### Section: Criteria for estimation of transport effects

The mass and heat transfer limitations were evaluated based on the total rate of consumption of  $\text{CO}_2$  as guided in the textbook *Catalysis From Principles to Applications* (Edited by Matthias Beller, Albert Renken and Rutger A. van Santen, Wiley-VCH, 2012, pages 102 and 548). The reaction rates (taken as an average over the bed) at the standard reaction condition of 40 bar,  $\text{WHSV} = 6000 \text{ mL g}_{\text{cat}}^{-1} \text{ h}^{-1}$  and

feed molar  $H_2:CO_2 = 3:1$  have been used. The calculation was performed for  $In_2O_3-ZrO_2$  (IZ-carb) catalyst at 623 K (350 °C) which showed the highest conversion of  $CO_2$  at 28%. The bulk density of  $In_2O_3-ZrO_2$  was measured at approximately  $1360 \text{ kg/m}^3$ , and the apparent activation energy was estimated at around 77 kJ/mol. **Mears Parameter (MP)** was calculated using the equation:

For examining the absence of interphase concentration gradients:

$$MP = \frac{-r_{A(obs)} \rho_b R n}{k_c C_{Ab}} < 0.15 \quad (S1)$$

For examining the absence of interphase temperature gradients:

$$MP = \frac{(-\Delta H)(r_{A(obs)} \rho_b R E)}{h T_b \cdot RT_b} < 0.15 \quad (S2)$$

where,

$-r_{A(obs)}$  = observed rate of reaction (mol/kg · s)

$n$  = reaction order (assume  $n = 1$  in this reaction)

$Rp$  = average catalyst granule radius (m)

$\rho_b$  = bulk density of catalyst bed ( $\text{kg/m}^3$ ) =  $(1 - \Phi)\rho_c$  ( $\Phi$  = porosity)

$\rho_c$  = solid density of catalyst ( $\text{kg/m}^3$ )

$C_{Ab}$  = bulk reactant concentration ( $\text{mol/m}^3$ )

$k_c$  = mass transfer coefficient (m/s)

$\Delta H$  = enthalpy of reaction (J/mol)

$E$  = activation energy of  $CO_2$  (J/mol)

$R$  = gas constant (8.314 J/mol.K)

**Weisz Prater parameter (WP)** was calculated using the equation:

For checking the absence of concentration profiles in an isothermal porous catalyst pellet:

$$WP = \frac{-r_{A(obs)} \rho_c R^2}{D_e C_{As}} < 0.6 \text{ (for } n = 1) \quad (S3)$$

For examining the absence of intraparticle temperature gradients:

$$WP = \frac{(-\Delta H)(r_{A(obs)} R^2 E)}{\lambda_e T_s \cdot RT_s} < 1 \quad (S4)$$

where,

$-r_{A (obs)}$  = observed rate of reaction (mol/kg · s)

$\rho_c$  = solid density of catalyst (kg/m<sup>3</sup>)

$R_p$  = average catalyst granule radius (m)

$D_e$  = effective diffusivity (m<sup>2</sup>/s)

$C_{As}$  = surface reactant concentration (mol/m<sup>3</sup>)

Moreover, the Thoenes-Kramers correlation (as shown below in eq. S3) was used to estimate the packed-bed external mass transport coefficient for the Mears Parameter.

$$\left[ \frac{k_c d_p}{D_{AB}} \left( \frac{\Phi}{1 - \Phi} \right) \frac{1}{\gamma} \right] = \left[ \frac{U d_p \rho}{\mu (1 - \Phi) \gamma} \right]^{\frac{1}{2}} \left( \frac{\mu}{\rho D_{AB}} \right)^{\frac{1}{3}} \quad (S5)$$

where,

$d_p$  = particle diameter (m)

$\Phi$  = void fraction (porosity of packed bed)

$\gamma$  = shape factor

$U$  = superficial gas velocity through the bed (m/s)

$\mu$  = viscosity (kg/m · s)

$\rho$  = fluid density (kg/m<sup>3</sup>)

$\nu = \frac{\mu}{\rho}$  = kinematic viscosity (m<sup>2</sup>/s)

$D_{AB}$  = gas phase diffusivity (m<sup>2</sup>/s)

$k_c$  = mass transfer coefficient (m/s)

Weisz-Prater and Maers parameters were calculated for In<sub>2</sub>O<sub>3</sub>-ZrO<sub>2</sub> (IZ-carb) catalysts at 623 K (350 °C) which showed the highest conversion of CO<sub>2</sub>, 28%. The Weisz-Prater and Maers parameters were WP = 0.156 and MP = 0.008, respectively for In<sub>2</sub>O<sub>3</sub>-ZrO<sub>2</sub> catalysts. The WP < 0.6 and MP < 0.15 indicating the absence of both intraparticle and interphase mass transfer limitations.

