to just a tenth encourages further in vivo testing of degradability.
Limitations: Renal arteries are end arteries; complete infarction is inevitable distal to the embolisation. This might negatively impact recanalisation and particle resorption.
Ethics committee approval: All experiments had institutional animal care and use committee approval.
Funding: German Federation of Industrial Research Associations (AIF).

Funnel-shaped catheter model decreases clot migration during mechanical thrombectomy
Y. Tanyildizi, E. Payne, T. Gerber, L. Seidmann, A. Heimann, O. Kempski, N. Keric, M. A. Brockmann, S. Kirschner*; Mainz/DE*

Purpose: One limitation of mechanical thrombectomy (MT) is clot migration during the procedure. This might be caused by abruption of the trapped thrombus at the distal access catheter (DAC) tip during stent-retriever retraction due to the cylindrical shaped tip of the DAC. Aiming to solve this problem, this study evaluates the proof-of-concept of a new designed funnel-shaped tip in an experimental in vitro setting.
Methods and materials: Two catheter models, one with a funnel-shaped tip and one with a cylindrical-shaped tip, were compared in an experimental setup. For MT, a self-made vessel model and thrombi generated from pig's blood were used. MT was performed 20 times for each device using two different stent-retrievers, 10 times respectively
Results: For the funnel-shaped model, MT was successful with both stent-retrievers (Trevo XP ProVue 3/20 mm; Trevo XP ProVue 4/20 mm) at the first pass in 9/10 times (90%), respectively. For the cylindrical-shaped model, MTs were successful at the first pass with the smaller stent-retriever 5/10 (50 %) and 6/10 (60%) for the larger stent-retriever.
Conclusion: The in vitro experiments show a better recanalisation rate for the funnel-shaped tip compared to the cylindrical-shaped tip. Further studies are needed to verify the safety and efficacy of the proposed funnel-shaped tip.
Limitations: A single in vitro experimental setting with missing in-vivo experiments due to a not yet feasible prototype of the novel DAC for in-vivo experiments.
Ethics committee approval: Animal experiments were carried out after receiving approval by the local government committee (Landesuntersuchungsamt Rheinland-Pfalz, Germany) under reference number 23 177-07/G 14-1-094 and in accordance with the German Animal Welfare Act (Tierschutzgesetz). All applicable international, national, and/or institutional guidelines for the care and use of animals were adhered to.

Photothermal-mediated local heating using a branched gold nanoparticle-coated stent to suppress stent-induced tissue hyperplasia in a rat's gastric outlet
M. Kim*; Jeju-si/KR (soir09@naver.com)*

Purpose: To investigate the effectiveness of photothermal (PT)-mediated local heating for suppressing stent-induced tissue hyperplasia and to evaluate in vivo temperature during local heating of a rat's gastric outlet.
Methods and materials: A branched gold nanoparticle (BGNP)-coated self-expandable metallic stent (SEMS) was produced for PT-mediated local heating under near-infrared laser irradiation. 45 rats were randomly divided into three groups (15 rats each). Group A received non-coated SEMS. Group B received BGNP-coated SEMS with local heating at 55°C. Group C received BGNP-coated SEMS without local heating. 5 rats in each group were sacrificed after heating. The remaining 10 rats were sacrificed 4 weeks after stent placement. The effectiveness of local heating was assessed by western blot and histopathological analysis results.
Results: BGNP-coated SEMSs were successfully fabricated. All procedures were successful in all rats. Stent-induced tissue hyperplasia-related variables were significantly lower in group B than in groups A and C (all $p<0.001$). The mean degree of CD31-positive deposition was significantly lower in group B than in groups A and C (all $p<0.001$). The mean degree of TUNEL-positive deposition was significantly higher in group B than in groups A and C (all $p<0.001$). Ki67-positive mesothelial monolayers were more prominent in groups A and C than in group B.
Conclusion: PT-mediated local heating suppressed tissue hyperplasia after stent placement in a rat's gastric outlet. The in vivo temperatures were significantly decreased compared to the in vitro temperatures during local heating.
Limitations: It is necessary to determine timing for local heating to suppress stent-induced tissue hyperplasia.
Ethics committee approval: Animal Board approval obtained.

A clinical-radiomics nomogram based on radiographic features to assess pulmonary metastasis of osteosarcoma of the extremities
P. Yin, N. Hong*; Beijing/CN (yinping915@163.com)*

Purpose: Osteosarcoma (OS) is the most common primary malignant bone tumour in adolescents. Pulmonary metastasis (PM) occurs in more than half of patients at different stages of the disease course, which is one of the important factors affecting the long-term survival of OS. We aimed to develop and validate a clinical-radiomics nomogram based on radiographic and clinical features that could predict PM of OS of the extremities.
Methods and materials: 1,100 patients (PM=418, non-PM=682) with histologically proven OS of the extremities were retrospectively analysed and divided into a training set (n=770) and a validation set (n=330). Radiographic features and risk factors (sex, age, type, grade, treatment, etc.) associated with PM were evaluated. We compared the performance of models based on radiographic features, clinical data, and their combination. The area under the receiver operating characteristic curve (AUC) and accuracy (ACC) were used to evaluate different models.
Results: A combined model had a relatively higher performance than an individual one. A clinical-radiomics nomogram based on combined features achieved an AUC of 0.873 and ACC of 0.842, followed by a radiomics model (AUC=0.821, ACC=0.790) and clinical data (AUC=0.762, ACC=0.706) in the validation set.
Conclusion: The clinical-radiomics nomogram had a good performance in predicting PM of OS of the extremities, which would be helpful in clinical decision-making.
Limitations: All images were acquired over the course of several years and all of our imaging data come from a single-centre. A a multicenter study with a large sample size is needed in further study.
Ethics committee approval: This study was approved by the local ethics committee of our hospital.
Funding: No funding was received for this work.

Quantitative analysis of airway and parenchymal lesions in idiopathic pulmonary fibrosis using an artificial intelligence-based technology
T. Handa, K. Tanizawa, T. Oguma, N. Tanabe, T. Niwamoto, H. Shima, T. Kubo, K. Togashi, T. Hirai*; Kyoto/JP (hanta@kuhp.kyoto-u.ac.jp)*

Purpose: Previous studies showed that the severity of traction bronchiectasis (TBE) might be associated with prognosis in idiopathic pulmonary fibrosis (IPF). This study aimed to quantify airway volumes as an indicator of TBE together with parenchymal lesions on chest high-resolution computed tomography (HRCT) and investigate their clinical significance in patients with IPF.
Methods and materials: A total of 103 IPF patients who visited Kyoto University Hospital and underwent chest HRCT and pulmonary function tests were enrolled. An artificial intelligence-based image analysis software was developed in collaboration with FUJIFILM Corporation. The software automatically measured airway volumes peripheral to the main bronchi, as well as volumes of parenchymal lesions. The extents of these volumes were expressed as percentages to total lung volume and their associations with pulmonary function and survival were analysed.
Results: Airway volumes had a moderate negative correlation with %FVC and strong positive correlation with FEV1/FVC. In univariate analysis, airway volumes, as well as volumes of some parenchymal lesions including consolidation and interstitial lung disease (ILD) (the sum of ground-glass opacity, reticulation, and honeycombing), were significantly associated with survival. In multivariate analysis, consolidation (hazard ratio [HR], 1.54; 95% confidence interval [95%CI], 1.25–1.90) and ILD volumes (HR, 1.06; 95%CI, 1.02-1.10), but not airway volumes, were independently associated with survival.
Conclusion: Airway volumes are novel parameters associated with pulmonary function and survival in IPF. Consolidation volume might also be a novel prognostic imaging biomarker in IPF.
Limitations: This is a single-centre, retrospective study with a moderate number of patients. Serial changes of CT parameters were not assessed.
Ethics committee approval: The Institutional Review Board of Kyoto university approved this retrospective study (IRB approval number R1353).
Funding: This study was supported by a grant from FUJIFILM Corporation.

Radiomic-based nomogram: a novel technique to predict the EGFR mutation status for first-generation EGFR TKI therapy
Q. Weng[1], J. Hui[1], H. Wang[1], C. Lan[1], M. Chen[1], P. Pang[2], M. Xu[1], Z. Wang[1], J. Ji[1]*; [1]Lishui/CN, [2]Hangzhou/CN*

Purpose: To develop a radiomics-based nomogram for preoperative prediction the EGFR mutation in NSCLC patients.
Methods and materials: All patients underwent nonenhanced CT scan before surgery. A.K. software extracted 396 radiomic features. LASSO logistic regression was used for feature dimension reduction and radiomic features construction. We incorporated the independent clinical features into the radiomic features model. The performance was compared between the radiomic feature model and the joint prediction model.
Results: The radiomic signatures were significantly associated with EGFR activating mutation. Five clinical features were contributed as a clinical feature model. The radiomic-based nomogram suggested high accuracy and good calibration for prediction of EGFR status in the training cohorts. Though it showed a slight decrease of accuracy in validation cohorts, the significant difference wasn't found between the two models in prediction power (P=0.1547).
Conclusion: We developed a combined prediction model showing a favourable performance for non-invasively predicting EGFR activating mutation in NSCLC patients.
Limitations: This is a retrospective study and only lesions which went to surgery were chosen, there may be a selection bias. Our study performed in two institutions and the different reconstruction algorithms may affect the image quality. Thus, it is necessary to validate our findings in multiple centres. The CT images analysed in the present study were nonenhanced and whether the findings in this study are suitable for enhanced images needs further investigation
Ethics committee approval: Our study has been approved by institutional review board of two institutions.
Funding: This study was supported by Zhejiang Medical and Health Science Project (2019RC320 to QY. Weng).

3D computer-aided volumetry (CADv) system with AI system: a comparison of quantitative nodule component measurement accuracy and pulmonary nodule differentiation capability on repeated CT examination
Y. Ohno[1], K. Aoyagi[2], Y. Kishida[3], S. Seki[3], Y. Ueno[3], A. Yaguchi[4], T. Yoshikawa[3]*; [1]Toyoake/JP, [2]Otawara/JP, [3]Kobe/JP, [4]Kawasaki/JP (yohno@fujita-hu.ac.jp)*

Purpose: To compare the capability for nodule component measurement and nodule differentiation between computer-aided volumetry (CADv) with and without convolutional neural network (CNN) on repeated CT in routine clinical practice.
Methods and materials: 170 consecutive patients detected with 215 pulmonary nodules (103 malignant and 112 benign nodules) at initial CTs underwent follow-up CT, pathological and bacterial examinations, treatment, or more than 2 years follow-up. In this study, each CADv automatically assessed solid and GGO component as well as total nodule (TN) volumes. In each patient, TN volume change per day (TN/day) and doubling time (DT) were also automatically evaluated from two serial CTs at each CADv. To evaluate the accuracy of volume measurement, the gold standard of each volume was computationally determined by the STAPLE method. To determine the utility of CNN, the measurement error of each volume was compared between both CADvs by t-test. To compare the capability for nodule differentiation, ROC analysis was performed. Finally, diagnostic accuracies were compared among all indexes determined by both CADvs by McNemar's test.
Results: Measurement errors of GGO and TN with CNN were significantly smaller than those without CNN ($p<0.05$). The area under the curve (Az) of TN/day with CNN (Az=0.94) was significantly larger than that of others ($p<0.0001$). In addition, Az of DT with CNN (Az=0.67) was significantly larger than that without CNN (Az=0.58, p=0.03).
Conclusion: CADv with CNN is more useful than without CNN for quantitative nodule component assessment and nodule differentiation on routine CTs.
Limitations: A limited study population.
Ethics committee approval: This prospective study was approved by our institutional review board of Kobe University Graduate School of Medicine and written informed consent was obtained from each subject.