Table S1: Calculation of Weisz-Prater criterion for In<sub>2</sub>O<sub>3</sub>-ZrO<sub>2</sub> (IZ-carb) catalyst

Symbol	Term	In <sub>2</sub> O <sub>3</sub> -ZrO <sub>2</sub> ,
r <sub>obs</sub>	Observed reaction rate at bulk concentration, mol/kg(catalyst)/s	5.966E-03
R <sub>p</sub>	The average radius of the catalyst particle (m)	2.125E-04
C <sub>As</sub>	Reactant (CO <sub>2</sub> ) concentration at external particle surface, mol/m <sup>3</sup>	195.6
ρ <sub>p</sub>	True bulk density of the catalyst, kg/m <sup>3</sup>	6400
T	Reaction temperature, K	623
P	Reaction pressure, bar	40
D <sub>CO<sub>2</sub>-H<sub>2</sub></sub>	Diffusivity of CO <sub>2</sub> in a mixture of CO <sub>2</sub> and H <sub>2</sub> , m <sup>2</sup> /s	5.64E-06
De	Effective diffusivity of spherical catalyst pellets, m <sup>2</sup> /s	5.64E-07
φ	Weisz-Prater Parameter $\phi = \frac{r_{obs} * \rho_p * R_p^2}{De * C_{As}}$	0.156

Table S2: Calculation of Maers criterion for In<sub>2</sub>O<sub>3</sub>-ZrO<sub>2</sub> (IZ-carb) catalyst

Symbol	Term	In <sub>2</sub> O <sub>3</sub> -ZrO <sub>2</sub> ,
$\tau_{obs}$	Observed reaction rate at bulk concentration, mol/kg(catalyst)/s	5.966E-03
$R_p$	The average radius of the catalyst particle (m)	2.125E-04
$C_{As}$	Reactant (CO <sub>2</sub> ) concentration at external particle surface, mol/m <sup>3</sup>	195.6
$\rho_p$	True density of the catalyst, kg/m <sup>3</sup>	1360
T	Reaction temperature, K	623
P	Reaction pressure, bar	40
$D_{CO_2-H_2}$	Diffusivity of CO <sub>2</sub> in a mixture of CO <sub>2</sub> and H <sub>2</sub> , m <sup>2</sup> /s	5.64E-06
$k_c$	mass transfer coefficient (m/s)	1.18E-02
$\phi$	Maers Parameter $\phi = \frac{r_{obs} * \rho_p * R_p^2}{De * C_{As}}$	0.0008

Note that the specific heat capacity (Cp) of H<sub>2</sub> and CO<sub>2</sub> was 14300 and 830 J/kg.K, respectively.

Thermal coefficient of H<sub>2</sub> and CO<sub>2</sub> was 0.182 and 0.017 W/m.K, respectively.