Objectively evaluating the labelling accuracy of the Stanford CheXpert dataset: a multi-reader study
H. Mahajan, R. S. Rajan, V. K. Agarwal, M. Murugavel, V. K. Venugopal, V. Mahajan*; New Delhi/IN (vasanthdrv@gmail.com)*

Purpose: To quantify the labelling accuracy of the CheXpert dataset released by Stanford University by comparing it with labels established by radiologists.
Methods and materials: 284 frontal chest x-rays were randomly extracted from the CheXpert dataset and read by 3 radiologists (R1, R2, R3) having 12, 14, and 32 years of experience, respectively. Each radiologist reported 'yes' or 'no' for all the labels provided in the CheXpert dataset. 'Support devices' were excluded due to the inherent unclear nature of the label. Percentage observed agreement was calculated for all three radiologists and the consensus of radiologists to the

CheXpert labels. In CheXpert, '-1' label was attributed to 'uncertain' presence of findings in the image. We evaluated 4 scenarios with '-1' treated as 'Yes', 'No', 'N/A', and a separate third label. Additionally, we intended to open-source our labels for these 284 images.
Results: The mean percentage observed agreement for R1 was 0.80, 0.83, 0.83, and 0.79, for R2 was 0.79, 0.82, 0.82, and 0.78, and for R3 was 0.79, 0.82, 0.82, and 0.78 for each of the four scenarios of '-1' labels. Percentage observed agreement between the consensus of 3 radiologists and CheXpert was highest for 'fractures' (0.94), 'pneumothorax' (0.93), and 'pneumonia' (0.87), and lowest for 'lung opacity' (0.63), 'atelectasis" (0.72), and 'pleural effusion' (0.76).
Conclusion: Our study demonstrates that labels extracted from Stanford's database using natural language processing are accurate and can be used for training and validating deep learning algorithms. More such open-source datasets can help in the development of many more algorithms.
Limitations: A small sample size of 284 x-rays is a major limitation of this study.

Leveraging deep learning artificial intelligence in detecting mismatched anatomy in chest images acquired with abdomen protocol: prevalence analysis and performance metrics
K. Y. Younis, K. Nye, G. Rao*; Waukesha/US (kh.younis@gmail.com)*

Purpose: In 2018, the two highest volume categories of x-ray procedures performed in the main radiology departments were chest (44%) and abdomen/pelvis (18%). X-ray images may be acquired using a protocol for different anatomy, resulting in using incorrect x-ray exposure parameters and image processing algorithms. Using the incorrect DICOM tags may also prevent the consistent and reliable use of hanging protocols in PACS. We propose an AI algorithm to automatically detect the onset of protocol mismatch related to chest frontal x-ray images and issue a warning to the technologist, enabling the technologist to acquire the exposure again but with the right protocol.
Methods and materials: We curated 732 unique x-ray images acquired with an abdomen protocol from mobile and fixed x-ray systems at institutions in the USA and Ireland. All the images were evaluated by a radiologic technologist and divided into two groups, namely chest and abdomen. A deep learning chest frontal detection algorithm was trained on 29,778 unique x-ray images from USA and Canada. The performance of the algorithm was evaluated using a confusion matrix analysis on the 732 unique images.
Results: The anatomy mismatch prevalence changed among sites with an average of 11.2% of chest exams taken with the abdomen protocol and a maximum of 12% in a large hospital. The overall accuracy in detecting chest images and rejecting abdomen images obtained with abdomen protocol was 96.9%. The false-positive rate of flagging true abdomen images as chest was only 1.5%, but that is reasonable since they include a large portion of the lungs.
Conclusion: A deep learning algorithm can be used to warn a radiographer if a chest image is acquired using a protocol for a different anatomy.

Quantitative image quality comparison of bone suppression images generated by dual-energy subtraction techniques and deep learning-based software
A. Son, K.-H. Do, G.-S. Hong, K.-W. Jo, K. P. Kim, J. H. Yun*; Seoul/KR (ayeon1230@gmail.com)*

Purpose: To investigate the quantitative image quality of bone suppression image (BSI) generated by deep learning-based (DL) software compared with dual-energy subtraction (DES) techniques.
Methods and materials: This prospective study included 40 adult patients who underwent two digital chest radiographs (CXR) using x-ray equipment with DES and x-ray equipment with DL software. In intercostal and bone regions, respectively, 720 region-of-interests (ROIs) were extracted from the original CXR and BSI. For the comparison of objective image quality, peak signal-to-noise ratio (PSNR) and structure similarity index (SSIM) were calculated from ROIs extracted from original CXR and BSI, and compared between DES techniques and DL software groups.
Results: In the intercostal regions, PNSR and SSIM of BSI generated by the DL software was significantly higher than those of DES technique (31.45±6.87 dB vs. 29.85±2.31 dB; and 97.51±8.76 % vs. 91.26±5.13 %; all P value < 0.001). In bone regions, PNSR of BSI generated by the DL software was significantly lower than that of DES technique (20.93±3.18 vs. 34.37±3.22 dB), but SSIM of BSI made by the DL software was significantly higher than that of DES technique (94.57±8.76 vs. 87.77±5.16 % in SSIM) (all P < 0.001).
Conclusion: DL software creates effective bone removal images while maintaining the image quality of the soft tissue.
Limitations: The image quality of the BSI generated by DES may be not an absolute criterion because the image quality of x-ray can be affected by x-ray exposure parameters.
Ethics committee approval: The present study protocol was reviewed and approved by the Institutional Review Board of Asan Medical Center (approval No. 2018-1348) and all patients gave written, informed consent.
Funding: This research was supported by a research grant from Samsung Electronics (2018).