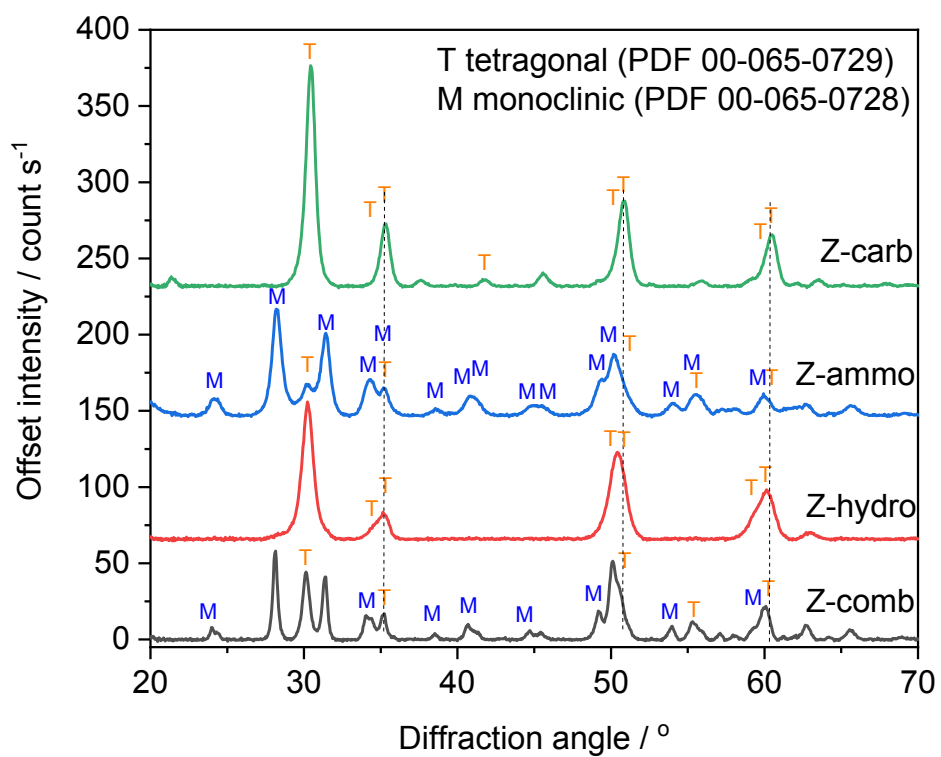

Thermal conductivity of In<sub>2</sub>O<sub>3</sub>-ZrO<sub>2</sub> was taken by average values of ZrO<sub>2</sub> (2.7 W/m.K, <https://doi.org/10.1016/j.ijft.2023.100424>) and In<sub>2</sub>O<sub>3</sub> (2.5 W/m.K, <https://doi.org/10.1016/j.ceramint.2021.03.129>).

The heat transfer coefficient can be calculated from the mass transfer coefficient by using the Chilton-

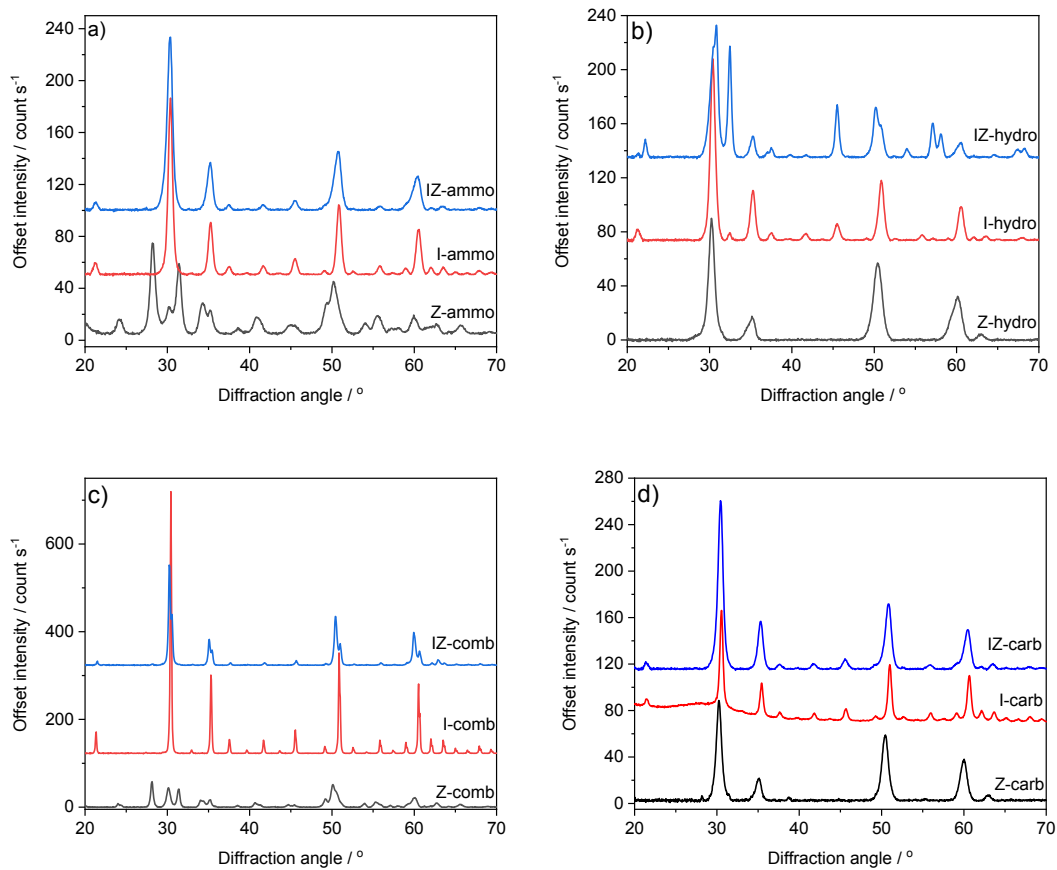

Colburn equation:  $\frac{h}{k_c} = \rho C_p \left( \frac{Sc}{Pr} \right)^{2/3}$  (S6)

Where Pr and Sc is the Prandtl and Schmidt number, Cp is the specific heat capacity.