Preoperative CT-based radiomics combined with intraoperative frozen section can diagnose invasive adenocarcinoma in pulmonary nodules: a multicentre study
G. Wu, H. C. Woodruff, S. Sanduleanu, T. Refaee, A. Jochems, R. Leijenaar, P. Lambin*; Maastricht/NL (g.wu@maastrichtuniversity.nl)*

Purpose: To develop a preoperative radiomics model and combine it with an FS and clinical data to distinguish invasive adenocarcinomas (IA) from preinvasive lesions/minimally invasive adenocarcinomas (PM).
Methods and materials: This multicentre study containing 623 lung adenocarcinoma patients was split by centre into training (n = 331), testing (n = 143), and external validation dataset (n = 149). Random-forest models were trained using radiomics features, results from FS, lesion volume, clinical and semantic features, and combinations thereof. The area under the curve (AUC) was used to evaluate model performances. The models were further assessed using diagnostic accuracy and calibration and decision curves.
Results: The radiomics-based model shows good classification performance and diagnostic accuracy for distinguishing IA from PM, with AUCs of 0.89, 0.89, and 0.88, in three datasets respectively, and with corresponding accuracies of 0.82, 0.79, and 0.85. Adding volume and FS significantly increases the performance of the model with AUCs of 0.96, 0.97, and 0.96, and with accuracies of 0.91, 0.94, and 0.93 in three datasets. There is no significant difference in AUC between the FS model with radiomics and volume against an FS with volume model alone, while the former has higher accuracy. The model combining all information shows minor non-significant improvements in AUC and accuracy compared to the FS model with radiomics and volume.
Conclusion: Radiomics are potential biomarkers for the risk of IA, especially in combination with FS, and could help guide surgical strategy for pulmonary nodules patients.
Limitations: A retrospective data collection and manual contour.
Ethics committee approval: The review boards approved this study and the informed consent was waived.
Funding: Supported by the Dutch Technology Foundation STW.

Development and validation of a deep learning-based model for automatic detection of tuberculosis on radiographs
D. Wang[1], S. Wu[1], H. Wang[1], T. Zou[1], Y. Sun[2], S. Drago Gonzalez[2], Y. Shen[1]; *[1]Beijing/CN, [2]Wiesbaden/DE*

Purpose: To develop a deep learning (DL)-based model for the automatic and efficient detection of tuberculosis on radiographs and to validate its feasibility in clinical practice.
Methods and materials: In this proposed model, ResNeXt was utilised as the backbone while the RetinaNet was adopted to extract object features. The non-local module was embedded to capture the correlations between tuberculosis characteristics and the surrounding points. The model was trained, validated, and tested on a private dataset containing 1,678 x-rays manifested with tuberculosis at a ratio of 8:1:1. In addition, two public datasets were used to validate the robustness of the DL-based model. One consisted of 58 tuberculosis abnormal x-rays and 80 normal x-rays (Montgomery County X-ray Set) and the other contained 336 tuberculosis abnormal x-rays and 326 normal x-rays (Shenzhen Hospital X-ray Set). Area under the receiver operating characteristics (AUROC) score, detection recall, and precision were calculated to evaluate the model performance.
Results: DL-based model achieved an AUROC score of 0.9301, a recall of 0.8523, and a precision of 0.8240 in the local test dataset. In addition, the DL-based model demonstrated excellent performance in detecting tuberculosis for the two public datasets with the AUROC scores of 0.9588 (Shenzhen) and 0.9666 (Montgomery). In particular, the recall and precision were 0.8363 and 0.9623 for Shenzhen datasets while 0.8448 and 0.9609 for Montgomery datasets.
Conclusion: The proposed DL-based model was efficient and robust for automatic tuberculosis detection. It might be applied to assist radiologists in clinical practice.
Limitations: This study need to expand the sample size from other hospitals to increase the model robustness and the conclusion confidence.

A comparison of ultra-low-dose chest CT with deep learning reconstruction and standard-dose chest CT with hybrid reconstruction
C. Steveson[1], J. Schuzer[2], S. Rollison[2], T. Machado[2], A. Jones[2], P. Julien-Williams[2], J. Moss[2], M. Chen[2]; *[1]Adelaide/AU, [2]Bethesda/US (chloe.steveson@medical.canon)*

Purpose: Deep convolutional neural network image reconstruction can reduce image noise and enable radiation dose reductions. The aim of this study is to investigate whether the use of a deep learning reconstruction algorithm allows for reduced radiation dose chest CT scanning.
Methods and materials: 105 consecutive patients with cystic lung diseases underwent a chest CT at standard and ultra-low radiation doses on a 320 detector row CT scanner. The standard dose scan was reconstructed using a soft tissue kernel with hybrid iterative reconstruction (AIDR3D) and the ultra-low-dose scan was reconstructed using a soft tissue kernel with deep learning reconstruction (AiCE) techniques. Cystic lung diseases were quantified as the percentage of lung volume occupied by cysts. Cyst scores were quantified by semi-automated software. The signal-to-noise ratio was calculated for each reconstruction. Data was analysed by linear correlation, paired t-test, and Bland-Altman.
Results: Patients averaged 49.1 years (range 27-76yrs), 91% were female. The mean radiation dose reduction was 97% (4.50 mSv ±2.24 mSv for standard dose vs. 0.14 mSv ±0.02 mSv for ultra-low-dose, p <0.001). The mean cyst score was 8.9±10.8 for standard dose AIDR 3D reconstruction and 8.5±11.3 for ultra-low-dose deep learning reconstruction, representing an insignificant difference of 0.38%. The linear correlation coefficient was excellent at 0.975 (p<0.001). Signal-to-noise for low-dose AiCE images was lower than to standard-dose AIDR3D images (4.20 vs. 7.38, respectively, p<0.001) but completely adequate for interpretation.
Conclusion: Deep learning reconstruction in conjunction with 97% radiation reduction has an excellent correlation with standard conventional chest CT.
Limitations: A single-centre study.

Brain atrophy in multiple sclerosis and clinically isolated syndromes: a 30-year follow-up
L. Haider[1], K. Chung[2], G. Birch[2], S. Mangesius[3], F. Prados[2], O. Ciccarelli[2], F. Barkhof[4], D. Chard[2]; *[1]Vienna/AT, [2]London/UK, [3]Innsbruck/AT, [4]Amsterdam/NL (l.haider@live.at)*

Purpose: Brain atrophy and the neurodegeneration underlying it starts early in multiple sclerosis (MS). However, the long-term clinical relevance of early atrophy is unknown.
Methods and materials: 132 people presenting with a clinically isolated syndrome were recruited between 1984-87 and followed-up clinically and with an MRI 1, 5, 10, 14, 20, and 30 years later. Third ventricular width, medullary width, and white matter lesions were measured at all available time points.
Results: At 30 years, 27 had a clinically isolated syndrome (CIS), 34 relapsing-remitting (RR) MS, 26 secondary progressive (SP) MS, and 16 had died due to MS-related (MSRD) causes. Of those who were alive, the mean expanded disability status scale (EDSS) in the CIS groups was 1 (0-2), in the RRMS group 1.5 (1-2), and in the SPMS group 6 (6-6,5).
Nested mixed effect models estimated significant faster atrophy rates in SPMS (p<0.0000) and MSRD patients (p<0.0000).
Using logistic regression, a reduction of 1 mm in the medullary width from baseline to 5 years, predicted a 6-fold increase in the probability of SPMS or MSRD over the next 25 years (p<0.013).
Atrophy rates within the first 5 years after CIS predicted a broad range of cognitive and motor function-based outcome measures at 30 years.

Conclusion: Our findings suggest that brain atrophy within 5 years of symptom onset predicts disability a decade or more later, indicating its relevannce prior to clinical progression.
Limitations: The analysis was restricted by the image quality of archival films analysed at baseline, one, and five-year follow-up.
Ethics committee approval: Approved by the National Research Ethics Service (15/LO/0650).

The bi-caudate ratio as an MRI marker of white matter atrophy in multiple sclerosis and ischaemic leukoencephalopathy
D. Serag, S. A. H. Hassanein; *Shebin El-Kom/EG*
(shaimaahamid@hotmail.com)

Purpose: To assess the value of the bi-caudate ratio as an MRI marker of white matter atrophy in multiple sclerosis and ischaemic leukoencephalopathy patients and to set a cut-off value to differentiate between patients with white matter atrophy and normal subjects.
Methods and materials: 115 patients (54 male and 61 female) (mean age {+SD}, 52.5 {+ 18.2} years) diagnosed with white matter leukoencephalopathy (MS in 51 patients and ischaemic leukoencephalopathy in 64 patients) and a control group of 60 subjects (27 male and 33 female) with normal white matter signal were scanned. The BCR was compared for both patients and controls. The BCR was compared for patients with MS and ischaemic leukoencephalopathy.
Results: BCR for the patients ranged from 0.13-0.27 mm (mean {± SD}=0.16±0.02), while for the control group it ranged from 0.05-0.13 mm (mean {± SD}=0.09±0.01). The difference between the two groups was statistically significant (P<0.001). A cut-off value of 0.13 was used to differentiate between the BCR in both patients and control groups with a sensitivity, specificity, and accuracy of 99.2%, 100%, and 99%, respectively. The difference in BCR for patients diagnosed with MS and ischaemic leukoencephalopathy was also statistically significant (P<0.001).
Conclusion: The bi-caudate ratio represents a linear measurement of subcortical atrophy that can be useful as a surrogate marker of global supra-tentorial white matter atrophy instead of the usually performed visual, and therefore subjective, assessment. It is an easily obtained measure that can be performed without complex time consuming volumetric studies. Our findings also revealed that the BCR is higher in patients with ischaemic leukoencephalopathy than in patients with MS.

A comparison study of three different methods for detection of T2/FLAIR signal changes in multiple sclerosis
R. Antulov[1], M. Kusk[1], V. Antonov[1], J. M. Christiansen[1], M. Dawari[1], E. M. H. Kruuse[2]; *[1]Esbjerg/DK, [2]Middelfart/DK*
(ronald.antulov@outlook.com)

Purpose: MRI is important in monitoring multiple sclerosis (MS) but conventional side-by-side reading (SBSR) of follow-up examinations for detecting new or changing T2/FLAIR lesions is time-consuming and prone to misdetection. Several recent articles presented methods for the detection of T2/FLAIR lesions based on commonly available software packages that accelerate the reading process. The aim was to compare two novel reading methods against SBSR in an everyday reading environment.
Methods and materials: 30 consecutive MS patients were included. MRI examinations were performed on the same 1.5T scanner and included a 3D-FLAIR sequence. 4 radiologists with different experience levels analysed two follow-up examinations, current and previous, respectively, on the same workstation. Automatic co-registration of the follow-up examinations along with colour coding of the current examination (CE) for the colour-coded reading (CCR) and contrast inversion of the CE for the inverted contrast reading (ICR) were performed. We analysed the specificity, sensitivity, positive predictive value (PPV), and negative predictive value (NPV) for the detection of new MS lesions (NMSL), MS lesion size changes (MSLSC), and reading time (RT). A senior neuroradiologist provided the reference standard.
Results: CCR showed the highest combined sensitivity [97.5%] and specificity [85%] for NMSL detection with a PPV of 93.1% and NPV of 95.4%. Regarding MSLSC detection, both CCR [60.9%] and ICR [80%] showed a higher combined sensitivity compared to SBSR [49%]. The combined mean RT showed a significant decrease when CCR [71s] and ICR [88s] were compared to SBSR.
Conclusion: CCR and ICR are valid alternatives to SBSR that reduce the RT while keeping or improving NMSL and MSLSC detection. Therefore such reading methods are recommended in everyday clinical routine.
Limitations: The number of included patients is limited.
Ethics committee approval: The IRB approved the study and waived the need for informed consent.
Funding: No funding was received for this work.