The MP and WP for heat transfer examination was MP = 0.007 << 0.15 and WP = 0.0002 << 1, indicating the absence of interphase and intraparticle temperature profile.

**Figure S3.** XRD patterns of ZrO<sub>2</sub> samples prepared from different methods.

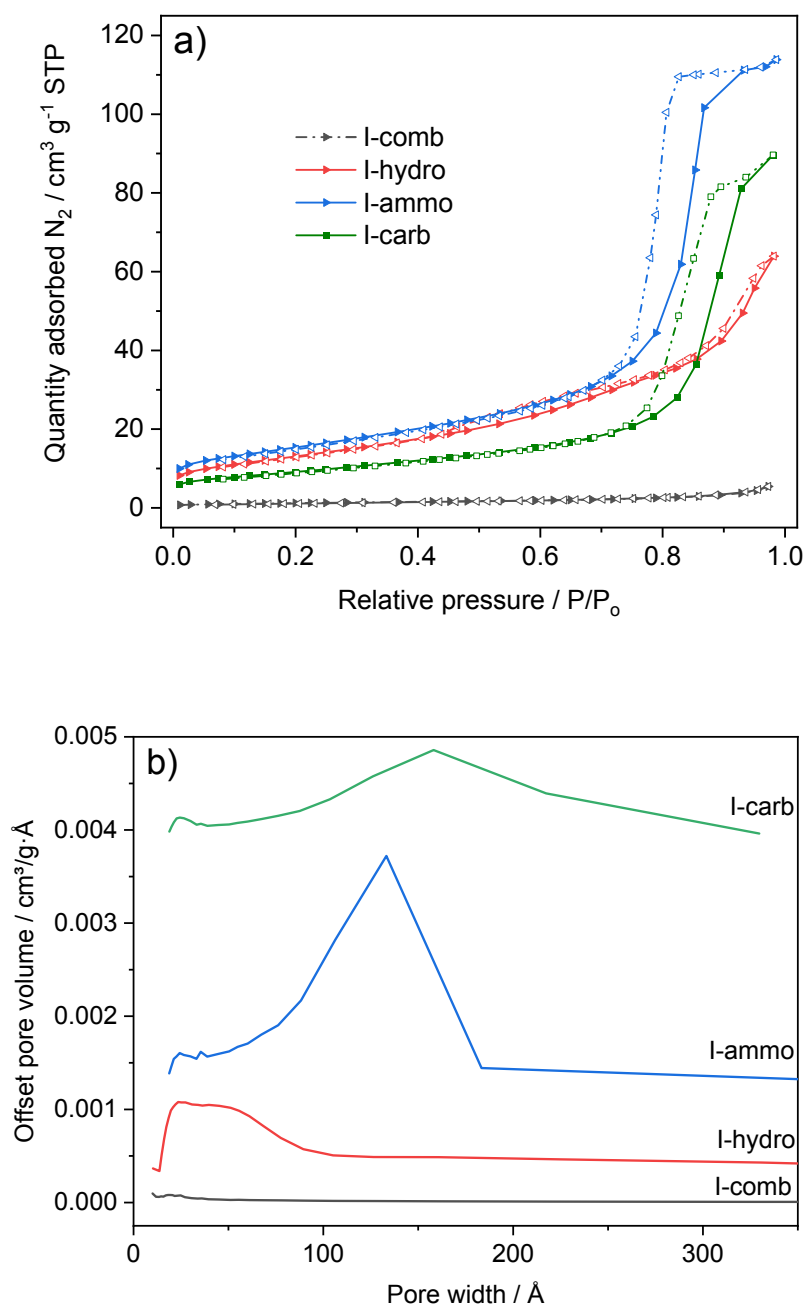

**Figure S4.** Comparison of XRD patterns of  $\text{ZrO}_2$ ,  $\text{In}_2\text{O}_3$ , and  $\text{In}_2\text{O}_3\text{-ZrO}_2$  prepared with the same synthesis method.