Cervical cord atrophy in MS: in search of a threshold area — a meta-analysis
A. Guarnera, C. C. C. Quattrocchi, V. Di Lazzaro, R. Papalia, B. B. Beomonte Zobel; *Rome/IT (guarneraalessia@gmail.com)*

Purpose: To investigate whether patients with MS present with significant cervical cord atrophy compared to healthy controls and to identify a cervical spinal cord area threshold that could discriminate patients with MS from healthy controls.
Methods and materials: Literature databases were searched (2001-2018) for cohort and case-control studies reporting measures of cervical cord areas on MRI scans in MS patients and controls to be included in the meta-analysis. Articles evaluating the size or changes in the size of MS plaques, non-homogeneous patient categories, and patients with MS undergoing experimental therapies were excluded.
Results: 17 studies were included, resulting in a total cohort of 1,545 patients and 505 controls. A significant statistical difference between progressive forms of MS (PMS, PPMS, and SPMS) patients and healthy controls cervical cord areas (p<00001) was ascertained. Based on a ROC curve, a cervical cord threshold area of 71 mm^2 (sensitivity 94%, specificity 100%) to determine progressive forms of MS patients from non-progressive forms of MS and healthy controls was identified (Younden index: 94%).
Conclusion: Cervical cord atrophy is statistically significant in PMS patients compared to healthy controls. The detection of a cervical cord trans-sectional area threshold of 71mm^2, measured by MRI in MS patients, could be used both in clinical practise to discriminate progressive forms of MS from healthy controls and non-progressive forms of MS and in clinical trials to validate the efficacy of established therapies and new therapies.
Limitations: The relative small number of studies analysed and the heterogeneity of sequences and methods used for cervical cord trans-sectional area measurements by the included studies.
Ethics committee approval: The study was approved by the institutional ethics board and adhered to the tenets of the declaration of Helsinki.
Funding: No funding was received for this work.

Brain connectivity changes in CMT1A patients: a resting-state functional MRI study
T. Perillo[1], G. Pontillo[2], S. Cocozza[3], R. Dubbioso[2], S. Tozza[2], F. Manganelli[2], M. Quarantelli[2], A. Brunetti[2]; *[1]Giugliano in Campania/IT, [2]Naples/IT*
(tperillo3@gmail.com)

Purpose: Evidence from different neuropathies demonstrated that peripheral nerve pathology can broadly influence brain connectivity, way beyond the involvement of the sensorimotor network. The aim of our study was to systematically investigate functional connectivity (FC) changes in the brain of Charcot-Marie-Tooth (CMT) 1A patients.

Methods and materials: In this observational cross-sectional study, we enrolled 18 right-handed patients with genetically confirmed CMT1A, along with 20 age- and sex-comparable healthy controls (HC). Resting-state (RS) fMRI data was analysed with a seed-based approach sampling 32 ROIs included in the SPM-based CONN toolbox and characterising an extended set of classical RS networks. Between-group differences for the distinct seeds were tested using the standard general linear model implemented in SPM12, covarying for age, sex, and mean motion, and correcting for multiple comparisons at the cluster level. The results of each analysis were considered significant for $p<0.05$ and were Bonferroni-corrected for multiple comparisons (0.05/32).
Results: In CMT1A patients compared to HC, several clusters emerged of increased FC relative to seeds within the default mode, dorsal attention, and language and salience networks, encompassing different supratentorial cortical areas ($p<0.001$).
Furthermore, a cluster of reduced FC relative to the occipital cortex was found in the left lentiform nucleus (p=3E-4).
Conclusion: CMT1A patients show extensive rearrangements of brain connectivity.
FC increase could reflect a reduction of the physiological anticorrelation between the default mode (DMN) and other networks (e.g. increased FC between hubs of the salience and dorsal attention networks and DMN nodes, namely posterior cingulate cortex and inferior parietal lobule), as well as a compensatory mechanism (e.g. increased FC within the language network).
Reduced FC between the occipital cortex and lentiform nucleus could represent a maladaptive disruption of the visual corticostriatal functional loop.

Investigation of brain structural plasticity in CMT1A patients: a combined VBM and TBSS study

E. A. Vola, G. Pontillo, S. Cocozza, R. Dubbioso, S. Tozza, F. Manganelli, M. Quarantelli, A. Brunetti; *Naples/IT*
(elena.a.vola@gmail.com)

Purpose: Although it is primarily a peripheral nervous system disease, several anecdotal reports of central nervous system (CNS) involvement have been described in different forms of Charcot-Marie-Tooth disease (CMT), including its most common subtype (CMT1A). The aim of this study was to investigate the presence of structural damage in the brain of CMT1A patients.
Methods and materials: 20 patients with genetically confirmed CMT1A were enrolled along with 20 age- and sex-comparable healthy controls (HC). Brain MRI exams included a 3D-GE-T1w for the voxel-based morphometry analysis (VBM) and diffusion tensor imaging (DTI) data for the tract-based spatial statistics (TBSS) analysis. CMT1A patients also underwent clinical and electrophysiological examinations including the determination of the CMT neuropathy score (CMTNS) as a global measure of disease severity and the compound motor action potential (CMAP) as an index of distal arm axonal damage.
Results: The VBM analysis revealed a cluster of significantly increased GM density in CMT1A patients compared to HC encompassing the right paravermian portions of the cerebellar lobules III, IV and V. No between-group differences emerged from the TBSS analysis when considering the DTI metrics. A significant negative correlation ($r=-0.738$, $p=0.003$) was found between the CMAP values and the age, sex, and TIV-adjusted z-scores of the first eigenvariate extracted from the cluster of significant between-group difference at the VBM analysis.
Conclusion: CMT1A patients show cerebellar grey matter modifications, which occur independently from central white matter microstructural alterations, possibly representing a structural plasticity mechanism which compensates for the primary peripheral nerve damage.

The prediction of clinical disability in multiple sclerosis using a combined machine learning and texture analysis approach

S. Cocozza[1], R. Cuocolo[1], G. Pontillo[1], L. Ugga[2], M. Petracca[1], R. Lanzillo[1], V. Brescia Morra[1], A. Brunetti[1]; [1]*Naples/IT*, [2]*Scafati/IT*
(sirio.cocozza@unina.it)

Purpose: Despite the use of advanced MRI techniques, imaging biomarkers often fail to accurately predict the accumulation of physical disability in multiple sclerosis (MS) patients. The aim of our study was to investigate the possible role of radiomics for the prediction of disability in MS by applying a machine learning approach to texture analysis (TA) parameters.
Methods and materials: 79 patients with MS were recruited. All patients underwent a neurological examination with the determination of the expanded disability status scale (EDSS) as an index of clinical disability along with an MRI protocol on a 3T scanner including 3D-T1-weighted and 3D-FLAIR sequences.
On FLAIR images, hyperintense lesions were segmented, while T1-weighted volumes were used to segment white matter (WM) and both cortical and deep grey matter (GM). Features were extracted using open-source software (Pyradiomics v2.1.2) with a resulting dataset that was processed with a data mining software (Weka v3.8), while a regression support vector machine was used for EDSS score prediction.
Model validation was performed with a train-test approach, with the test group constituting 25% of the total population.
Results: MS patients (M/F=44/35; 41.5±11.0 years) showed a median EDSS score of 3.5.
The subset evaluator produced a dataset containing 47 features (22 from T1-weighted and 25 from FLAIR sequences, mainly derived from deep GM).
The support vector machine obtained a correlation coefficient of 0.87, with a mean absolute error of 0.5 and a root mean square error of 0.7.
Conclusion: Our results demonstrate that a machine learning-derived model including TA parameters mainly related to deep GM is able to predict physical disability in MS patients with significant accuracy.
Limitations: A single center, retrospective study.

Impact of enhancement and lesion size on quantitative susceptibility mapping values of multiple sclerosis lesions

G. Manasseh[1], T. Hilbert[1], M. J. Fartaria[1], J. Deverdun[2], T. Kober[1], P.-P. P. Maeder[1], P. Hagmann[1], V. Dunet[1]; [1]*Lausanne/CH*, [2]*Montpellier/FR*
(gibran.manasseh@alumni.ethz.ch)

Purpose: Quantitative susceptibility mapping (QSM) is an emerging method used to characterise brain lesions in multiple sclerosis (MS). Our goals were to investigate the relation between QSM values and gadolinium (Gd)-enhancing MS lesions and to assess the relation between QSM values and lesion size.
Methods and materials: We performed a retrospective study on 73 MS patients who underwent a single-time-point brain MRI at 3T (MAGNETOM Skyra, Siemens Healthcare, Erlangen, Germany), including 3D FLAIR, T1-MPRAGE pre/post-Gd, and double-echo GRE (TE=20/40ms) sequences. The fully automated prototype method LeManPV was used for the automated lesion segmentation on 3D FLAIR and T1-MPRAGE pre-Gd images. A set of lesions was selected manually according to specific criteria. Active lesions were identified using T1-MPRAGE pre/post-Gd data. QSM maps were estimated from GRE images using a standard post-processing pipeline including RESHARP and TVSB algorithms. QSM lesions values were extracted using LeManPV lesion masks and compared between non-enhancing and enhancing lesions with the

Wilcoxon rank-sum test. The relation to size was evaluated with the Spearman coefficient.
Results: 3,894 lesions were found by the LeManPV method. We selected 985 lesions (25%), of which 35 (3.6%) were enhancing. We observed similar mean QSM values in enhancing and non-enhancing lesions (0.0026±0.0184 vs 0.0050±0.0176 ppm, p=0.32). For lesions with a volume greater than 70 µL, the difference was significant (-0.0044±0.0150 vs 0.0082±0.0177 ppm, p=0.028). In non-enhancing lesions, there was a very weak correlation between QSM values and lesions size for lesions ≥70 µL (rho=0.18, p=0.0015) but not for lesions <70 µL (rho=0.06, p=0.13).
Conclusion: On a single time-point, QSM values may be influenced by lesion size and enhancement status. This should be taken into account when QSM values are used to identify active MS lesions.

Microscopic anisotropy imaging without the confounding effect of fibre orientation dispersion can significantly improve the characterisation of pathology in multiple sclerosis

K. Winther Andersen[1], S. Lasic[2], H. Lundell[1], M. Nilsson[2], D. Topgaard[2], F. Szczepankiewicz[2], H. Roman Siebner[1], M. Blinkenberg[1], T. B. Dyrby[1]; [1]Copenhagen/DK, [2]Lund/SE (samo@rwi.se)*

Purpose: Can tensor-valued diffusion encoding provide higher specificity in multiple sclerosis (MS)? In contrast to the traditional fractional anisotropy (DTI-FA), microscopic fractional anisotropy (µFA) obtained from tensor-valued diffusion encoding is not affected by fibre dispersion and might therefore be a better disease biomarker. We estimated DTI-FA and µFA in a group of relapsing-remitting (RRMS) and primary progressive (PPMS) MS patients and age-matched healthy controls (HC).
Methods and materials: 45 MS and 28 HC were scanned (14 PPMS, 26 RRMS, and 27 HC analysed) on a Philips Achieva 3T, 32-channel head-coil. DTI-FA from conventional DWI: 106 images 2x2x2 mm, 50 slices, scan time 21.5 min. µFA from tensor-valued DWI: 2.5x2.5x2.5 mm, 14 slices, scan time 16.2 min.
Results: Tissue pathology in normal-appearing white matter (NAWM) was reflected by µFA, but not DTI-FA. µFA was lowest in PPMS and highest in HC. DTI-FA tended to be higher in HC than in RRMS, but counterintuitively, higher DTI-FA was observed in PPMS than in RRMS, probably due to degenerated crossing fibres. µFA provides stronger correlations with clinical scores. Total lesion volume correlated with µFA but not DTI-FA. µFA negatively correlated with age but not DTI-FA.
Conclusion: Compared to traditional diffusion MRI, tensor-valued encoding can significantly improve the characterisation of pathology in MS.
Limitations: Lower image resolution may lead to partial volume effects reducing specificity.

MR planimetric measurements for diagnosis and outcome prediction of multiple sclerosis

S. Mangesius[1], S. Pereverzyev[1], L. Lamplmayr[1], L. Lenhart[1], L. Haider[2], G. Bsteh[1], S. Wurth[1], F. Deisenhammer[1], E. R. R. Gizewski[1]; [1]Innsbruck/AT, [2]Vienna/AT (stephanie.mangesius@tirol-kliniken.at)*

Purpose: Brain volume change has been suggested as an MRI predictor of disability in multiple sclerosis (MS). However, volumetric measurements are not used routinely as no accepted methodology for clinical use exists to date. Easily applicable planimetric measurements are proposed for different neurologic disease entities. In this pilot study, we investigated whether planimetric measures predict the technically more complex volumetric measurements in MS patients.
Methods and materials: Neural networks (NNs) were used to predict the volumetric measures (grey matter [GM], white matter [WM], and cerebrospinal fluid [CSF]) with planimetric measures. The planimetric input variables were preselected using Spearman's correlation (SC) coefficient.
Results: Planimetric characteristics yielding a high correlation with volumetric characteristics were GM with frontooccipital diameter (FOD) (SC=0.98), midbrain diameter (M_d) (SC=0.92), pontine area (P_A) (SC=0.98), midbrain-to-pontine diameter ratio (SC=0.90), WM with transverse skull diameter (SC=0.89), FOD (SC=0.93), M_d (SC=0.85), P_A (SC=0.95), CSF with third ventricle width unaligned (SC=0.82), anterior segment of corpus callosum/genu (SC=-0.83), corpus callosum index (CCI) (SC=-0.83), and regional anterior CCI (SC=-0.92). The NNs constructed based on these measures predicted the volumes of GM, WM, and CSF with errors below 11% for GM, 5% for WM, and 15% for CSF.
Conclusion: Despite the small sample size, we observed high correlations between MR planimetric and volumetric measurements and were able to construct NNs with low prediction errors.
Limitations: Larger patient cohorts will allow separation in training and test sets to investigate MR planimetry as an easy to apply and robust imaging biomarker to evaluate cerebral and ventricular volume in patients with MS with similar accuracy as, and strong correlations with, volumetric measurements.
Ethics committee approval: The study has been approved by the ethical committee of the Medical University of Innsbruck.

Non-invasive quantification of hepatic steatosis using conventional ultrasonography with liver biopsy as gold standard

G. Weijers; *Nijmegen/NL (Gert.Weijers@radboudumc.nl)*

Purpose: Quantitative analysis of conventional ultrasonography can be an attractive non-invasive alternative for liver biopsies to stage steatosis. We validated the computer aided ultrasound (CAUS) method for staging human steatosis against qualitative as well as a quantitative histopathology.
Methods and materials: In a cohort consisting of consecutive patients referred for liver biopsy (n=224), with a variety of clinical indications, biopsy and ultrasound examinations were performed. Histological examination revealed 87 patients with steatosis (NAFLD activity score (NAS): 1-3) and 128 patients with liver fibrosis score. A fully automated method applied to digitally scanned HE-slides was developed to estimate the steatosis proportional area (SPA) in order to obtain absolute steatosis values. Five ultrasound images per patient were analysed using the CAUS protocol, which determines depth-dependent histogram and parametric texture parameters after several pre-processing steps. Pearson correlations to NAS and SPA were obtained for all CAUS parameters. Data was divided (50-50%) into a training and test set in order to train (multiple linear regression analysis) and test (area under the receiver operation curve (AUROC)) independently.
Results: Best correlating parameters were the mean-echo-level (R=0.71, p<0.01) and the residual-attenuation-coefficient (R=0.77, p<0.01). High predictive performance with an AUC of 0.94 to NAS and 0.99 to SPA was found. Fibrosis was not found to be a confounding parameter for staging steatosis.
Conclusion: The excellent predictive performance values indicate the potential usage of the generic applicable CAUS method for steatosis screening and follow-up studies.
Limitations: CAUS accurately quantifies steatosis, but is so far not suitable for detection of fibrosis or cirrhosis. Therefore, CAUS should be seen as an additional offline tool performed by radiologists.
Ethics committee approval: Approved by the institutional review board (no.2016-2763).

Non-invasive assessment of liver cirrhosis with multiphasic dual energy CT using iodine maps: correlation with model of end-stage liver disease score

D. Mastrodicasa[1], M. J. Willemink[2], C. Duran[3], V. Hinostroza[1], L. Molvin[1], M. Khalaf[1], R. B. Jeffrey[1], B. N. Patel[1];
[1]*Stanford, CA/US,* [2]*Menlo Park, CA/NL,* [3]*Boston, MA/US (domenico.mastrodicasa@gmail.com)*

Purpose: To determine whether multiphasic dual -energy (DE) CT iodine quantitation correlates with severity of chronic liver disease.
Methods and materials: 28 cirrhotic and 22 non-cirrhotic patients who underwent a multiphasic liver protocol DECT and had MELD scores available were included. All three phases (arterial, portal venous (PVP), and delayed) were performed in DE mode. ROIs were placed in the caudate, left and right hepatic lobe, in the aorta, common hepatic artery (CHA), and portal vein (PV) to measure iodine (I) values (mg I/ml). (λ) were calculated as follows: $I_{delayed-arterial}$/ time and $I_{delayed-PVP}$/ time. λ were correlated with MELD scores and the area under the curve of the receiver operating characteristic (AUROC) was calculated to distinguish cirrhotics and non-cirrhotics.
Results: Cirrhotic and non-cirrhotic patients had significantly different $\lambda_{delayed-PVP}$ for caudate (λ = 1.350 vs. 2.350, P<.0001), left (λ = 1.383 vs. 2.200, P<.004), and right (λ = 1.063 vs. 1.913 , P<.0001) lobe. $\lambda_{delayed-arterial}$ were significantly different for CHA (λ = 2.450 vs. 11.250, P<.023) and PV (λ = 2.750 vs. 3.750, P<.013). A significant correlation was found between MELD scores and $\lambda_{delayed-PVP}$ of caudate, left and right lobes (rho=0.340, P=.034; rho=0.393, P=.005; rho=0.368, P=.034, respectively). AUROC for caudate, left, and right lobe $\lambda_{delayed-PVP}$ in differentiating cirrhotics from non-cirrhotics were 0.794, 0.739, and 0.908, respectively.
